Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfillment of the requirements for the degree of Master of Science

MUTATION INDUCTION OF CHRYSANTHEMUM (*Dendranthema grandiflora*Tzvelev) USING GAMMA AND ION BEAM IRRADIATION

By

SHAKINAH BINTI SALLEH

February 2013

Chair: Associate Professor Yahya bin Awang, PhD

Faculty: Agriculture

Chrysanthemum is one of the major temperate cut flowers in Malaysia. In chrysanthemum production, there is always a demand for new cultivars with varied flower colours and shapes coupled with other preferred traits. Induced mutation using physical mutagens including gamma ray and ion beam in combination with *in vitro* propagation can be used to generate variations in ornamental plants. The present study was conducted to generate variations in chrysanthemum to produce new cultivars through nuclear technology in combination with plant biotechnology techniques.

In establishing the protocol for *in vitro* propagation, ray florets were cultured on Murashige and Skoog (MS) medium containing five levels of α-naphthaleneacetic acid (NAA) (0, 0.2, 0.5, 1.0 and 2.0 mg/L) and four levels of 6-benzylaminopurine (BAP) (0, 0.5, 1.0 and 2.0 mg/L). Optimum concentration for callus initiation occurred in medium with 0.5 mg/L NAA + 0.5 mg/L BAP while the concentration for shoot regeneration was optimum in MS medium with 0.5 mg/L NAA + 2.0 mg/L BAP. The highest number of normal shoots was also obtained in medium with 0.5 mg/L NAA and 2.0 mg/L BAP. Medium NAA at 0.5 mg/L + BAP at 0.5 mg/L was established as optimum for callus induction from ray florets explants. Subsequent subcultures were done in medium with 0.5 mg/L NAA and 2.0 mg/L BAP for shoot development.

A radiosensitivity (radiation sensitivity) test was carried out to determine the optimum dose for mutation using acute gamma (0 to 120.0 Gy) and ion beam (0 to 30.0 Gy) for two types of explants (ray florets and nodal explants) based on their *in vitro* survival and shoot regeneration. The results showed that the optimum dose for mutation induction of ray florets explants using acute gamma was less than 41.36 Gy and the corresponding dose for ion beam was less than 10.48 Gy. The shoulder dose for irradiated ray florets explants using acute gamma and ion beam were approximately 10.0 and 2.0 Gy, respectively. The optimum dose for mutation induction of nodal explants using acute gamma and ion beam was less than 43.33 and 10.32 Gy, respectively. The shoulder dose for irradiated nodal explants using acute gamma and ion beam were approximately 10.0 and 3.0 Gy, respectively. The

result suggests that the relative biological effectiveness (RBE) for ray florets and nodal explants was 3.95 and 4.20, respectively.

The *in vitro* propagated plantlets were grown in Cameron Highlands, Malaysia (elevation: 1500 m) to evaluate the changes on morphological and flowering characteristics of plants. 16 categories of plants were established in the field: Those derived from ray florets – acute gamma treatment (10.0 and 20.0 Gy) and ion beam treatment (0.5, 1.0 and 2.0 Gy); plants derived nodal explants - acute gamma treatment (10.0, 20.0, 30.0, 40.0 and 60.0 Gy) and ion beam treatment (0.5, 1.0, 2.0, 3.0, 5.0 and 8.0 Gy). Results showed that the ion beam totally altered the plant morphology and flowering characteristics (except the response time) of plants derived from ray florets explants. Acute gamma only altered the flowering characteristics (except the response time). Leaf characteristics were altered by both mutagens. Both acute gamma and ion beam did not alter the morphology of plants derived from nodal explants but showed marked differences in the flowering characteristics especially on the number of buds and flower colours. Both mutagens altered the leaf characteristics such as leaf colour, blade length and shape. In conclusion, ray florets explants are more sensitive to both types of physical mutagens as compared to nodal explants. Ion beam was found to be more effective than acute gamma in inducing mutations for *Dendranthema grandiflora* cv. ‘Reagan Red’.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**MUTASI ARUHAN KE ATAS KEKWA (*Dendranthema grandiflora*
Tzvelev) MENGGUNAKAN SINAR GAMMA DAN ALUR ION**

Oleh

SHAKINAH SALLEH

Februari 2013

Pengerusi: Profesor Madya Yahya bin Awang, Ph.D.

