## ACKNOWLEDGEMENTS

The basic data for this report were obtained from the Division of Geological Survey KARDEX FILE. James A. Williams of that Division was of great assistance in making the file available and in providing a space for Mineral Industry Research Laboratory employees to work. He also provided assistance in abstracting some of the information for inclusion into the system.

Funds for completing the file came from the U.S. Bureau of Mines under Contract No. G0111783. A. L. Service of the Bureau of Mines provided much encouragement and is responsible for the awarding of the contract.

Earl H. Beistline, Dean of the College of Earth Sciences and Mineral Industry, helped with many of the administrative problems associated with the development of the system of programs.

Ernest N. Wolff of the Mineral Industry Research Laboratory provided invaluable assistance throughout the project. He is acknowledged for his persistent support and encouragement during the writing and the many test runs of the program.

Many workers helped abstract data for the MINFILE system. They have been acknowledged in earlier publications but a separate thanks is here extended.

Finally, Nils I. Johansen of the Mineral Industry Research Laboratory provided the final impetus before publication by editing the manuscript and securing bids for publication.

## A COMPUTER PROCESSABLE STORAGE AND RETRIEVAL PROGRAM FOR ALASKA MINERAL INFORMATION

### Introduction

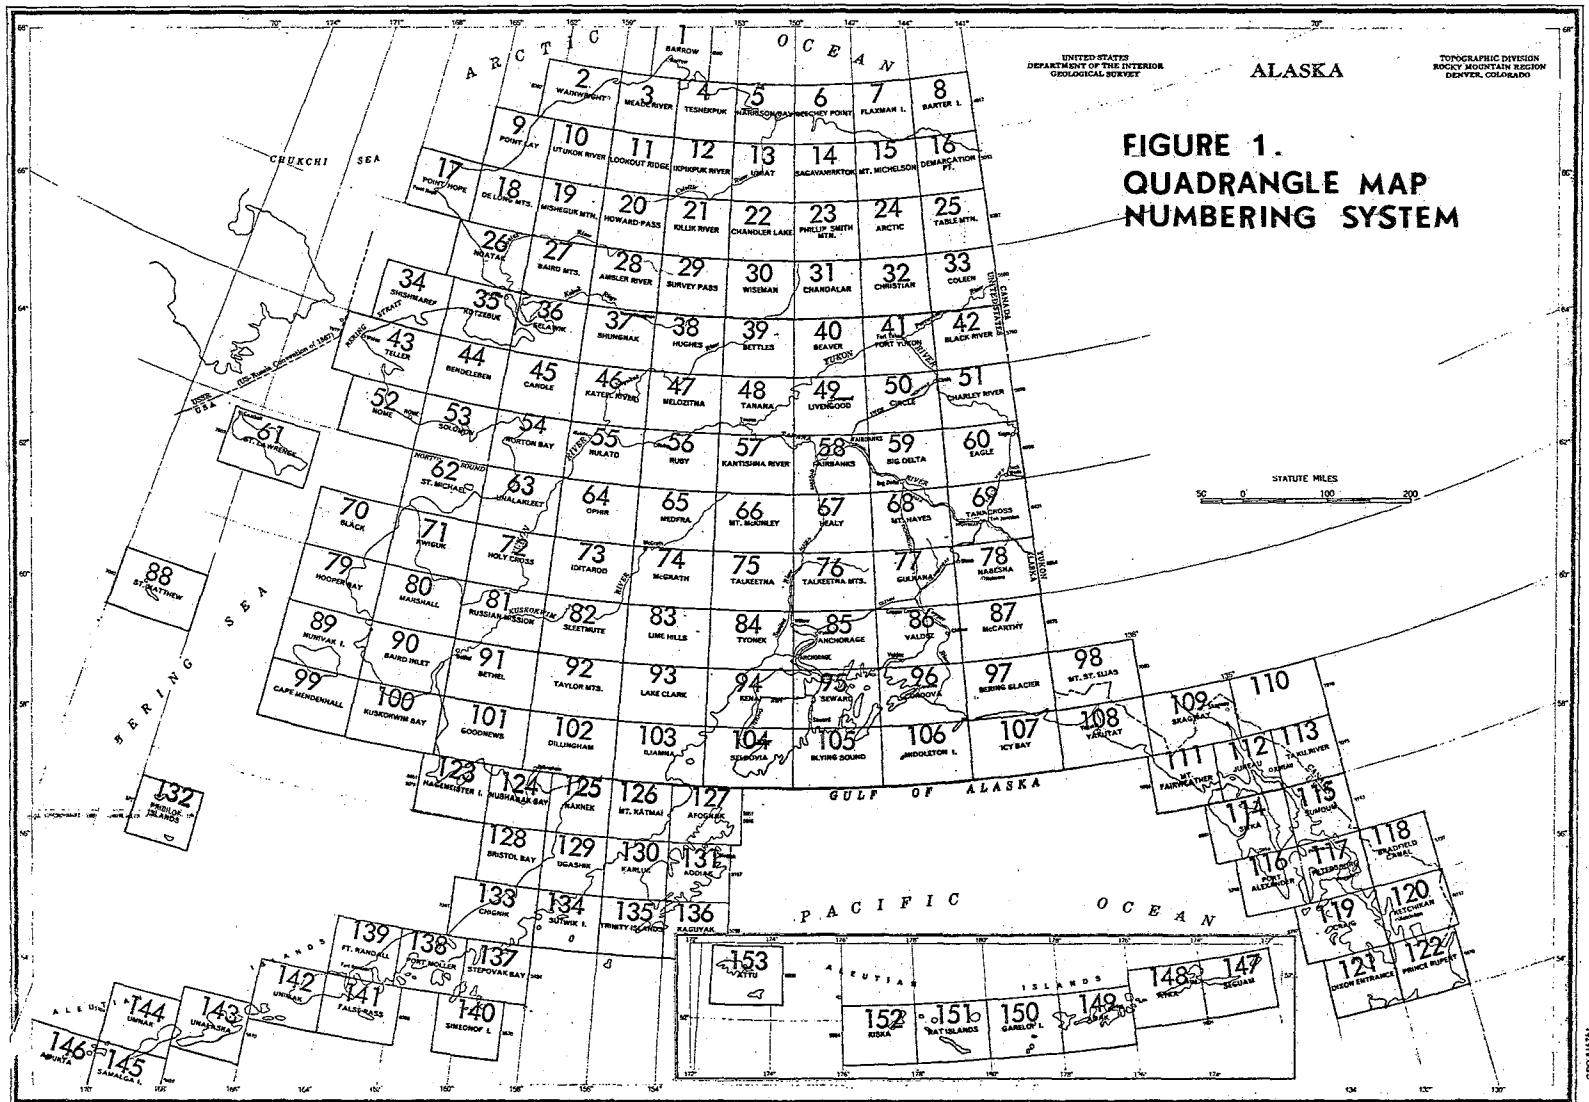

The Mineral Industry Research Laboratory has developed a storage and retrieval file for Alaska mineral information to facilitate resource studies. The basis for the computer-processable file is the Division of Geological Survey Mineral Kardex system which contains an entry for every mineral property in Alaska that has either been recorded in the literature or has been claimed under the mineral staking laws. Use of the file has greatly increased the research capability of the laboratory to compile resource-oriented reports such as M.I.R.L. Report No. 16, "Final Report - Mineral Resources of Northern Alaska," M.I.R.L. Report No. 18, "Known and Potential Ore Reserves, Seward Peninsula, Alaska", and M.I.R.L. Report No. 27, "Copper Mineral Occurrences in the Wrangell Mountain - Prince William Sound Area, Alaska" and S.E. Alaska Mineral Commodity Maps. The programs have been given the name MINFILE. MINFILE1 refers to a program that stores mineral information on magnetic tape. MINFILE2 is a Retrieval program, MINFILE3 is a program to correct and make additions to the file. MINFILE4 and MINFILE5 are utility programs used for maintenance of the system.

