# 1 Introduction

In this short technical note we describe the production of a set of density maps of facilities and utilities across Europe. This dataset consists of 24 raster grids layers of 500x500 metres with each 500 m<sup>2</sup> cell representing the number of Points of Interest (POI) per category, for the 2016 reference year, hereinafter referred as 'POI density grids'.

The work has been carried out in the frame of the Knowledge Centre for Territorial Policies. This dataset was produced in April 2018 in the scope of the collaboration between DG JRC and International Transport Forum (ITF) at the Organisation for Economic Co-operation and Development (OECD). It acts as a think tank for global transport policy issues and organises an annual summit of transport ministers. This work outputs will support the analysis of the spatial structure of regions and cities in terms of the supply of key urban services and amenities and will feed into the LUISA Territorial Modelling Platform.

In the next section are described the used datasets and the methods deriving the final density grids. Chapter 3 analysis the output results both thematically and spatially, focusing on Paris as example. The conclusions are presented on the final chapter just before the annexes where detailed statistics can be found.

## 2 Data and methods

Two input datasets were used to generate the POI density grids, both covering the entire European Union 28 countries, plus Norway, Switzerland, Iceland, the Balkan region, Turkey, Ukraine, Belarus and part of Russia:

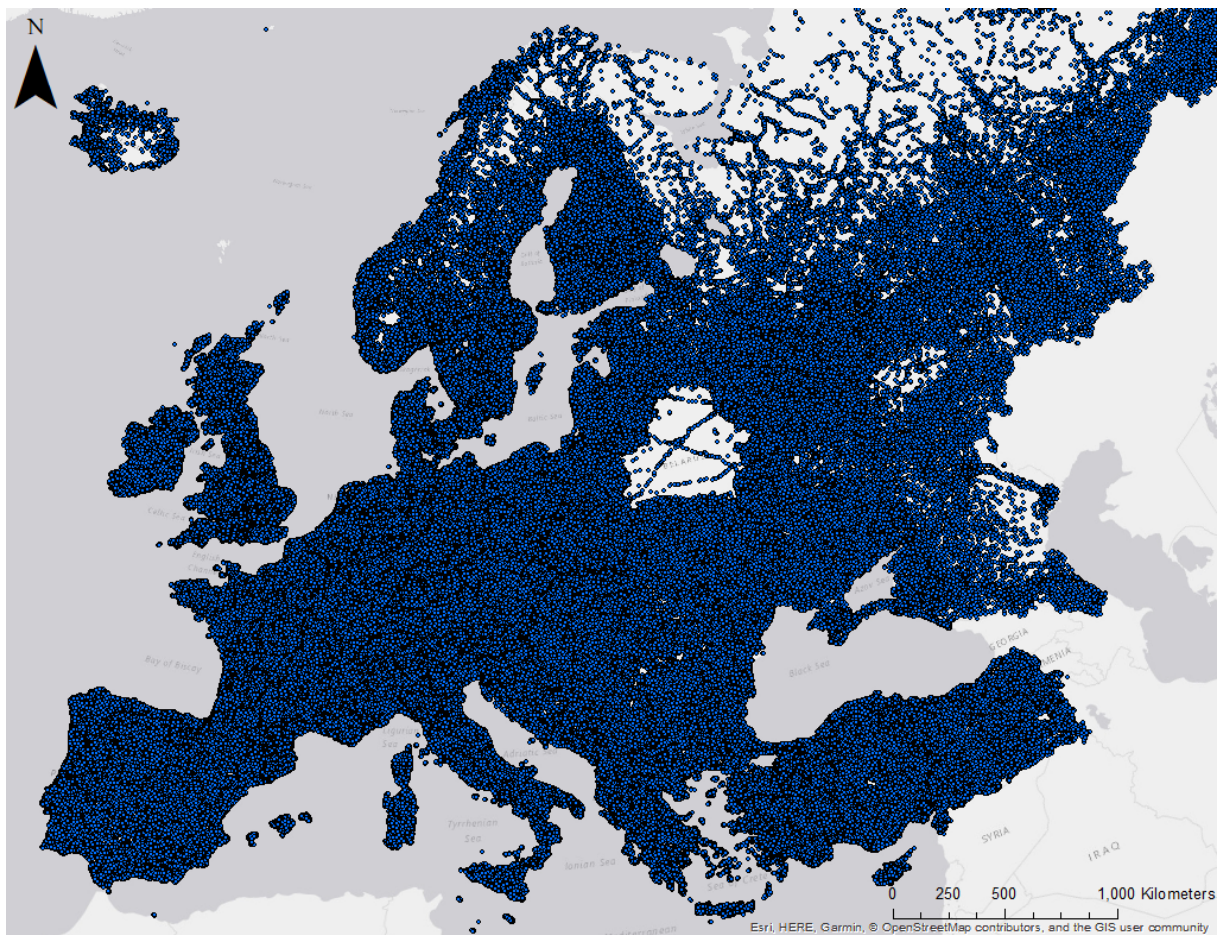

- TomTom Multinet 2017 Points of Interest (POI);
- Reference 500 m<sup>2</sup> raster grid.

TomTom is a Dutch company that produces traffic, navigation and mapping products. It also makes action cameras, GPS sport watches, fleet management systems, and location-based products.

