Abstract

Tomato Dicer-like2 (*sLDCL2*) is a key component of resistance pathways against potato virus X (PVX) and tobacco mosaic virus (TMV). It is also required for production of endogenous small RNAs including miR6026 and other non-canonical miRNAs. The *sLDCL2* mRNAs are targets of these *sLDCL2*-dependent RNAs in a feedback loop that was disrupted by target mimic RNAs of miR6026. In lines expressing these RNAs there was, correspondingly, enhanced resistance against PVX and TMV. These findings illustrate a novel miRNA pathway in plants and a crop protection strategy in which miRNA target mimicry elevates expression of defense-related mRNAs.

Keywords

RNA silencing; tomato; Dicer; miRNA; virus

Introduction

RNA silencing plays important roles in plant development, genome stability, and anti-viral resistance (Baulcombe 2004). There are multiple pathways of RNA silencing in plants in which small (s)RNAs, ranging from 20-24-nt, bind to Argonaute (AGO) effector proteins. The AGO ribonucleoprotein then anneals to a target RNA through Watson-Crick base pairing with an outcome that depends on the nature of the target RNA. If the target RNA is cytoplasmic there is post-transcriptional gene silencing (PTGS) through cleavage of target RNA and/or translation inhibition (Rogers and Chen 2013) whereas, with nuclear RNA, there may be epigenetic effects in which AGOs recruit DNA/chromatin modifying factors (Law and Jacobsen 2011).

In plants, the cytoplasmic pathways of RNA silencing involve two different types of sRNA: small interfering (si)RNAs and microRNAs (miRNA). The siRNAs are produced from various types of double stranded RNA whereas miRNAs have a hairpin-like RNA precursor in which there are mismatches in the regions of base pairing. In both instances the processing enzyme is referred to as Dicer-Like (DCL).

The siRNA and miRNA pathways inter-connect through a complex mechanism involving secondary siRNA production (Allen et al. 2005; Zhai et al. 2011; Li et al. 2011). In the ‘two-hit’ model a transcript with dual miRNA target sites is the secondary siRNA precursor (Allen et al. 2005) whereas in the ‘one-hit’ model the miRNA, is typically 22-nt rather than the canonical 21-nt (Chen et al. 2010; Cuperus et al. 2010). In both models the miRNAs may mediate cleavage of their target RNA, as in the normal miRNA pathway, but there are several additional steps. First the 3’ cleavage product of the target RNA is converted into a double-stranded (ds) form by an RNA-dependent RNA polymerase 6 (RDR6) RNA. The dsRNA is

then processed by DCL4 to secondary siRNAs (Allen et al. 2005; Gasciolli et al. 2005).

A distinct feature of these secondary RNAs is that they align predominantly to their template RNA in a phased register in which the first position is opposite position 10 of the initiator miRNA. In some instances the phasing register has a 21-nt spacing (Allen et al. 2005; Zhai et al. 2011; Creasey et al. 2014) but, in male reproductive organs of monocots, there are also phased secondary sRNAs with a 24-nt register (Johnson et al. 2009).

There are two mechanisms for 22-nt sRNA production. One mechanism, for miRNAs, is based on DCL1 that typically produces 21-nt sRNAs but, if the precursor RNA has an asymmetric bulge in the base paired region, it generates 22-nt products. Presumably the bulge allows 22-nt RNA to be accommodated between the DCL active sites on either side of the mature miRNA. The second mechanism of 22-nt sRNA production involves DCL2 and it is independent of bulges in the precursor RNA. DCL2 in *Arabidopsis* can process endogenous and viral dsRNA into 22-nt sRNAs especially when other DCLs, especially DCL4, are absent (Gasciolli et al. 2005; Xie et al. 2004; Bouché et al. 2006). More importantly, DCL2 plays a primary role in transgene silencing, especially in sense transgene induced silencing and in transitivity of hairpin-induced transgene silencing (Mlotshwa et al. 2008; Parent et al. 2015). There is also a role of DCL2 in systematic spreading of transitive silencing between cells and through the vascular system (Wu et al. 2017; Taochy et al. 2017).

In addition to involvement in transgene and viral RNA silencing there could be secondary sRNA cascades affecting endogenous gene expression and anti-virus defense that are also dependent on DCL2 and endogenous 22-nt sRNAs. To investigate this possibility we analyzed DCL2 isoforms in tomato and find that *sIDCL2a* and *sIDCL2b* are the most

abundantly expressed genes in the four member *sLDCL2* family. From *sldcl2ab* mutants we conclude that DCL2 is the major Dicer in tomato defense against TMV and PVX and that it is involved in the biogenesis of endogenous 22-nt sRNA. The 24-nt sRNA pathways are also influenced by DCL2, both positively and negatively. Amongst the endogenous 22-nt-sRNAs there are miRNAs including miR6026 that targets *sLDCL2* mRNA and triggers secondary sRNA production. We disrupted this regulatory feedback loop with target mimic RNAs of miR6026 so that *sLDCL2* was upregulated and anti-virus resistance was enhanced. We propose that disruption of this and other defense-related miRNAs could be used as part of integrated pest management strategy to protect crops against viruses and other pathogens.

Results and Discussion

CRISPR mutants of *sLDCL2*

The tomato genome encodes four isoforms of *sLDCL2* (Bai et al. 2012) of which two (*sLDCL2a* and *sLDCL2b*) are highly expressed in young leaves and two (*sLDCL2c* and *sLDCL2d*) are barely detectable by RT-PCR (Supplemental Fig. S1). To investigate the functions of *sLDCL2* we designed a pair of CRISPR small guide RNAs (sgRNAs) to target the RNase III domain closest to the C terminus of *sLDCL2a* and *sLDCL2b* (Supplemental Fig. S2A) and we transformed them into tomato as part of an integrated construct with Cas9. Of the several T0 plants with edited *sLDCL2a* or *sLDCL2b*, we selected two for further analysis. Both plants carried the same deletion of two codons and an isoleucine to valine substitution in the *sLDCL2a* RNase domain but they had different premature stop codons in *sLDCL2b* (Supplemental Fig. S2B, C). These alleles (*sldcl2a-1*, *sldcl2b-1* and *sldcl2b-2*) have mutations in a highly conserved region of DCL2 (Supplemental Fig. S2D) and it is likely that they would encode non-functional proteins.

The selfed progeny of these T0 plants in which the CRISPR/Cas9 transgene was lost by segregation are *sldcl2a-1 sldcl2b-1*, *sldcl2a-1 sldcl2b-2*, *sldcl2a-1 sldcl2b-1*, or *sldcl2b-2*, depending on whether they carried one or both of the mutations in the homozygous condition (Supplemental Table S1). Transcript levels of *sIDCL2a* and *sIDCL2b* were similar or slightly higher in *sldcl2a-1 sldcl2b-1/sldcl2a-1 sldcl2b-2* (hereafter referred as *dcl2ab*) than in M82 wild type (hereafter referred as WT) (Supplemental Fig. S3) indicating that the mutations do not cause transcript degradation through mRNA decay. There was similarly no effect on other *DCL* mRNAs (Supplemental Fig. S3) and it is unlikely, therefore, that the loss of DCL2 results in compensating changes in other DCLs.

sIDCL2a/sIDCL2b affects endogenous 22-nt and 24-nt sRNA accumulation

Although DCL2 plays crucial roles in sense transgene-induced silencing and transitivity of hairpin-induced transgene silencing (Mlotshwa et al. 2008), it may also backup DCL4 in the production of sRNAs from viral and endogenous RNAs (Gasciolli et al. 2005; Wu et al. 2017; Bouché et al. 2006). Until now, however, there has been no analysis of sRNA from endogenous loci dependent on DCL2 in the presence of DCL4 that could be informative about a DCL4-independent role.

To investigate this possibility, we sequenced sRNA in WT and *dcl2ab* tomato leaves and found the predominant size class of sRNA was 24-nt with small amounts of 21-nt species (Fig. 1A) in both genotypes. The lack of a severe development phenotype (Supplemental Fig. S4) in *dcl2ab* indicates that the mutations did not lead to loss of essential sRNA species. Of the 642,444 sRNAs there were 2,432 (0.4%) with differential accumulation between WT and *dcl2ab* of which 1,779 were less abundant in *dcl2ab* (*sIDCL2*-dependent sRNA-D2 sRNA) and 653 were more abundant (*sIDCL2*-inhibited sRNA-D2i sRNA) (Fig. 1B; Supplemental

Tables S2 and S3). The D2 sRNAs were predominantly 22-nt (Fig. 1C) consistent with the role of DCL2 in 22-nt sRNA biogenesis as is likely in *Arabidopsis* (Gascioli et al. 2005; Bouché et al. 2006). In addition, there was a minor 24-nt peak (Fig. 1C) in both D2 and D2i sRNA that implies positive and negative roles of DCL2 in 24-nt sRNA pathways.

The 22-nt D2 sRNAs were predominantly from transposable elements (TEs) (Fig. 1D), indicating that sIDCL2a/sIDCL2b plays a role in genome stability. The D2 and D2i 24-nt sRNA, in contrast, were mostly from inter-genic regions (Fig. 1D). There was also a difference in the chromosomal distribution of these differentially expressed (DE) sRNA. The genomic loci producing 22-nt D2 sRNA revealed by SegmentSeq (Hardcastle et al. 2012) were distributed evenly across chromosomes whereas those with 24-nt DE sRNAs were in the distal regions (Fig. 1E; Supplemental Fig. S5) that, in the tomato genome, correspond to euchromatin (Tomato Genome Consortium 2012).

Our interpretation of these findings is that sIDCL2a/sIDCL2b produces 22-nt D2 sRNA directly by cleavage of precursor RNAs. The 24-nt D2 sRNAs are likely to be secondary sRNAs that may be dependent on a 22-nt D2 sRNA, as in monocots (Johnson et al. 2009). The D2 loci, according to this idea, with predominantly 22-nt sRNAs (Supplemental Fig. S6) would be largely made up of primary sRNAs generated by DCL2. The D2 loci with predominantly 24-nt sRNA (Supplemental Fig. S6) would be largely secondary sRNA loci. Consistent with the role of DCL2 in release of 22-nt D2 sRNAs the precursors of four D2 sRNA loci accumulated at higher levels in *dcl2ab* than in WT (Supplemental Fig. S7).

The D2i sRNAs of all size classes are likely to be derived from precursor RNAs that are normally processed by sIDCL2 but, in the *dcl2ab* plants, are available for other DCL proteins

(Nagano et al. 2014). Consistent with this proposal the 24-nt D2i sRNA regions produced sRNA that was predominantly 22-nt in WT plants (Supplemental Fig. S8). The precursors of two D2i loci were similarly abundant in WT and *dcl2ab* (Supplemental Fig. S7) consistent with processing by DCL2 in WT into 22-nt sRNA and a substitute DCL producing 24-nt sRNA in *dcl2ab*.

sIDCL2a/sIDCL2b-dependent 22-nt miRNAs

To find out whether the D2 22-nt sRNAs included miRNAs we compared the abundance of tomato miRNA reads in the sRNA-seq datasets of WT and *dcl2ab*. All of the 21-nt miRNAs and most of 22-nt miRNAs did not show statistically significant differences ($p < 0.01$) (Fig. 2A). The main exception, however, was the 22-nt miRNA: miR6026 (Fig. 2A, B). Consistent with the sRNA-seq data, the level of miR6026 detected by Northern blotting of RNA from 24-day-old leaves was lower than WT in *dcl2b* and much lower in *dcl2ab* (Fig. 2C). By comparison, the 22-nt miR482e was at the same level in WT and mutant genotypes (Fig. 2C). In contrast, most of miRNAs including miR482e were downregulated in the sIDCL1 knock down line (Kravchik et al. 2014) compared to control, whereas miR6026 was not affected by sIDCL1 knock down (Supplemental Fig. S9). We conclude, therefore, that miR6026 is unusual amongst miRNAs in that it is sIDCL2-dependent.

The most straightforward interpretation of these data is that the *MIR6026* precursor is cleaved by DCL2 to release miR6026. Other possibilities are that other DCL proteins carry out the cleavage and that DCL2 merely stabilizes the processed miR6026 or its precursor. The former possibility is unlikely because DCL2 has no role in stabilizing other 22-nt miRNAs and the latter can be ruled out because there are 21-nt sRNAs from the stem loop in the *MIR6026* precursor RNA that are unaffected by *dcl2ab* (Supplemental Fig. S10). An effect

on the precursor is also ruled out because there are similar levels of pre-miR6026 in WT and *dcl2ab* (Supplemental Fig. S7).

The 22-nt miRNAs in *Arabidopsis* trigger secondary sRNA production using their RNA targets as a template (Chen et al. 2010; Cuperus et al. 2010) and, correspondingly, in tomato, there were sRNAs corresponding to the miR6026 potential target mRNAs (Fig. 2D; Supplemental Table S4) that include the mRNAs for *sIDCL2a*, *sIDCL2b*, *sIDCL2d* and a disease resistance gene - *sITM2* (Kravchik et al. 2014; Li et al. 2011; Wu et al. 2016) (Fig. 3; Supplemental Fig. S11). These sRNAs were predominantly 21-nt in length and they aligned with the 3' side of the miRNA target site (Fig. 3; Supplemental Fig. S11). The sRNAs from *sIDCL2a/b/d*, like many secondary sRNAs, were predominantly in a phased register corresponding to the miRNA-directed cleavage site. This phasing pattern was most pronounced in the regions adjacent to the miRNA target (Fig. 3; Supplemental Fig. S11). The phasing of the *sIDCL2* sRNAs is less pronounced than with the tasiRNA loci in *Arabidopsis*. To explain this difference we propose that the 22-nt secondary sRNAs (Supplemental Table S5) from the *sIDCL2* mRNAs could act *in cis* and trigger additional rounds of secondary sRNA in various phasing registers.

The sRNAs of *sIDCL2a*, *sIDCL2b* and *sIDCL2d* are dependent on sLRDR6 and partially on sIDCL4 (Supplemental Fig. S12) and their biogenesis, therefore, is like that of the well-known phasi/tasiRNA and easiRNA biogenesis in *Arabidopsis* (Allen et al. 2005; Zhai et al. 2011; Creasey et al. 2014). A crucial difference, however, is that the miR6026 is DCL2-dependent and there is, therefore, a feedback component to the system. The triggers of *Arabidopsis* phasi/tasiRNA and easiRNAs are 22-nt, similarly to miR6026, but they are dependent on DCL1 rather than DCL2 (Cuperus et al. 2010).

Our characterization of miR6026 provides the first example of non-DCL1 processed miRNA in plants with a validated target RNA (Supplemental Fig. S9). There are other 22-nt miRNAs but they are dependent on DCL1 (Cuperus et al. 2010) and their size is determined by an asymmetric bulge in the miRNA/miRNA* (Supplemental Fig. S13). The 22-nt miR6026 has a precursor that is symmetrical in the miRNA/miRNA* region and its size is likely to be influenced by the DCL2 protein, as for the 22-nt D2 sRNAs, rather than by the structure of the miRNA precursor.

Of the tomato 22-nt miRNAs there are three others, in addition to miR6026, that have symmetric structures in the miRNA/miRNA* duplex: miR5302b-5p, miR10533 and miR828. The former two are reduced in the *dcl2ab* samples (Fig. 2A) but not as much as miR6026. We predicted potential target genes of miR5302b-5p and miR10533 (Supplemental Table S6) however none of them produced sRNA in WT according to the sRNA-seq data (data not shown). The miR828 is expressed only at low abundance so that differential expression in the *dcl2ab* mutant cannot be assessed (data not shown) but the phased secondary sRNAs from its *TAS4* target locus (Singh et al. 2016) were less abundant in the *dcl2ab* mutant (Supplemental Fig. S14). It is likely, therefore, that both of these other 22-nt miRNAs with symmetrical precursors are DCL2-dependent, like miR6026, although it is not clear whether miR5302 or miR10533 triggers secondary siRNA.

