# Continuity for multilinear commutator of Marcinkiewicz operator on Besov spaces

*Gu Guangze and Cai Mingjie*

## CONTINUITY FOR MULTILINEAR COMMUTATOR OF MARCINKIEWICZ OPERATOR ON BESOV SPACES

GU GUANGZE AND CAI MINGJIE

*Received 24 September, 2013*

*Abstract.* In this paper we prove the continuity for the multilinear commutator associated to the Marcinkiewicz operator on Besov spaces.

*2010 Mathematics Subject Classification:* 42B20; 42B25

*Keywords:* multilinear commutator, Marcinkiewicz operator, Besov space

### 1. INTRODUCTION

As the development of singular integral operators, their commutators and multilinear operators have been well studied (see [1–4, 14]). From [2, 4, 9, 13], we know that the commutators and multilinear operators generated by singular integral operators and the Lipschitz functions are bounded on the Triebel-Lizorkin and Lebesgue spaces. The purpose of this paper is to introduce the multilinear commutator associated to the Marcinkiewicz operator and prove the continuity properties for the multilinear commutator on Besov spaces.

### 2. PRELIMINARIES AND THEOREMS

First, let us introduce some notations. Throughout this paper,  $Q$  will denote a cube of  $R^n$  with sides parallel to the axes. For a locally integrable function  $f$ , the sharp function of  $f$  is defined by

$$f^\#(x) = \sup_{Q \ni x} \frac{1}{|Q|} \int_Q |f(y) - f_Q| dy,$$

where, and in what follows,  $f_Q = |Q|^{-1} \int_Q f(x) dx$ . It is well-known that (see [14, 15])

$$f^\#(x) \approx \sup_{Q \ni x} \inf_{c \in \mathbb{C}} \frac{1}{|Q|} \int_Q |f(y) - c| dy.$$

For  $\beta \geq 0$ , the Besov space  $\dot{\lambda}_\beta(R^n)$  is the space of functions  $f$  such that

$$\|f\|_{\dot{\lambda}_\beta} = \sup_{\substack{x, h \in R^n \\ h \neq 0}} \left| \Delta_h^{[\beta]+1} f(x) \right| / |h|^\beta < \infty,$$

where  $\Delta_h^k$  denotes the  $k$ -th difference operator (see [12]).

For  $b_j \in \dot{\lambda}_\beta(R^n)$  ( $j = 1, \dots, m$ ), set

$$\|\vec{b}\|_{\dot{\lambda}_\beta} = \prod_{j=1}^m \|b_j\|_{\dot{\lambda}_\beta}.$$

Given some functions  $b_j$  ( $j = 1, \dots, m$ ) and a positive integer  $m$  and  $1 \leq j \leq m$ , we denote by  $C_j^m$  the family of all finite subsets  $\sigma = \{\sigma(1), \dots, \sigma(j)\}$  of  $\{1, \dots, m\}$  of  $j$  different elements. For  $\sigma \in C_j^m$ , set  $\sigma^c = \{1, \dots, m\} \setminus \sigma$ . For  $\vec{b} = (b_1, \dots, b_m)$  and  $\sigma = \{\sigma(1), \dots, \sigma(j)\} \in C_j^m$ , set  $\vec{b}_\sigma = (b_{\sigma(1)}, \dots, b_{\sigma(j)})$ ,  $b_\sigma = b_{\sigma(1)} \cdots b_{\sigma(j)}$  and  $\|\vec{b}_\sigma\|_{\dot{\lambda}_\beta} = \|b_{\sigma(1)}\|_{\dot{\lambda}_\beta} \cdots \|b_{\sigma(j)}\|_{\dot{\lambda}_\beta}$ .

**Definition 1.** Let  $0 < p, q \leq \infty$ ,  $\alpha \in R$ . For  $k \in Z$ , set  $B_k = \{x \in R^n : |x| \leq 2^k\}$  and  $C_k = B_k \setminus B_{k-1}$ . Denote by  $\chi_k$  the characteristic function of  $C_k$  and  $\chi_0$  the characteristic function of  $B_0$ .

(1) The homogeneous Herz space is defined by

$$\dot{K}_q^{\alpha, p}(R^n) = \{f \in L_{loc}^q(R^n \setminus \{0\}) : \|f\|_{\dot{K}_q^{\alpha, p}} < \infty\},$$

where

$$\|f\|_{\dot{K}_q^{\alpha, p}} = \left[ \sum_{k=-\infty}^{\infty} 2^{k\alpha p} \|f \chi_k\|_{L^q}^p \right]^{1/p};$$

(2) The nonhomogeneous Herz space is defined by

$$K_q^{\alpha, p}(R^n) = \{f \in L_{loc}^q(R^n) : \|f\|_{K_q^{\alpha, p}} < \infty\},$$

where

$$\|f\|_{K_q^{\alpha, p}} = \left[ \sum_{k=1}^{\infty} 2^{k\alpha p} \|f \chi_k\|_{L^q}^p + \|f \chi_{B_0}\|_{L^q}^p \right]^{1/p};$$

And the usual modification is made when  $p = q = \infty$ .

