

## A review of some works in the theory of diskcyclic operators

### ABSTRACT

In this paper, we give a brief review concerning diskcyclic operators and then we provide some further characterizations of diskcyclic operators on separable Hilbert spaces. In particular, we show that if  $x \in H$  has a disk orbit under  $T$  that is somewhere dense in  $H$ , then the disk orbit of  $x$  under  $T$  need not be everywhere dense in  $H$ . We also show that the inverse and the adjoint of a diskcyclic operator need not be diskcyclic. Moreover, we establish another diskcyclicity criterion and use it to find a necessary and sufficient condition for unilateral backward shifts that are diskcyclic operators. We show that a diskcyclic operator exists on a Hilbert space  $H$  over the field of complex numbers if and only if  $\dim(H)=1$  or  $\dim(H)=\hat{O}$ . Finally, we give a sufficient condition for the somewhere density disk orbit to be everywhere dense.

**Keyword:** Diskcyclic operators; Hypercyclic operators; Supercyclic operators; Weighted shift operators