Fakulti: Pertanian

Kekwa merupakan satu daripada bunga keratan iklim sederhana yang utama di Malaysia. Dalam industri pengeluaran bunga kekwa, permintaan yang tinggi tertumpu kepada kultivar baru yang mempunyai warna bunga dan bentuk yang lebih menarik disamping ciri-ciri baik yang lain. Untuk tujuan ini, penggunaan kaedah pembiakan *in vitro* dan mutasi aruhan menggunakan mutagen fizikal seperti sinar gamma dan alur ion didapati amat sesuai. Kajian ini dilakukan untuk menghasilkan kultivar baru bunga kekwa melalui penggunaan teknologi nuklear dan bioteknologi.

Dalam membangunkan protokol pembiakan *in vitro*, eksplan ranggi bunga telah dikulturkan di atas media Murashige and Skoog (MS) yang mengandungi 5 aras α -naphthaleneacetic acid (NAA) (0, 0.2, 0.5, 1.0 and 2.0 mg/L) dan empat aras 6-benzylaminopurine (BAP) (0, 0.5, 1.0 and 2.0 mg/L). Kepekatan optima bagi NAA dan BAP untuk membentuk kalus berlaku pada media yang mengandungi 0.5 mg/L NAA dan 0.5 mg/L BAP dan untuk penghasilan pucuk adalah optima pada media MS yang mengandungi 0.5 mg/L NAA + 2.0 mg/L BAP. Jumlah pucuk normal tertinggi berlaku pada media yang mengandungi 0.5 mg/L NAA and 2.0 mg/L BAP. Oleh itu, media yang mengandungi 0.5 mg/L NAA and 0.5 mg/L BAP telah digunakan bagi mengaruh pembentukan kalus daripada eksplan ranggi bunga. Kalus kemudiannya telah disubkulturkan beberapa kali pada media 0.5 mg/L NAA and 2.0 mg/L BAP bagi penggandaan pucuk.

Ujian radiosensitiviti (sensitiviti terhadap radiasi) telah dilakukan untuk menentukan dos optimum mutasi dengan menggunakan akut gama (0 hingga 120.0 Gy) dan alur ion (0 hingga 30.0 Gy) ke atas dua jenis eksplan (ranggi bunga dan tunas aksilari) berdasarkan kepada keupayaan kedua-dua jenis eksplan untuk hidup dan membentuk pucuk secara *in vitro*. Hasil kajian menunjukkan bahawa dos optimum untuk mengaruh mutasi ke atas eksplan ranggi bunga melalui akut gama adalah kurang daripada 41.36 Gy and dengan alur ion beam adalah kurang daripada 10.48 Gy. Anggaran takat akhir penurunan (*shoulder end*) keluk regenerasi bagi eksplan ranggi bunga yang disinarkan dengan akut gama and alur ion adalah pada dos 10.0 and 2.0 Gy, secara berturutan. Dos optimum bagi mengaruh mutasi ke atas tunas

aksilari melalui gama akut adalah kurang 43.33 Gy dan dengan alur ion adalah kurang daripada 10.32 Gy. Anggaran takat akhir penurunan (*shoulder end*) keluk regenerasi bagi eksplan tunas aksilari yang disinarkan dengan akut gama dan alur ion adalah pada dos 10.0 dan 3.0 Gy. Kajian ini mendapati RBE (kecekapan biologi relatif) bagi eksplan ranggi bunga adalah 3.95 dan bagi eksplan tunas aksilari adalah 4.20.