**Definition 2.** Let  $1 \leq q < \infty$ ,  $\alpha \in R$ . The central Campanato space is defined by (see [17])

$$CL_{\alpha, q}(R^n) = \{f \in L_{loc}^q(R^n) : \|f\|_{CL_{\alpha, q}} < \infty\},$$

where

$$\|f\|_{CL_{\alpha, q}} = \sup_{r>0} |B(0, r)|^{-\alpha} \left( \frac{1}{|B(0, r)|} \int_{B(0, r)} |f(x) - f_{B(0, r)}|^q dx \right)^{1/q}.$$

**Definition 3.** Let  $0 < \delta < n$ ,  $0 < \gamma \leq 1$  and  $\Omega$  be homogeneous of degree zero on  $R^n$  such that  $\int_{S^{n-1}} \Omega(x') d\sigma(x') = 0$ . Assume that  $\Omega \in Lip_\gamma(S^{n-1})$ , that is there exists a constant  $M > 0$  such that for any  $x, y \in S^{n-1}$ ,  $|\Omega(x) - \Omega(y)| \leq M|x - y|^\gamma$ . The Marcinkiewicz multilinear commutator is defined by

$$\mu_{\Omega, \delta}^{\vec{b}}(f)(x) = \left( \int_0^\infty |F_{t, \delta}^{\vec{b}}(f)(x)|^2 \frac{dt}{t^3} \right)^{1/2},$$

where

$$F_{t, \delta}^{\vec{b}}(f)(x) = \int_{|x-y| \leq t} \frac{\Omega(x-y)}{|x-y|^{n-1-\delta}} \left[ \prod_{j=1}^m (b_j(x) - b_j(y)) \right] f(y) dy.$$

Set

$$F_{t, \delta}(f)(x) = \int_{|x-y| \leq t} \frac{\Omega(x-y)}{|x-y|^{n-1-\delta}} f(y) dy,$$

we also define that

$$\mu_{\Omega, \delta}(f)(x) = \left( \int_0^\infty |F_{t, \delta}(f)(x)|^2 \frac{dt}{t^3} \right)^{1/2},$$

which is the Marcinkiewicz operator (see [16]).

Let  $H$  be the space  $H = \left\{ h : \|h\| = \left( \int_0^\infty |h(t)|^2 \frac{dt}{t^3} \right)^{1/2} < \infty \right\}$ . Then, it is clear that

$$\mu_{\Omega, \delta}(f)(x) = \|F_{t, \delta}(f)(x)\| \text{ and } \mu_{\Omega, \delta}^{\vec{b}}(f)(x) = \|F_{t, \delta}^{\vec{b}}(f)(x)\|.$$

Note that when  $b_1 = \dots = b_m$ ,  $\mu_{\Omega, \delta}^{\vec{b}}$  is just the  $m$  order commutator. It is well known that commutators are of great interest in harmonic analysis and have been widely studied by many authors (see [1-9, 11-13]). Our main purpose is to study the boundedness properties for the multilinear commutator  $\mu_{\Omega, \delta}^{\vec{b}}$  on Besov spaces.

Now we state our theorems as following.

**Theorem 1.** Let  $0 < \delta < n$ ,  $1 < r < n/\delta$ ,  $1/s = 1/r - \delta/n$ ,  $0 < \beta < \min(1/2m, \gamma/m)$  for  $0 < \gamma \leq 1$ , and  $b_j \in \dot{\Lambda}_\beta(R^n)$  for  $j = 1, \dots, m$ . Then  $\mu_{\Omega, \delta}^{\vec{b}}$  is bounded from  $L^p(R^n)$  to  $\dot{\Lambda}_{\delta+m\beta-n/p}(R^n)$  for any  $n/(\delta + m\beta) \leq p \leq n/\delta$ .

**Theorem 2.** Let  $0 < \delta < n$ ,  $0 < \beta < \min(1/2m, \gamma/m)$  for  $0 < \gamma \leq 1$ ,  $1 < q_1 < n/(\delta + m\beta)$ ,  $1/q_2 = 1/q_1 - (\delta + m\beta)/n$ ,  $\max(-n/q_2 - 1/2, -n/q_2 - \gamma) < \alpha \leq -n/q_2$  and  $b_j \in \dot{\Lambda}_\beta(R^n)$  for  $j = 1, \dots, m$ . Then  $\mu_{\Omega, \delta}^{\vec{b}}$  is bounded from  $\dot{K}_{q_1}^{\alpha, \infty}(R^n)$  to  $CL_{-\alpha/n-1/q_2, q_2}(R^n)$ .

