The issue of food security has in recent times attracted a lot of scholarly debates in Nigeria. In spite of different methodologies utilised by the governments in addressing the challenge, the issue still persists. Results further revealed that the agricultural sector has not performed palatably in its quest for ensuring sustainable development. Suffice to note that agriculture should be given its rightful place if the country wants to experience development that will be said to be sustainable. In addressing this, the second Sustainable Development Goals (SDGs) become handy because of its emphasis on eradicating hunger, which can only be achieved when the role of agriculture is recognised in the nation. It is on this premise that this paper examined the key role of Agriculture in achieving Sustainable Development Goal 2 in Nigeria. This is a conceptual paper that relies on an extensive review of related literature. The findings show that the agriculture sector faces many challenges, making it quite difficult in achieving its main goal which is ensuring an adequate supply of food in all parts of the country. In specific terms, the current insurgency in Northern Nigeria has been one of the major factors which have further destabilised the lopsided agricultural sector in the country. The paper recommended among others that investment in the agricultural sector should be given top priority by the Federal, State and Local Governments so that the continuous dependence on imported products will be reduced, as well as to relieve dependence on the oil sector for economic growth.
