JLA: James Lind Alliance

PSP: Priority Setting Partnership

MDT: Multi-disciplinary Team

BACKGROUND

CF is a life limiting, autosomal recessive condition. It affects 1 in 2000-3000 newborns in the European Union and 1 in 3500 newborns within the United States of America¹. Currently, within the UK around 10,000 people suffer from CF².

CF is a multisystem disorder which requires long term, specialist multidisciplinary team (MDT) care in order to manage the many treatment decisions and aspects of CF disease effectively. Treatment varies from patient to patient according to the nature and severity of their symptoms and includes but is not limited to airway clearance, pancreatic enzyme replacement, dietary supplementation, antibiotics and nebulisers.

There are many uncertainties regarding Cystic Fibrosis (CF) treatment. Well-designed clinical trials should focus on questions which are important to patients and clinicians. Recently, the first James Lind Alliance (JLA) Priority Setting Partnership (PSP) in CF was completed³, bringing clinicians, patients and carers together to identify the Top 10 research priorities. Now that we know which treatment uncertainties are most important to the CF community, we want to examine how these priorities are reflected in the current clinical trial landscape. We aim to do this by carrying out a systematic review of the clinical trials registries and mapping the results to the James Lind Top ten.

REVIEW QUESTION

The review aims to identify current clinical trials on cystic fibrosis treatments and to find out how well these trials reflect the James Lind Alliance top ten priorities for research.

SEARCHES

Databases: PubMed; Australia and New Zealand Clinical Trials Register; EU Clinical Trials register; Clinicaltrials.gov; ISRCTN

Dates searched: 1st January 2016 – 9th November 2017

Language restrictions: only those trials published in English

The terms “cystic fibrosis” and where possible “interventional” were used.

Non registry studies were found by contacting relevant members of the Cystic Fibrosis Foundation regarding the Success with Therapies Research Consortium (STRC), CF health hub.

Search strategies are in Appendix 1

CONDITION BEING STUDIED

Treatment interventions for adults and children with cystic fibrosis.

PARTICIPANTS/POPULATION

Participants diagnosed with CF (through genetic testing or sweat testing) and of any age. Studies including other conditions but where CF patients are analysed as a specific subgroup were included if they met the rest of the inclusion criteria.

INTERVENTION(S)

Studies of treatment interventions in CF will be included. Studies involving trials of combinations of interventions, timings and duration of intervention and stopping interventions will also be included.

Studies covering diagnosis, newborn screening or those concerning diagnostic test accuracy will be excluded as well as those concerning policy, evaluation of the training of physicians or organisation of care.

The interventions we include will likely fall into these categories: drugs interventions (antibiotics and CFTR modulators), behavioural interventions (supportive care etc), dietary interventions (vitamin D, fibre etc), device or web based interventions (trackers, smartphone apps or virtual reality etc) and other interventions such as home monitoring and exercise for example.

COMPARATOR(S)/CONTROL

The comparator will be either be a placebo, usual treatment or no treatment.

TYPES OF STUDY TO BE INCLUDED

The study type we are looking for is interventional clinical trials of treatments for CF. We will include completed and ongoing trials.

CONTEXT

Setting includes inpatient and outpatient treatments in primary and secondary care and includes any trial that confers patient benefit.

PRIMARY OUTCOME(S)

The primary outcome is any clinically meaningful outcome which reflects patient benefit. We expect the outcomes to fall into the following categories but this list is not exclusive:

- Lung Function (e.g. FEV1, FVC, Lung clearance index etc)
- Health-related quality of life validated measures (e.g. Cystic Fibrosis Questionnaire (CFQ) 26)
- Respiratory symptom outcomes (e.g. Respiratory and Systemic Symptoms Questionnaire RSSQ)
- Hospitalisation (e.g. number of nights inpatient)
- School/Work attendance (e.g. number of days missed)

- Nutrition & Growth (e.g. weight gain, height, fat)
- Radiological (e.g. bone mineral density)
- Sputum properties
- Pulmonary exacerbations (measured by frequency of exacerbation or time to next exacerbation etc)
- Antibiotic use (e.g. number of courses, combinations, delivery method)
- Adverse effects (toxicity & allergy, microbiology, complication of delivery)
- Exercise tolerance
- Sweat chloride as a measure of CFTR function
- Mucus clearance
- Nasal symptom scores
- Bowel symptoms (e.g. stool frequency, abdominal pain etc)
- Treatment burden
- Treatment adherence
- Cost

SECONDARY OUTCOME(S)

There are no secondary outcomes

DATA EXTRACTION

Electronic search results will be collated into an Excel document. Studies found through other searches will be assembled into a separate Excel document.

Where possible, data on study title, recruitment, intervention, outcome measures, sponsor/collaborators/funding and study type will be recorded in the Excel Document.

For all studies, duplicates will be checked for manually and excluded.

The title/abstract of each study will be scanned by one reviewer and trials that are not interventional will be excluded. A second reviewer will check those records where there is uncertainty.

Studies which are deemed to fulfil the inclusion criteria from the title and abstract will be retrieved in full and scanned again for inclusion. Trials excluded at this stage will be listed with the reason for exclusion.

Data will be collected on the trial characteristics, the sponsor of the trial and the funding source.

STRATEGY FOR DATA SYNTHESIS

The primary aim of the review is to match the identified clinical trials with the top ten priorities for research in CF which were the result of a James Lind Alliance Priority Setting Partnership.

All available information on the trials will be reviewed in order to extract the main aims of the trial and to make a decision on the most accurate match of each study to the Top 10 research priorities. Matching will be recorded in Excel.

A second reviewer will check the matching decisions (NR) to ensure matching results are as accurate as possible. Any trials with matches made to the Top 10 priorities deemed by the first reviewer to be uncertain and needing a second opinion will be flagged. A final decision will be made by discussion.

ANALYSIS OF SUBGROUPS OR SUBSETS

Matching of trials to the James Lind Alliance top ten will be done for each priority in turn.

DISSEMINATION PLANS

We intend to publish the results in a peer reviewed journal and present at the European CF Society meeting.
