## Introduction

The High Street is widely established as a dynamic construct with a multitude of stakeholders and a plethora of factors that contribute to an 'endless litany of change' (Morganosky, 1997, p. 269). The complexities of dealing with the High Street have been well documented in the literature (Clarke et al., 1997; Hernandez et al., 1998; Peel, 2010; Pioch and Byrom, 2004; Wrigley and Dolega, 2011; Wrigley and Lambiri, 2014), and these complexities can constrain the attempts of local authorities, retailers, citizens, and other key stakeholders to plan and adapt effectively. This is an enduring situation in most places, and the abundance of academic research, market reports, High Street data, as well as the extensive interest from the media and the public, seem to have had little effect on the ground (Parker et al., 2016, p. 3), thus failing to alleviate the ongoing decline in the importance of the High Street, which impacts upon both retailers and communities.

These challenges have led to our understanding of the High Street as a 'wicked problem', which requires successful collaboration between place stakeholders, researchers, and practitioners to tackle the misalignments between academic and practitioner knowledge. 'Wicked problems' call for participatory approaches to research that can 'enable the mutually beneficial reciprocal-exchange of resources and knowledge' between the relevant parties (Phillips et al., 2013, p. 235). In this article, we present such an approach, influenced by the tenets of engaged scholarship (Van de Ven, 2007), that guided the ESRC-funded High Street UK 2020 project. By situating engaged scholarship in the context of retailing and the High Street, we argue that such an approach can address the issues of the limited application of existing academic knowledge to the problem, as well develop and exchange new knowledge of relevance and rigour for High Street stakeholders, researchers, and practitioners (Pettigrew, 2001). Furthermore, we present how our collaborative relationship with place stakeholders helped us to provide a useful models of High Street performance that represent a more commonly-held 'reality' (Rescher, 2003), can be easily interpreted, and therefore be put into practice more easily (through, for example, towns' development or action plans). Based on our findings and dissemination of the High Street UK 2020 project, we suggest that engaged scholarship, as a form of research that requires 'researchers and practitioners (to) coproduce knowledge that can advance theory and practice in a given domain' (Van de Ven & Johnson, 2006, p. 803), can be an alternative to dominant methodological approaches in the fields of retailing, town centre management, and place management in general.

## What is Engaged Scholarship?

In academia, and particularly in business schools, finding ways to address the theory-practice gap and harmonise the scholarly pursuits of researchers with society's pressing concerns (Phillips et al., 2013) is a recurring issue. As King and Learmonth (2015) illustrate, the relevance, usefulness, applicability, and impact of original academic research has been questioned repeatedly (see e.g. Boyer, 1996; Learmonth et al., 2012; Shapiro et al., 2007; Smith et al., 2011; Starkey and Madan, 2001), and has led to the 'growing realization that so-called 'theory' and 'practice' cannot be bifurcated as separate domains' (King and Learmonth, 2015, p. 354). What is needed therefore, is a shift in how researchers approach the knowledge production problem, and how they can move from an 'unengaged process of inquiry in social research' (Van de Ven, 2007, p. 5) to an approach that is participatory, reflexive, transdisciplinary, collaborative, and directed towards accomplishing societal

1  
2  
3 advancements while maintaining high-quality research standards (Cuthill, 2010; Gibbons et  
4 al., 1994).

5  
6 Engaged scholarship is a participative form of research for obtaining the understanding of a  
7 complex problem in its particular context (Van de Ven, 2007) from key stakeholders (usually  
8 people actually affected by the problem). Its origins can be traced to the work of Boyer  
9 (1990), who argued that scholarly activities need to move beyond the conduct of original  
10 research (scholarship of discovery), in order to form a dynamic definition of scholarship that  
11 also helps building bridges between theory and practice (scholarship of integration),  
12 incorporates scientific discovery with problem solving that assists individuals and  
13 communities (scholarship of application), and promotes educational progress (scholarship  
14 of teaching) (Paynter, 2014). Ultimately, the scholarship of engagement entails the  
15 deployment of all the above activities from outside the campus to people and places, where  
16 the work of the engaged scholar can be directed toward larger, more humane ends (Boyer,  
17 1990), and where collaboration in knowledge production can produce 'knowledge that is  
18 more penetrating and insightful than when scholars or practitioners work on the problems  
19 alone' (Van de Ven, 2007, p. 9).

