

Dr. Mohammed Hayyan ALSIBAI is a Senior Lecturer (Assistant Professor) at Faculty of Engineering Technology – University Malaysia Pahang (UMP) since 2013. He got his Ph.D. and Master Degree in Computer Science from Graduate school of Systems and Information Engineering, University of Tsukuba, Japan in 2012. He is teaching several courses like Electricity and Electronics Fundamentals, Electric fundamentals and circuit analysis, Digital logic design, Microprocessor and interfacing, Computer programming and Arduino short course.

His research interests include Data analysis, visual information and image processing, visual and statistical pattern recognition, machine learning, micro-processing, embedded systems, fuzzy logic, logic programming, and mobile robotics.

Sulastrri Abdul Manap is a lecturer at Faculty of Engineering Technology – University Malaysia Pahang (UMP) since 2013. She was born in Kuala Krau, Pahang. She received her Bachelor Degree of Electrical Engineering (Electronics) in 2003 from Universiti Teknologi Malaysia and earned her Master Degree of Engineering in 2012 from Universiti Malaya. She teaches several courses like Electricity and Electronics Fundamentals, Computer programming and Arduino short course.

Her research interests include embedded system, digital signal processing, and real-time applications. She has almost 10 years of industrial experience of working as an engineer.

Contents

Contents	v
List of figures	viii
List of sketches.....	ix
Preface	xi
1. WHAT IS?	1
1.1. What is Arduino/Genuino?	1
1.2. What is a microcontroller?	2
1.3. What are sensors?.....	2
1.4. How do things work?	2
1.5. What is prototyping?	2
1.6. Powering Arduino/Genuino.....	3
1.7. Examples and applications	3
Self-training	4
Summary.....	4
2. Digital, Analog and Binary systems	5
2.1. Introduction	5
2.2. Analog vs. Digital	5
2.3. Testing tools	7
2.4. Binary system	7
2.4.1. Let us make things simpler – Do you know how to count?.....	9
2.5. Text and characters can also be digitally represented by 0/1 bits	9
2.6. Digital electronics	9
Self-training	10
Summary.....	10
3. Getting Started with Arduino on Windows	11
3.1. Get an Arduino/Genuino board and an USB cable	11
3.2. Download Arduino software.....	11
3.3. Connect the board	12
3.4. Launch the Arduino application.....	12
3.5. Open the blink example.....	12
3.6. Select your board	13
3.7. Select your serial port.....	13
3.8. Upload the program.....	14
3.9. Code reference	14

Self-training	15
Summary	15
4. Digital I/O	17
4.1. Operating the digital I/O pins	17
<i>Example 1 - Blinking an LED:</i>	19
<i>Example 2: Blinking an LED without using delay()</i>	21
<i>Example 3: Reading button status</i>	23
Pull up / pull down resistors	23
<i>Example 4 – controlling an LED brightness using PWM</i>	26
What is PWM?	26
Adjusting duty cycle	27
Controlling an LED brightness using PWM (The implementation)	28
<i>Example 5: Buzzer or piezo speaker</i>	31
Self-training	32
Summary	32
5. Analog I/O	35
5.1. Using the built in ADC	36
<i>Example 1 - Analog input using a potentiometer</i>	37
<i>Example 2 - Analog input using an LDR</i>	39
<i>Example 3 - Analog in, PWM out</i>	41
<i>Example 4 - Temperature sensor</i>	44
Self-training	46
Summary	46
6. Serial Communication	47
6.1. What is serial communication?	47
6.2. Baud rate	48
6.3. Serial monitor	48
6.4. Serial available	49
<i>Example 1 –Hello world</i>	50
<i>Example 2 - ‘Talk’ to the board through serial port</i>	51
Self-training	54
Summary	54
7. Interfacing Devices	55
7.1. Interfacing devices – Seven-segment display	55
7.2. Interfacing devices – Motor	65
7.3. Interfacing devices –LCD	68

<i>Project 1: Digital thermometer with high temperature alarm function</i>	68
7.4. Interfacing devices – Bluetooth/mobile phones	71
<i>Project 2: Switch an alarm signal ON/OFF using a mobile phone</i>	71
Self-training – Do you own professional project.....	74
Summary	74
APPENDIX Quick review on Arduino C++ programing language	75
References.....	81

Preface

How to read this book?

Do you know: Open source, Prototyping, Electronics?

Arduino is a microcontroller. It is an open-source project which created kits for prototyping and building control devices and interactive tools that can sense and control devices.