The biological function of sIDCL2-dependent miR6026

To explore the biological function of miR6026 we transgenically expressed a non coding RNA with two tandem repeats of a miR6026 target mimic site. These RNAs were designed, like the endogenous target mimic RNAs of miR399 (Puga et al. 2007), to have a three

nucleotide bulge at positions 10 and 11 of the miRNA binding site (Fig. 4A). We predicted that this RNA would lock the miR6026 into a nonproductive interaction that would compete with the normal binding to *sLDCL2a*, *sLDCL2b*, *sLDCL2d* and *sITM2* mRNAs.

Transgenic tomato lines with high (L2, L6) or low expression levels (L7) of the target mimic RNA grew normally under growth chamber conditions (Fig. 4B, C) and set fruit and seed as well as WT plants. There was a negative correlation between miR6026 accumulation and the target mimic RNA in these plants (Fig. 4B) indicating that the target mimic RNA reduces the cognate miRNA abundance, as in other examples (Yan et al. 2012). This target mimic RNA effect was highly specific so that the only affected miRNA in the L6 lines was miR6026 (p-value cutoff, $p < 0.05$) (Supplemental Fig. S15). Correspondingly there was upregulation of *sLDCL2a* and, to a lesser extent, *sLDCL2b* that correlated with the levels of the target mimic RNA (Fig. 4D).

An sRNA-seq analysis of two independent T1 plants from L6 and L7 confirmed that the level of miR6026 was lower in L6 than L7 (Supplemental Fig. S15) and that there was a parallel effect on secondary sRNA from *sLDCL2a*, *sLDCL2b* and *sLDCL2d* (Fig. 4E). In contrast the *sITM2* sRNA and mRNA were not affected (Fig. 4E; Supplemental Fig. S16). To further validate miR6026-directed target cleavage, we assayed for miR6026 cleavage sites of *sLDCL2a*, *sLDCL2b* and *sLDCL2d* mRNAs with 5'-RLM-RACE. In each instance the predicted cleaved products for miR6026 were amplified in WT rather than *dcl2ab* or target mimic lines (Supplemental Fig. S16).

These findings confirm that miR6026 targets mRNAs of *sLDCL2a*, *sLDCL2b* and *sLDCL2d* *in vivo* and that it is responsible for the *sLDCL2* secondary sRNA production. These findings

also explain the higher mRNA levels of *sIDCL2a* and *sIDCL2b* in *dcl2ab* than in WT (Supplemental Fig. S3B). The lack of an effect on *sITM2* sRNA is likely because other miRNAs target the *sITM2* mRNA and could trigger secondary siRNA in the absence of miR6026 (Li et al. 2011) (Supplemental Fig. S11F; Supplemental Fig. S17).

The increased abundance of *sIDCL2a* and *sIDCL2b* RNA in L6 (strong mimic line) relative to WT lines (Fig. 4D) should influence the levels of endogenous D2 and D2i sRNAs (Fig. 1) and exogenous viral sRNAs (Xie et al. 2004; Bouché et al. 2006). Consistent with these predictions there was a trend for the endogenous D2 sRNAs to increase more in L6 than in L7 and for the D2i sRNAs to be less abundant (Supplemental Fig. S18). The effect on D2 sRNAs was clearest with the 22-nt species and with the 24-nt D2i sRNAs (Supplemental Fig. S18).

The potential involvement of DCL2 in viral sRNA production was supported by the increase in *sIDCL2b* mRNA in TMV- and PVX-infected tomato (Fig. 5A) and by the enhanced viral symptoms in *dcl2ab* relative to WT (Fig. 5B, C). The TMV-infected mutant plants had ‘wiry’ (Lesley 1928) or shoestring-like leaves whereas infected WT plants have chlorosis without leaf distortion (Fig. 5B; Supplemental Fig. S19). PVX-infected *dcl2ab* plants were dead two weeks after inoculation in contrast to the WT plants that survived although with growth stunting and leaf distortion (Fig. 5B). Consistent with the upregulation of *sIDCL2b* upon virus infection (Fig. 5A), the TMV-infected *dcl2b* had ‘wiry’ leaves as with infected *dcl2ab* (Supplemental Fig. S20). However, at 34 days after infection, the TMV symptoms were milder on *dcl2b* than on *dcl2ab* (Supplemental Fig. S20), consistent with a role of *sIDCL2a* in the late stages of anti-viral defense.

The anti-viral activity of DCL2 was confirmed by the sRNA profiles of TMV-infected WT and *dcl2ab*. In *dcl2ab* the 22-nt viral sRNAs were less abundant than in WT (Supplemental Fig. S21) whereas 21-nt viral sRNAs were increased (Supplemental Fig. S21), due possibly to compensating activity of DCL4.

Also consistent with an antiviral role of DCL2 the 22-nt sRNAs in TMV-infected L6 were more abundant than in WT plants (Supplemental Fig. S21). In addition there were fainter chlorotic symptoms than in WT (Fig. 5B; Supplemental Fig. S19) and viral RNA accumulation was reduced (Fig. 5D). There was also less viral RNA accumulation in PVX-infected mimic plants than in WT (Fig. 5E), although the viral symptoms were similar (Fig. 5C).

The reduction of symptoms or virus infection in the TMV-infected plants is likely due to DCL2/miR6026 because the TMV symptoms in progeny of L6 × *dcl2b* or *dcl2ab* were as severe as in the *dcl2b* and *dcl2ab* (Supplemental Fig. S22). From these results we conclude that the DCL2-miR6026 feedback influences the effect of RNA silencing on viral RNA accumulation and viral disease progression in tomato (Supplemental Fig. S23).

This analysis of sIDCL2 has both applied and basic science implications. At the applied level we have demonstrated that disease resistance can be enhanced by blocking a miRNA that targets a defense mRNA (Fig. 5). In our L6 lines this effect was achieved without inhibition of basic features in growth and development (Fig. 4C) although a more detailed phenotypic analysis remains to be carried out. The potential of this approach is also confirmed by findings of enhanced resistance to soybean mosaic virus (SMV) (Bao et al. 2018) and *Phytophthora infestans* (Jiang et al. 2018) in other lines in which defense mRNAs were

elevated by miRNA target site mimics. There are multiple miRNAs including miR403 (Harvey et al. 2011) and the miR482 family (Shivaprasad et al. 2012) that, like miR6026, target defense proteins. Although the effect of any single defense miRNA mimic may be weak (Fig. 5) it could be that strong resistance can be achieved by combining several of these RNAs in a single line.

The fundamental science advance of this work is through the finding that there are endogenous 22-nt sRNA products of DCL2 including the miRNAs (Fig. 1; Fig. 2). The finding of DCL2-dependent siRNAs had been suspected previously from the analysis of *DCL2* in *Arabidopsis* (Xie et al. 2004; Bouché et al. 2006) but not shown directly unless the plants also lacked DCL4. We also show that there are D2 sRNAs and D2i sRNAs that are predominantly 24-nt length (Fig. 1C-E). The DCL2 effect on 24-nt sRNAs is most likely indirect and it could influence the epigenome of tomato through the RNA-direct DNA methylation pathway (Nuthikattu et al. 2013). From these various findings it is clear that DCL2 is not merely a back up for DCL4 but an important component of the diverse RNA silencing pathways of plants.

Materials and methods

Plant materials

All tomato plants used in this study are *Solanum lycopersicum* cv M82. CRISPR/Cas9 mutants were obtained by stably transforming tomato plants as described previously (Gouil and Baulcombe 2016). For target mimicry plants, two tandem repeats of miR6026 target mimic were cloned into the gateway construct pGWB402 omega, and then transformed into tomato. Primers for cloning and genotyping were listed in Supplemental Table S7.

For virus infection, three-week-old plants of *Nicotiana benthamiana* were rub-inoculated with TMV U1 virion or infiltrated with agrobacteria carrying pGR106 for PVX (Harris et al. 2013). After one week, *N. benthamiana* leaves were harvested and grinded to sap which was rubbed onto 10-day-old tomato cotyledons for inoculation.

RNA analyses

Total RNA was extracted by the TRIzol method. Northern blotting and sRNA library preparation were performed as described (Shivaprasad et al. 2012). RT-PCR was performed as described (Harris et al. 2013). 5'-RLM-RACE was performed following the instruction of GeneRacer Kit (Life Technologies). Primers were listed in Supplemental Table S7.

Bioinformatics

The sRNA reads were trimmed using Trimgalore and mapped to the Heinz genome SL3.0 or respective genes using Bowtie (Langmead et al. 2009) with specified parameters of -m 1 and -v 0. The bam files were used for differential sRNA analysis by segmentSeq (Hardcastle et al. 2012) and DESeq2 (Love et al. 2014) after filtering out those sRNAs with less than five sequencing reads in five libraries. The raw sequencing data are available in the NCBI SRA database under accession No. SRP127908.

Phasing analysis of sRNA was performed by counting 21-nt sRNA mapped to each of 21 registers in each gene. Register 1-21 represents the distance of sRNA starting site from 5' of miR6026. Percentages of 21-nt reads corresponding to each of the 21 registers from each gene were shown by radar plots.

Analyses of miRNA were performed based on a tomato miRNA list (Supplemental Table S8)

combining 92 miRNAs from miRBase22 and 30 from recent publications.

Acknowledgements

We are grateful to Dr. John Carr for providing virus material and help. We thank Mel Steer and James Barlow for technical assistance. We thank Drs Betty Chung, Sara Lopez-Gomollon, Claudia dos santos Martinho, Francisco Navarro and Adrian Valli for helpful comments and discussions. We also thank Dr. Ming-Tsung Wu for assistance with RLM-RACE analysis. This work was supported by European Research Council Advanced Investigator Grant ERC-2013-AdG 340642 (TRIBE), the Royal Society (RP170001) and the Balzan Foundation. D.C.B. is the Royal Society Edward Penley Abraham Research Professor.

Author contributions: Experiments were designed by Z.W. and D.C.B., and were performed by Z.W., A.C.P., W.H.Y., and S.T. Bioinformatics analysis was performed by Z.W. and T.J.H. The manuscript was prepared by Z.W. and D.C.B.

Figures

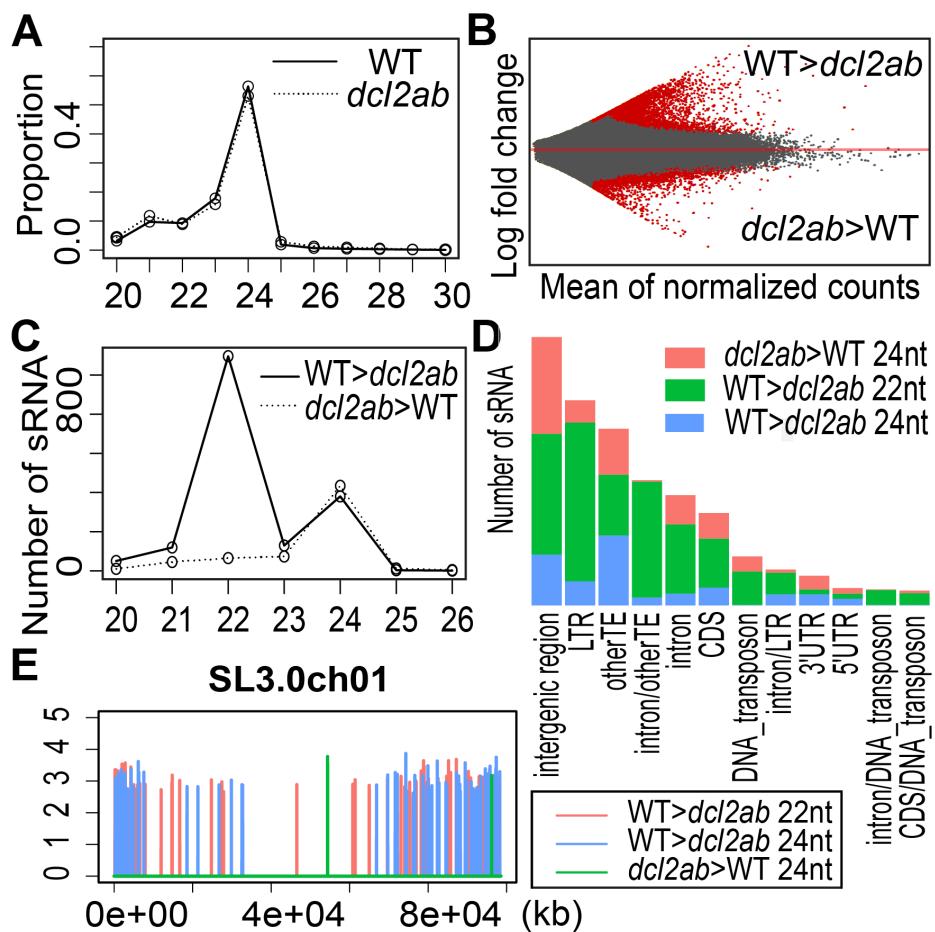

Figure 1. sDCL2a and sDCL2b are responsible for endogenous sRNA biogenesis. High-throughput sequencing data of sRNAs in 24-day-old leaves of WT and *dcl2ab* mapped to tomato genome SL3.0. **A.** sRNA size profile in WT and *dcl2ab*, respectively; **B.** MA plot showing differential analysis of sRNAs between WT and *dcl2ab*. sRNAs that are differentially expressed ($p\text{-adj} < 0.01$ calculated by DESeq2) are coloured in red; **C.** Length distribution of differentially expressed sRNA (DE sRNA); **D.** Genomic feature analysis of 22-nt D2 sRNA and 24-nt DE sRNA; Y-axis shows the number of DE sRNA in each category of genomic feature; **E.** Chromosomal distributions of 22-nt D2 loci and 24-nt DE loci. X-axis shows the chromosomal coordinates, and y-axis shows the log₁₀ values of sRNA reads number in WT and *dcl2ab* for D2 and D2i loci, respectively.

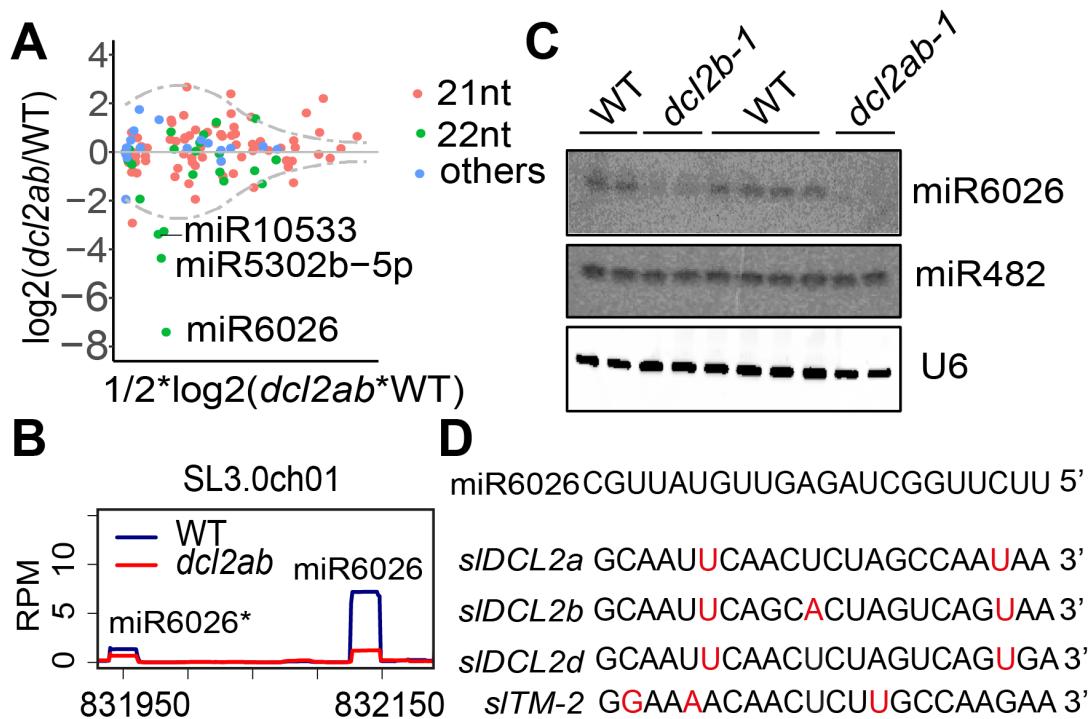

Figure 2. sIDCL2a and sIDCL2b are required for biogenesis of miR6026. **A.** MA Plot showing miRNA abundance in WT and *dcl2ab*. Different sizes of miRNAs are shown in different colours. miR6026, miR5302b-5p and miR10533 are marked; **B.** sRNA RPM plots showing reduced accumulations of miR6026 in *dcl2ab* as compared to WT. Mature miR6026 and miR6026* are marked; **C.** Northern blots of miR6026 and miR482e with total RNA extracted from 24-day-old leaves of WT, *dcl2b*, and *dcl2ab* mutants, with U6 as loading control; **D.** Sequences of miR6026 and potential targets. Mismatches are shown in red.

