UNIVERSITI SAINS MALAYSIA
2016

HYDRAULIC MODELLING OF BAFFLE CONFIGURATION ON THE REMOVAL EFFICIENCY OF A RECTANGULAR OIL/WATER SEPARATION TANK

by

HAITHAM ALAA HUSSEIN

Thesis submitted in fulfillment of the requirements for the degree of Doctor of Philosophy

February 2016

ACKNOWLEDGEMENTS

I would like to express my deep and sincere gratitude to my supervisor, Assoc. Professor Dr. Rozi Abdullah. His wide knowledge and his logical way of thinking have been of great value for me. His understanding, encouraging and personal guidance have provided a good basis for the present thesis.

I am deeply grateful to my co-supervisor, Professor Md Azlin Md Said, for his detailed and constructive comments, and for his important support throughout this work.

During this work, I have collaborated with Mrs Nurul Akma, Mr Mohd Taib and many colleagues for whom I have great regard, and I wish to extend my warmest thanks to all those who have helped me with my work in the School of Civil Engineering of Universiti Sains Malaysia.

My warm thanks are due my parents and my family. They have lost a lot due to my research abroad. Without their encouragement, it would have been troublesome for me to finish this work. My thanks also go to all my friends and postgraduate students in the Civil Engineering School for their friendly help and support.

Abstract xxii

CHAPTER 1 - INTRODUCTION

1.1 Background 1

1.2 Problem statement 1

1.3 Motivation 3

1.3.1 Need for Design Development 4

1.3.2 Need for Physical Models 5

1.3.3 Need for Computational Model 5

1.4 Objective of the Study 6

1.5 Research Scope 6

1.6 Research Organization 8

CHAPTER 2 - LITERATURE REVIEW

2.1 Introduction 10

2.2 Gravity Separators Process 14

2.3 Gravity Separator Theory 15

2.4 Flow Pattern and Hydraulic Characteristic in Separation Tanks 23

2.4.1 Density Current 26

2.4.2 Short Circuiting and Circulation Zone 28
2.5 Hydraulic Retention Time (HRT) 30
2.6 Inlet Flow 31
2.7 Velocity Profile 35
2.8 Design and Baffle Configuration 36
2.9 Measurement of FOG in Wastewater 40
2.10 Miscellaneous Studies 42
2.11 Summary 42

CHAPTER 3 - RESEARCH METHODOLOGY

3.1 Dimensional Analysis 44
3.1.1 Buckingham Π Theorem 45
3.2 Overview 48
3.3 Laboratory Experiments 50
3.4 Experimental Setup 53
3.4.1 Velocity Measurement Inside the Separator Tank 55
3.4.2 Best End Baffle Location (using clear water) 63
3.4.3 Best Inlet Baffle Location (Using Clear water) 64
3.4.4 Best Inlet Baffle Height (Using Clear water) 65
3.4.5 Best Angle of the Baffle (Using Clear water) 66
3.4.6 Inlet Baffle Experimental Setup for Assessment Removal Efficiency Inside Separation Tank (Using Palm Oil with Water) 67
3.5 Numerical Modelling Overview 80
3.5.1 Fluid Flow Governing Equation of Flow-3D® 84
3.5.2 Boundary Condition 93
3.5.3 System of Mesh 97
3.5.4 Drift Flux Model for Two-Component Flows 98

CHAPTER 4 - RESULTS AND DISCUSSION

4.1 Introduction 101
4.2 Experimental Assessment 102
4.2.1 Best Position of End Baffle 102
4.2.2 Best Position of Inlet Baffle 107
4.2.3 Best Height of Inlet Baffle 117

4.2.4 Best Angle of Inlet Baffle 121
4.3 Evaluation of Experimental Results 125
4.4 Computational Model of Oil/Water Separation Tank 127
4.4.1 One and Two Phase Flow Validation 131
4.4.2 Numerical Model and Experimental Comparison 132
4.4.3 Best End Baffle Location 135
4.4.4 Best Position of Inlet Baffle 139
4.4.5 Best Inlet Baffle Height 149
4.4.6 Best Angle of Inlet Baffle 153
4.4.7 Effect of Inlet Baffle on the Removal Efficiency of Separation Tank 161
4.5 Empirical Models for Design of Separator Tank 162
4.5.1 Scaling Effects on Flow Distribution of Oil/Water Separation Tank 165