Its Multinet geospatial navigation data included 30.069.065 georeferenced points originally in WGS84 coordinate system, and then projected to ETRS89 Lambert Azimuthal Equal Area [1].

The reference raster and the categories used to calculate the final density grids, were provided and defined by ITF [2].

**Figure 1:** Partial representation of TomTom georeferenced Points of Interest.

Python was the programming language chosen to perform the work, while resorting to ESRI's ArcPy library for the geospatial operations.

The initial 121 categories originally available at TomTom's dataset were aggregated to 24 larger groups as defined by ITF. This was done by creating specific SQL programming

language expressions. These expressions were used to select and aggregate all corresponding POI.<sup>1</sup>

As example, the following SQL expression selects all POI for "shop other" category. These are identified by their corresponding "SUBCAT" number:

SQL expression: (*"SUBCAT" >= 9361001 AND "SUBCAT" <= 9361007*) OR (*"SUBCAT" >= 9361026 OR "SUBCAT" <= 9361083*)

Once selected, these were converted to raster format (i.e. .tif), using ITF 500 m<sup>2</sup> grid as reference, creating a density POI raster for that specific category.

Finally, a zonal statistics operation calculated the total and average number of points per cell for each EU28 countries.

This process was repeated 24 times for the following categories:

- Bank;
- Café;
- Church;
- Cinema;
- Cultural centre;
- Department store;
- Health doctor;
- Health general;
- Hospital;
- Market;
- Museum;
- Parks;
- Pharmacy;
- Post;
- Rail;
- Restaurant;
- Restaurant area;
- School;
- Shop food;
- Shop other;
- Stadium;
- Theatre;
- Tourist;
- Transit.

In annex 1 a look-up table can be found with the correspondence between the aggregate grouping from ITF and the included TomTom POI categories.

