## Synthesis of carbon nanotube-carbon nanosphere on the CF surface by CVD

## ABSTRACT

In the current work, the synthesis of carbon nanotubes (CNTs) and carbon nanospheres (CNS's) has been investigated by applying the chemical vapor deposition method in a onestep sample preparation. In this method, iron nitrate non-hydrate (Fe(NO<sub>3</sub>)<sub>3</sub>.9H<sub>2</sub>O) and acetylene (C<sub>2</sub>H<sub>2</sub>) have been used as the catalyst source and carbon source, respectively, to grow CNT directly on the CF surface at 700°C and then CNS's were synthesized on the CNT layers at 900°C under a 250sccm gas flow rate ( $40\%N_2$ ,  $40\%H_2$ , 20% C<sub>2</sub>H<sub>2</sub>). According to the SEM and TEM micrographs from the resultant carbon nanoparticles, the diameters of the CNTs and CNS's have been estimated about 30-50nm and 300-400nm, respectively.