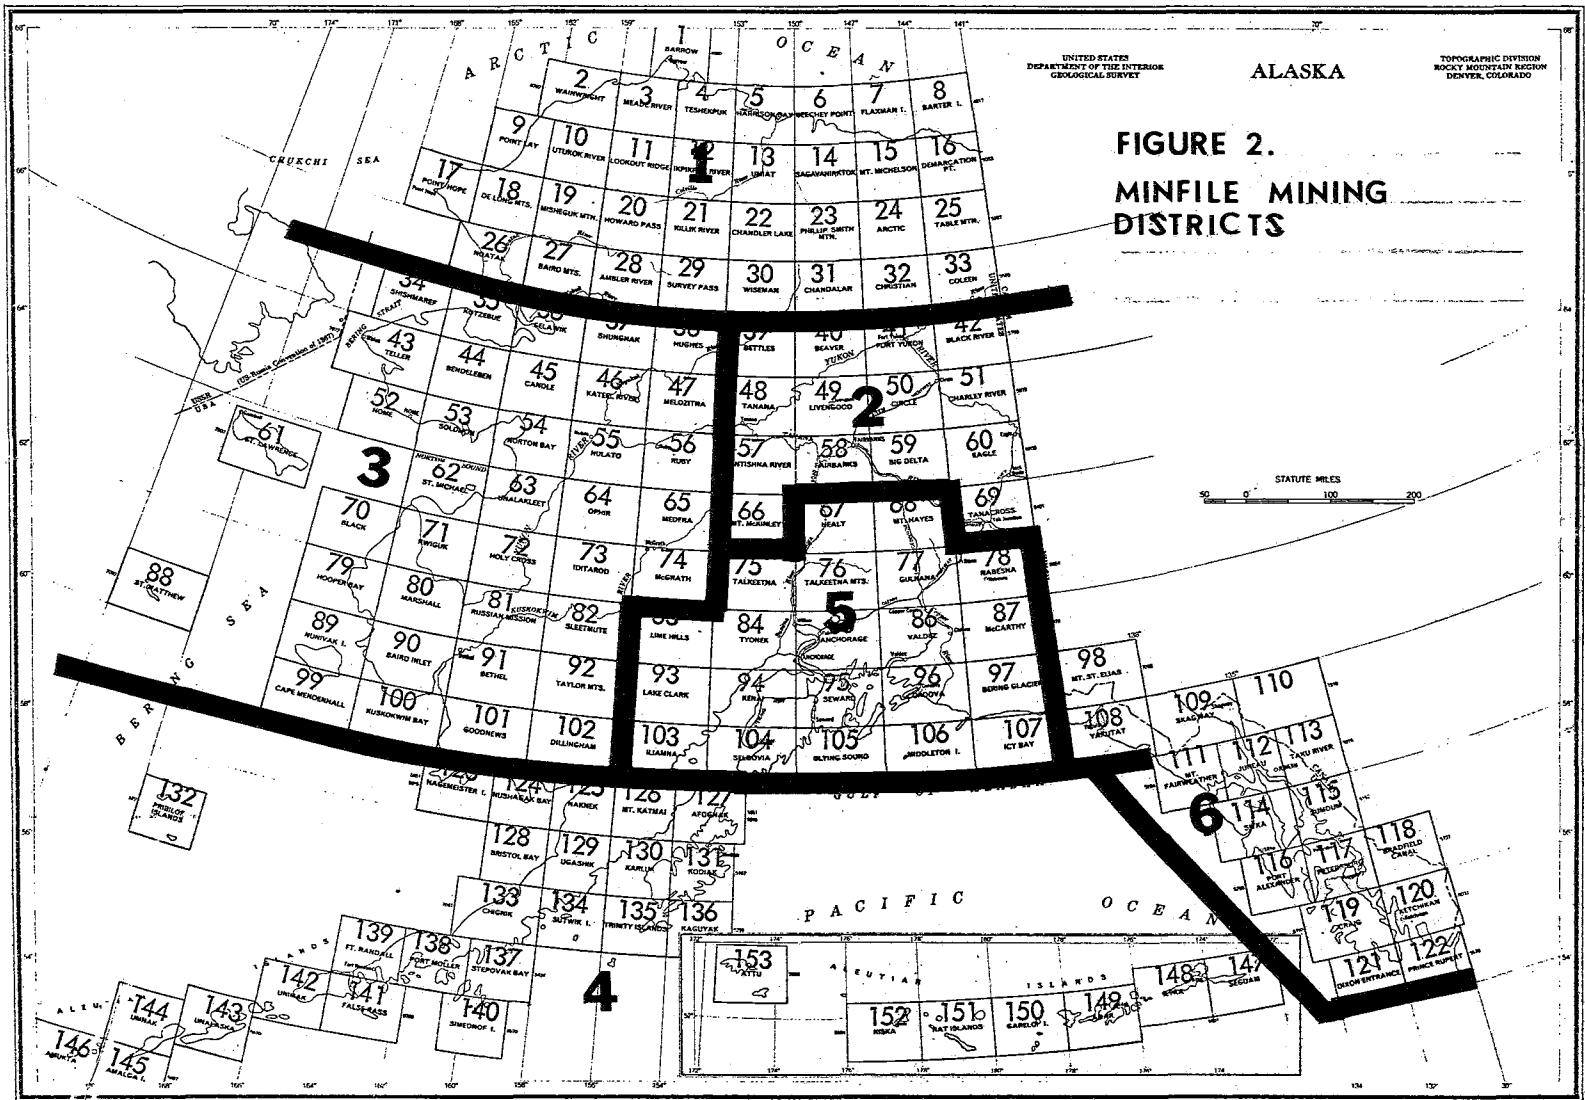

Figure one illustrates the State Division of Geological Survey Quadrangle numbering system for Alaska's 1-250,000 Map Series. These quadrangles are numbered starting with the Barrow quadrangle as number one and increasing in number as one would read a book. Each property within a quadrangle has a quadrangle number corresponding to the quadrangle number within which it is located. The first property in the Craig quadrangle would be serially numbered 1 (one) and would have a prefix of 119 or 119-1; the second property would have the number 119-2 etc. In addition to this system of quadrangle and serial numbers, each property is referenced to a Mining District. Figure two illustrates a proposed revision of the State of Alaska Mining Districts. These districts approximate the current districts but conform to quadrangle boundaries which enable more accurate record keeping. The MINFILE system utilizes the districts as shown on Figure two.

Some examples of general purpose user options might be: select all of the properties in Southeastern Alaska which contain antimony and which are currently not active (annual assessment documents not current). This run with the computer program, MINFILE2, would print a standard list containing information about each property selected. In the event that the user would like to have more information about any particular property in the list obtained, he can visit or correspond with the Division of Geological Survey.

As another example, suppose that a company were making a preliminary study of porphyry copper deposits. It might then be interest in all properties within a range of quadrangles or within a range of latitude and longitude boundaries which contain only copper and molybdenum; in other words, the property must have both copper and

**FIGURE 1.**  
**QUADRANGLE MAP**  
**NUMBERING SYSTEM**

molybdenum reported. This option would produce a standard list of only those properties which contain both copper and molybdenum.