*Remark 1.* Theorem 2 also hold for the nonhomogeneous Herz type Hardy space.

## 3. PROOFS OF THEOREMS

To prove the theorems, we need the following lemmas.

**Lemma 1** ([12]). *For  $0 < \beta < 1, 1 \leq p \leq \infty$ , we have*

$$\begin{aligned} \|b\|_{\dot{\lambda}_\beta} &\approx \sup_Q \frac{1}{|Q|^{1+\beta/n}} \int_Q |b(x) - b_Q| dx \approx \sup_Q \frac{1}{|Q|^{\beta/n}} \left( \frac{1}{|Q|} \int_Q |b(x) - b_Q|^p dx \right)^{1/p} \\ &\approx \sup_Q \inf_c \frac{1}{|Q|^{1+\beta/n}} \int_Q |b(x) - c| dx \approx \sup_Q \inf_c \frac{1}{|Q|^{\beta/n}} \left( \frac{1}{|Q|} \int_Q |b(x) - c|^p dx \right)^{1/p}. \end{aligned}$$

**Lemma 2** ([10]). *For  $\alpha < 0, 0 < q < \infty$ , we have*

$$\|f\|_{\dot{K}_q^\alpha} \approx \sup_{\mu \in \mathbb{Z}} 2^{\mu\alpha} \|f \chi_{B_\mu}\|_{L^q}.$$

**Lemma 3** ([10]). *Let  $0 < \eta < n, 1 < p < n/\eta$ . Suppose  $b \in \dot{\lambda}_\beta(\mathbb{R}^n)$ , then*

$$|b_{2^{k+1}B} - b_B| \leq C \|b\|_{\dot{\lambda}_\beta} k |2^{k+1}B|^{\beta/n} \text{ for } k \geq 1.$$

**Lemma 4** ([16]). *Let  $0 < \delta < n, 1 < p < n/\delta$  and  $1/q = 1/p - \delta/n$ . Then  $\mu_{\Omega, \delta}$  is bounded from  $L^p(\mathbb{R}^n)$  to  $L^q(\mathbb{R}^n)$ .*

**Lemma 5** ([7]). *Let  $0 \leq \eta < n, 1 < r < n/\eta, 1/r - 1/s = \eta/n$  and  $b_j \in \dot{\lambda}_\beta(\mathbb{R}^n)$  for  $j = 1, \dots, m$ . Then  $\mu_{\Omega, \delta}^{\vec{b}}$  is bounded from  $L^r(\mathbb{R}^n)$  to  $L^s(\mathbb{R}^n)$ .*

*Proof of Theorem 1.* It is only to prove that there exists a constant  $C_0$  such that

$$\frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \int_Q |\mu_{\Omega, \delta}^{\vec{b}}(f)(x) - C_0| dx \leq C \|f\|_{L^p}.$$

Fix a cube  $Q, Q = Q(x_0, d)$ , we decompose  $f$  into  $f = f_1 + f_2$  with  $f_1 = f \chi_Q, f_2 = f \chi_{(\mathbb{R}^n \setminus Q)}$ .

When  $m = 1$ , for  $C_0 = \mu_{\Omega, \delta}(((b_1)_Q - b_1)f_2)(x_0)$ , we have

$$\begin{aligned} F_{t, \delta}^{b_1}(f)(x) &= (b_1(x) - (b_1)_Q) F_{t, \delta}(f)(x) \\ &\quad - F_{t, \delta}((b_1 - (b_1)_Q)f_1)(x) - F_{t, \delta}((b_1 - (b_1)_Q)f_2)(x). \end{aligned}$$

Then

$$\begin{aligned} &|\mu_{\Omega, \delta}^{b_1}(f)(x) - \mu_{\Omega, \delta}(((b_1)_Q - b_1)f_2)(x_0)| \\ &= \left| \|F_{t, \delta}^{b_1}(f)(x)\| - \|F_{t, \delta}(((b_1)_Q - b_1)f_2)(x_0)\| \right| \\ &\leq \|(b_1(x) - (b_1)_Q) F_{t, \delta}(f)(x)\| + \|F_{t, \delta}((b_1 - (b_1)_Q)f_1)(x)\| \\ &\quad + \|F_{t, \delta}((b_1 - (b_1)_Q)f_2)(x) - F_{t, \delta}((b_1 - (b_1)_Q)f_2)(x_0)\| \\ &= A(x) + B(x) + C(x). \end{aligned}$$

