Hypertension

Dexamethasone

ABSTRACT

Introduction: *Portulaca oleracea* is used as a nutritional and medicinal plant. The aim of this study was to assess the effect of hydroalcoholic extract of *P. oleracea* seeds in dexamethasone-induced hypertension in rats.

Methods: For induction of hypertension, dexamethasone (30 µg/kg/d, subcutaneously) was administered for 14 days. Animals received *P. oleracea* extract as a pretreatment at various doses of 100, 200 and 400 mg/kg/d orally from 4 days before dexamethasone administration and during the test period. Systolic blood pressure (SBP) and heart rate were measured using tail-cuff method. The weight of thymus gland was estimated as a marker of glucocorticoid activity.

Results: Dexamethasone injection significantly increased SBP ($P < 0.001$) while decreased the body and thymus weights ($P < 0.05$ and $P < 0.001$, respectively). Oral administration of *P. oleracea* could not prevent rising in SBP and decreasing in thymus weight. It also increased heart rate in hypertensive rats at the dose of 400 mg/kg/d ($P < 0.05$).

Conclusion: The results of this study revealed that hydroalcoholic extract of *P. oleracea* seeds aggregates hypertension in dexamethasone-induced hypertensive rats. Hence, it should be used with caution in hypertensive patients receiving glucocorticoids.

Implication for health policy/practice/research/medical education:

The results of this study revealed that hydroalcoholic extract of *P. oleracea* seeds aggregates hypertension in dexamethasone-induced hypertensive rats. Therefore, it is recommended that its using be avoided in hypertensive patients receiving glucocorticoids.

Introduction

Hypertension or high blood pressure is a common global health problem. According to the statistical report of the World Health Organization (WHO) in 2015, about 24.0% of male and 20.5% of female subjects suffer from high blood pressure worldwide. There is also a high prevalence of hypertension in Iran and this vascular disease affects 24.1% of Iranian male and 23.3% of Iranian female subjects above 18 years old (1). Hypertension is an important cause for dangerous disorders in major end-organs such as ischemic heart diseases, stroke and renal failure (2). The early diagnosis of hypertension and its medical treatment

along with a change in life style would be associated with a decline in the risk of cardiovascular events (3). However, high blood pressure is properly managed only in less than 30% of patients and many people complain of side effects of conventional antihypertensive drugs (4). Recent studies have reported the preventive and helpful effects of various herbal medicines in cardiovascular diseases including hypertension (5).

Portulaca oleracea L. commonly known as purslane belongs to the Portulacaceae family. This annual succulent herb is growing throughout the Old World and used as a salad and vegetable in many countries (6). Wide

range of pharmacological properties has been reported for various extracts of *P. oleracea* including antioxidant, antibacterial, hepatoprotective, analgesic, muscle relaxant, anti-inflammatory, bronchodilatory, antihyperglycemic, antihyperlipidemic and anticancer activities (6-11). Some investigations have proposed the potential of this herbal medicine for protection against cardiovascular diseases (12).

In this study, an attempt was made to determine the effect of hydroalcoholic extract of *P. oleracea* seeds in dexamethasone-induced hypertension in rats.

Methods

Animals

Male Wistar rats weighing 180 to 220 g were randomly selected from the animal house of the School of Pharmacy and Pharmaceutical Sciences (Isfahan, Iran). The animals were kept under standard laboratory conditions including 12 h light/12 h dark cycle and room temperature of 20-25°C with free access to water and standard animal diet.

Chemicals

Captopril was purchased from Tehran Darou Pharmaceutical Co. (Tehran, Iran) and dexamethasone was obtained from Darou Pakhsh Pharmaceutical Co. (Tehran, Iran).

Plant material and preparation of the extract

The *P. oleracea* seeds were purchased from a local market of medicinal plants in Isfahan, Iran, and authenticated by Dr Ghaemmaghami (Department of Biology, School of Science, University of Isfahan). A voucher specimen (No. 1891) was deposited at the Herbarium of the School of Pharmacy and Pharmaceutical Sciences, Isfahan, Iran. For the preparation of hydroalcoholic extract, the powdered seeds of plant were extracted with ethanol (70%), using maceration method for 72 hours at room temperature. After completion of extraction (3 times), the solvent was removed by a rotary evaporator under low pressure at 50°C to yield a viscous residue. The obtained extract was stored at -20°C.