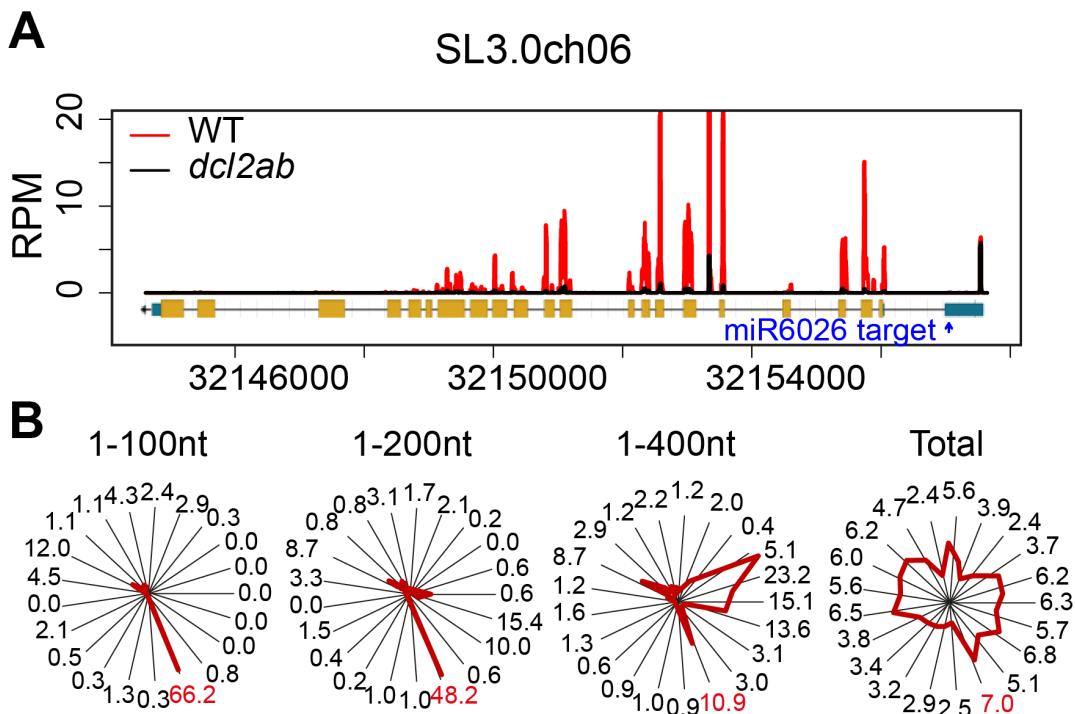

Figure 3. Accumulation of *sLDCL2a* sRNAs is reduced in *dcl2ab*. **A.** sRNA RPM plots showing the levels of *sLDCL2b* sRNAs in WT and *dcl2ab*. In the gene models, rectangles and lines represent exons and introns, respectively. UTRs and ORFs are in cyan and yellow, respectively. Arrows mark the direction of transcription. Target site of miR6026 is marked with blue arrowhead; **B.** The phasing of *sLDCL2a* sRNAs in WT. Radar plots show percentages of 21-nt reads corresponding to each of the 21 registers from the whole transcript of *sLDCL2a*, or 1-100nt, 1-200nt, 1-400nt of the *sLDCL2a* transcript (the distance from the miR6026 cleavage position) in WT sRNA-seq data. Percentage of register of the 10th position, the miR6026-guided cleavage site between the 10th and 11th nucleotide of miR6026 was marked in red.

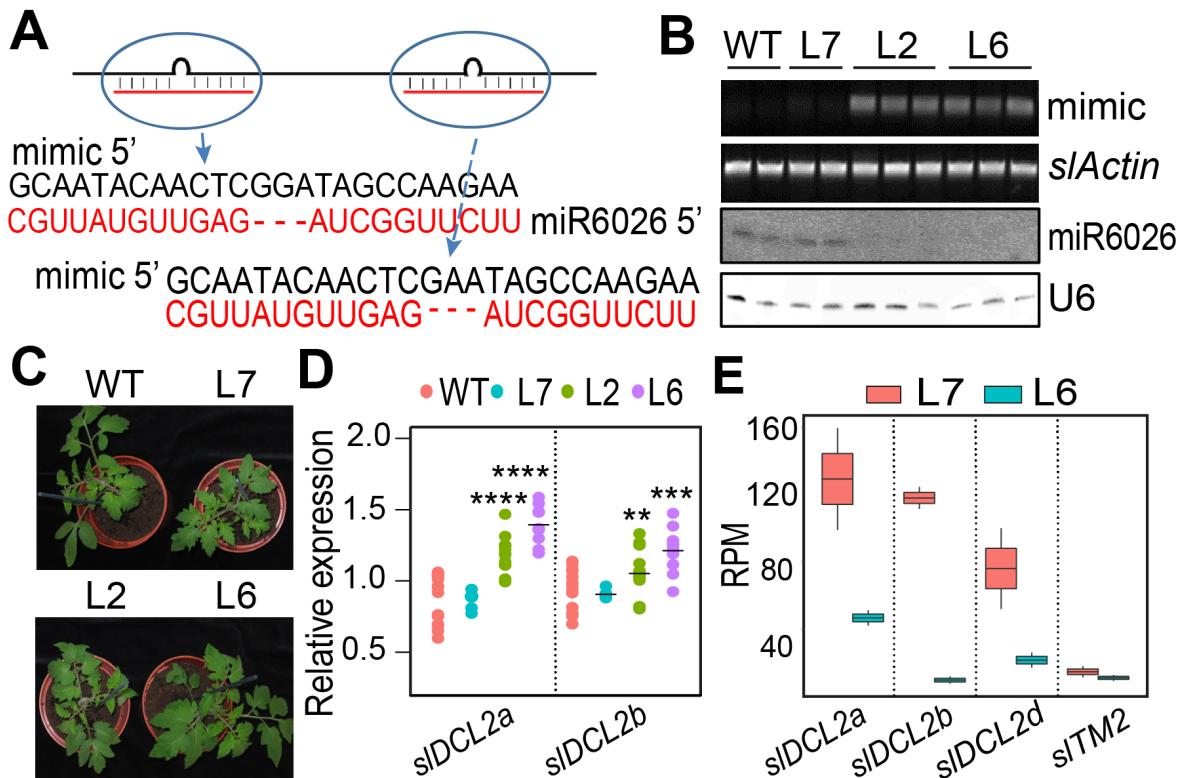

Figure 4. miR6026 targets *slDCL2a/b/d* transcripts and triggers secondary sRNA production.

A. Diagram of miR6026 target mimic; **B.** (upper to lower) semi-quantitative RT-PCR of miR6026-mimic RNA in WT and different mimicry lines with *sLActin* as control; Northern Blots of miR6026 with U6 as loading control; **C.** 3-week old plants of WT, one weak mimic line (L7) and two strong mimic lines of miR6026 (L2 and L6); **D.** qRT-PCR of *slDCL2a* and *slDCL2b* in wild type and mimicry lines; ** p < 0.01, *** p < 0.001, **** p < 0.0001; **E.** RPM of total reads mapped to potential target transcripts of miR6026 in weak mimic line (L7) and strong mimic line (L6).