For  $A(x)$ , for  $1 < p < q < n/\delta$ ,  $1/q = 1/p - \delta/n$ , by the boundness of  $\mu_{\Omega, \delta}$  from  $L^p(\mathbb{R}^n)$  to  $L^q(\mathbb{R}^n)$  and Hölder's inequality with exponent  $1/q + 1/q' = 1$  and Lemma 1, we have

$$\begin{aligned} & \frac{1}{|Q|^{1+(\delta+\beta)/n-1/p}} \int_Q |A(x)| dx \\ & \leq \frac{1}{|Q|^{1+(\delta+\beta)/n-1/p}} \left( \int_Q |b_1(x) - (b_1)_Q|^{q'} dx \right)^{1/q'} \left( \int_Q |\mu_{\Omega, \delta}(f)(x)|^q dx \right)^{1/q} \\ & \leq C \frac{|Q|^{\beta/n+1/q'}}{|Q|^{1+(\delta+\beta)/n-1/p}} \frac{1}{|Q|^{\beta/n}} \left( \frac{1}{|Q|} \int_Q |b_1(x) - (b_1)_Q|^{q'} dx \right)^{1/q'} \left( \int_Q |f(x)|^p dx \right)^{1/p} \\ & \leq C \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p}. \end{aligned}$$

For  $B(x)$ , denoting  $p = rt$ ,  $1 < r < s < n/\delta$ ,  $1/s = 1/r - \delta/n$ , by the boundness of  $\mu_{\Omega, \delta}$  from  $L^r(\mathbb{R}^n)$  to  $L^s(\mathbb{R}^n)$  and Hölder's inequality with exponent  $1/t + 1/t' = 1$  and Lemma 1, we have

$$\begin{aligned} & \frac{1}{|Q|^{1+(\delta+\beta)/n-1/p}} \int_Q |B(x)| dx \\ & \leq \frac{1}{|Q|^{(\delta+\beta)/n-1/p}} \left( \frac{1}{|Q|} \int_{\mathbb{R}^n} |\mu_{\Omega, \delta}((b_1(x) - (b_1)_Q) f \chi_Q)(x)|^s dx \right)^{1/s} \\ & \leq C \frac{1}{|Q|^{(\delta+\beta)/n-1/p+1/s}} \left( \int_Q |(b_1(x) - (b_1)_Q) f(x)|^r dx \right)^{1/r} \\ & \leq C \frac{1}{|Q|^{(\delta+\beta)/n-1/p+1/s}} \left( \int_Q |b_1(x) - (b_1)_Q|^{rt'} dx \right)^{1/rt'} \left( \int_Q |f(x)|^{rt} dx \right)^{1/rt} \\ & \leq C \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p}. \end{aligned}$$

For  $C(x)$ , note that  $|x_0 - y| \approx |x - y|$  for  $y \in Q^c$ , we have

$$\begin{aligned} C(x) &= \|F_{t, \delta}((b_1 - (b_1)_Q) f_2)(x) - F_{t, \delta}((b_1 - (b_1)_Q) f_2)(x_0)\| \\ &= \left( \int_0^\infty \left| \int_{|x-y| \leq t} \frac{\Omega(x-y) f_2(y)}{|x-y|^{n-1-\delta}} (b_1(y) - (b_1)_Q) dy \right. \right. \\ &\quad \left. \left. - \int_{|x_0-y| \leq t} \frac{\Omega(x_0-y) f_2(y)}{|x_0-y|^{n-1-\delta}} (b_1(y) - (b_1)_Q) dy \right|^2 \frac{dt}{t^3} \right)^{1/2} \\ &\leq \left( \int_0^\infty \left[ \int_{|x-y| \leq t, |x_0-y| > t} \frac{|\Omega(x-y)| |f_2(y)|}{|x-y|^{n-1-\delta}} |(b_1(y) - (b_1)_Q)| dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\ &\quad + \left( \int_0^\infty \left[ \int_{|x-y| > t, |x_0-y| \leq t} \frac{|\Omega(x_0-y)| |f_2(y)|}{|x_0-y|^{n-1-\delta}} |b_1(y) - (b_1)_Q| dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\ &\quad + \left( \int_0^\infty \left[ \int_{|x-y| \leq t, |x_0-y| \leq t} \left| \frac{|\Omega(x-y)|}{|x-y|^{n-1-\delta}} - \frac{|\Omega(x_0-y)|}{|x_0-y|^{n-1-\delta}} \right| \right. \right. \end{aligned}$$

$$\begin{aligned} & \times |b_1(y) - (b_1)_Q| |f_2(y)| dy]^2 \frac{dt}{t^3})^{1/2} \\ & \equiv I_1 + I_2 + I_3. \end{aligned}$$