20  
21 Undoubtedly, engaged scholarship advocates a fundamental shift in the relationship  
22 between researchers and other stakeholders (Van de Ven, 2011). This starts with a  
23 recognition that the problem under study cannot be answered with one person's limited  
24 resources and capabilities, which leads researchers to adopt a participant frame of  
25 reference and engage in a reflexive, collective learning process that respects all other kinds  
26 of knowledge production (Alvesson and Sköldbberg, 2000; Hendrickx, 1999). In addition,  
27 engaged scholarship requires researchers to adopt a pluralist view of science and practice,  
28 and take part in conversation and discourse with different people, with the goal to produce  
29 new, but complementary knowledge outputs that can help answer complex problems (Van  
30 de Ven, 2007). In this sense, engaged scholarship can be understood as a collaborative  
31 research method that advances scientific knowledge, helps understand real complex  
32 problems, and has emancipatory potential (Huzzard and Johansson, 2014; Strumińska-Kutra,  
33 2016). Therefore, engaged scholarship has strong bonds with critical management studies,  
34 collaborative inquiry, and participatory action research, as it is also advocating that  
35 academics be actively involved in practice and in the creation of practice-based knowing to  
36 achieve transformative goals in society (King and Learmonth, 2015; Willmott, 2008;  
37 Wolfram Cox et al., 2009).

38  
39 This deviation from traditional, self-referential scholarship is also reflected in the  
40 philosophical underpinnings of engaged scholarship, which favour a 'more inclusive  
41 research philosophy that is open to and integrates some of the differences of alternative  
42 philosophies of science' (Van de Ven, 2007, p. 63) instead of choosing one that fits the  
43 researcher's view and values. Thus, engaged scholarship adopts a realist position that  
44 includes elements from different philosophical approaches (e.g. critical realism,  
45 pragmatism, constructivism, critical theory), and allows researchers to better coordinate the  
46 multiple models, theories, and perspectives that are constructed and identified during the  
47 research process (Azevedo, 1997). In this way, engaged scholarship favours the use of  
48 multidimensional methods and theories, and obtains findings by triangulation through  
49 engagement, which 'increases the richness (and complexity) of problem representation, and  
50  
51

1  
2  
3 decreases the likelihood of myopic representations that other stakeholders may perceive as  
4 being biased and misdiagnosed views of the 'real world' situation (Van de Ven, 2007, p.  
5 285). Whereas engaged scholarship attempts to connect different research approaches that  
6 can lead to theoretical and methodological contradictions and inconsistencies (for a review,  
7 see Strumińska-Kutra, 2016), it allows an evolutionary growth of knowledge via the  
8 development of models that 'better fit the problems they are intended to solve' (Van de  
9 Ven, 2007, p. 70). Thus, as Wells (2016) describes, engaged scholarship does not attempt to  
10 seek generalisability, but rather aims for relevant theorisation and explanation in a specific  
11 situation, through an immersive, interactive, and emergent collaborative learning process  
12 (Wells, 2016, p. 43).  
13  
14  
15