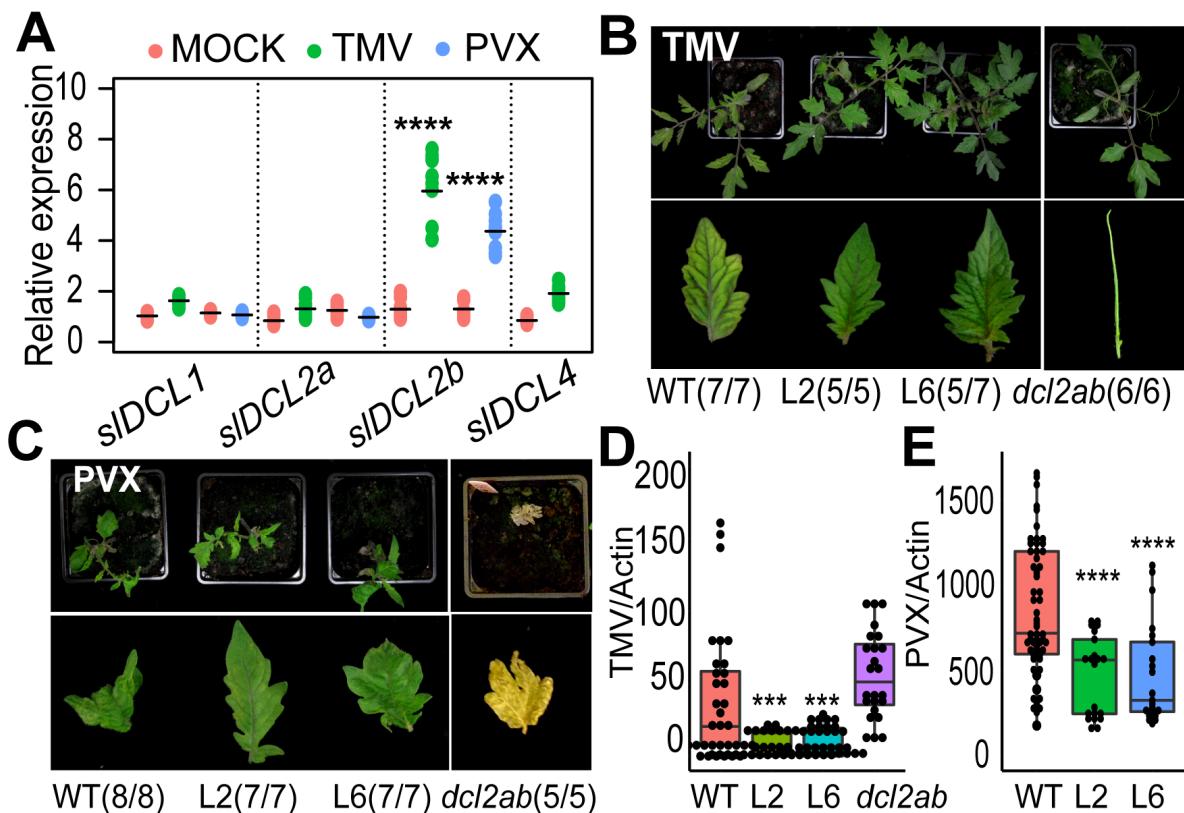

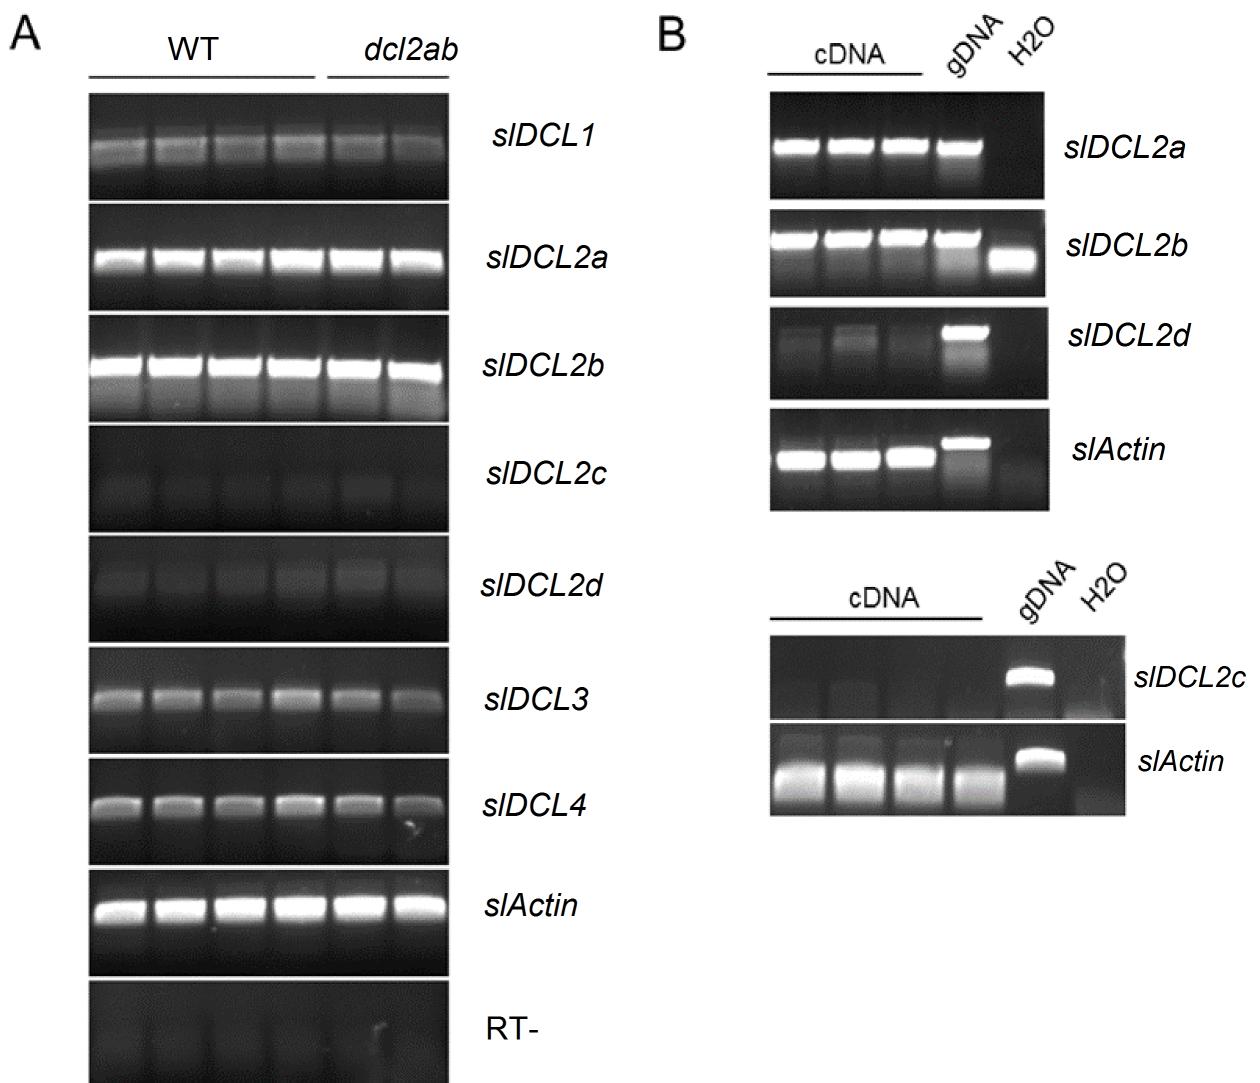

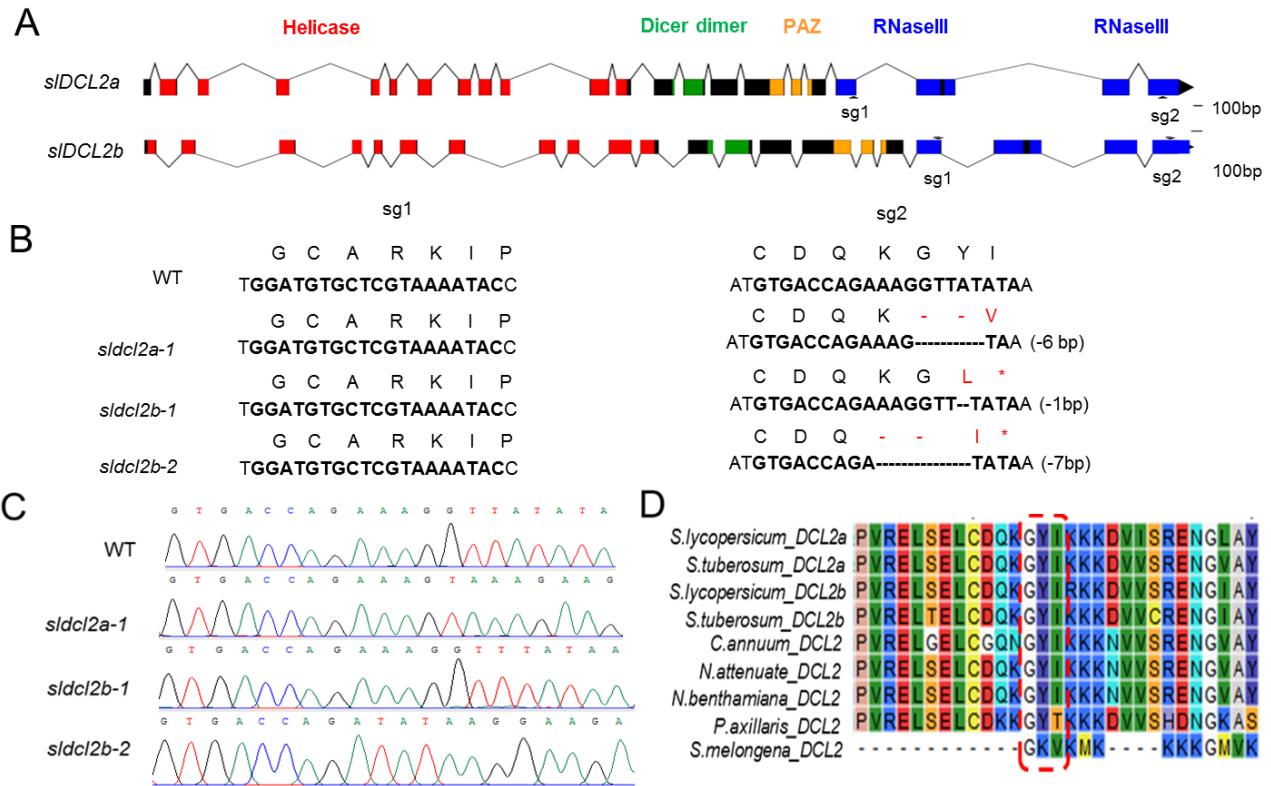

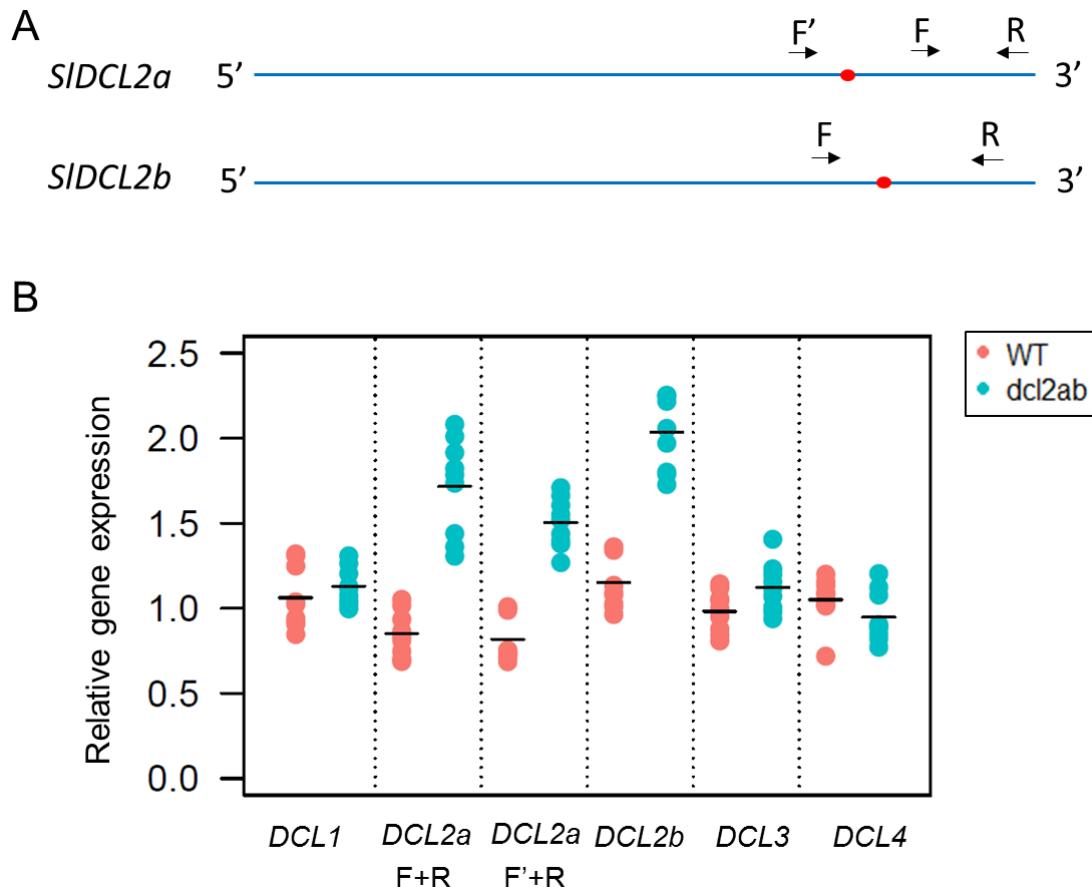

Figure 5. siDCL2a and siDCL2b are required for tomato antiviral defense against TMV and PVX. **(A).** qRT-PCR results of siDCLs in MOCK and virus-infected samples. *slActin7* was used as an endogenous control; **(B).** Two weeks after TMV inoculation the plants showed chlorosis (WT), weak chlorosis (L2 and L6), and 'shoestring' (*dcl2ab*) symptoms of TMV; numbers in parenthesis show the number of plants with the indicated symptoms and the number of infected plants; **(C).** Two weeks after PVX inoculation the plants showed the growth stunting and leaf distortion symptoms (WT and target mimic lines L2 and L6) or lethality (*dcl2ab*); numbers in parenthesis show the number of plants with the indicated symptoms and the number of infected plants; **(D-E).** Real time PCR analysis of TMV or PVX in infected plants. *slActin7* was used as a control. *** p < 0.001, **** p < 0.0001.

Supplemental Figure S1. (A) RT-PCR of *sIDCLs* in M82 and the *dcl2ab* mutant. Total RNA was extracted from 24-day-old leaves and then cDNA was synthesized with oligodT primer. PCR products of 28 cycles were segregated in 1.5% agarose gel. Genomic DNA and H₂O as positive and negative controls, respectively. (B) PCR of *sIDCL2s* in M82 cDNA and genomic DNA (gDNA). PCR products were obtained from gDNA, suggesting that lack of PCR products from cDNA is due to lower gene expression instead of failure of PCR.

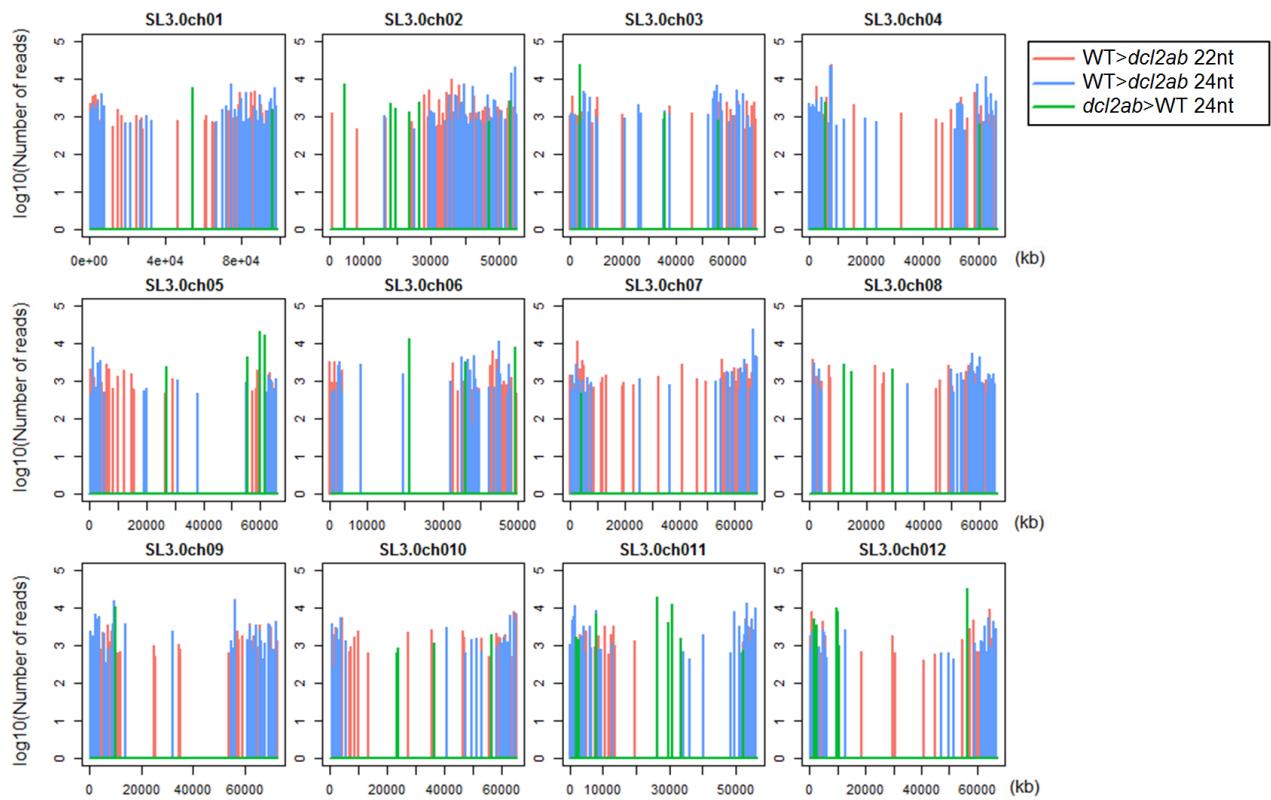

Supplemental Figure S2. *sIDCL2* mutants. (A) Gene structures of *sIDCL2a* and *sIDCL2b*. Exons and introns are indicated by rectangles and lines respectively. Functional domains are labelled with different colours. Small guide RNA (sgRNA) targets are marked with arrowheads; (B) Encoded amino acids of sgRNA target regions are shown. Amino acid changes by mutation are highlighted in red; (C) Sanger sequencing results of mutations; (D) Protein sequence alignments of DCL2 in *Solanaceae*. The mutation region is marked by red rectangle.

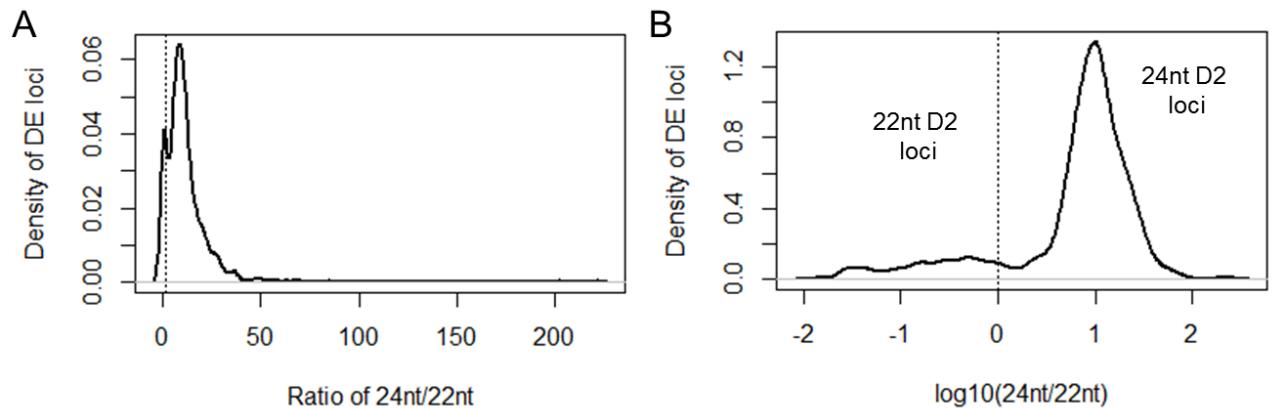

Supplemental Figure S3. (A) Schemes of RT-PCR primers of *SfDCL2a* and *SfDCL2b*. Dark blue lines represent mRNAs. Red dots indicate the mutations. Forward and reverse primers are marked with F or F' and R arrowheads; (B) RT-qPCR of *sfDCLs* in WT and the *dcl2ab* mutant. *sfActin7* was used as endogenous control.