By the Minkowski's inequality and Hölder's inequality and Lemmas 1, 3:

$$\begin{aligned} I_1 & \leq C \int_{Q^c} |b_1(y) - (b_1)_Q| \frac{|f(y)|}{|x-y|^{n-1-\delta}} \left( \int_{|x-y| \leq t < |x_0-y|} \frac{dt}{t^3} \right)^{1/2} dy \\ & \leq C \int_{Q^c} |b_1(y) - (b_1)_Q| \frac{|f(y)|}{|x-y|^{n-1-\delta}} \left| \frac{1}{|x-y|^2} - \frac{1}{|x_0-y|^2} \right|^{1/2} dy \\ & \leq C \sum_{k=0}^{\infty} \int_{2^{k+1}Q \setminus 2^kQ} |b_1(y) - (b_1)_{2^kQ}| |x_0-y|^\delta \frac{|Q|^{1/2n} |f(y)|}{|x_0-y|^{n+1/2}} dy \\ & \leq C \sum_{k=0}^{\infty} 2^{-k/2} \frac{1}{|2^{k+1}Q|^{1-\delta/n}} \left( \int_{2^{k+1}Q} |f(y)|^p dy \right)^{1/p} \\ & \quad \times \left[ \int_{2^{k+1}Q} (|b_1(y) - (b_1)_{2^{k+1}Q}|^{p'} + |(b_1)_{2^{k+1}Q} - (b_1)_Q|^{p'}) dy \right]^{1/p'} \\ & \leq C \sum_{k=0}^{\infty} 2^{-k/2} \frac{1}{|2^{k+1}Q|^{1-\delta/n}} \left( \int_{2^{k+1}Q} |f(y)|^p dy \right)^{1/p} \\ & \quad \times \left[ |2^{k+1}Q|^{\beta/n+1/p'} \frac{1}{|2^{k+1}Q|^{\beta/n}} \left( \frac{1}{|2^{k+1}Q|} \int_{2^{k+1}Q} |b_1(y) - (b_1)_{2^{k+1}Q}|^{p'} dy \right)^{1/p'} \right. \\ & \quad \left. + |(b_1)_{2^{k+1}Q} - (b_1)_Q| |2^{k+1}Q|^{1/p'} \right] \\ & \leq C \sum_{k=0}^{\infty} k 2^{k(-1/2+\delta+\beta-n/p)} |Q|^{\beta/n+1/p'-1+\delta/n} \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p} \\ & \leq C |Q|^{(\delta+\beta)/n-1/p} \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p}. \end{aligned}$$

Similarly, we have  $I_2 \leq C |Q|^{(\delta+\beta)/n-1/p} \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p}$ .

We now estimate  $I_3$ . By the following inequality:

$$\left| \frac{\Omega(x-y)}{|x-y|^{n-1-\delta}} - \frac{\Omega(x_0-y)}{|x_0-y|^{n-1-\delta}} \right| \leq C \left( \frac{|x-x_0|}{|x_0-y|^{n-\delta}} + \frac{|x-x_0|^\gamma}{|x_0-y|^{n-1-\delta+\gamma}} \right),$$

we obtain

$$\begin{aligned} I_3 & \leq C \int_{Q^c} |b_1(y) - (b_1)_Q| \frac{|f(y)||x-x_0|}{|x_0-y|^{n-\delta}} \left( \int_{|x_0-y| \leq t, |x-y| \leq t} \frac{dt}{t^3} \right)^{1/2} dy \\ & \quad + C \int_{Q^c} |b_1(y) - (b_1)_Q| \frac{|f(y)||x-x_0|^\gamma}{|x_0-y|^{n-1-\delta+\gamma}} \left( \int_{|x_0-y| \leq t, |x-y| \leq t} \frac{dt}{t^3} \right)^{1/2} dy \\ & \leq C \sum_{k=0}^{\infty} \int_{2^{k+1}Q \setminus 2^kQ} |b_1(y) - (b_1)_Q| \left( \frac{|Q|^{1/n}}{|x_0-y|^{n+1-\delta}} + \frac{|Q|^{\gamma/n}}{|x_0-y|^{n+\gamma-\delta}} \right) |f(y)| dy \end{aligned}$$