### 16 Engaged scholarship and partnerships in the context of the High Street

17 When comparing the underlying assumptions of engaged scholarship with the High Street  
18 and its academic disciplines or areas (e.g. retailing, marketing, geography, planning and  
19 public administration), a degree of similarity is evident. High Street performance and  
20 development, which, in the UK, is often investigated under the labels of 'town centre  
21 management' and 'place management' has long been associated with different types of  
22 engagement, such as business engagement (Coca-Stefaniak et al., 2005; Dawkins and Grail,  
23 2007; Parker et al., 2014; Wrigley and Dolega, 2011), multiple stakeholder engagement (De  
24 Nisco et al., 2008; Omholt, 2013; Warnaby et al., 2005) and community engagement (Coca-  
25 Stefaniak and Carroll, 2015; Woolrych and Sixsmith, 2013)), which are integral in place  
26 decision-making. Engagement between established town partnerships, such as Business  
27 Improvement Districts, Local Development Companies, Community Interest Companies,  
28 town teams, and the local government, can 'create more efficient, inclusive and pluralist  
29 local governance, bringing together key organizations and actors (from the three spheres of  
30 state, market and civil society) to identify communities' top priorities and needs, and work  
31 with local people to provide them' (Geddes, 2006, p. 87).  
32  
33  
34  
35

36 In addition, working in partnership is long recognised as an important objective in local  
37 community agendas, and as a way for addressing so-called complex and interrelated issues  
38 such as the future of the High Street through trust-building and knowledge-sharing exercises  
39 (Balloch and Taylor, 2001; Raco, 2000; Taylor, 2006). In this sense, researchers' engagement  
40 within these partnerships is not only aligned with the tenets of engaged scholarship, but  
41 also consistent with current policies regarding local governance in the UK (e.g. DCLG, 2009).  
42 Therefore, merging engaged scholarship into the already well-established processes of town  
43 centre and place management can be a step towards the strengthening of stakeholder  
44 participation in the management of the High Street, and can also stimulate opportunities for  
45 learning, dialogue and knowledge production for everyone involved (Peel, 2003).  
46  
47  
48

49 Furthermore, when examining the literature of collaborative planning and strategic spatial  
50 planning (Brand and Gaffikin, 2007; Depriest-Hricko and Prytherch, 2013; Healey, 1998,  
51 2006; Innes, 1996), valuable outcomes that fit with engaged scholarship can be drawn  
52 regarding stakeholder/community interaction, conflict resolution, and consensus building in  
53 a pluralistic environment. Indeed, engaged scholarship can mesh well in participatory  
54 projects and town partnerships, where the multitude of understandings and the constant  
55 conflict of values and interests that are entailed in all stakeholder interactions need to be  
56 recognised and eventually legitimised (Albrechts, 2015; Hillier, 2003; Mouffe, 2005).  
57  
58  
59  
60

Engaged scholarship's theoretical and methodological pluralism can be utilised in order to support what Brand and Gaffikin (2007) label as the 'smart pluralism' approach, which shifts away from coercive dominance and aims to maximize the chance of positive outcomes via compromise and knowledge exchange (Le Feuvre et al., 2016). Whereas strategizing in pluralistic contexts raises various challenges (e.g. inflationary consensus, collective paralysis, inertia, dilution of town initiatives, (Denis et al., 2007) that are consistent with criticisms regarding the ability of engaged scholarship to produce valuable results in the long term (McKelvey, 2006), the 'splicing' of methodological, theoretical, and 'on the ground' pluralisms can be a vehicle towards the production of more insightful knowledge for academics, and both emergent and intended strategies for town partnerships (Arkesteijn and Volker, 2013). In the next part of this article, we will demonstrate how our approach to engaged scholarship corresponded to the participatory processes that took place during the life of the High Street UK 2020 project.

### High Street UK 2020: A model of engaged scholarship

To best explain our approach to the High Street UK 2020 project, we will use Van de Ven's (2007) diamond model of engaged scholarship (figure 1) as a guide for the milestones and outcomes that stemmed from our engagement with stakeholders. Van de Ven's model is appropriate for this purpose, as it is a knowledge production model that advises collaboration with stakeholders and the researchers at every stage (problem formulation, theory building, research design, problem solving, (Hunt, 2008). It is also an iterative model, which allows us to show how our method enabled 'simultaneous problem solving of lower level issues within the greater research question at hand' (Phillips et al., 2013, p. 236). Our model of engaged scholarship differs slightly from Van de Ven's, as it takes numerous case studies and a plethora of stakeholders into the knowledge transfer/exchange loop (see also Wells, 2016). However, Van de Ven's model follows a step-by-step approach that allows us to frame the research in a simple and effective way. We will now present each stage more thoroughly. An outline of milestones and outcomes at every stage can be seen in Table 1.

