1986 GREENWRAP AND STAKE TOMATO CULTIVAR EVALUATION -FREMONT & COLUMBUS

Robert J. Precheur, Gerry Myers and Charles Willer

Data Analysis and Report: Robert J. Precheur

Mailing Address: Department of Horticulture The Ohio State University 2001 Fyffe Court Columbus 43210

This is a summary of our work evaluating several green wrap tomato cultivars in Fremont and fresh market stake cultivars in Columbus.

FREMONT

<u>Trial Design & Cultural Practices</u> Transplants were obtained through BHN research of Florida. Seven cultivars were grown in a randomized complete block design with 3 replications.

Spacing was 60 inches between rows and 18 inches between plants within rows. There were 15 plants per plot and they were planted on May 15, 1986. Stakes were placed at two plant intervals. Plants were pruned according to directions provided by BHN research. For Sunny, 3-4 suckers were removed; BHN 24: 2 suckers removed; BHN 28 and 66 were pruned the same as Sunny, and BHN 67 & 69B were pruned 1 more sucker than Sunny.

On May 13, 700 lbs/A of 10-20-20 were applied broadcast and disced in. The field was then sprayed with 4 lbs/A Devrinol. At planting 1/2 pint of 10-34-0 was applied per plant. On June 13, 1/2 pint of Sencor was applied post. On June 18, the plants were sidedressed with 150 lbs/A of 10-34-0. The insecticide/fungicide schedule is as follows:

Material	Dates			
Copper	6/14,	6/23		
Manzate 200	6/14,	6/23,	7/4,	7/28,
Guthion	6/23,			
Kocide & Dyrene	7/1			
Sevin	7/4			
Bravo	7/14,	7/27,	8/4,	8/12
Benlate	7/18			
Dithane M 45	8/4			

COLUMBUS

<u>Trial Design & Cultural Practices</u> Trial design was as for Fremont. Seed was sown on March 10 and 17, 1986. Seedlings were transplanted to 2 1/4" cell paks and moved outdoors to harden them off on May 6. Cultivars: Taurus, Mountain Pride, Celebrity, HXP 2807, and Pik Red were planted in the field on May 20. Cultivars: Castle Crown, Revolution, Castle King, Taylor, and Burton were planted on May 29. One thousand pounds/A of 15-15-15 were broadcast and worked in after plowing. At field planting, each plant received 1/2 pint of 10-52-8 starter solution, mixed 3 pounds per 50 gallons of water. Sencor was applied post at 1/4 pound ai/A after the plants were well established. Irrigation was applied at the rate of 1 inch per week.

No fungicides were applied during the season. There were two applications of Sevin and Thiodan and 1 application of Guthion for insect control.

Seed Sources: see Table of Seed Sources for explanation of the seed source codes. External Fruit Appearance & Disorders (from L to R): General Appearance, Concentric Cracking, Radial Cracking, Catfacing, Zippering, Deformed Fruit, Blothcy Ripening. >>SCALE: 5 = Very Good, 1 = Poor.

Internal Fruit Ratings: Core: size and appearance at stem end. >>SCALE: 5 = Very Good, 1 = Poor.

All ratings based on 1 harvest in August.

1986 SWEET CORN CULTIVAR EVALUATION

COLUMBUS: Gerald Myers, Ken DeWeese, Laura Brinkman, Gail Edgington, and Jeff Hartline

FREMONT: Charles Willer and staff

Data Analysis and Report: Robert J. Precheur

Mailing Address: Department of Horticulture The Ohio State University 2001 Fyffe Court Columbus 43210

This is a summary of our work evaluating several super and normal sweet corn cultivars. The same cultivars were evaluated at both Fremont and Columbus in 1986. However, due to labor restraints, weather, and the increased number of research projects at Fremont, not all of the Fremont plots could be harvested at the proper time.

<u>Trial Design</u> At both locations, thirteen super-sweet cultivars were grown in a randomized complete block design with 4 replications. Twelve normal sweet corn cultivars were evaluated in Fremont and 13 normal varieties were evaluated in Columbus. Spacing was 36 inches between rows and 8-10 inches between plants within rows. There were 45 seeds per plot.

FREMONT

<u>Cultural Practices</u>: Seed was sown on June 2, 1986. Guard rows were planted to the north and south sides of rows running east and west at Fremont. All plots were planted with hand jabbers at a plant spacing as mentioned above. Super Sweet Corn plots were isolated from normal sweet corn plots. Nine hundred pounds/A of 10-20-20 were broadcast and worked in after plowing. One hundred fifty pounds of 10-20-20 fertilizer was was worked in and marked out 2 weeks prior to planting. The corn was sidedressed with ammonium nitrate at a rate of 150 lbs/A. Three quarts of Lasso per acre were used for weed control. Insecticides were applied on a regular spray schedule, See below:

Material	Date Applied
Sevin	7/14, 7/18
Lannate	7/18, 8/12
Dipel	8/12

July	5.35	
August	2.79	
September	2.83	

COLUMBUS

<u>Cultural Practices:</u> Corn was seeded on May 14, 1986. Plot size and spacing were as mentioned above for Fremont. Guard rows were planted to the east and west sides of rows running north and south with guard hills across the north and south ends of the entire planting. In addition to the other guard rows, 4 rows of an early maturing and a late maturing cultivar were planted on both the east and west sides of the entire planting of plots to enhance pollination. Super Sweet Corn plots were isolated from normal sweet corn plots. All plots were planted by hand jabber.

Prior to plowing, 15-15-15 fertilizer was applied broadcast at a rate of 1000 lbs per acre. There was also 250 pounds 6-24-12 placed 2 inches to the side and 2 inches below the seed at planting time. Dual herbicide was applied immediately after planting. Most lots of seed had been treated with a fungicide and/or insecticide. Irrigation was' used throughout the season as needed.

There were no sprays for worm control as indicated by the excessive amount of ears lost to worm damage.

Table 5. Sweetness Characteristics of Super Sweet Corn Cultivars At 3 Post-Harvest Intervals, Columbus-1986

At harvest, a sample was taken for analysis for soluble solids (SS) and refractive index (RI). The sample was divided into 3 lots and stored at 40 degrees F. The post-harvest analysis appears in the table above for the 3 time periods. For each test period, certain cultivars are significantly sweeter than others at that particular time and also for the three periods. However, it cannot be determined if one cultivar is better than holding sugar than another since some cultivars seem to be gaining sugar from day 1 to day 7. This sugar increase indicates the wide variation in sugar content from ear to ear at harvest.

On day 1 after harvest, Summer Delicious had significantly greater soluble solids and Landmark had significantly greater refractive index than all other cultivars. On day 5, Summer Delicious and Miracle were sweeter than all other cultivars. On day 7, Summer Delicious is again sweeter than all other cultivars except for Miracle. The LSD values can be used to make other comparisons since there are other significant differences in sweetness.

Much appreciation is given to Winston Bash, Jeff Thomas, and Andrea Anderson from the pilot plant who ran the various sugar tests for this report.
