Studies Relating to the Ovarian Monitor

A thesis presented in partial fulfilment of
the requirements for the degree of
Master of Science in Biochemistry
at Massey University.

Delwyn Cooke, B.Sc., Dip.Sc.

December, 1993

Department of Chemistry and Biochemistry
Massey University

Dedication

This thesis is dedicated to
Mervyn George Blackwell

Abstract

Hormonal data contained on the Melbourne Women's Hospital Menstrual Cycle Database and data collected in the Palmerston North Centre of the World Health Organisation trial were analysed and compared. The analysis of the two sets of data showed that the utilisation of a threshold excretion rate for urinary Pregnanediol or Pregnanediol Glucuronide of $7 \mu\text{mol } 24 \text{ hr}^{-1}$ was an acceptable marker for the end of the fertile period. The data collected by the women participants in the World Health Organisation Trial also showed that the Ovarian Monitor, a home fertility test, provided the most simple, comprehensive and accurate marker of fertility status available.

Lysozymes from several sources were examined as possible replacements for the hen egg white lysozyme in the Ovarian Monitor as a means of reducing the Estrone Glucuronide assay time. Unfortunately, although they were all found to possess a faster initial rate, the clearing curves were also more biphasic making them unsuitable for use in the current end-point assay. These differences were attributed to the presence of electrostatic fields on both the enzyme and the substrate. However, the human lysozyme obeyed second order kinetics for a significant percentage of the twenty minute clearing curve. Thus, the Estrone Glucuronide assay time could be significantly reduced by adapting the Ovarian Monitor to linearise the human lysozyme clearing curve with an appropriate algorithm.

Human lysozyme is very expensive thus, it was necessary to optimise conjugation condition for Estrone Glucuronide using the more economical hen egg white lysozyme. Also, chromatographic conditions for conjugate purification had to be established before the human lysozyme could be conjugated and the viability of the above proposal could be tested.

Both the mixed anhydride and active ester conjugation methods were optimised. The most effective purification scheme involved pH 4.3 phosphate buffers using a Mono-S column followed by an Alkyl Superose column.

Acknowledgements

First, and foremost I would like to acknowledge my supervisor Associate Professor Len Blackwell for perseverance in the face of adversity and for the many frank and open discussions we have had during the course of this work.

Secondly, I would like to thank my flatmate Inge Merts, for allowing me to monopolise her computer and convert the lounge into a semi-permanent study for the last unmentionable number of months, not to mention for paying to get the computer fixed during one of its less co-operative phases. I am also equally indebted to Kerry Blackwell for formatting and invaluable assistance in getting this work to press on time.

I would also like to thank Yinqi Wu for synthesising starting material for me and his supervision during my excursion into the world of organic chemistry and Hale Nicholson for his supervision of the molecular biology. I would also like to acknowledge Mr Dick Poll for using my conjugate samples to trial the newly acquired SMART system.

I am also especially grateful to my family for their financial support over my years at Massey and especially this last year. Most notably I am grateful to my mother who always seems to be the initiator of such things.

The receipt of a grant from the Palmerston North Medical Foundation is gratefully acknowledged.

Merry Christmas!!

Chapter Four: Synthesis of Estrone Glucuronide Conjugates

<i>Scheme 4.1</i>	<i>The Synthesis of Estrone Glucuronide Conjugate by the Mixed Anhydride Method</i>	161
<i>Scheme 4.2</i>	<i>Disproportionation of the Mixed Anhydride Reagent</i>	162
<i>Scheme 4.3</i>	<i>The Synthesis of Estrone Glucuronide Conjugate by the Active Ester Method</i>	166
<i>Scheme 4.4</i>	<i>The Synthesis of Estrone Glucuronide</i>	171
<i>Scheme 4.5</i>	<i>Mechanism of the Koenigs-Knorr Coupling of the Bromosugar to Estrone</i>	17

Abbreviations

α	Smoothing Constant
A_{280}	Absorbance at 280 nm
Abs	Absorbance
BBT	Basal Body Temperature
BIP	Basic Infertility Pattern
bp	Base Pairs
CM	Carboxy-methyl
c type	Chick Type
DCC	Dicyclohexylcarbodiimide
DCU	Dicyclohexylurea
DMF	Dimethylformamide
DMSO	Dimethylsulphoxide
E_0	Total Enzyme Concentration
e	Charge on an electron
<i>E. coli</i>	<i>Escherichia coli</i>
E1G	Estrone Glucuronide
E1G-(H)	Estrone Glucuronide (acid form)
E1G-(Na)	Estrone Glucuronide (Na form)
EDTA	Ethylenediamine Tetra-acetic Acid
ESA	Exponentially Smoothed Average
FE	Forecast Error
FPLC	Fast Protein Liquid Chromatography
FSH	Follicle Stimulating Hormone
GEWL	Goose Egg White Lysozyme
GLC	Gas Liquid Chromatography
g type	Goose type
HEWL	Hen Egg White Lysozyme
HuL	Human Lysozyme
Hz	Hertz
IBC	Isobutylchloroformate

I.D.	Internal Diameter
IEP	Iso-electric Point
k	Boltzmann's constant
kb	Kilobase Pairs
LB	Luria-Bertani Broth
LH	Luteinising Hormone
MAD	Mean Absolute Deviation
<i>M. lysodeikticus</i>	<i>Micrococcus lysodeikticus</i>
NAG	N-acetylglucosamine
NAM	N-acetylmuramic Acid
NFP	Natural Family Planning
NHS	N-hydroxysuccinimide
NMR	Nuclear Magnetic Resonance
PAGE	Polyacrylamide Gel Electrophoresis
Pd	Pregnanediol
PdG	Pregnanediol Glucuronide
SD	Standard Deviation
SDS	Sodium Dodecyl Sulphate
SE _n	Substrate Molecule with n Number of Lysozyme Molecules Attached
SFE	Smoothed Forecast Error
std. dev.	Standard Deviation
T	Absolute Temperature
T ₁	Initial Transmittance
T ₂	Final Transmittance
ΔT	Change in Transmission
T4L	T4 Phage Lysozyme
TAE	Tris-Acetate Buffer containing EDTA
TE	Tris-HCl Buffer containing EDTA or Total Estrogens
TEPDDE	Total Estrogen and Pregnanediol Data Entry
TEWL	Turkey Egg White Lysozyme
TS	Tracking Signal
TLC	Thin Layer Chromatography

TNB

Tri-n-butylamine