#### Problem Formulation

In the initial stage of the project, and prior to the production of the bid, we started to engage with key stakeholders (retailers, town centre partnerships, local authorities, property owners/developers and residents), getting their views of the high street knowledge problem. This approach requires from the researcher to adopt a journalist's approach, by being open to the interpretations of others, being able to answer the basic questions of why, when, what, where, who, and how the problem exists, and learn to appreciate the problem's multiple dimensions and manifestations (Van de Ven, 2007, pp. 77–79). What was clear from our discussions with stakeholders, was the uncertainty of how to manage or develop a high street could meet the needs of its community, perhaps not immediately, but in the fairly near future (2020 and beyond. From our initial collaboration, it was clear that academic and professional knowledge was fragmented, and that the study of retail change in particular geographic locations was limited (Wang, 2011), thus making it difficult to those experiencing the problem to ensure the future of their town centres. With this in mind, we started developing a project bid that would help the local agents of change to identify and understand their information requirements, get access to accurate and relevant academic knowledge, to improve the quality of decision making, and provide solid academic underpinning to their plans for action. The bid was developed as an ESRC

1  
2  
3 knowledge exchange project for a large-scale retail sector initiative, and addressed the  
4 following key project questions:  
5

- 6 1. Why haven't high street stakeholders acted on the research and data that has been  
7 available to manage change in a more effective way?
- 8 2. How can research and data be delivered more effectively to high street stakeholders  
9 so that it is used to inform decision making?  
10

### 31 Theory Building

32  
33 Once we had agreed a common knowledge exchange problem, we started further  
34 discussions with retail experts, academics, and place stakeholders, in order to enhance  
35 theory building. At this stage, we wanted to help our project towns understand their  
36 information requirements and get access to accurate and relevant academic knowledge,  
37 which could improve the quality of decision making and provide solid academic  
38 underpinning to future plans of action. According to Van de Ven (2007), the knowledge  
39 exchange 'anomaly' can be resolved by creating a theory/model through processes of  
40 abduction, deduction, induction, which can provide a coherent resolution that can also be  
41 applicable in subsequent situations (Agar, 1986). During the stage of problem formulation,  
42 we came to the realisation that the fragmentation of the retail literature, and the  
43 complexity of factors that impact upon the High Street, leave little room for existing  
44 theories to influence change. Therefore, our goal was to develop a model of retail centre  
45 change that would stem from a review of the literature and existing theories, as well as  
46 from conversations with retail experts that have previously addressed the High Street  
47 problem (Van de Ven, 2011). After discussions between the research team and our retail  
48 experts regarding the future of the High Street, we identified that High Street performance  
49 is mainly a reflection of retail performance, with footfall and vacancy rates as key indicators.  
50 This 'strongly-held assumption' (Van de Ven, 2007, p. 110) served as our initial theory and it  
51 appeared to be plausible and worthy of further investigation, as it stemmed from the  
52 knowledge and experiences of diverse stakeholders.  
53  
54  
55  
56  
57  
58  
59  
60