Every time a selection is made which produces a printed output, the MINFILE2 program automatically accumulates the number of properties which have met the requirements that the user has specified. In addition, the number of claims represented by the properties are accumulated.

Since MINFILE2 accumulates not only the number of properties but also the number of claims for each selection, the user can obtain a printed listing of the mineral properties within a mining district and also the number of properties and the accumulated number of mineral claims represented by the properties in each district. The program will also output the number of claims in each mining district that are actively held. It also can be applied to statistical record keeping by quadrangle. It is possible not only to obtain the statistics for current and total mineral properties by quadrangle, but very easy to obtain this same type of information by elements, or by year.

#### Future Development of the MINFILE System

As time progresses the system should be expanded to provide much more of the information required by the mineral exploration industry and by State and Federal organizations in planning field programs and studies of areas for ore deposit potential. Other files suggest themselves immediately when thinking about research in any area of Alaska. If it were possible not only to obtain a list of the properties associated with any request, but also to have these properties keyed to a storage and retrieval file of published information, in other words, a computer stored bibliography, then the advantages of the file would be increased immensely. It would also be possible to develop a file for published topographic, geological, geophysical and geochemical maps. If this file were also keyed to the MINFILE system, information on the mineral properties in any area of Alaska could be provided by computer, along with listings of the maps and publications that consider the area. Other types of information which can and should be incorporated into the MINFILE system might be geological factors for each individual ore deposit: the type of the host rock, structure of the host rock, the classification of the deposit and many other variables.

#### MINFILE1 and MINFILE2

At present, the information recorded for each property includes:

1. The mining district within which it is located (see Fig. 2).
2. The quadrangle number (see Fig. 1).
3. A serial number.
4. Location on a 1:250,000 quadrangle map in inch X and Y coordinates.
5. The latitude and longitude of the property.
6. The year discovered or staked.
7. The property or claim names.
8. Lode or placer.
9. Active or inactive.

10. Patented or unpatented.
11. Number of claims within the property.
12. Whether or not there is published information about the property.
13. Land status code.
14. Development code.
15. Production code.
16. Reserves code.
17. An exploration activity code.
18. The elements that occur on the property.

Once this information is extracted from the Kardex File it is entered on Fortran coding forms (Figure 3), key punched and loaded with the MINFILE1 loading program. The loading program is also a check program in that it makes a series of tests to determine whether or not there are key punch errors or errors in coding. It also rearranges the elements that have been coded on the forms into an alphabetical sequence. Currently it is possible to record a maximum of 34 elements or commodities per property.

The retrieval program which is called MINFILE2, provides a system whereby questions can be asked of the computer, answered by information retrieved from the MINFILE and printed for the user. A system of programs to do this is written in Fortran IV for the IBM 360 Model 40 computer. At the present time, there are 16 questions and subquestions that can be asked of the computer, optionally, the first 7 being the most common requests. These options are listed in order:

1. To select properties that contain any of up to 12 elements as specified.
2. To select properties by elements as in 1, but from a particular quadrangle or group of quadrangles.
3. To select properties by elements as in 1 from claims that occur between specified latitudes and longitudes.
4. To select properties by elements as in 1 from within a specified quadrangle and lying between coordinates, in inches, within the quadrangle, i.e. X1 to X2, Y1 to Y2.
5. To select properties within a specified quadrangle or quadrangles which contain all of the elements specified. For example, if copper and molybdenum are specified, the property will not be picked unless it contains both copper and molybdenum. In the previous four options, if copper and molybdenum would have been specified, any property which contained either copper or molybdenum would have been selected by the computer.
6. To select only properties within a specified range of latitude-longitude boundaries as in option 3 but selecting all of the elements specified.
7. To select, as in option 4, properties within a single specified quadrangle lying between X1, X2, Y1 and Y2 boundaries but to select all of the elements specified.
8. This option has been written to facilitate automatic plotting of mineral claims data. It selects claims by quadrangles and elements as in 2 and produces a tape or set of cards, which are used with a University of Alaska plotting and

1

contouring program to develop a plot or contour map at any desired scale. Sometimes X1, X2, Y1, Y2 coordinate values are used by the U.S. Geological Survey to delineate the extent of a property such as a placer property which may occupy a mile or more on a stream; e.g., the lower extent is denoted by X1, Y1 and upper by X2, Y2. This program averages such coordinate values, and corrects them to true North-South coordinates.