If you **understand nothing** from the previous lines, **be happy!** This book is written mainly for you.

A lot of beginners approaching electronics for the first time think that they have to learn how to build everything from scratch. Actually this is not true with Arduino/Genuino and this book. This book presents Arduino which is a leading-edge prototyping technology. It is particularly appropriate as introductory course. We used the content of this book to conduct short courses since 2013. Our courses used to target 2nd year students of engineering technology program. We also had few students from different departments. The content is designed for non-professionals to make them start their path in the technology as professionals. The students in this stage are only familiar with electricity basics and have no idea about digital computing. They also have basic programming knowledge in C programming. Therefore, we are sure this book is suitable to any technology lover. To make an innovative project you only need to have a basic knowledge in programming. You need to be aware about electricity and electrical safety issues. Using basic electricity instruments like multimeter, power sources, batteries and different electronic components is demonstrated in this book. Some hints, explanations are added wherever needed.

In this book we focus on software/hardware engineering best practices. At the heart of the book are our two objectives:

- 1- Learn to make live-codes for real applications.
- 2- Learn how to be self-independent lifelong learner on technology related topics.

In other words, this book is helping you to be able to access the huge sources on the internet which might seem complicated for you. We guarantee after finishing this book, you will be able to understand the huge sources available on-line. Moreover, you will have very powerful tools to be able to develop your own interactive objects or projects. We try to avoid long theoretical explanation and keep it at minimum. We explain the theories inside the practical experiments explanation only when we feel it is useful to know these theories. Therefore, we consider our book as 100% practical book.

In this book we provide working programs, rather than in code snippets. We provide a detailed explanation of the basics that you need to understand any program and any project. All the source code is available at <http://mhdhayyan.alsibai.info/downloads/>

Most of schematics and circuit graphs in this book were developed using “Fritzing” software (<http://fritzing.org>). Actually we recommend readers to use this software. There are many project examples available on Fritzing project page (<http://fritzing.org/projects/>) which is also a good source for learning.

Finally, it is important to mention that Arduino is designed to be an easy-to-use hardware and software electronic prototyping platform. The main idea of Arduino is enabling users to create interactive electronic objects easily. In this book, we cover most of the important concepts which allow readers to do many professional projects. It is important to know that Arduino is a platform which uses AVR Atmel microcontroller. AVR family supports many advanced technologies and concepts. These concepts includes: Timers, interrupt, internal and external clocks and oscillators, Analog comparator, Digital to analog convertors DAC (Opposite to ADC), Two-Wire Interface (TWI), CAN controller support and the JTAG signals. Most of these technologies are for more advanced or industrial projects. To use these technologies with Arduino, the reader need to understand the structure, the registers and the instructions of the AVR microcontroller which is used with his/her Arduino board. For example Atmel AVR ATmega328 is used in Arduino Uno. These topics are out of scope of this book. However, with the topics covered in this book, a lot of application can be implemented. Anyway, interested readers may refer to our online free course titled “micro-controlling: Start as professional” on the link: <https://www.openlearning.com/courses/micro-controlling-start-as-professional>. This course covers most of the above mentioned technologies and concepts.

About the Authors

- Dr. Mohammed Hayyan ALSIBAI is a Senior Lecturer (Assistant Professor) at Faculty of Engineering Technology – University Malaysia Pahang (UMP) since 2013. He got his Ph.D. and Master Degree in Computer Science from Graduate school of Systems and Information Engineering, University of Tsukuba, Japan in 2012. He is teaching several courses like Electricity and Electronics Fundamentals, Electric fundamentals and circuit analysis, Digital logic design, Microprocessor and interfacing, Computer programming and Arduino short course.

His research interests include visual information and image processing, visual and statistical pattern recognition, machine learning, computer vision, micro-processing, embedded systems, Fuzzy logic, logic programming, remote sensing, modeling and simulation, computational graphics and mobile robotics.

- Sulastri Abdul Manap is a lecturer at Faculty of Engineering Technology – University Malaysia Pahang (UMP) since 2013. She was born in Kuala Krau, Pahang. She received her Bachelor Degree of Electrical Engineering (Electronics) in 2003 from Universiti Teknologi Malaysia and earned her Master Degree of Engineering in 2012 from Universiti Malaya. She teaches several courses like Electricity and Electronics Fundamentals, Computer programming and Arduino short course.

Her research interests include embedded system, digital signal processing, and real-time applications. She has almost 10 years of industrial experience of working as an engineer.