----- INSERT TABLE 1 HERE -----

In order to investigate these factors that would support our theory, we conducted a systematic literature review (see Appendix 1 for search process and review parameters for this study) in order to form a reliable knowledge base from a range of studies that can be relevant to academics, practitioners and other stakeholders (Tranfield et al., 2003). We initially identified 156 factors that may influence the performance of the High Street. During our first project meeting, and in line with the engaged scholarship model, we presented these initial factors to academic and retail experts and our town team partners. Participants were asked to comment on the factors and also to identify additional performance factors that were not present. Partner towns identified 50 additional factors (Parker, Ntounis and Quin, 2014) that influence the High Street, which led to the review of 33 additional studies. For 12 of those factors that we could find no evidence of their effect on High Street performance, we outlined a research agenda to engage academics on furthering the research on retail change (Parker et al., 2014). Such a scholastic process outlines the foundation of theory building in engaged scholarship, which is based on deductive, literature-based, literature gap formulation and application, that is modified inductively through co-production with practitioners. Moreover, the combination of literature-based and practitioner-based engaged scholarship helped us develop an initial theory and identify 201 factors that can interest researchers and also help practitioners and place stakeholders in their everyday work (Nielsen, 2010, pp. 402–403). The findings of each stage of the research are presented in the second article in this Special Issue.

### Research Design

At this stage of the research process, we needed to develop the appropriate methods and obtain empirical evidence from our retail experts for evaluating the factors that influence High Street performance (Van de Ven and Johnson, 2006). Given the multitude of interpretations, research philosophies (conceptual, empirical etc.) and methods used to measure these factors, a meta-analysis would not be possible. In addition, the studies have not conceptualised 'performance' (or any other dependent variable) in any comparable

manner. It is only fairly recently researchers have been interested in the collaboration activities of stakeholders on the High Street – so we knew little about the type of factors these initiatives seek to influence. This led us to two research questions.

RQ1: How much influence does each factor have over High Street performance?

RQ2: How much influence could the High Street have over the factor?

Addressing these questions requires an understanding of the dynamic concept of the High Street as a social phenomenon. Therefore, model development needed to take into account not only how much these factors influence High Street performance (RQ1), but also how people respond and adapt to High Street change over time because of these factors (RQ2) (Van de Ven, 2007, p. 145), and under which circumstances or contingencies High Street transformation occurs over time (Bruner, 1990; Tsoukas, 1989). Based on these questions, we used the Delphi technique for scoring all factors that may influence the performance of the High Street, following their identification from our systematic literature review. The Delphi technique is unique in its method of eliciting and refining group judgement as it is based on the notion that a group of experts is better than one expert when exact knowledge is not available (Paliwoda, 1983). To establish the amount of influence the High Street may have over the factor we asked 22 retail experts to: 1) classify each one of the 201 factors as spatial, macro, meso or micro (See Figure 2). Then we asked respondents to 2) rate how influential each factor was on the vitality and viability of the High Street. A 5-point Likert scale was used for rating the influence of each factor on the High Street, with 1 being "not at all influential" and 5 "extremely influential". Participants were also free to write additional comments on each factor. The result of the Delphi exercise, after plotting each factor, can be seen in figure 3.

----- INSERT FIGURE 2 HERE -----

Whereas the purpose of a Delphi study is to establish sufficient expert consensus to make a forecast or assignment of values believable or useful (Shields et al., 1987), this did not limit us from treating it as a collective learning process that would enhance our perspectives on the issues of the High Street (Peluchette and Gerhardt, 2015). Discussions during the Delphi exercise and the experts' comments unveiled that from the long list of 201 factors, many had either the same meaning/definition, or were conceptually related. This prompted us to use a novel exploratory approach and statistical tests in order to combine factors that effectively meant the same thing or could be related such as 'visual appearance' and

1  
2  
3 'cleanliness' (Parker et al., 2016, p. 8). The end result was a more coherent representation  
4 of factors and scales, based on the advice from retail experts. In addition, we realised that  
5 in order to bring further clarity, we needed to identify the Top 25 priorities for change (see  
6 Figure 4), based on the results from the "Get on with it!" quadrant, as these micro factors  
7 could be influenced by High Street stakeholders, and can also have the greatest influence on  
8 vitality and viability. This decision was mainly informed by the interests and perspectives of  
9 the town partnerships involved in the project (Van de Ven, 2007, p. 193), which, given their  
10 lack of time and resources, were looking for a model that could help them to focus activity  
11 and resources on action that will have the most impact on vitality and viability (Parker et al.,  
12 2016).