Anak benih tersinar daripada eksplan ranggi bunga dan tunas aksilari telah ditanam di Cameron Highlands, Malaysia (ketinggian: 1500 m) bagi menilai perubahan morfologi dan tabiat pembungaan. 16 kategori pokok telah digunakan: pokok daripada eksplan ranggi bunga – rawatan gama akut (10.0 dan 20.0 Gy) dan rawatan alur ion (0.5, 1.0 and 2.0 Gy); pokok daripada eksplan tunas aksilari – rawatan gama akut (10.0, 20.0, 30.0, 40.0 and 60.0 Gy) dan rawatan alur ion (0.5, 1.0, 2.0, 3.0, 5.0 and 8.0 Gy). Keputusan menunjukkan bahawa alur ion telah mengubah keseluruhan morfologi pokok serta sifat pembungaan (kecuali masa untuk mula berputik) pokok daripada eksplan ranggi bunga sementara gama akut hanya mengubah sifat pembungaannya (kecuali masa untuk mula berputik). Kedua-dua mutagen telah berjaya mengubah ciri-ciri daun. Gama akut dan alur ion tidak berjaya mengubah morfologi pokok daripada eksplan tunas aksilari tetapi kedua-duanya mengubah ciri-ciri pembungaan terutamanya pada bilangan kudup dan warna bunga. Kedua-dua mutagen juga mengubah cirri-ciri daun seperti warna, panjang dan bentuk daun. Kesimpulannya, eksplan ranggi bunga adalah lebih sensitif kepada kedua-dua jenis mutagen fizikal berbanding eksplan tunas aksilari. Secara keseluruhan, alur ion adalah lebih efektif

berbanding gama akut dalam mengaruh mutasi pada *Dendranthema grandiflora* cv. ‘Reagan Red’.

ACKNOWLEDGEMENTS

I would like to extend my sincerest thanks and appreciation to those who have helped me complete this study. I wish to thank, first and foremost, my Supervisor, Associate Professor Dr. Yahya Awang from the Faculty of Agriculture, Universiti Putra Malaysia (UPM) for his continuing support, patience, guidance and comments.

A special thanks is due to my committee members, Associate Professor Dr. Thohirah Lee Abdullah, Faculty of Agriculture, Universiti Putra Malaysia (UPM), Dr. Zaiton Ahmad, Malaysian Nuclear Agency (Nuclear Malaysia) and Mr. Abdul Kahar Sandrang, Malaysian Agricultural Research and Development Institute (MARDI), for their advice and encouragement.

My immense gratitude goes to Miss Affrida Abu Hassan, Mr. Shuhaimi Shamsudin, and the staff of Agrotechnology and Bioscience Division, Nuclear Malaysia for their unwavering support and help.

I would like to express the deepest appreciation to Dr. Yutaka Oono, Radiation-Applied Biology Division, Japan Atomic Energy Agency (JAEA), Japan and Mr. Ahmad Takim Saring, Faculty of Science and Technology, Universiti Kebangsaan Malaysia (UKM) for their co-operation and help in irradiating my chrysanthemum plant samples.

I am extremely grateful to Dr. Wan Abdullah Wan Yusoff, Station Manager, Mr. Mohammad Abid Ahmad, Mr. Zulkifli Mohd Saaid and all the staff of Malaysian Agricultural Research and Development Institute (MARDI) Cameron Highland for their kindness and assistance throughout the study period.

I would also like to thank the Ministry of Science Technology and Innovation (MOSTI) for the financial support, the Malaysian Public Service Department and the Malaysian Nuclear Agency for approving my study leave and everyone involved, direct or indirectly in the study.

I am fully indebted to my mother, Mrs. Kalsom Abdullah, my late father, Mr. Salleh Din, my two sisters; Miss Shakidah and Mrs. Noorshakila and my brother-in-law, Mr. Khiruddin Mohamed for their love, affection, and encouragement. Without their moral support and prayers, I couldn't have completed my research work.

I certify that a Thesis Examination Committee has met on 21 February 2013 to conduct the final examination of Shakinah binti Salleh on her thesis entitled "Mutation Induction of Chrysanthemum (*Dendranthema grandiflora* Tzvelev) using Gamma and Ion Beam Irradiation" in accordance with the Universities and University College Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The committee recommends that the student be awarded the Master of Science.

Members of the Thesis Examination Committee were as follows:

Sheikh Awadz bin Sheikh Abdullah, PhD

Associate Professor
Faculty of Agriculture
Universiti Putra Malaysia
(Chairman)

Saleh bin Kadzimin, PhD