$$\begin{aligned}
 &\leq C \sum_{k=0}^{\infty} (2^{-k} + 2^{-k\gamma}) \frac{1}{|2^{k+1}Q|^{1-\delta/n}} \int_{2^{k+1}Q} |b_1(y) - (b_1)_Q| |f(y)| dy \\
 &\leq C \sum_{k=0}^{\infty} (2^{-k} + 2^{-k\gamma}) \frac{1}{|2^{k+1}Q|^{1-\delta/n}} \left( \int_{2^{k+1}Q} |f(y)|^p dy \right)^{1/p} \\
 &\quad \times \left[ |2^{k+1}Q|^{\beta/n+1/p'} \frac{1}{|2^{k+1}Q|^{\beta/n}} \left( \frac{1}{|2^{k+1}Q|} \int_{2^{k+1}Q} |b_1(y) - (b_1)_{2^{k+1}Q}|^{p'} dy \right)^{1/p'} \right. \\
 &\quad \left. + |(b_1)_{2^{k+1}Q} - (b_1)_Q| |2^{k+1}Q|^{1/p'} \right] \\
 &\leq C \sum_{k=0}^{\infty} k(2^{k(-1+\delta+\beta-n/p)} + 2^{k(-\gamma+\delta+\beta-n/p)}) |Q|^{\beta/n+1/p'-1+\delta/n} \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p} \\
 &\leq C |Q|^{(\delta+\beta)/n-1/p} \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p}.
 \end{aligned}$$

Thus

$$\begin{aligned}
 &\frac{1}{|Q|^{1+(\delta+\beta)/n-1/p}} \int_Q |C(x)| dx \\
 &\leq C \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p} \frac{1}{|Q|^{1+(\delta+\beta)/n-1/p}} \int_Q |Q|^{(\delta+\beta)/n-1/p} dx \leq C \|b_1\|_{\dot{\lambda}_\beta} \|f\|_{L^p}.
 \end{aligned}$$

This completes the proof of case  $m = 1$ .

Now, we consider the case  $m \geq 2$ . We write, for  $\vec{b} = (b_1, \dots, b_m)$ ,

$$\begin{aligned}
 F_{t,\delta}^{\vec{b}}(f)(x) &= \int_{|x-y| \leq t} \left[ \prod_{j=1}^m ((b_j(x) - (b_j)_Q) - (b_j(y) - (b_j)_Q)) \right] f(y) \frac{\Omega(x-y)}{|x-y|^{n-1-\delta}} dy \\
 &= \sum_{j=0}^m \sum_{\sigma \in C_j^m} (-1)^{m-j} (b(x) - (b)_Q)_\sigma \int_{|x-y| \leq t} (b(y) - (b)_Q)_{\sigma^c} f(y) \frac{\Omega(x-y)}{|x-y|^{n-1-\delta}} dy \\
 &= \prod_{j=1}^m (b_j(x) - (b_j)_Q) F_{t,\delta}(f)(x) + (-1)^m F_{t,\delta} \left( \prod_{j=1}^m (b_j(y) - (b_j)_Q) f \right)(x) \\
 &\quad + \sum_{j=1}^{m-1} \sum_{\sigma \in C_j^m} (-1)^{m-j} (b(x) - (b)_Q)_\sigma F_{t,\delta}^{\vec{b}_{\sigma^c}}(f)(x),
 \end{aligned}$$

$$\text{thus, set } C_0 = \mu_{\Omega,\delta} \left( \prod_{j=1}^m (b_j - (b_j)_Q) f_2 \right)(x_0),$$

$$|\mu_{\Omega,\delta}^{\vec{b}}(f)(x) - \mu_{\Omega,\delta} \left( \prod_{j=1}^m (b_j - (b_j)_Q) f_2 \right)(x_0)|$$

$$\begin{aligned}
&\leq \left\| \prod_{j=1}^m (b_j(x) - (b_j)_Q) F_{t,\delta}(f)(x) \right\| + \sum_{j=1}^{m-1} \sum_{\sigma \in C_j^m} \left\| (b(x) - (b)_Q)_\sigma F_{t,\delta}^{\vec{b}_{\sigma^c}}(f)(x) \right\| \\
&\quad + \left\| F_{t,\delta} \left( \prod_{j=1}^m (b_j - (b_j)_Q) f_1 \right)(x) \right\| + \left\| F_{t,\delta} \left( \prod_{j=1}^m (b_j - (b_j)_Q) f_2 \right)(x) \right. \\
&\quad \left. - F_{t,\delta} \left( \prod_{j=1}^m (b_j - (b_j)_Q) f_2 \right)(x_0) \right\| \\
&= S_1(x) + S_2(x) + S_3(x) + S_4(x).
\end{aligned}$$