---

### 3 Results

#### 3.1 Thematic Analysis

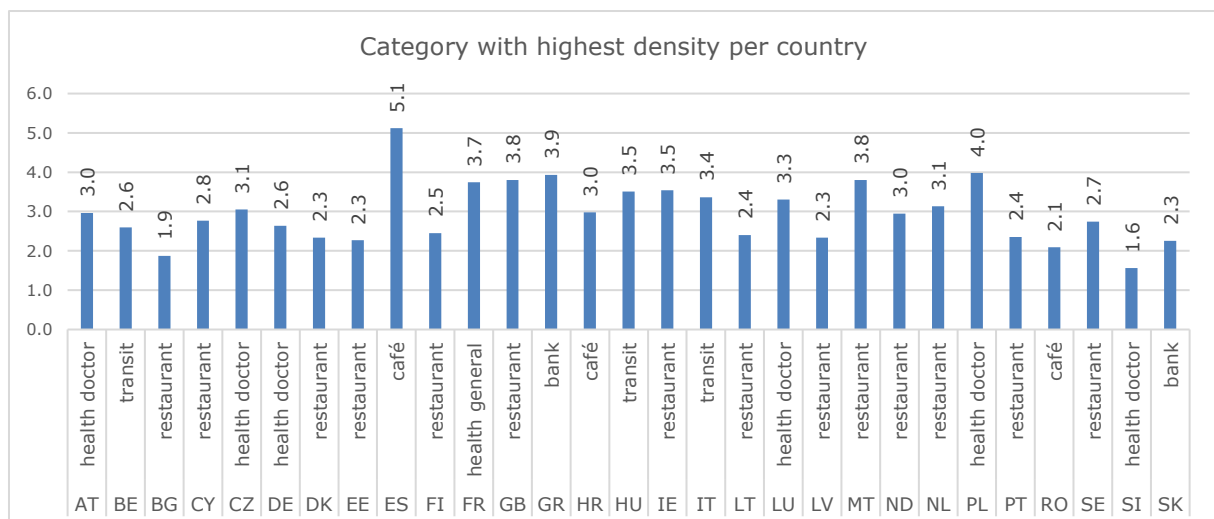

From the resulting density grids, the average number of POI per cell was then calculated. Figure 2 reflects the computed results for cells with at least one POI. "Shop other" category is the densest with an average 805.8 points/cell, while "Restaurant area" the sparsest with 1.0 points/cell. In total terms, "Shop other" has a total of 2.822.325 points while only 44 POIs refer to "Restaurant area" in the entire dataset.

**Figure 2.** Average POI per 500 m<sup>2</sup> cell

The following graph (figure 3) shows the average densest POI category per country and corresponding value. Due being under and overly represented, "Restaurant area" and "Shop other" were excluded and the analysis focused at EU28 level. Points related with health ("Health doctor" and "Health general") and leisure ("Restaurant" and "Café") are overall the most densely populated. The "Bank" category in Greece and Slovakia reaches the highest values (3.0 points/500 m<sup>2</sup> and 2.3 points/500 m<sup>2</sup> respectively). "Transit" (Public Transport Stop) is the densest in several countries (Belgium, Hungary and Italy) but its spatial distribution is not widespread and limited to some European areas (mainly Great Britain, Netherlands, Belgium Denmark, Sweden, Estonia, Switzerland and a few metropolitan areas). Annex 2 table shows all calculated values per category and country.

**Figure 3.** Highest average density (500 m<sup>2</sup>) and corresponding category per country

Using the same approach, the highest total value and corresponding category for each EU28 country is represented on the following graph (Figure 4). "Transit" in Great Britain (GB) has the highest total value of any country with 358.049 points. The lowest is found in Bulgaria for the restaurant category. Because countries dimensions influence this count, there is a wider gap between values. Annex 3 shows all values per category and country.

**Figure 4.** Highest total value and most represented category per country

**3.2 Spatial Analysis**

In addition to the thematic analysis above, it is interesting to explore the spatial distribution of the data. The following graph (Figure 5) depicts the population per POI ratio. "Transit" category was not included due not being represented in all countries. At EU28 the value is set at 16.47 persons per POI. Eastern countries, mainly Bulgaria, Romania, Croatia, Slovakia but also Greece, Cyprus and the Baltic countries are clearly above this average. Luxembourg, Belgium and France are on the opposite side of the spectrum. This reveals the dataset spatial heterogeneity and which countries might be underrepresented.