CHAPTER 5 - CONCLUSIONS AND RECOMMENDATIONS

5.1 Introduction 171
5.2 End Baffle Position 172
5.3 Inlet Baffle Position 173
5.4 Inlet Baffle Height 173
5.5 Inlet Baffle Angle 174
5.6 Efficiency and Geometric Design of Separation Tank 175
5.7 Recommendations for Future Research 176

PEMODELAN HIDRAULIK TATARAJAH SESEKAT KEATAS KECEKAPAN PENYINGKIRAN UNTUK TANGKI PEMISAHAN MINYAK/AIR

ABSTRAK

Pembuangan lemak, minyak dan gris ke dalam sistem retikulasi menyebabkan penyumbatan saluran paip dan limpahan pembentungan pembersihan. Rekabentuk tangki pemisahan minyak/air berdasarkan graviti digunakan dengan meluas di dalam unit rawatan. Pengunaan sesekat di dalam tangki pemisahan dan penilaian kesannya keatas kecekapan hidraulik adalah suatu bidang yang mencabar yang dijalankan oleh penyelidik. Kajian ini melibatkan penilaian kesan lokasi sesekat hujung, lokasi sesekat masuk, ketinggian sesekat masuk dan sudut pemasangan sesekat masuk ke atas corak aliran dan kecekapan penyingkiran tangki pemisah minyak/air menggunakan ujian makmal dan penyelakuan berangka. Meterhalaju Akustik Doppler (ADV) digunakan untuk mengukur medan halaju di dalam tangki pemisahan minyak/air di dalam makmal dengan tatarajah sesekat yang berlainan jenis untuk menentukan susuk halaju. Ujian makmal dijalankan untuk mengukur kecekapan penyingkiran tangki pemisahan minyak/air dengan berlainan tatarajah sesekat masuk. Penyelakuan berangka termasuk corak aliran dan ciri-ciri hidraulik tangki pemisahan minyak/air dengan tatarajah sesekat yang berlainan dijalankan untuk menentukan lokasi sesekat hujung dan sesekat masuk, ketinggian sesekat masuk dan sudut sesekat masuk. Hasil keputusan ujian makmal dan penyelakuan berangka menunjukan, lokasi sesekat hujung d_e/L = 0.76, lokasi sesekat masuk d_i/L = 0.12, nisbah ketinggian tenggelam sesekat masuk H_{ib}/H = 0.24, dan sudut sesekat masuk 90^o, mencapai

kecekapan penyingkiran yang maksima. Tatarajah sesekat tersebut menyebabkan isipadu zon sirkulasi dan tenaga kinetik yang minima, keseragaman susuk halaju yang tinggi, muka itu kecekapan penyingkiran yang tinggi di dalam tangki pemisahan minyak/air. Rumus untuk menentukan kecekapan penyingkiran berdasarkan lokasi sesekat masuk diperolehi daripada keputusan ujian makmal.

HYDRAULIC MODELLING OF BAFFLE CONFIGURATION ON THE REMOVAL EFFICIENCY OF A RECTANGULAR OIL/WATER SEPARATION TANK

ABSTRACT

The particular release of fat, oil, and grease (FOG) into collection systems ultimately brings about the blockage of conduits and subsequent sanitary sewer overflows. Designing oil and water rectangular separation tank due to gravitation is extensively applied in treatment units. Using baffles in separation tanks and measuring its effects on hydraulic efficiency is a challenging subject that researchers have investigated. In this study, the effects of end baffle location, inlet baffle location, inlet baffle height, and inlet baffle angle installation on the flow pattern and removal efficiency of oil/water separation tanks are investigated using experimental test and numerical simulation. The velocity field in the laboratory separation tank with various types of baffles configuration was measured by Acoustic Doppler Velocimeter (ADV) to determine the velocity profile. In addition, experimental tests are conducted to measure the removal efficiency of separation tanks equipped at different inlet baffle. Numerical simulation, including the modelling of flow pattern and hydraulic characteristics of separation tanks with different baffle configurations, was performed to determine the best end and inlet baffle location, height of inlet baffle and angle of inlet baffle. Based on the results of experimental tests and numerical models, end baffles location d_e/L=0.76, with an inlet baffle position d_i/L=0.12, inlet baffle submersible depth ratio H_{ib}/H= 0.24, and inlet baffle angle

installed at 90^0, achieve the highest removal efficiency. This configuration produced minimum circulation zone volume and kinetic energy, the most uniform velocity profiles, and thus highest removal efficiency in the separation tank. Finally a formula to determine the removal efficiency as a function of inlet baffle location is obtained from laboratory test results.