For  $S_1(x)$ , for  $1 < p < q < n/\delta$ ,  $1/q = 1/p - \delta/n$ , by the boundness of  $\mu_{\Omega,\delta}$  from  $L^p(\mathbb{R}^n)$  to  $L^q(\mathbb{R}^n)$  and Hölder's inequality with exponent  $1/q'_1 + \dots + 1/q'_m + 1/q = 1$  and Lemma 1, we have

$$\begin{aligned}
&\frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \int_Q |S_1(x)| dx \\
&\leq C \frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \prod_{j=1}^m \left( \int_Q |b_j(x) - (b_j)_Q|^{q'_j} dx \right)^{1/q'_j} \left( \int_Q |\mu_{\Omega,\delta}(f_1)|^q dx \right)^{1/q} \\
&\leq C \frac{|Q|^{m\beta/n+1/q'_1+\dots+q'_m}}{|Q|^{1+(\delta+m\beta)/n-1/p}} \prod_{j=1}^m \frac{1}{|Q|^{m\beta/n}} \left( \frac{1}{|Q|} \int_Q |b_1(x) - (b_1)_Q|^{q'_j} dx \right)^{1/q'_j} \\
&\quad \times \left( \int_Q |f(x)|^p dx \right)^{1/p} \\
&\leq C \|\vec{b}\|_{\dot{\Lambda}_\beta} \|f\|_{L^p}.
\end{aligned}$$

For  $S_2(x)$ , denoting  $p = rt$ ,  $1 < r < s < n/\delta$ ,  $1/s = 1/r - \delta/n$ , by the boundness of  $\mu_{\Omega,\delta}$  from  $L^r(\mathbb{R}^n)$  to  $L^s(\mathbb{R}^n)$  and Lemma 1, we have

$$\begin{aligned}
&\frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \int_Q |S_2(x)| dx \\
&\leq C \sum_{j=1}^{m-1} \sum_{\sigma \in C_j^m} \frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \left( \int_Q |b(x) - (b)_Q|^{s'} dx \right)^{1/s'} \\
&\quad \times \left( \int_Q \mu_{\Omega,\delta}((b - b_Q)_{\sigma^c} f)(x)^s dx \right)^{1/s} \\
&\leq C \sum_{j=1}^{m-1} \sum_{\sigma \in C_j^m} \frac{|Q|^{|\sigma|\beta/n+1/s'}}{|Q|^{1+(\delta+m\beta)/n-1/p}} \frac{1}{|Q|^{|\sigma|\beta/n}} \left( \frac{1}{|Q|} \int_Q |b(x) - (b)_Q|^{s'} dx \right)^{1/s'}
\end{aligned}$$

$$\begin{aligned}
 & \times \left( \int_Q |(b(x) - b_Q)_{\sigma^c} f(x)|^r dx \right)^{1/r} \\
 & \leq C \sum_{j=1}^{m-1} \sum_{\sigma \in C_j^m} \frac{|Q|^{m\beta/n+1/s'+1/rt'}}{|Q|^{1+(\delta+m\beta)/n-1/p}} \|b_{\sigma}\|_{\dot{\lambda}_{\beta}} \|b_{\sigma^c}\|_{\dot{\lambda}_{\beta}} \|f\|_{L^p} \\
 & \leq C \|\vec{b}\|_{\dot{\lambda}_{\beta}} \|f\|_{L^p}.
 \end{aligned}$$

For  $S_3(x)$ , for  $1 < r < s < n/\delta$ ,  $1/s = 1/r - \delta/n$ , by the boundness of  $\mu_{\Omega, \delta}$  from  $L^r(\mathbb{R}^n)$  to  $L^s(\mathbb{R}^n)$ , taking  $p = rt$ ,  $1 < r < p < \infty$ , we have

$$\begin{aligned}
 & \frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \int_Q |S_3(x)| dx \\
 & \leq \frac{1}{|Q|^{(\delta+m\beta)/n-1/p}} \left( \frac{1}{|Q|} \int_{\mathbb{R}^n} |\mu_{\Omega, \delta}(\prod_{j=1}^m ((b_j - (b_j)_Q)) f \chi_B)(x)|^s dx \right)^{1/s} \\
 & \leq C \frac{1}{|Q|^{(\delta+m\beta)/n-1/p+1/s}} \left( \int_Q |\prod_{j=1}^m (b_j(x) - (b_j)_Q) f(x)|^r dx \right)^{1/r} \\
 & \leq C \frac{1}{|Q|^{(\delta+m\beta)/n-1/p+1/s}} \prod_{j=1}^m \left( \int_Q |b_j(x) - (b_j)_Q|^{rt_j} dx \right)^{1/rt_j} \left( \int_Q |f(x)|^{rt} dx \right)^{1/rt} \\
 & \leq C \|\vec{b}\|_{\dot{\lambda}_{\beta}} \|f\|_{L^p}.
 \end{aligned}$$

