

Coexistence of neurofibromatosis type-1 and primary pulmonary sarcoma: a case report and review of the literature

ABSTRACT

Neurofibromatosis type-1 (NF1) is a genetic disorder characterized by café-au-lait spots, neurofibroma and other associated features. The risk of malignancy is approximately 2.5 to 4fold higher as compared to general population. However, primary pulmonary sarcoma is rarely reported in patients with NF1. Here, we describe a case of NF1 complicated with primary pulmonary sarcoma.