**Figure 5.** Population per country at country level

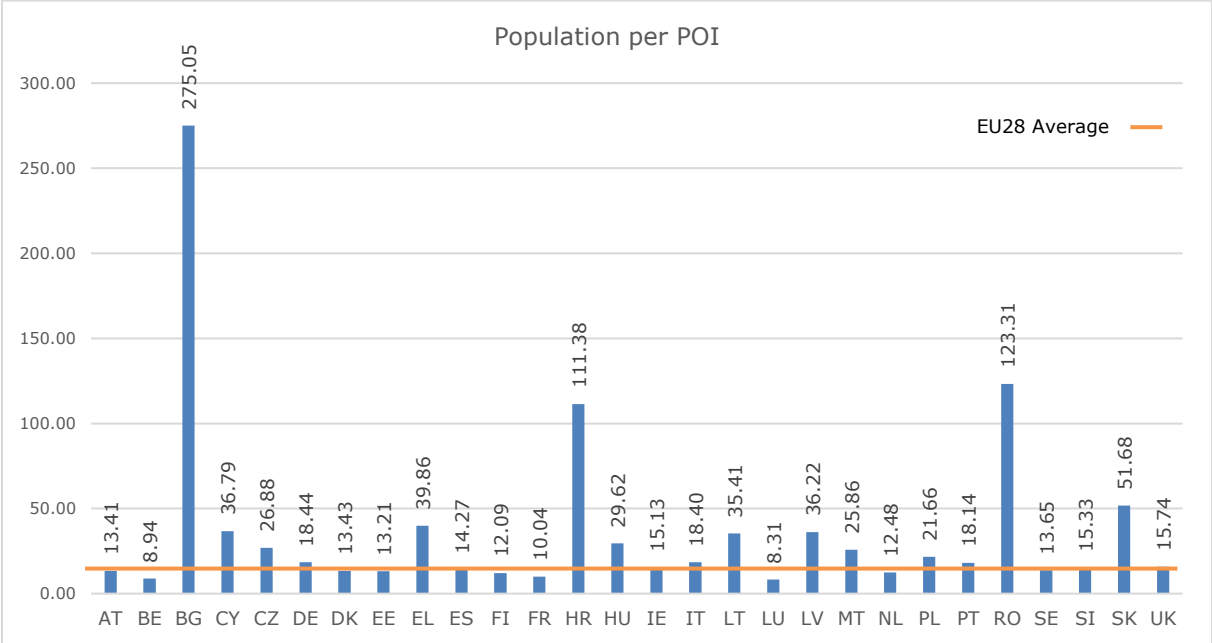

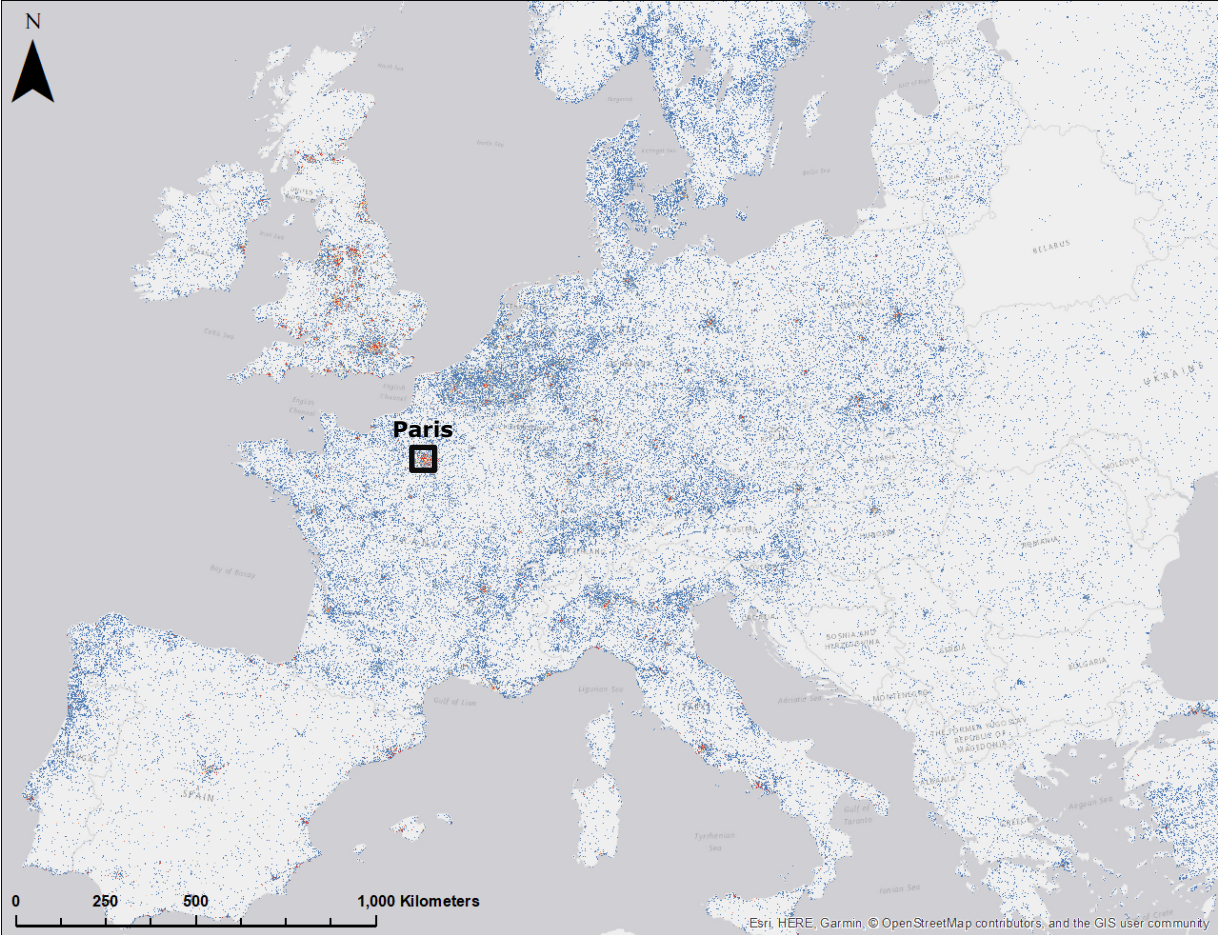

