

Isotope exchange investigation of nitrogen redistribution in expanded austenite - DTU Orbit (07/08/2016)

Isotope exchange investigation of nitrogen redistribution in expanded austenite

Sequential plasma and gaseous nitriding of Fe–18Cr–10Ni–3Mo stainless steel at 390°C with 14N and 15N isotopes followed by denitriding in flowing hydrogen was investigated. Redistribution of plasma-inserted nitrogen atoms (15N) by subsequent gaseous nitriding (14N) was observed. Denitriding after plasma- and gaseous nitriding resulted in predominant retraction of 14N, and only a minor amount of 15N. The nitrogen isotope diffusion behaviour is explained by two different states of nitrogen bonding and short-range ordering between nitrogen and chromium.

General information

State: Published

Organisations: Department of Mechanical Engineering, Materials and Surface Engineering, Université de Poitiers, Helmholtz-Zentrum Dresden-Rossendorf

Authors: Christiansen, T. L. (Intern), Drouet, M. (Ekstern), Martinavičius, A. (Ekstern), Somers, M. A. J. (Intern)

Keywords: (Nitriding, Nuclear reaction analysis, X-ray diffraction (XRD), Stainless steel)

Pages: 582-585

Publication date: 2013

Main Research Area: Technical/natural sciences

Publication information

Journal: Scripta Materialia

Volume: 69

Issue number: 8