### 34 Problem Solving 35

36 After the completion of the model and the formulation of the top 25 priorities, we  
37 embarked on a variety of activities in order to communicate and apply the HSUK2020 model  
38 to our 10 towns (Van de Ven, 2007). At the problem-solving stage, which entails the  
39 dissemination, interpretation, and application of empirical findings (Phillips et al., 2013), the  
40 impact of the study is the criterion that outlines the usefulness of research findings (Hunt,  
41 2008). Consequently, we sought to warrant that HSUK2020 will leave a suite of legacy  
42 products (such as the HSUK2020 modelling tool, podcasts from academic experts,  
43 intervention place templates, reports, this special issue, etc.), which can eventually facilitate  
44 change in behaviour, conditions, and in the way communities interpret co-produced  
45 knowledge in their own High Streets (Franz, 2009).  
46  
47  
48

49 Naturally, amplifying HSUK2020's impact and legacy involved continued interactions and  
50 discussions between the research team, our retail experts and practitioners, and our 10  
51 towns. Half-day workshops have been run in all 10 locations, in which local partners were  
52 introduced to the 201 factors and top 25 priorities for change, and offered their feedback  
53 and also their own perspectives on how these can inform town centre decision making. In  
54 addition, action planning seminars proffered an update on the reflection of our findings,  
55 including a new forecasting tool that enabled each centre to consider different scenarios,  
56 based on footfall data provided by one of our project partners. Appropriate place  
57  
58  
59  
60

1  
2  
3 interventions, under the broad categories of “repositioning”, “reinventing”, “rebranding”,  
4 and “restructuring”, were also contextualised in partnership with our 10 user communities,  
5 helping individual high streets to identify an alternative, sustainable future for their high  
6 street in 2020 and an action plan for achieving that aim.  
7  
8  
9  
10

18  
19  
20  
21  
22  
23  
24  
25

26  
27 At this stage, a greater sharing of power and activities (Van de Ven, 2007, p. 274) between  
28 the research team and our town partners allowed us to take advantage of their skills in  
29 engaging with the best possible audiences and even in designing some of the research  
30 activities. Taking a back seat during workshops and presentations made all activities a  
31 collective learning experience, and allowed us to concentrate on “problem solving and  
32 action, looking for ‘what works’ not just on participation and communication of new voices  
33 and categories” (Strumińska-Kutra, 2016, p. 879). However, we did not hesitate from being  
34 critical, challenging the established conventions (Huzzard and Johansson, 2014) of town  
35 centre management in many occasions, and highlighting the necessity for developing  
36 applicable action plans to our project towns, based on the novel contributions and  
37 knowledge that our continuing engagement with them produced.  
38  
39

40  
41 Consequently, a more ‘positive’ story about town centre change emerged, one of ‘hope’  
42 rather than ‘doom and gloom’. In turn, this encouraged more collaboration across  
43 stakeholders, was a clear message that was cascaded throughout the project. This engaged  
44 a number of media (local press, national radio, local radio). The coverage of the local  
45 workshops and subsequent interviews all helped disseminate the priority actions that had  
46 been agreed by the towns, through the HSUK2020 project. In addition, the project was  
47 acknowledged in Wrigley and Lambiri’s (2015) report, “British High Streets: from Crisis to  
48 Recovery?”, and research findings have been presented to numerous conferences,  
49 symposiums, and meetings in the UK, Europe, Latin and North America, furthering  
50 HSUK2020’s impact internationally.  
51  
52

### 53 54 Conclusion

55  
56 In an era of transformative retail change (Millington et al., 2015), forces such as internet  
57 retailing, multichannel/omnichannel retailing, the rise of different convenience cultures,  
58  
59  
60