Experimental design

For induction of hypertension, dexamethasone (30 µg/kg/d) was injected subcutaneously (s.c.) in rats for 14 days, and the control group received daily s.c. injection of normal saline (1 mL/kg). In this prevention study, animals received *P. oleracea* seeds extract (100, 200 and 400 mg/kg) or captopril (40 mg/kg, an antihypertensive agent as a reference drug) orally using an intra-gastric tube from 4 days before dexamethasone administration and during the test period (days 1-18). Six rats were used in each group. All animals were weighted on alternate days. At the end of the experiment, the rats were sacrificed under ether anesthesia and the thymus glands were isolated. The weight of thymus was measured and expressed as

milligrams per 100 g body weight. Decline in thymus weight was considered as a marker of glucocorticoid activity (13,14).

Measurement of systolic blood pressure and heart rate

The systolic blood pressure (SBP) and heart rate were recorded by non-invasive tail-cuff method (AD Instrument PowerLab Data Acquisition System, Australia) at the first and last days of the experiment in conscious rats. Ten minutes before measurements, each animal was restrained in a heated chamber at 38±1°C. A training period of 1 week was established before the experiment to allow the rats become adapted to the procedure. Five measurements of blood pressure and heart rate were taken for each rat and their averages were used to obtain the mean values.

Statistical analysis

All values were shown as the mean ± standard error of mean (SEM). For statistical evaluation, one-way analysis of variance (ANOVA) followed by Tukey post hoc test was used (SPSS software version 18.0). Differences with a value of $P < 0.05$ were considered to be significant.

Results

Effect of *Portulaca oleracea* seeds extract on blood pressure

Administration of dexamethasone significantly increased SBP from 116.3 ± 2.7 to 152.6 ± 3.6 mmHg ($P < 0.001$) compared to the normal control group (122.5 ± 1.5 mmHg). Captopril caused a significant decrease in SBP ($P < 0.001$) but pretreatment with *P. oleracea* seeds extract could not prevent the increase in SBP (Figure 1).

Effect of *Portulaca oleracea* seeds extract on heart rate

As shown in Figure 2, heart rate was not significantly changed after administration of dexamethasone, captopril or *P. oleracea* seeds extract at the doses of 100 and 200 mg/kg. However, treatment with 400 mg/kg of *P. oleracea* seeds extract caused a significant increase in rats heart

Figure 1. Effects of *P. oleracea* seeds extract and captopril (40 mg/kg) on systolic blood pressure in dexamethasone-induced hypertensive rats. Values are means ± SEM for six rats. ### $P < 0.001$ versus normal saline group, and *** $P < 0.001$ versus dexamethasone group.

Figure 2. Effects of *P. oleracea* seeds extract and captopril (40 mg/kg) on heart rate in dexamethasone-induced hypertensive rats. Values are means \pm SEM for six rats. # $P < 0.05$ versus normal saline control group.

rate compared to the normal control group ($P < 0.05$).

Effect of *Portulaca oleracea* seeds extract on body weight

Dexamethasone injection caused a significant decrease in body weight in hypertensive animals compared to normal control group ($P < 0.05$). Administration of *P. oleracea* seeds extract significantly increased weight loss at all doses. However, captopril could prevent body weight loss induced by dexamethasone ($P < 0.05$, Figure 3).

Effect of *Portulaca oleracea* on thymus weight

Administration of dexamethasone significantly reduced the thymus gland weight as a marker of glucocorticoid activity in hypertensive rats ($P < 0.001$). Treatment with *P. Oleracea* seeds extract and captopril could not prevent the thymus weight decline (Figure 4).