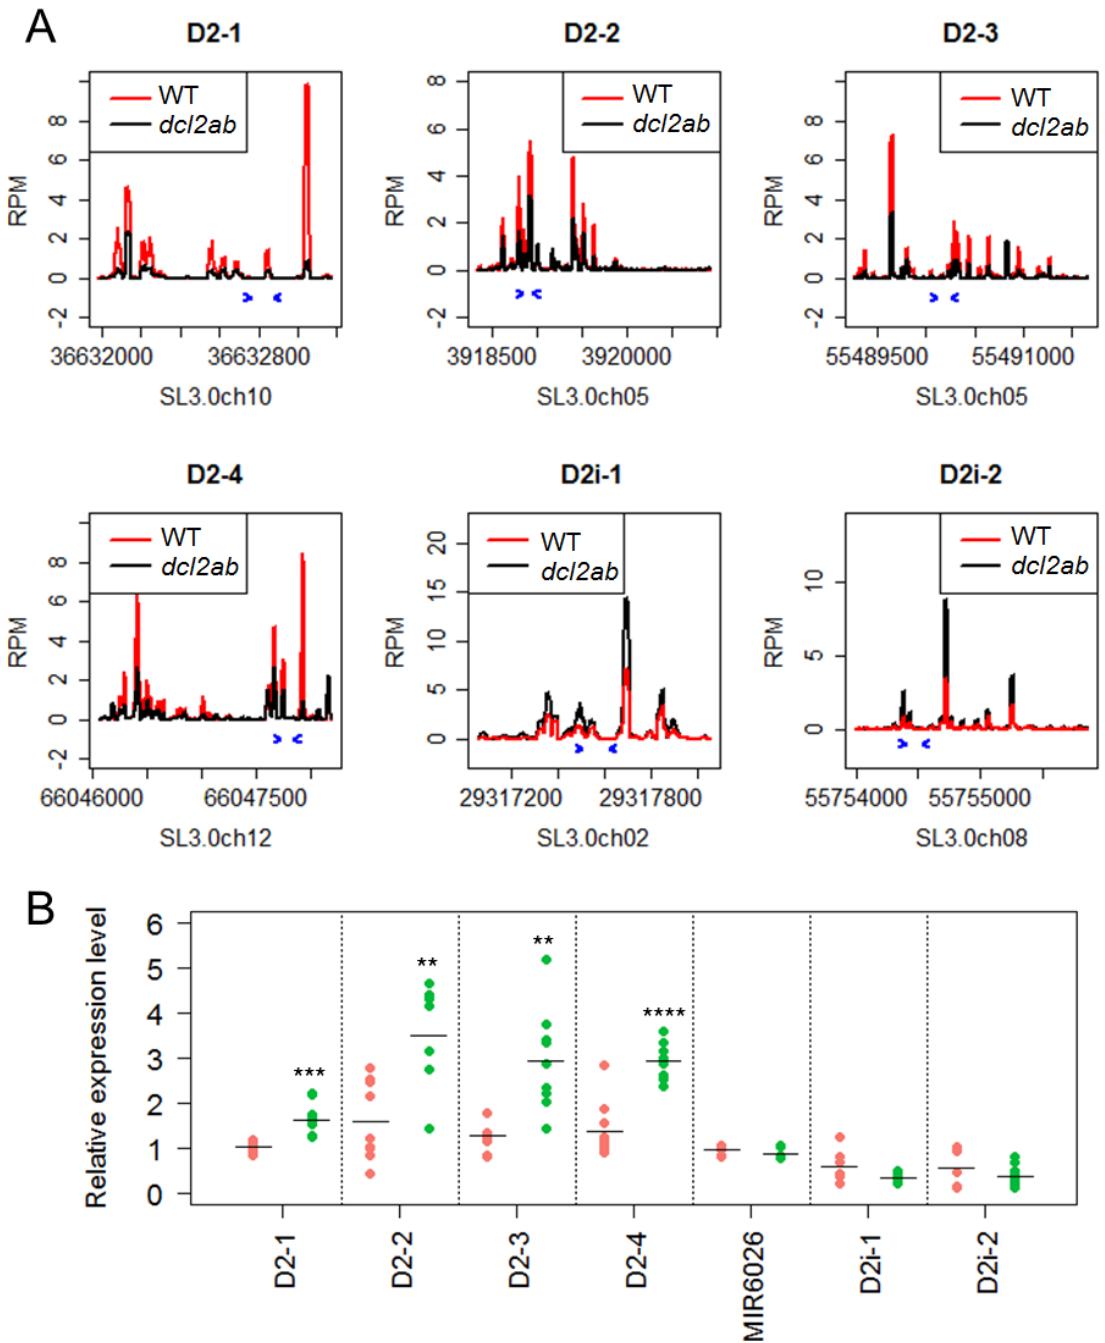

Supplemental Figure S4. Phenotypes of *dcl2a*, *dcl2b* and *dcl2ab*.

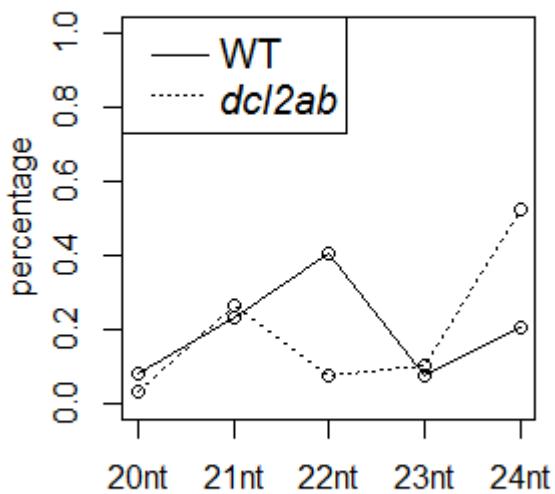

Supplemental Figure S5. Chromosomal distribution of DE loci in WT and *dcl2ab*. X-axis shows the chromosomal coordinates, and y-axis shows the log10 values of sRNA reads in WT for 22nt and 24nt D2 loci and in *dcl2ab* for 24nt D2i loci.

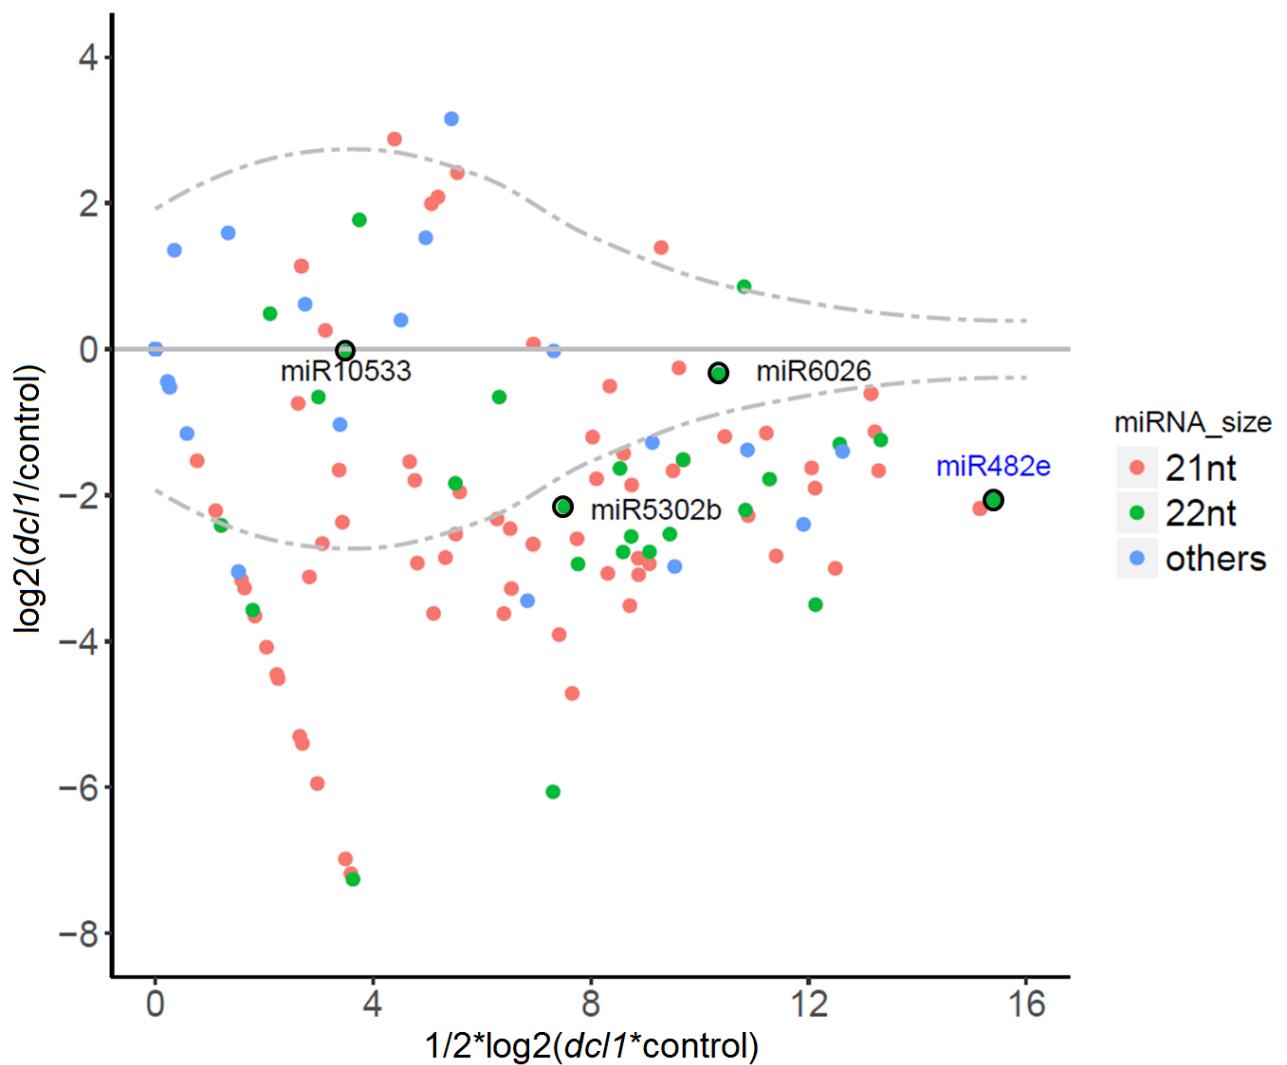

Supplemental Figure S6. Ratio of 24nt/22nt sRNA loci of the tomato genome. The sRNA were analysed for differential expression (DE) loci between WT and *dcl2ab* by segmentSeq (Hardcastle 2010). There are 1, 215 DE loci including 647 ones that are downregulated in *dcl2ab* than WT (D2 loci) and 568 that were upregulated in *dcl2ab* (D2i loci). Kernel density plots show the density of D2 loci vs the ratio of 24nt sRNA: 22nt sRNA within each locus (**A**) or the \log_{10} value of ratio (**B**). Vertical lines indicate 24nt:22nt=1 so that loci on the left are 22nt predominant D2 loci and those on the right are 24nt predominant D2 loci.

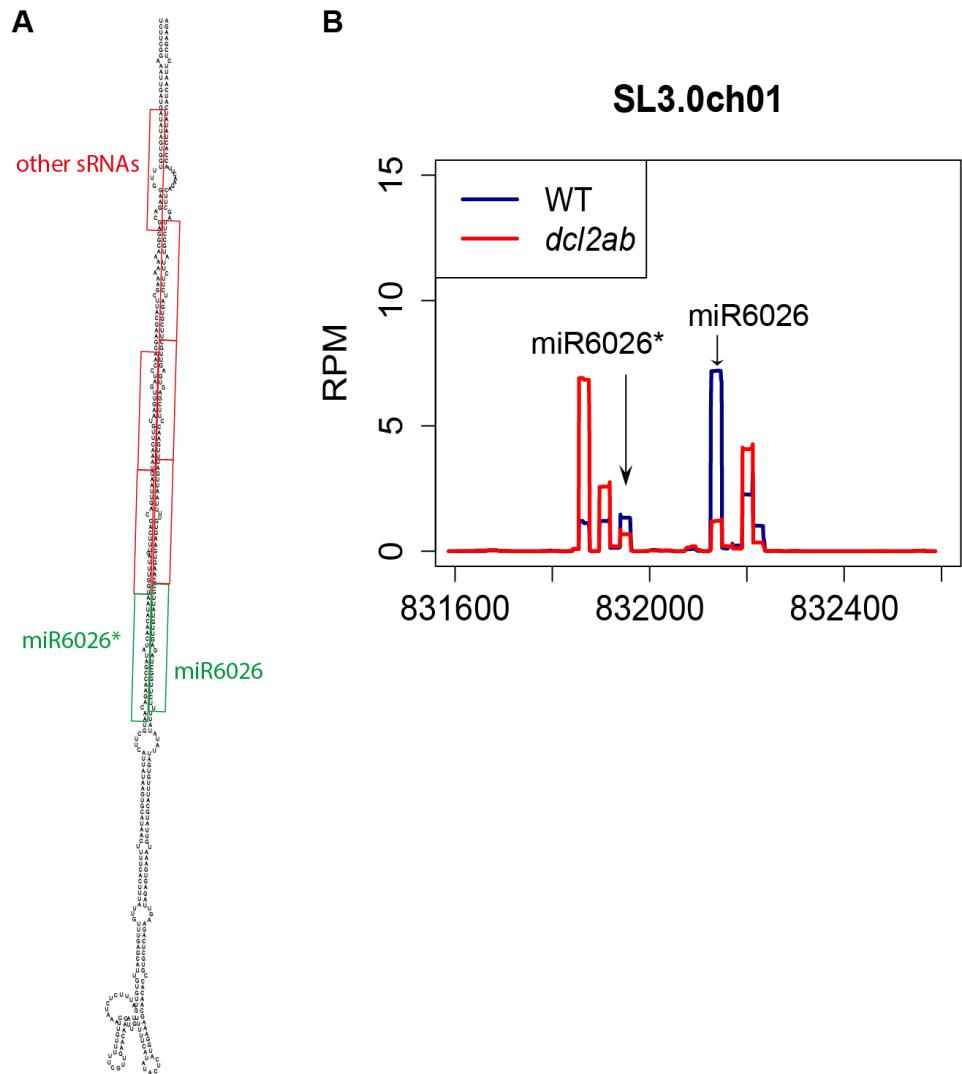

Supplemental Figure S7. **A.** sRNA RPM plots showing accumulation of sRNAs mapped to five D2 and two D2i loci in WT and *dcl2ab*. Primers used in **B** are marked with arrowheads; **B.** RT-qPCR results of D2 and D2i precursors, including pre-miR6026, in WT and *dcl2ab*. *slActin* was used as control. ** p < 0.01, *** p < 0.001, **** p < 0.0001.

Supplemental Figure S8. 24-nt D2i sRNA regions produce more 22-nt sRNAs in WT than *dcl2ab*. 24-nt D2i sRNA sequences were collected and used as Bowtie alignment reference of WT and *dcl2ab* sRNA sequencing data. Percentage shows the composition of different sizes of sRNAs from the 24-nt D2i sRNA regions in WT and *dcl2ab*.