9. To select properties lying between specified latitudes and longitudes as in 3, then average the XY coordinates as in 8 and produce either a short tape or cards for entering into the general plotting and contouring program.
10. To select claims by U.S. Geological Survey coordinates within a single quadrangle and element as in 4, average the X and Y coordinates as in 8 and produce a short tape or cards for entry into a standard plotting or contouring program.
11. To select claims by quadrangles and combined elements as in 5, then average the X and Y coordinates as in 8 to produce a tape or set of cards for plotting.
12. To select claims or mineral properties by latitude-longitude and combined elements as in 6, average the X and Y coordinates and produce a set of cards, or tape for plotting.
13. To select claims by U.S. Geological Survey coordinates within a quadrangle which contain all of the elements selected as in option 7, but to produce a short tape or set of cards which have averaged the X and Y coordinates for each mineral property.
14. Option 14 prepared a short Fortran tape for input into a sort program and for input into a general purpose contouring or plotting program. This tape, unlike others, contains information concerning the mining districts, the quadrangle, the serial number of the property, the latitude and longitude, the U.S. Geological Survey coordinates, the claim name and production code. Its general use has been to rearrange properties within a quadrangle in order of increasing X or Y U.S. Geological Survey coordinates in order to facilitate correlation with properties within the literature which are located in the same place but which have a different name.
15. The same as 14 except that selection is based upon latitude-longitude rather than coordinates with the quadrangle.
16. Prints a list of the claims from the short Fortran tape produced by options 14 and 15.

All of the above options except 16 permit selection on the following basis: mining district, activity code, patent status, production code, lode or placer, and merit code.

#### Input to the System (MINFILE1)

Data for the MINFILE systems are loaded with the program MINFILE1, and are entered on two cards per property according to the format shown on Figure 3. Column information contained on these two cards follows:

CARD NUMBER ONE:

Col 1 Mining District designation.

Col 2-4 Quadrangle Number, see Figure 1.

Col 5-7 Property serial number within a quadrangle.

Col 8-10 X1

Col 80 Card Code = 1

#### CARD NUMBER TWO

Col 1-7 Same as Card Number 1

Col 42-79 Punch a 1 in appropriate column if the element (see Fig. 3) is present.

#### Use of the Data File (MINFILE2)

MINFILE2 is cataloged on the core image library at the University Computer Center. It is not necessary therefore, to physically possess either a source or object deck to run the program. One header card must be key punched for each file access. Figure 4 illustrates the format of this card. Columns 1 and 2 of the header specify the mode desired. Columns 3 through 26 allow spaces for element selection. For example, if all copper, lead zinc and molybdenum properties are to be printed from the file, columns 1 and 2 would contain "01" and columns 2 through 9 would contain "11163321". The rest of the card would be blank. Columns 29 through 79 allow spaces for information needed for other modes of the program (2 through 16) or mode qualifiers. (Latitudes, longitudes, quadrangles, U.S. Geological Survey coordinates, year, mining district, activity code, patent status, production code, lode or placer, and merit code.)

The following job setup will produce a list of all copper deposits from quadrangle numbers 108 through 122:

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57  
// JOB ACTIVE, MIRL02, HEINER T=15  
// EXEC MINFILE2  
0211 108122  
~~~~~ blank card ~~~~  
/\*  
/\*

Modes one through eight will produce a standard printout. Page one of the output will give the parameters of the retrieval desired and start to list the properties which satisfy the user's requirements.

The output is scaled to standard 8 1/2" x 11" format in order that it may be xeroxed or easily included in reports. All pages of the output will be numbered and will contain the date retrieved from the file. Space is allowed for the decoding and printing of 8 elements per property along with other pertinent data about the property.

## Output Examples by Mode

- 01: The 01 mode requires that each entry be checked to see if it contains any one of the elements specified on the headers. If 99 was specified in the first element field, all entries which pass the mode qualifiers are selected and printed.
  - 02: The 02 mode entries must fall within the quadrangle or quadrangles specified, and then must contain at least one of the elements specified.
  - 03: The 03 mode requires that the entries must fall within the specified range of latitude-longitudes, high and low, and in addition must contain at least one of the specified elements.
  - 04: Mode 04 requires that an acceptable entry must fall within the specified range of USGS coordinates, and must contain at least one of the specified elements.
  - 05: Mode 05, requires that an entry must fall within the quadrangle or range of quadrangles specified, and in addition, must contain ALL of the elements specified, i.e., if three elements are named, all three must be present or the property will not be selected.
  - 06: Mode 06 requires that an entry must fall within the specified range of latitude-longitudes, and in addition, must contain ALL of the specified elements.

IBM

## **FORTRAN Coding Form**

GX28-7327-6 U/M 050\*\*  
Printed in U.S.A.

**Figure 4**

\*A standard card form, IBM electro 888157, is available for punching statements from this form.

*\*\*Number of forms per pad may vary slightly.*

- 07: Mode 07 requires that an entry must fall within the specified range of USGS coordinates, and in addition, must contain ALL of the specified elements.
- 08: Modes 08, 09 and 10 produce a different output from the preceding ones. After selection of a valid entry is made (based upon element(s) and qualifiers,) the X1, X2 and Y1, Y2 values are averaged. Then, if LTC (see Figure 5, Col 78) is "1" cards are punched; if it is a "2" a tape is written on 181. In both cases a list is printed on the printer, containing the same information as that punched or written on cards or tape, except that blank spaces are inserted between fields for readability. This information is, from left to right: X Coord., Y Coord., Mining District Number, Quadrangle Number, Serial Number, Spaces for 12 elements, latitude and longitude in decimals, latitude and longitude in degrees minutes and seconds, Merit Code, and Production Code.
- 09: Mode 09 requires that the entry meet the requirements of latitude-longitude as in mode 03. An abbreviated listing with X, Y averaged, and either cards or tape are produced.
- 10: Mode 10 requires that the entry meet the same requirements for acceptability on the basis of USGS coordinates as in Mode 04. An abbreviated listing and either cards or tape are produced.
- 11: Modes 11, 12, and 13 are the same as Modes 08, 09 and 10, except that  
12: the selection on the basis of elements is dependent on the entry containing  
13: ALL of the elements specified instead of any one of them. In other words,  
selection of properties are made as in Modes 05, 06, 07.
- 14: Mode 14 specifies that the entry must be within the quadrangle or quadrangles specified on the header. Certain information (see following example) is extracted and written on another tape. This tape is intended for input to the utility sort routines. This tape can be listed using Mode 16.
- 15: Mode 15 is the same as 14 except that selection of entries are made on the basis of latitude-longitude.
- 16: Mode 16 is used to list the tape which was made by options 14 or 15.

#### Use of MINFILE3

MINFILE3 is used to update the data file. Input cards to MINFILE3 are in the same format as input to MINFILE1. Action to be taken is specified by an appropriate code in Column 80.

|     |        |                                                                           |
|-----|--------|---------------------------------------------------------------------------|
| Col | 80 = 1 | Card 1 of new entry                                                       |
|     | = 2    | Card 2 of new entry                                                       |