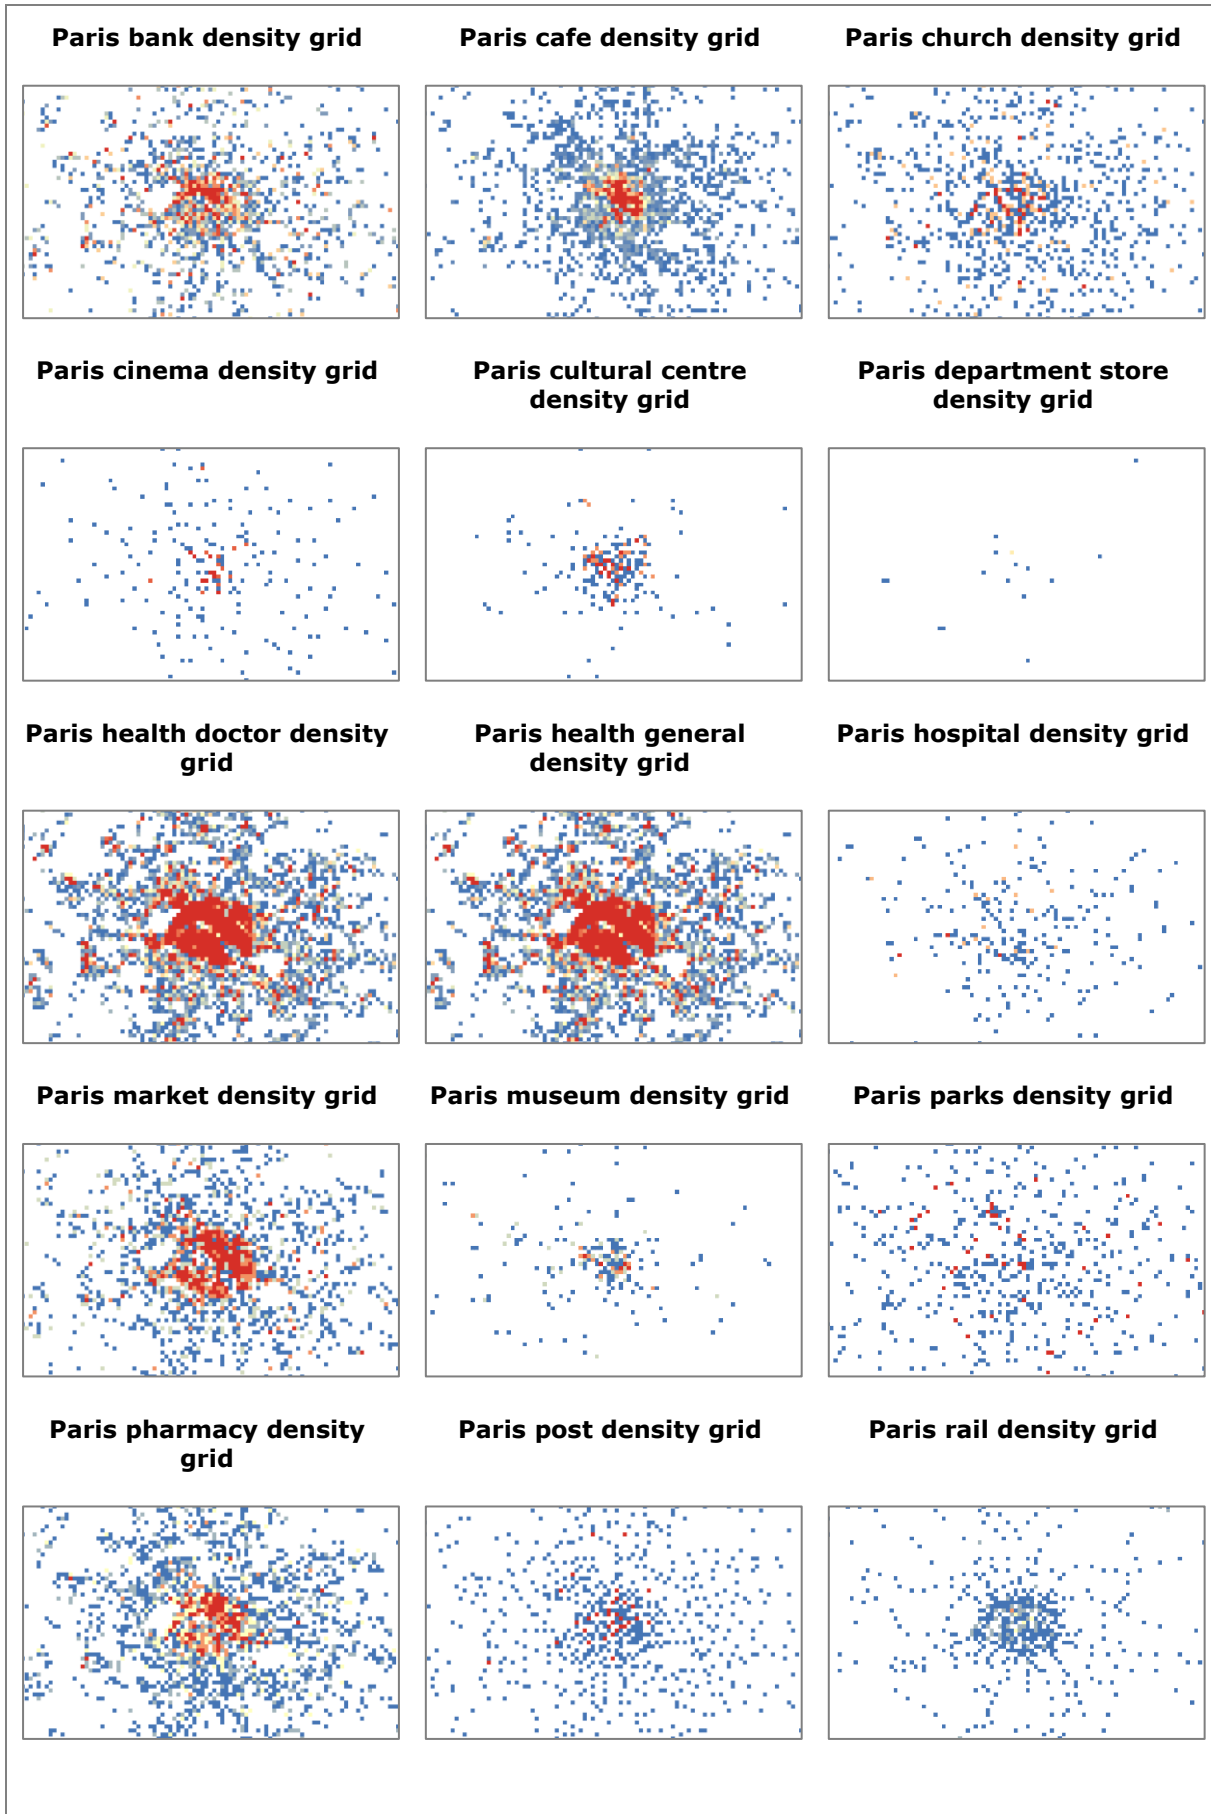

Figure 6 exemplifies a grid map of all POI types per 500 m<sup>2</sup> cells. Urban areas have the highest densities while rural zones the lowest presence of services following current population distribution.