Discussion

The present study investigated the effect of hydroalcoholic extract of *P. oleracea* seeds on blood pressure in the animal model of dexamethasone-induced hypertension in rats. The results showed that oral administration of *P. Oleracea* seeds extract could not prevent rising in SBP.

Chronic use of dexamethasone leads to hypertension through various mechanisms including increased activity of cardiovascular regulating systems such as sympathetic, renin-angiotensin and endothelin systems and changing in hemodynamic status (15). Augmented sensitivity and reactivity to angiotensin II and norepinephrine and subsequently increased vascular resistance have been defined following dexamethasone administration (16). The roles of oxidative stress and over-production of reactive oxygen species (ROS) through nicotinamide adenine dinucleotide phosphate (NAPDH) oxidase pathway and nitric oxide (NO) deficiency have also been implicated in the pathophysiology of glucocorticoid-induced hypertension (17). Some antioxidant agents and herbal medicines have been able to prevent and reduce

hypertension from dexamethasone in various investigations (18). The hydroalcoholic extract of stems and green leaves of *P. oleracea* has been reported to have antihypertensive activity with negative inotropic and chronotropic effects (19). Phytochemical analysis of *P. oleracea* demonstrated the presence of flavonoids, terpenoids, coumarins, alkaloids, sterols and various nutrients including calcium, magnesium, thiamin, riboflavin, nicotinic acid, vitamin C, carotene, vitamin E, fatty acids, omega-3, linolenic acid, oxalic acid and others (20,21). Its aerial parts are also rich in potassium ions elucidating the muscle relaxant effect of *P. oleracea* (8). There are also valid documents for the presence of biologically active catecholamines including noradrenaline, dopamine and L-dopa in *P. oleracea*. Large concentrations of noradrenaline in the fresh plant have been reported as 2.5 mg/g which is probably larger than that of extractable amount from the mammals suprarenal glands (22). These neurotransmitters may be responsible for increasing blood pressure in this model of hypertension in which dexamethasone intensifies the reactivity to vasopressor effects of catecholamines.

There is no accurate data for toxicity profile of seeds

of *P. oleracea*, however Musa and coworkers reported moderate toxicity and LD50 about 1853-1875 mg/kg for methanolic extract of *P. oleracea* (23). There are some reports for the alteration in oxalic acid content in *P. oleracea* extract based on the nitrogen concentration and nitrate/ammonium ratio in the nutrient solutions (24). Toxic level of plasma oxalate has been associated with atherogenic activity through increasing the intracellular calcium concentration in endothelial cells and inhibition of endothelial proliferation (25). Although *P. oleracea* extract at the dose of 400 mg/kg has been used in some studies (26), but it seems that the lower doses would have the better safety profile with minor adverse effects. The results of the present study also showed increasing in weight loss after administration of *P. oleracea* seeds extract in dexamethasone-induced hypertensive rats. The hypolipidemic effect and reducing body weight gain have been reported for *P. oleracea* in animal models of hyperlipidemia. Different biochemicals such as polyphenols, phytosterols, alkaloids and saponins may be responsible for antihyperlipidemic effect of this plant through decreasing food intake, increasing gastrointestinal motility, promoting insulin sensitivity, regulating the cell energy metabolism or reducing free fatty acids, reducing cholesterol absorption through interfering with its enterohepatic circulation and increasing cholesterol fecal excretion (11,27).

Conclusion

The results of this study revealed that hydroalcoholic extract of *P. oleracea* seeds could not prevent dexamethasone-induced hypertension. The presence of high amounts of catecholamines in this extract and increasing reactivity to vasopressor effects of catecholamines in dexamethasone-induced hypertension may be accountable for increasing blood pressure in this animal model of hypertension.

Authors' contributions

All authors made substantial contributions to conception and design, and/or acquisition of data, and substantially to the writing of the manuscript. All authors read the final version and confirmed the manuscript publication.

Conflict of interests

The authors declare no conflicts of interest. The authors alone are responsible for the content of the paper.

Ethical considerations

All procedures were approved by the ethics committee of Isfahan University of Medical Sciences (IR.MUI.REC.1395.2.104).