|     | = 3    | Corrections to an entry in the file, for information<br>on Card 1, format |
|     | = 4    | Corrections to an entry in the file, information on<br>Card 2, format     |
|     | = 5    | Delete the entry.                                                         |

All input cards must have mining district, quadrangles, and serial number in Columns 1 through 7.

Cards coded 1 and 2 in Column 80 should contain all information for a new entry.

"Update" or "correction" cards (Column 80 = 3 or 4) should contain only the information to be added or changed, all other columns left blank. To remove incorrect information where the correct data is not available, put a " $\emptyset$ " in the first position in the field.

| The above example produced the following listing. Columns 29-32 qualify the listing to select only 1969 recordings. Column 73 causes only entries from district 4 to be printed. 99 in col. 344 cause all elements to be listed. |                                                                                                                                                                                                                                                                                       |       |                   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | 4  |    |                         |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| The above example will produce the following listing. Note that in addition to searching between 57-59° latitude & 134-137° longitude only properties which contain either Fe or Sb or both will be selected. Coding 6 in column 73 for selection of District 6 was not necessary. |                                                                                                                                                                                                           |       |                   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |                         |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

APPENDIX 12  
Computer Printout of MINFILE2

C PROGRAM NAME - MINFILE2  
C BY EVE PORTER FOR L. E. HEINER JANUARY 1970  
C  
C PURPOSE -  
C  
C THE MINERAL CLAIMS DATA FILE SYSTEM WAS DEVELOPED AT THE MINERAL  
C INDUSTRIES RESEARCH LAB, UNIVERSITY OF ALASKA, BY EVE PORTER UNDER THE  
C DIRECTION OF LAWRENCE E. HEINER. THE PURPOSE OF THE SYSTEM IS TO PROVIDE A  
C GENERALIZED, DETAILED SYSTEM FOR COMPUTER HANDLING OF MINERAL RESOURCE DATA.  
C  
C THE SYSTEM OF PROGRAMS IS WRITTEN ENTIRELY IN FORTRAN IV FOR THE  
C IBM 360 MODEL 40, OPERATING UNDER DOS.  
C  
C MINERAL CLAIMS DATA IS KEYPUNCHED INTO CARDS  
C THESE CARDS ARE LOADED TO MAGNETIC TAPE. THE RESULTING TAPE IS  
C UNFORMATTED FORTRAN. LOADING IS ACCOMPLISHED BY PROGRAM MINFILE1 (SEE  
C SOURCE LISTING). A CONSIDERABLE AMOUNT OF EDITING IS DONE WHEN THE CARDS  
C ARE LOADED TO TAPE, TO HELP GUARD AGAINST ANY CODING OR KEYPUNCHING ERRORS  
C WHICH MAY HAVE OCCURRED.  
C  
C THE DATA FILE, ONCE RESIDENT ON MAGNETIC TAPE, IS READ WITH THE  
C FOLLOWING FORTRAN READ STATEMENT. NOTE THAT NO FORMAT STATEMENT IS USED,  
C AS THE TAPE IS UNFORMATTED.  
C  
C READ(8)MD,IQUAD,ISER,(CORD(K),K=1,4),LAT1,LAT2,LONG1,LONG2,  
C 1(IYR(K),K=1,4),(CLAIM(K),K=1,27),LP,IA,IPAT,NOCL,IPUB,  
C 2(IREF(K),K=1,2),MERIT,LS,LD,IPRO,IRES,(IEXPL(K),K=1,2),  
C 3(MELEM(K),K=1,34)  
C  
C THE VARIABLE NAMES ARE DESCRIBED AS FOLLOWS  
C MD I1 NUMBER OF THE MINING DISTRICT IN WHICH THE CLAIM IS LOCATED  
C IQUAD I3 NUMBER OF THE MAP QUADRANGLE  
C ISER I3 SERIAL NUMBER OF THE PROPERTY WITHIN THE QUAD  
C CORD F3.1 FOUR ARE USED. THESE ARE THE X-Y COORDINATES ON THE USGS  
C SYSTEM. THEY APPEAR IN SEQUENCE X1,X2,Y1,Y2.  
C LAT1 I2 THE DEGREES PORTION OF THE LATITUDE  
C LAT2 I2 THE MINUTES PORTION OF THE LATITUDE  
C LONG1 I3 THE DEGREES PORTION OF THE LONGITUDE  
C LONG2 I2 THE MINUTES PORTION OF THE LONGITUDE  
C IYR 4I1 THE YEAR IN WHICH THE ENTRY WAS FILED ON THE CLAIM  
C CLAIM 27I1 THE NAME GIVEN TO THE PROPERTY BY THE OWNER  
C LP I1 DESIGNATES THE TYPE OF MINE. '0' = LODE, '1' = PLACER  
C IA I1 ACTIVITY CODE. '0' = INACTIVE, '1' = ACTIVE  
C IPAT I1 PATENT STATUS. '0' = UNPATENTED, '1' = PATENTED  
C NOCL I3 NUMBER OF SEPARATE CLAIMS INCLUDED IN THIS PROPERTY  
C IPUB I1 PUBLICATION CODE  
C IREF 3I1 REFERENCE CODE  
C MERIT I1 MERIT CODE. THIS RANGES FROM 0 THRU 4  
C LS I1 CLAIM STATUS CODE. THIS RANGES FROM 3 THRU 5  
C IPRO I1 PRODUCTION CODE. THIS RANGES FROM 0 THRU 5  
C IRES I1 RESERVES CODE.  
C IEXPL 2I1 EXPLORATION CODE. 1ST DIGIT IS AGENCY CODE, RANGE 1 THRU 4  
C 2ND DIGIT IS TYPE CODE, RANGE 1 THRU 6

C MELEM 3411 THESE ARE THE MINERAL ELEMENT CODES  