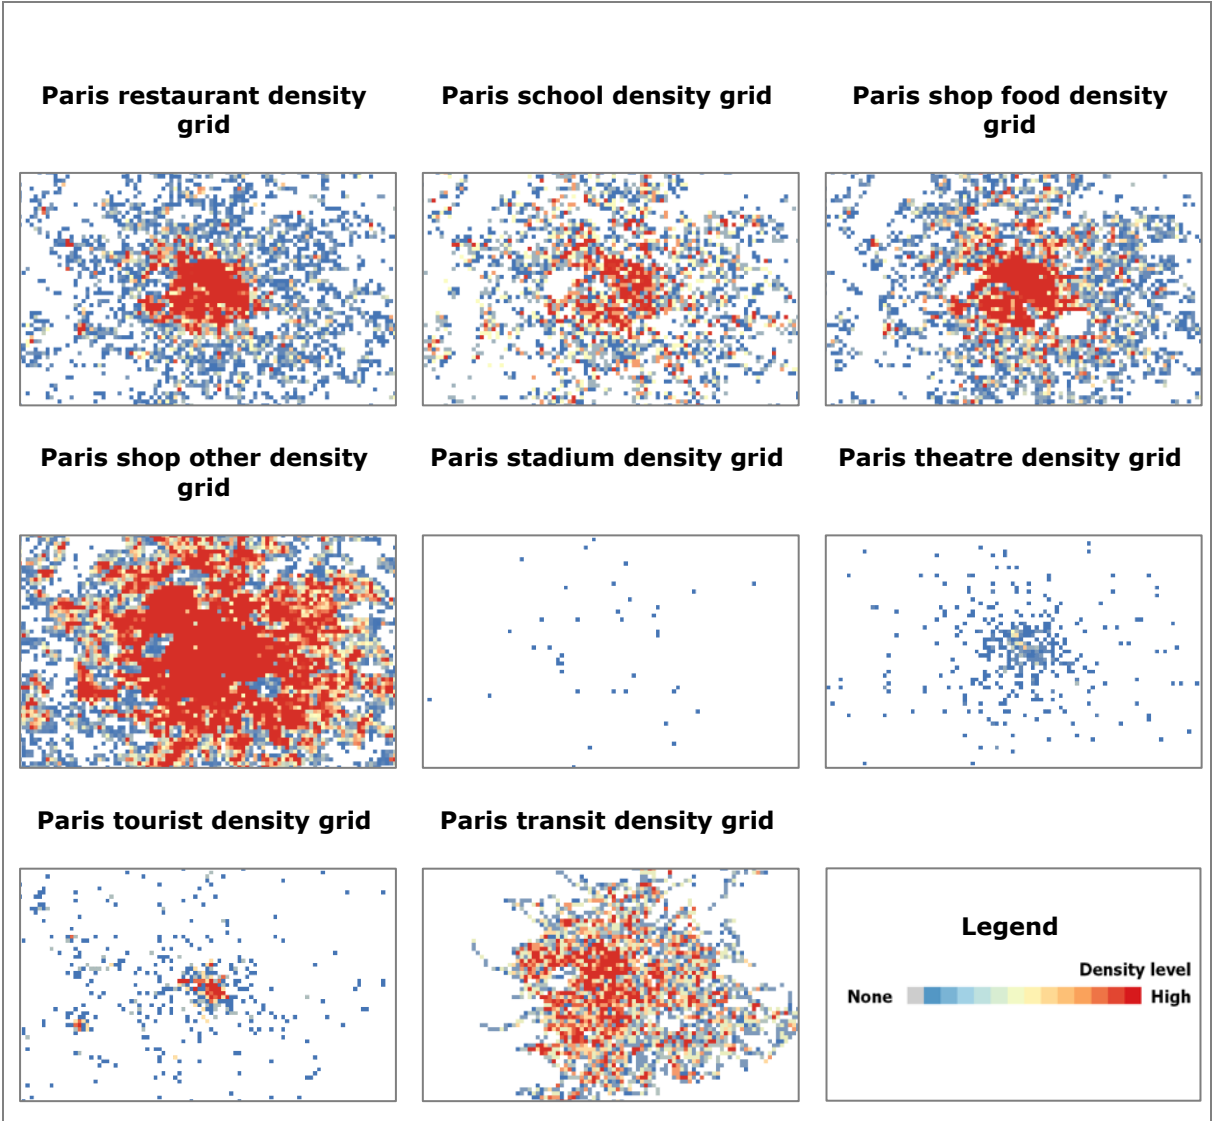

**Figure 6.** Grid map of all POI per 500 m<sup>2</sup> cell

As result of the wide geographical coverage, figure 6 depict Paris zoom-ins for every POI type. "Restaurant area" was omitted since no point are present for that specific location. The colour ramp varies from red for highest densities, to blue for the lowest. In general these figures reflect the variance reflected on the graph from the above figure 2.

**Figure 7.** Paris zoom-ins per POI type

## **4 Conclusions**

The resulting POI density grids described in this technical note have the potential to be used in several ways and scopes. From refining land-use/land-maps, to measuring accessibility and supply of key services and amenities or the impact of these in housing prices.

This new data sources can be combined with existing information and modelling techniques providing new insights on the phenomena driving urban and rural areas. Cities and urban areas can be compared and spatial distributions studied to better understand their allocation determinants, giving planners and policymakers new key insights.

These grids provide an added input value to territorial analysis by giving extra layers of information often still missing at European level.

As final note, other data sources like Open Street Map and Eurographics could have been used, but due its commercial character, spatial precision and wide use, TomTom was the preferred.