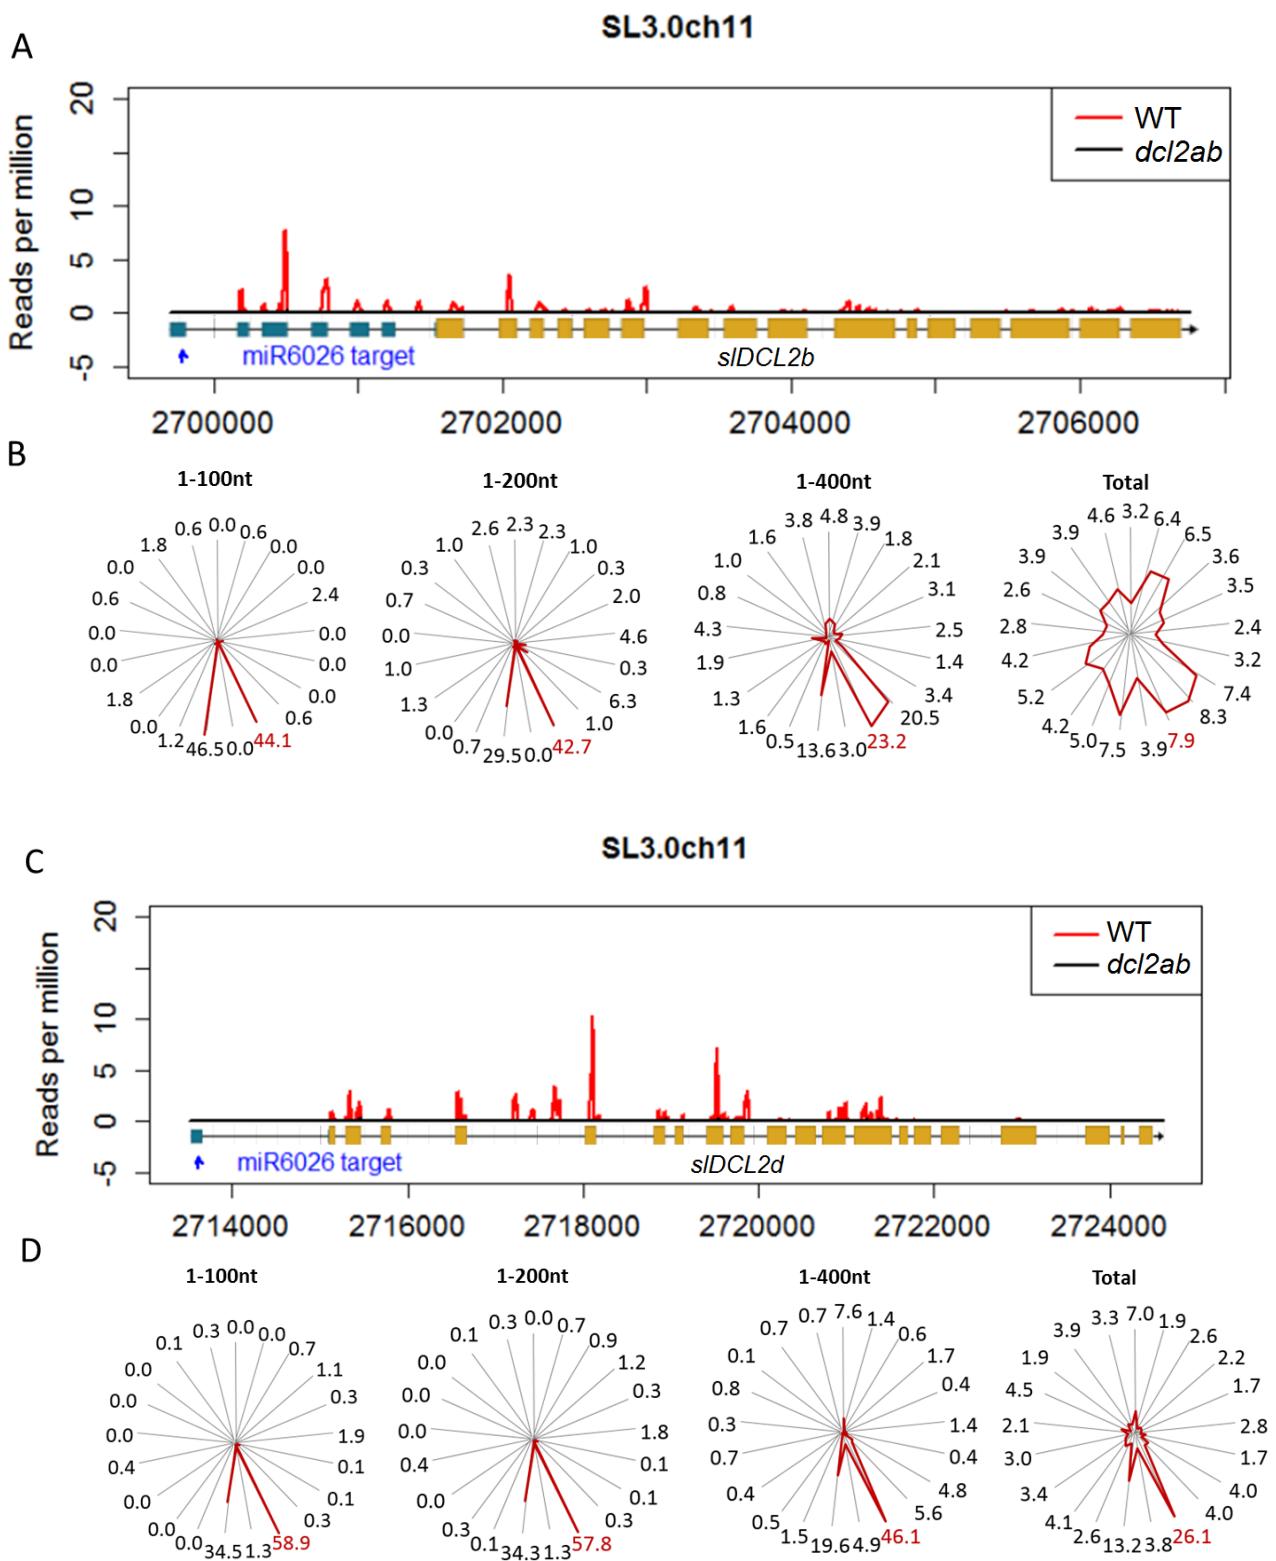

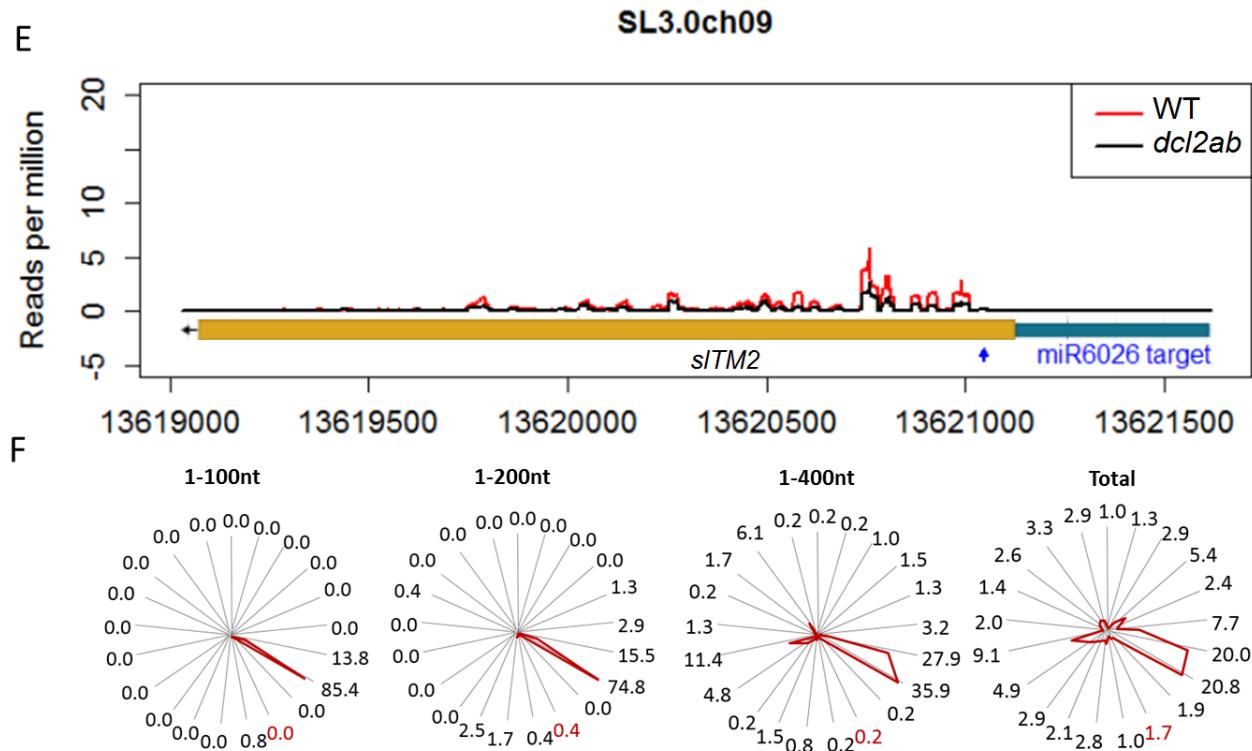

Supplemental Figure S9. MA Plot showing miRNA abundance in WT and *dcl1* by re-analyzing published *dcl1* sRNA-seq data (Kravchik et al. 2014). 21-nt and 22-nt sizes of miRNAs are shown in different colours. Three slDCL2-dependent miRNAs (miR6026, miR5302b and miR10533) and one slDCL1-dependent miRNA (miR482e) are marked.

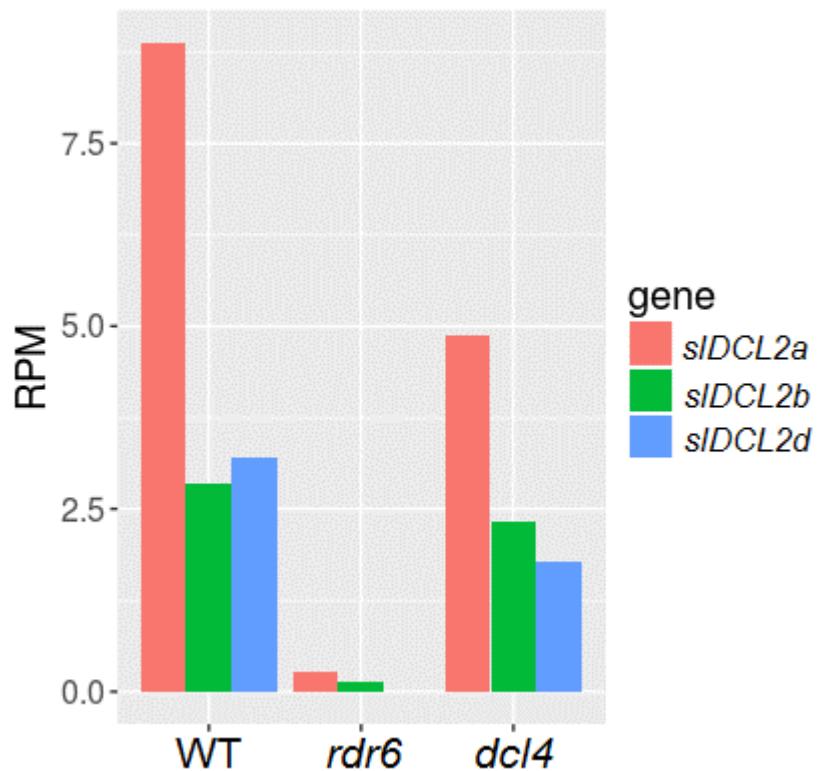

Supplemental Figure S10. A. Stem loop structure of miR6026 precursor.

miR6026/miR6026* and other sRNAs are marked in green and red, respectively. **B.** sRNA RPM plots showing accumulations of sRNAs from pre-miR6026 in WT and *dcl2ab*. Mature miR6026 and miR6026* are marked with arrowheads.