C 0 = MINERAL NOT IN THIS ENTRY  
C 1 = MINERAL PRESENT IN THIS ENTRY  
C NOTE -  
C  
C LATITUDE-LONGITUDE WILL BE ENTERED AS XXDEGXXMIN {XXXX} LATITUDE  
C XXXDEGXXMIN {XXXXXX}LONGITUDE  
C USGS COORDINATES WILL BE ENTERED AS FOUR FIELDS XX.X.  
C ALL FIELDS RIGHT-JUSTIFIED  
C  
C THE FOLLOWING IS A SEQUENTIAL LIST OF THE ELEMENTS WHICH MAY BE  
C CARRIED FOR EACH CLAIM ENTRY IN THE FILE. THE ELEMENTS, THEIR  
C ABBREVIATIONS AND SUBSCRIPTS ARE

SUBROUTINE MERITS

C WRITTEN BY EVE PORTER FOR L.E.HEINER JANUARY 1970  
C FOR USE IN THE MIRL DATA FILE SYSTEM  
C REVISED FOR MORE DETAILED SELECTION APRIL 1970  
C THIS SUBROUTINE DETERMINES IF THE CURRENT ENTRY IS ACCEPTABLE FOR  
C FURTHER PROCESSING ON THE BASIS OF MERIT CODE AS SPECIFIED BY THE  
C HEADER CARD  
C IF HEADER CODE = 0 NO CHECK IS MADE  
C IF HEADER CODE = 1 ONLY MERIT CODE 1 IS ACCEPTED  
C IF HEADER CODE = 2 ONLY MERIT CODE 2 IS ACCEPTED  
C IF HEADER CODE = 3 ONLY MERIT CODE 3 IS ACCEPTED  
C IF HEADER CODE = 4 ONLY MERIT CODE 4 IS ACCEPTED  
C IF HEADER CODE = 5 MERIT CODES 1 TO 4 ARE ACCEPTED  
C IF HEADER CODE = 6 MERIT CODES 2, 3, 4 ARE ACCEPTED  
C IF HEADER CODE = 7 MERIT CODES 3 AND 4 ARE ACCEPTED  
C IF HEADER CODE = 9 ONLY MERIT CODE 0 (UNCODED) IS ACCEPTED

0001

SUBROUTINE USGSLL(IQUAD,XR,YR,ZLAT,ZLONP,XROT,YROT)

C  
C THIS SUBROUTINE WILL CALCULATE THE LATITUDE AND LONGITUDE OF A  
C POSITION SPECIFIED IN USGS COORDINATES. IQUAD IS THE QUADRANT NUMBER  
C FROM THE 1/250,000 SCALE MAP USED TO LOCATE THE POSITION. XR AND YR  
C ARE THE X AND Y COORDINATES OF THE POSITION IN INCHES ON THE MAP.  
C THE Y AXIS COINCIDES WITH THE LEFT HAND BORDER OF THE MAP.  
C THE X AXIS IS DEFINED AS PERPENDICULAR TO THE Y AXIS AND  
C INTERSECTING THE Y AXIS AT THE LOWER LEFT CORNER OF THE MAP.  
C PSF IS A  
C PAPER SHRINKAGE FACTOR AND CAN EASILY BE CHANGED. IT REPRESENTS THE  
C RATIO OF THE PRESENT SIZE OVER THE ORIGINAL. ZLAT AND ZLONP ARE IN  
C DEGREES NORTH AND WEST AND ARE RETURNED TO THE CALLER.  
C  
C THIS PROGRAM WAS WRITTEN BY WM. MENDENHALL AND INCORPORATED IN THE  
C MINFILE SYSTEM BY JAMES DRYDEN, MAY 1971.

C  
C  
C THE ARGUMENTS XROT AND YROT ARE THE ROTATED X AND Y COORDINATES  
C RETURNED TO THE CALLER. THE ORIGINAL X AND Y COORDINATES ARE MEASURED  
C WITH Y COINCIDENT TO THE EXTREME WEST LONGITUDE LINE ON THE MAP. THE  
C ROTATED COORDINATE SYSTEM USES AN X AXIS WHICH INTERSECTS THE EXTREME  
C SOUTHERN LATITUDE AT BOTH EDGES OF THE MAP AND THE Y AXIS IS PERPEN-  
C DICULAR TO X, INTERSECTING AT THE WESTERN EDGE.

0002

DIMENSION ZLA(153), ZLO(153), DLL(153)

C  
C ZLA(N) AND ZLO(N) ARE THE LATITUDE AND LONGITUDE OF THE LOWER LEFT  
C HAND CORNER OF QUADRANT N. DLL(N) IS THE DIFFERENCE IN LONGITUDE  
C BETWEEN THE LOWER RIGHT AND LEFT HAND CORNERS OF THE QUADRANT.

**APPENDIX 13**  
**Computer Printout of MINFILE3**

APPENDIX 13  
DOS FORTRAN IV 360N-F0-479 3-1 MINEFIL3 DATE 09/25/71 TIME 03.16.43 PAGE 0001

C PROGRAM NAME - MINFILE3  
C BY EVE PORTER FOR L.E.HEINER, M.I.R.L.  
C APRIL, 1970  
C  
C PURPOSE - TO PROVIDE THE ABILITY TO CHANGE INFORMATION IN THE  
C MINEFIL SYSTEM -  
C  
C 1. BY CHANGING ANY INFORMATION WITHIN A SPECIFIED  
C RECORD (EXCEPT MINING DISTRICT, QUAD AND SERIAL  
C NUMBER)  
C  
C 2. BY DELETING ANY RECORD SPECIFIED BY MINING  
C DISTRICT, QUAD AND SERIAL NUMBER.  
C  
C 3. BY ADDING ANY RECORD IN THE PROPER SEQUENCE  
C  
C METHOD -  
C ACTION TO BE TAKEN IS GOVERNED BY TWO FIELDS -  
C 1. KEYFIELDS - MINING DISTRICT, QUAD AND SERIAL  
C (COLS 1 TO 7 IN EACH INPUT CARD) SPECIFY THE  
C RECORD WHICH IS TO BE PROCESSED.  
C 2. CARD CODE - INDICATES WHAT ACTION IS TO BE  
C TAKEN. THIS CODE MUST APPEAR IN COL. 80.  
C  
C THE UPDATE IS FROM TAPE TO TAPE. THAT IS, THE 'OLD' TAPE  
C IS READ, CARDS ARE READ SEQUENTIALLY AND ACTION IS TAKEN  
C AS NECESSARY, AND THE RESULTING DATA IS WRITTEN ON A NEW  
C TAPE.  
C  
C INPUT CARDS ARE CODED IN COL 80 AS FOLLOWS  
C 1 - CARD 1 OF 2 FOR A NEW ENTRY TO THE FILE  
C 2 - CARD 2 OF 2 FOR A NEW ENTRY TO THE FILE  
C 3 - CONTAINS UPDATE INFORMATION FOR AN ENTRY ALREADY  
C IN THE FILE, IN THE SAME FORMAT AS CARD TYPE 1  
C 4 - CONTAINS UPDATE INFORMATION FOR AN ENTRY ALREADY  
C IN THE FILE, IN THE SAME FORMAT AS CARD TYPE 2  
C 5 - DELETE THE ENTRY WHICH HAS THE SAME MINING DISTRICT,  
C QUAD, AND SERIAL AS APPEAR IN COLS 1 TO 7 OF CARD  
C  
C \*\*\*\*\*  
C  
C NOTE  
C  
C 1. TO ADD AN ENTRY TO THE FILE THERE MUST BE BOTH  
C CARD 1 AND CARD 2.  
C  
C 2. TO CORRECT AN ENTRY BY CHANGING OR ADDING INFORMATION  
C USE ONLY THE CARD 3 OR CARD 4, AS NECESSARY.  
C MINING DISTRICT, QUAD, AND SERIAL MUST BE ENTERED ON  
C EACH CARD, THEN ONLY THE NEW OR CHANGED INFORMATION.  
C LEAVE ALL UNUSED COLUMNS BLANK