## **GETTING IN TOUCH WITH THE EU**

### **In person**

All over the European Union there are hundreds of Europe Direct information centres. You can find the address of the centre nearest you at: [https://europa.eu/european-union/contact\\_en](https://europa.eu/european-union/contact_en)

### **On the phone or by email**

Europe Direct is a service that answers your questions about the European Union. You can contact this service:

- by freephone: 00 800 6 7 8 9 10 11 (certain operators may charge for these calls),
- at the following standard number: +32 22999696, or
- by electronic mail via: [https://europa.eu/european-union/contact\\_en](https://europa.eu/european-union/contact_en)

## **FINDING INFORMATION ABOUT THE EU**

### **Online**

Information about the European Union in all the official languages of the EU is available on the Europa website at: [https://europa.eu/european-union/index\\_en](https://europa.eu/european-union/index_en)

### **EU publications**

You can download or order free and priced EU publications from EU Bookshop at: <https://publications.europa.eu/en/publications>. Multiple copies of free publications may be obtained by contacting Europe Direct or your local information centre (see [https://europa.eu/european-union/contact\\_en](https://europa.eu/european-union/contact_en)).

## The European Commission's science and knowledge service

Joint Research Centre

### JRC Mission

As the science and knowledge service of the European Commission, the Joint Research Centre's mission is to support EU policies with independent evidence throughout the whole policy cycle.

**EU Science Hub**