1  
2  
3 and car ownership and its relationship out-of-town developments, have already permeated  
4 and altered the fabric of our High Streets and town centres. The complex nature of the High  
5 Street requires all stakeholders (insiders and outsiders) to work together effectively, in  
6 order to develop the basic knowledge and resources that can explain how we can create  
7 sustainable town centres in the near future (Louis and Bartunek, 1992). In this respect,  
8 collaborative forms of engaged scholarship, as the one described in this paper, can  
9 'generate knowledge on big questions and issues by testing alternative ideas and different  
10 views of a common problem' (Peluchette and Gerhardt, 2015, p. 416). As we argued in this  
11 paper, the joint knowledge production between the research team and the community,  
12 enabled us to improve our understanding of factors affecting high streets amongst a diverse  
13 group of stakeholders, rather than remotely draw our own conclusions of what factors will  
14 influence our high streets (Lewis, 2012).  
15  
16

17  
18 As successful as our approach was, we are not arguing that engaged scholarship model is  
19 the new "golden standard" on how to conduct research in retailing and town centre change  
20 (Van de Ven, 2007). Like any approach, engaged scholarship can suffer from the biases, and  
21 the disparities between the goals and problem-solution cycles, of academics, field experts,  
22 practitioners, and local communities (McKelvey, 2006). However, engaged scholarship can  
23 pave the way for beneficial collaboration that can 'produce research findings that make  
24 more significant advancements to theory and practice than the traditional approach of  
25 going it alone' (Van de Ven, 2007, p. 296). The ongoing impact of HSUK2020 on our project  
26 towns' action plans, and its success in securing further funding for extending our research  
27 on High Street change, are testaments to how engaged scholarship research can drive the  
28 agendas for both academics and communities. As scholars, we have benefitted enormously  
29 from creating relevant knowledge for our High Streets with the people who work, shop, live,  
30 and use them every day, who in turn carried the torch of knowledge to their local councils  
31 and other networks. This shows that engaged scholarship can become a valuable tool for  
32 researchers, but also has the potential to motivate communities to become more involved  
33 in the revamping of their centres. Hopefully, such a development will make a difference to  
34 the vitality and viability of our High Streets (Millington et al., 2015).

Figure 4: Top 25 priorities for change

**Research Project:** High Street UK 2020: Transferring knowledge to facilitate the repositioning, reinventing, rebranding and restructuring of sustainable retail centres.

**Research aim:** To channel the existing academic knowledge relating to retail and high street change directly to individual locations, as well as work directly with the end users of research to identify gaps for further investigation and research.

<i>Research Stage</i>	<i>Stakeholders Involved</i>	<i>Activities</i>	<i>Outcomes</i>
<i>Problem Formulation</i>	High Street stakeholders	Discussions with key stakeholders	Grounding the problem in the context of sustainable High Street Production of research bid based on stakeholders' perspectives
<i>Theory Building</i>	Research team Retail Experts Project Partners	Systematic Literature Review Initial theory of High Street Performance 201 Factors identified	Setting the parameters influencing high street performance Factors influencing high street change identified deductively Collaborating with stakeholders in identifying additional factors of high street change Inductive co-production of theory
<i>Research Design</i>	Research team Retail Experts Project Partners	Sample selection Delphi Technique Quantitative/Statistical Analysis Theoretical Model designed Top 25 Priorities of Change	Creating a collective learning process by engaging retail experts in research design Collaborating with retail experts to finalise the HSUK2020 model
<i>Problem Solving</i>	Research team Retail Experts Project Partners Communities High Street stakeholders	Presenting the HSUK2020 model Top 25 Priorities of Change explained Workshops Meetings Reports Conferences Radio Interviews	Development of forecasting tool based on footfall data Engaging a wide range of stakeholders towards prioritising actions for town centre change Disseminating findings to anyone who is interested in high street change internationally

Table 1: Summary of project activities and outcomes, based on Van de Ven's model