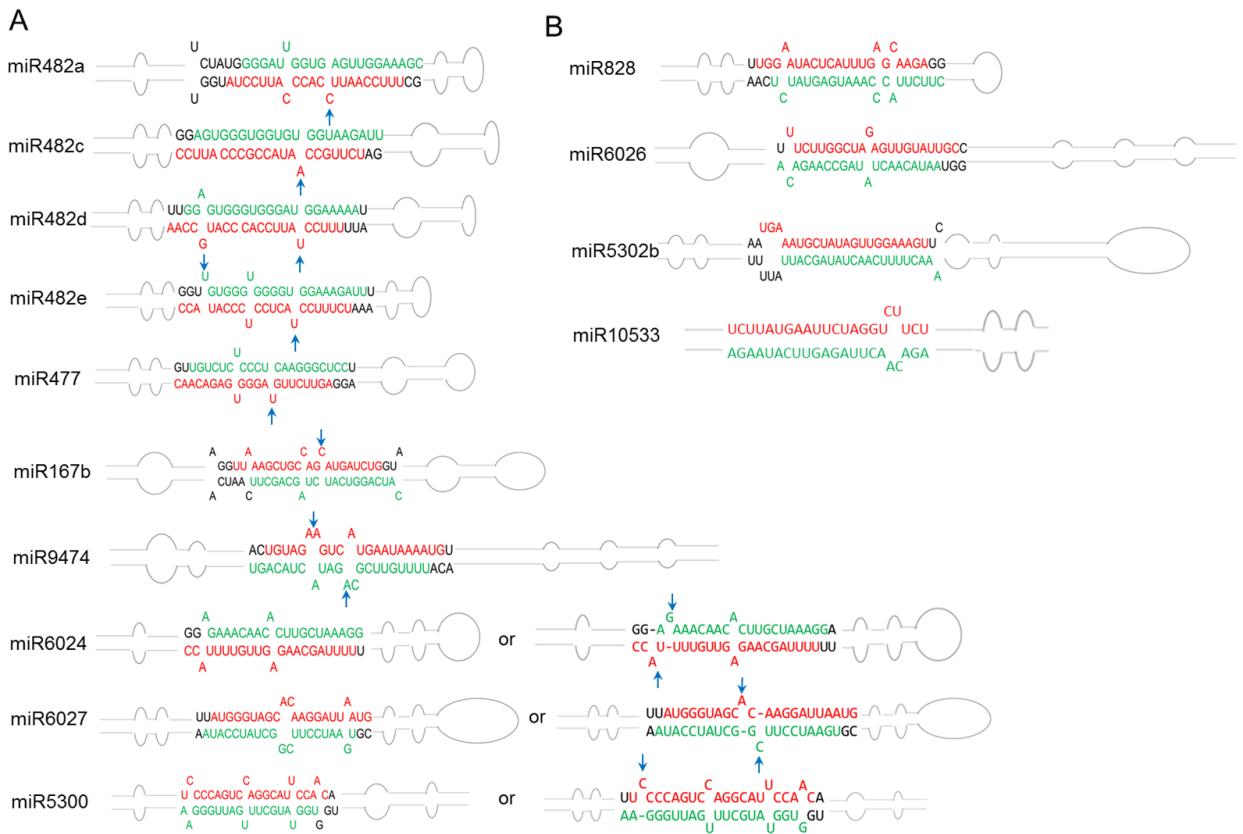

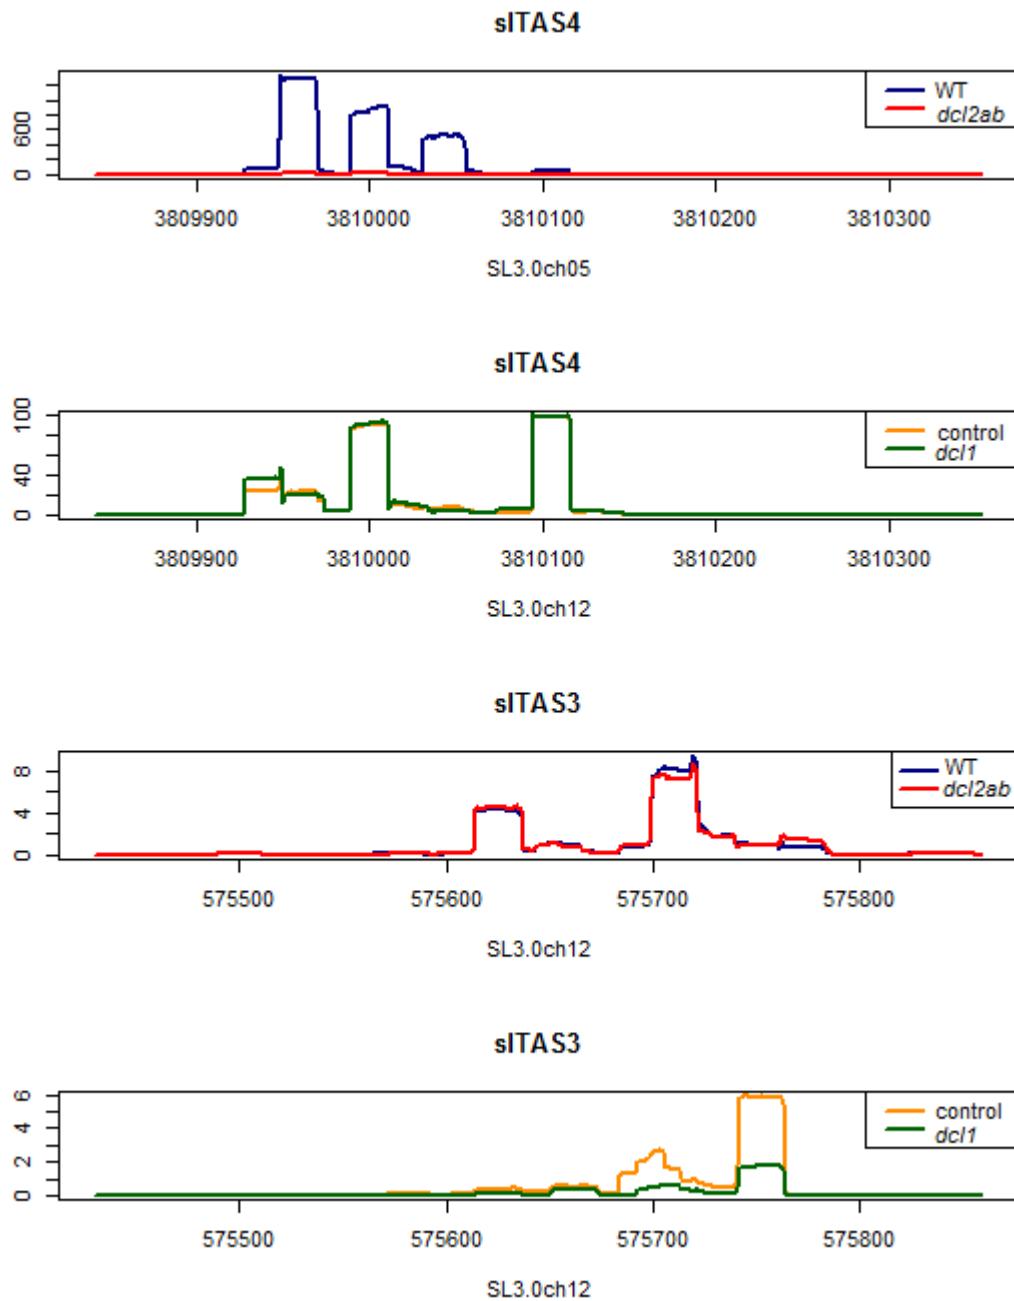

Supplemental Figure S11. Accumulation of *sIDCL2b* and *sIDCL2d* sRNA, not *sITM2* sRNA, is reduced in *dcl2ab*. (A, C, E) sRNA RPM plots showing the levels of *sIDCL2a*, *sIDCL2d*, and *sITM2* sRNAs in WT and *dcl2ab*. The p-values of *sIDCL2a*, *sIDCL2b*, *sIDCL2d* and *sITM2* sRNA between WT and *dcl2ab* are 0.01, 0.0008, 0.003 and 0.11, respectively. In the gene models, rectangles and lines represent exons and introns, respectively. UTRs and ORFs are in cyan and yellow, respectively. Arrows mark the direction of transcription. Target site of miR6026 is marked with blue arrowhead; (B, D, F) The phasing of *sIDCL2a*, *sIDCL2d* and *sITM2* sRNAs in WT. Radar plots show percentages of 21-nt reads corresponding to each of the 21 registers from the whole transcript of *sIDCL2b*, or 1-100nt, 1-200nt, 1-400nt of the *sIDCL2b* transcript in WT sRNA-seq data. The 10th position (in red) indicates the miR6026-guided cleavage site between the 10th and 11th nucleotide of miR6026.

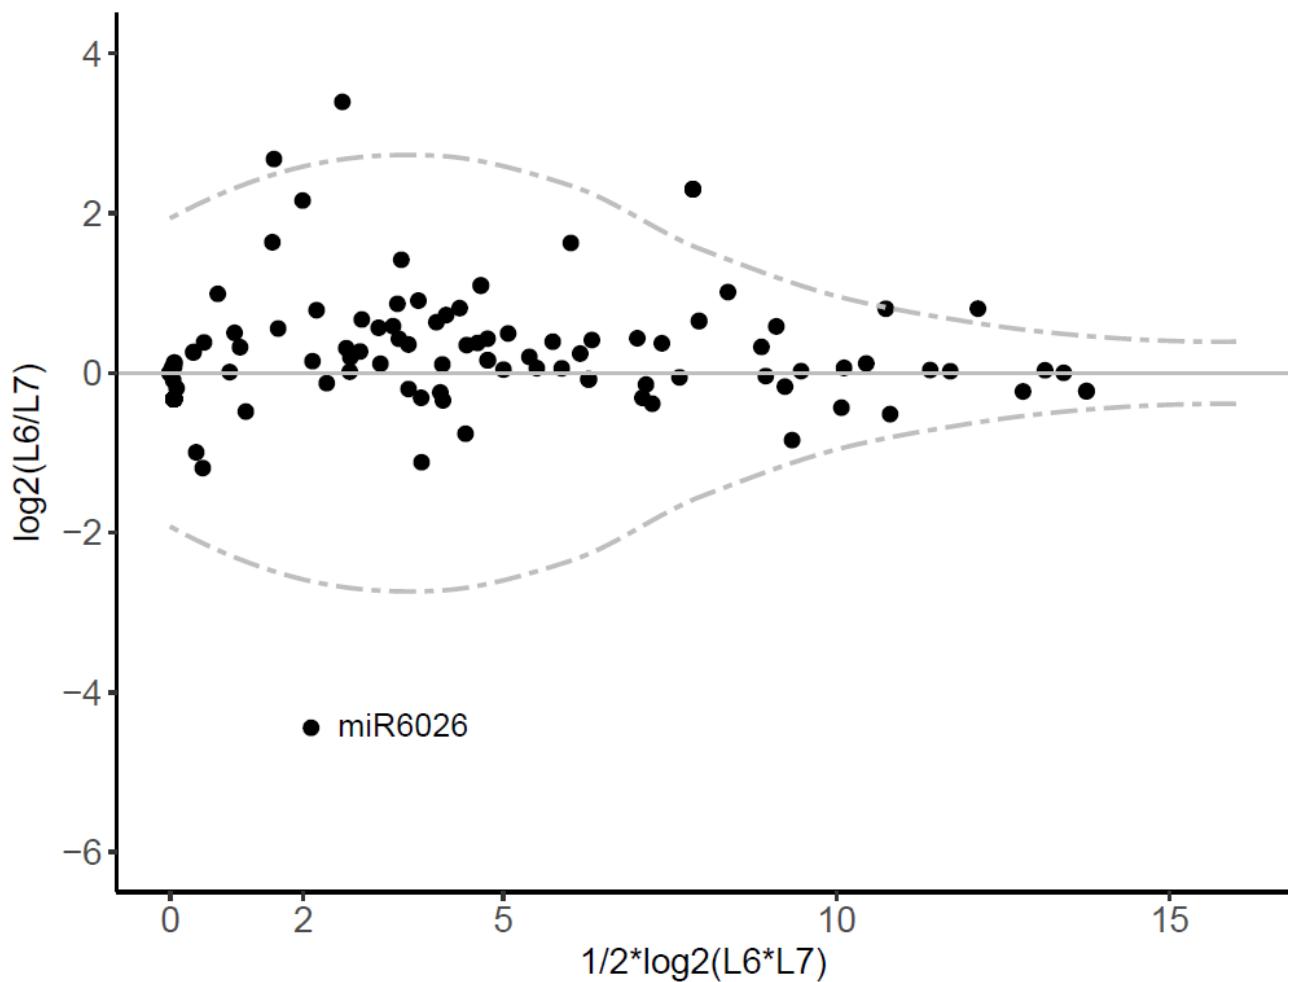

Supplemental Figure S12. RPM plot of *SIDCL2* sRNA in WT, *rdr6*, and *dcl4*.

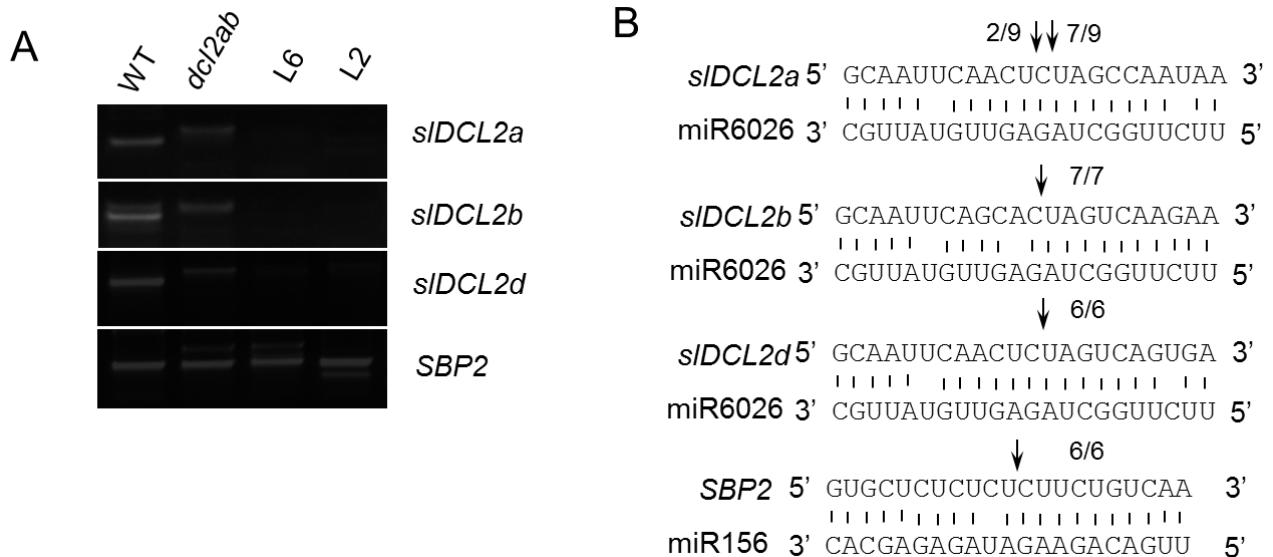

Supplemental Figure S13. miRNA foldback structures of sIDCL1-dependent 22-nt miRNAs (A) and sIDCL2-dependent 22-nt miRNAs (B). Arrows indicate the predicted asymmetric positions within the foldbacks.

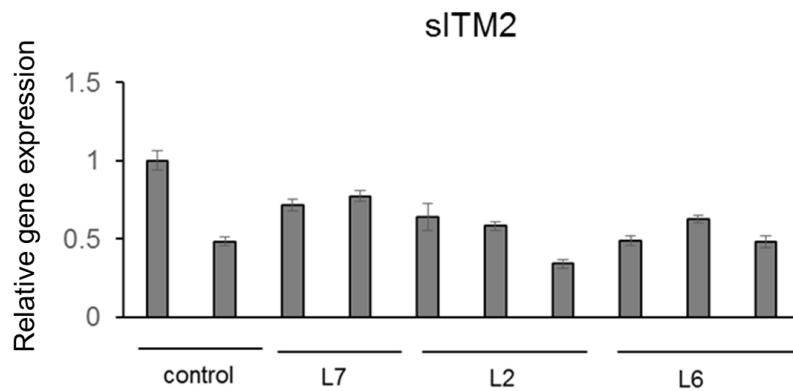

Supplemental Figure S14. The sRNA RPM plots showing the levels of tasiRNAs of slTAS4/slTAS3 in WT, *dcl1*, and *dcl2ab*. For sRNA analysis in *dcl1*, as the *dcl1* samples differed drastically in miRNA from the control samples, we normalized sRNA to reads number of 24-nt sRNA in each sample, instead of reads number of total sRNA.

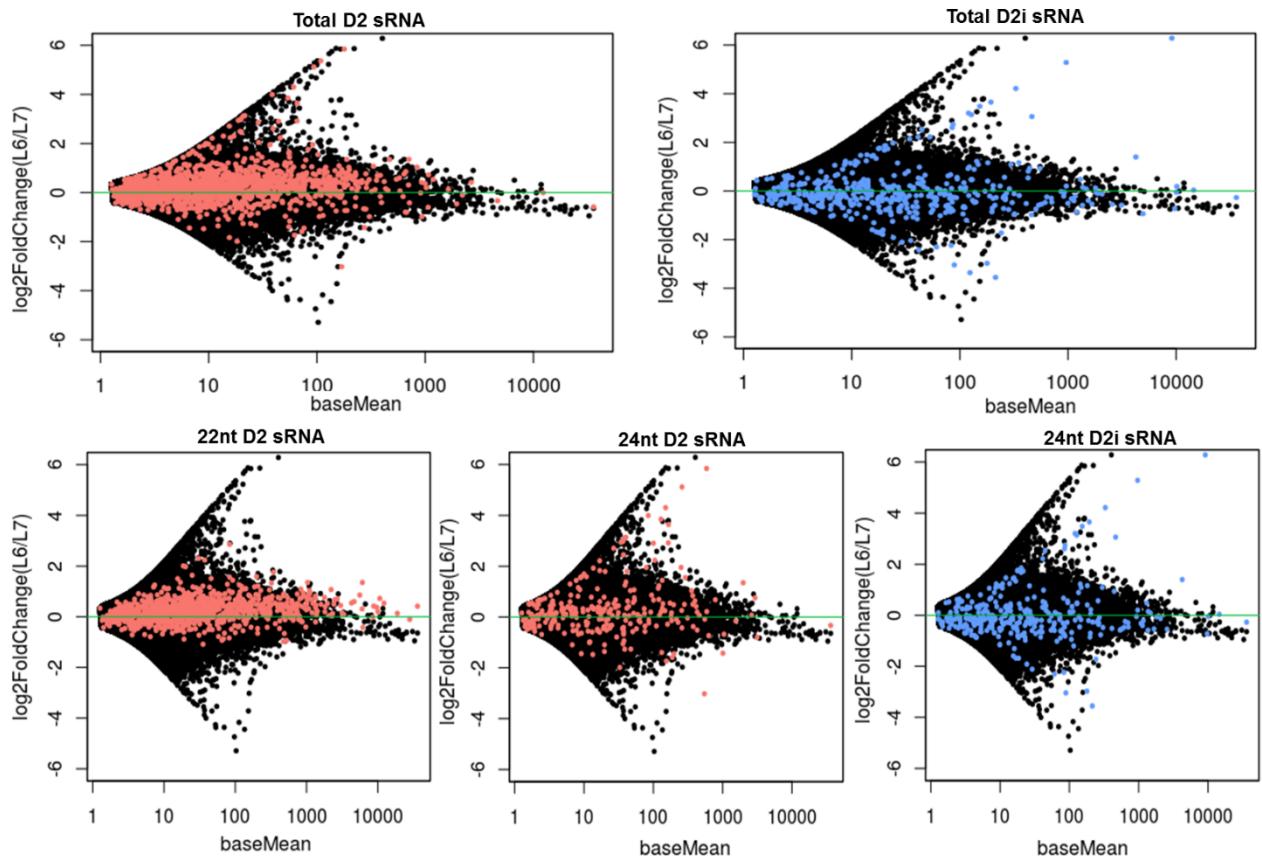

Supplemental Figure S15. MA Plot showing individual miRNA abundance levels in target mimic lines L7 (weak line) and L6 (strong line). Significantly differential expressed miRNAs ($p < 0.05$) between L7 and L6 are marked.

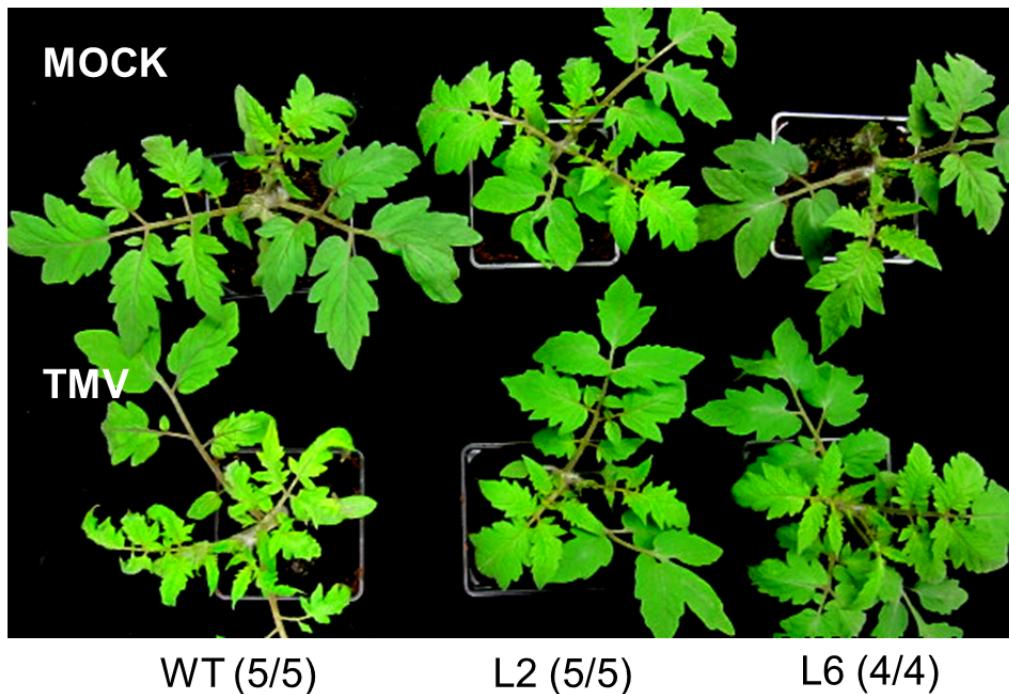

Supplemental Figure S16. Validation of miR6026-targeted *sIDCL2* mRNA cleavage sites by 5'-RLM-RACE. **A.** RLM-RACE PCR results of 3' fragments of cleaved *sIDCL2* mRNA from WT, *dcl2ab* and target mimic lines (L2 and L6), with *SBP2* as control; **B.** Sanger sequencing results of amplified products from WT showed in **A**. The arrows indicate the cleavage sites and the numbers show the frequency of clones sequenced.

Supplemental Figure S17. Knock down of miR6026 does not affect the transcript level of *sITM2*. QRT-PCR of *sITM2* in control, weak mimicry line (L7), and strong mimicry lines (L2 and L6). *slActin7* was used as endogenous control.

Supplemental Figure S18. MA plot showing accumulation of D2 and D2i sRNAs in L7 (weak mimic line) and L6 (strong mimic line). X axis represents the mean of normalized counts for each sRNA, whereas Y axis represents the \log_2 ($\text{RPM_L6}/\text{RPM_L7}$) of each sRN(A) D2 and D2i sRNAs are coloured in red and blue, respectively; Different sizes of D2 and D2i sRNAs are marked.

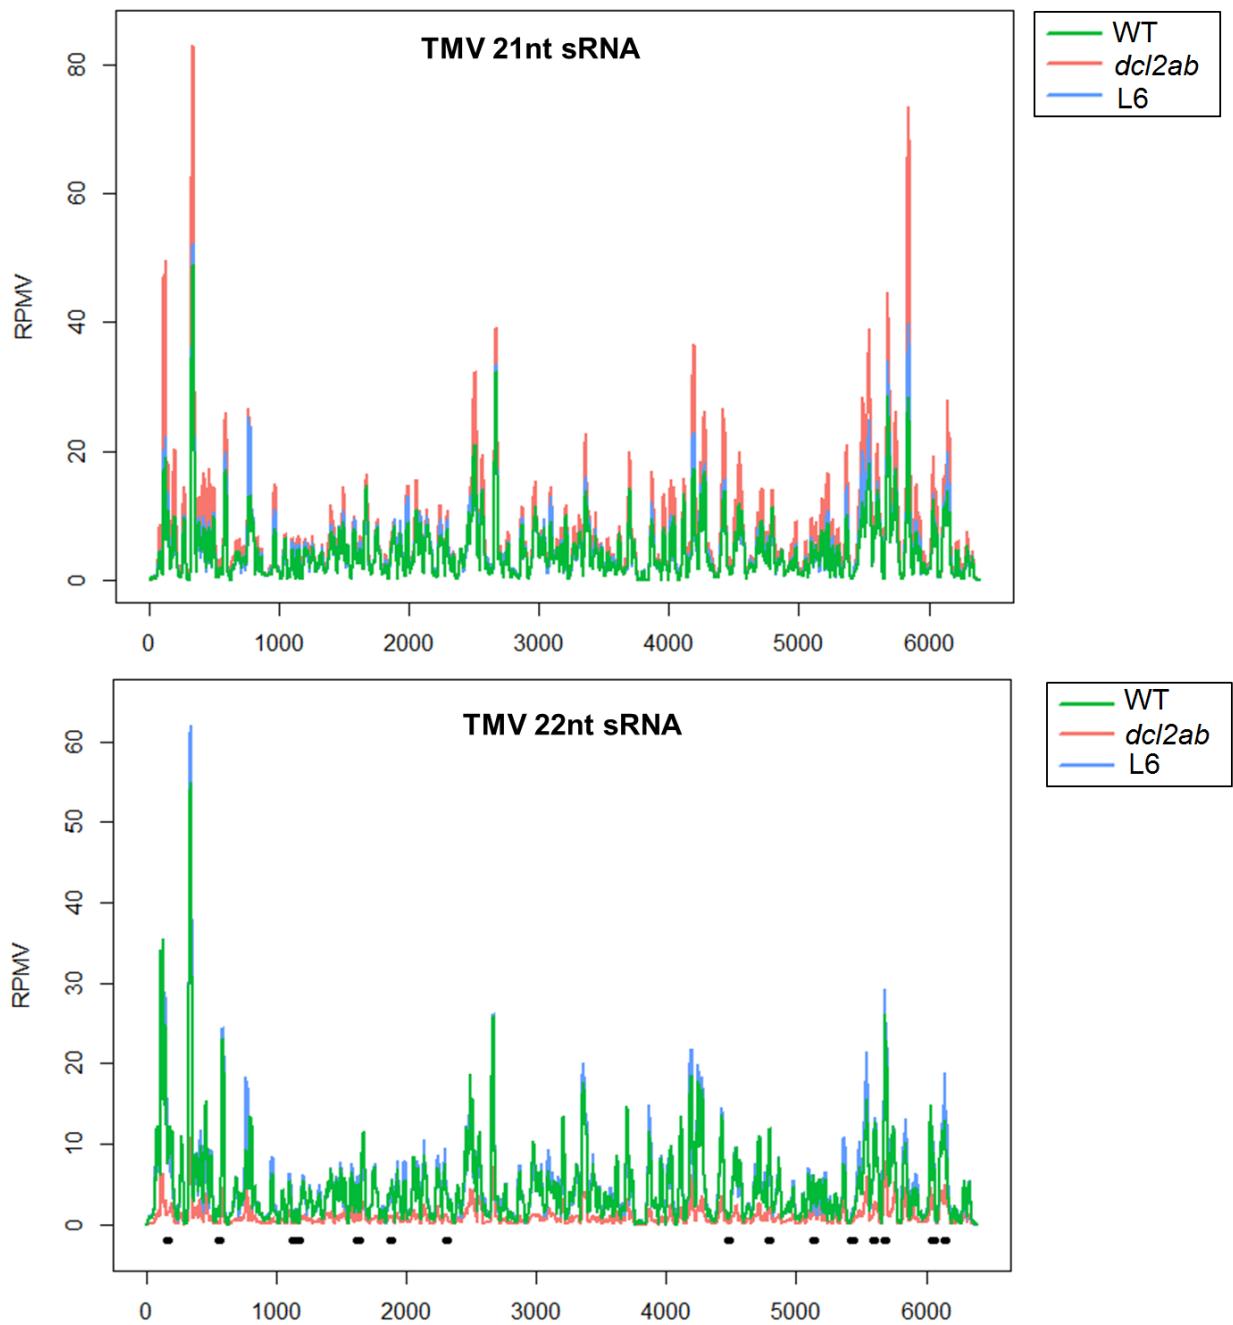

Supplemental Figure S19. Plants of two weeks after MOCK and TMV infection showing chlorosis and weaker chlorosis phenotypes of TMV infected WT and target mimic lines (L2 and L6), respectively; numbers in parenthesis show the number of plants with the representative symptoms and the number of infected plants

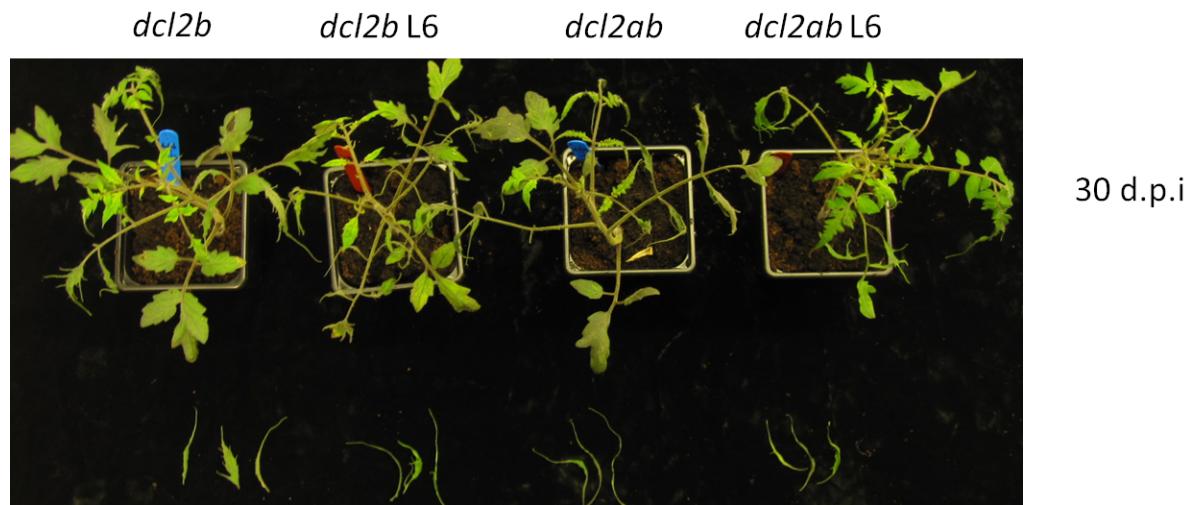

Supplemental Figure S20. Plants and leaves of 20 days (A) and 34 days (B)

after TMV infection; Numbers in parenthesis show the number of plants with the representative symptoms and the number of infected plants. d. p. i., days post infiltration.

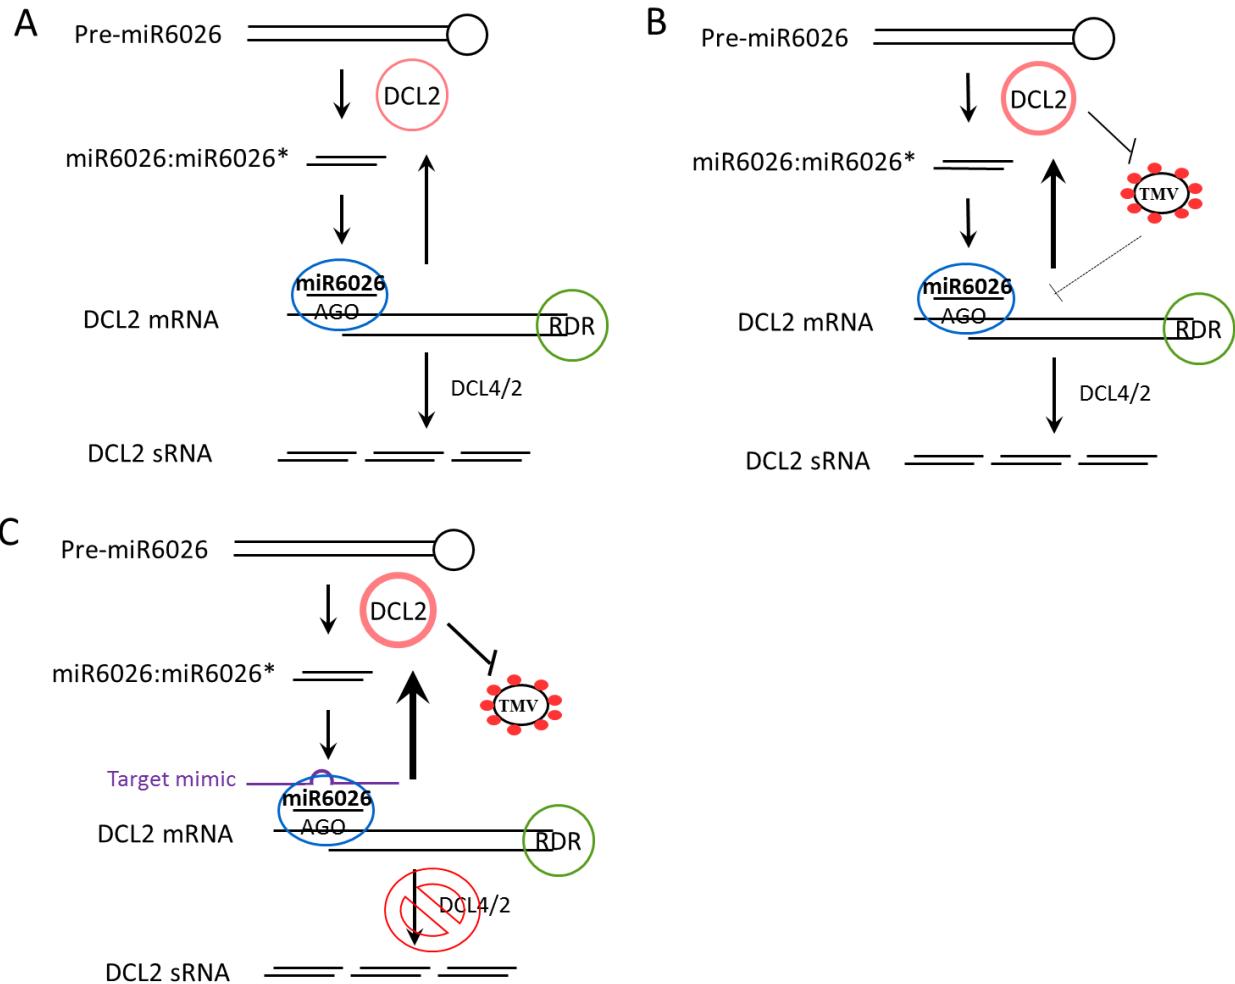

Supplemental Figure S21. The sRNA RPM plots showing the levels of TMV siRNAs in infected WT, *dcl2ab* and L6. The X axis indicates corresponding genome of TMV, the Y axis indicates the RPMV values (RPM normalized by TMV virus RNA amounts). Short bars under plots represent significantly ($p < 0.01$) upregulated 22nt sRNA in L6.

Supplemental Figure S22. Plants and leaves of 30 days after TMV infection.

dcl2b L6 and *dcl2ab L6* indicate *dcl2b* and *dcl2ab* plants with miR6026 target mimic through crossing with L6 respectively.

Supplemental Figure S23. Proposed working models. **(A)** Under normal condition, miR6026 is produced by SiDCL2 and targets SiDCL2 mRNA to generate secondary sRNA; **(B)** TMV infection upregulates SiDCL2b possibly through inhibiting miR6026-targeting of SiDCL2. Upregulate SiDCL2 contributes anti-viral function. **(C)** Target mimic eliminates miR6026 and thus prevents SiDCL2 from being targeted. Upregulate SiDCL2 elevates anti-viral activity.

Supplementary Table S1. Mutant alleles of *sIDCL2a* and *sIDCL2b*.

Mutant	<i>sIDCL2a</i> genotype	<i>sIDCL2b</i> genotype
	s	s
<i>sldcl2a-1</i>	<i>sldcl2a-1</i> homozygous	
<i>sldcl2b-1</i>	WT	<i>sldcl2b-1</i> homozygous
<i>sldcl2b-2</i>	WT	<i>sldcl2b-2</i> homozygous
<i>sldcl2a-1</i> <i>sldcl2b-1</i>	<i>sldcl2a-1</i> homozygous	<i>sldcl2b-1</i> homozygous
<i>sldcl2a-1</i> <i>sldcl2b-2</i>	<i>sldcl2a-1</i> homozygous	<i>sldcl2b-2</i> homozygous