For  $S_4(x)$ , similar to the proof of  $C(x)$  in the case  $m = 1$ , we get

$$\begin{aligned}
 S_4(x) & \leq \left( \int_0^\infty \left[ \int_{|x-y| \leq t, |x_0-y| > t} \frac{|\Omega(x-y)| |f_2(y)|}{|x-y|^{n-1-\delta}} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\
 & \quad + \left( \int_0^\infty \left[ \int_{|x-y| > t, |x_0-y| \leq t} \frac{|\Omega(x_0-y)| |f_2(y)|}{|x_0-y|^{n-1-\delta}} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\
 & \quad + \left( \int_0^\infty \left[ \int_{|x-y| \leq t, |x_0-y| \leq t} \left| \frac{|\Omega(x-y)|}{|x-y|^{n-1-\delta}} - \frac{|\Omega(x_0-y)|}{|x_0-y|^{n-1-\delta}} \right| \right. \right. \\
 & \quad \left. \left. \times \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| |f_2(y)| dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\
 & \equiv V_1 + V_2 + V_3,
 \end{aligned}$$

Thus, we choose  $1 < p_j < \infty$ ,  $j = 1, \dots, m$ ,  $1/p_1 + \dots + 1/p_m + 1/p = 1$  and get

$$V_1 \leq C \sum_{k=0}^{\infty} \int_{2^{k+1}Q \setminus 2^kQ} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| |x_0 - y|^\delta \frac{|Q|^{1/2n} |f(y)|}{|x_0 - y|^{n+1/2}} dy$$

$$\begin{aligned}
&\leq C \sum_{k=0}^{\infty} 2^{-k/2} \frac{1}{|2^{k+1}Q|^{1-\delta/n}} \prod_{j=1}^m \left[ |2^{k+1}Q|^{m\beta/n+1/p'} \|b_j\|_{\dot{\lambda}_\beta} \right. \\
&\quad \left. + k |2^{k+1}Q|^{m\beta/n+1/p'} \|b_j\|_{\dot{\lambda}_\beta} \right] \|f\|_{L^p} \\
&\leq C \sum_{k=0}^{\infty} k 2^{k(-1/2+\delta+m\beta-n/p)} |Q|^{m\beta/n+1/p'-1+\delta/n} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p} \\
&\leq C |Q|^{(\delta+m\beta)/n-1/p} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p}.
\end{aligned}$$

Similarly, we have  $V_2 \leq C |Q|^{(\delta+m\beta)/n-1/p} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p}$ . For  $V_3$ , we obtain

$$\begin{aligned}
V_3 &\leq C \sum_{k=0}^{\infty} \int_{2^{k+1}Q \setminus 2^kQ} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| \left( \frac{|Q|^{1/n}}{|x_0-y|^{n+1-\delta}} + \frac{|Q|^{\gamma/n}}{|x_0-y|^{n+\gamma-\delta}} \right) |f(y)| dy \\
&\leq C \sum_{k=0}^{\infty} (2^{-k} + 2^{-k\gamma}) \frac{1}{|2^{k+1}Q|^{1-\delta/n}} \int_{2^{k+1}Q} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| |f(y)| dy \\
&\leq C \sum_{k=0}^{\infty} k (2^{k(-1+\delta+m\beta-n/p)} + 2^{k(-\gamma+\delta+m\beta-n/p)}) \\
&\quad |2^{k+1}Q|^{m\beta/n+1/p'-1+\delta/n} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p} \\
&\leq C |Q|^{(\delta+m\beta)/n-1/p} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p}.
\end{aligned}$$

Thus

$$\begin{aligned}
&\frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \int_Q |S_4(x)| dx \\
&\leq C \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p} \frac{1}{|Q|^{1+(\delta+m\beta)/n-1/p}} \int_Q |Q|^{(\delta+m\beta)/n-1/p} dx \leq C \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{L^p}.
\end{aligned}$$

This completes the proof of Theorem 1.  $\square$

*Proof of Theorem 2.* Fix a ball  $B = B(0, l)$ , there exists  $\epsilon_0 \in \mathbf{Z}$  such that  $2^{\epsilon_0-1} \leq l < 2^{\epsilon_0}$ . We choose  $x_0$  such that  $2l < |x_0| < 3l$ . It is only to prove that

$$2^{\epsilon_0(\alpha+n/q_2)} \left( \frac{1}{2^{\epsilon_0 n}} \int_{|x| < 2^{\epsilon_0}} |\mu_{\Omega, \delta}^{\vec{b}}(f)(x) - \mu_{\Omega, \delta}^{\vec{b}}(f_2)(x_0)|^{q_2} dx \right)^{1/q_2} \leq C \|f\|_{\dot{K}_{q_1}^{\alpha, \infty}}.$$

We write, for  $f_1 = f \chi_{4B_{\epsilon_0}}$  and  $f_2 = f \chi_{R^n \setminus 4B_{\epsilon_0}}$ , then

$$|\mu_{\Omega, \delta}^{\vec{b}}(f)(x) - \mu_{\Omega, \delta}^{\vec{b}}(f_2)(x_0)| \leq |\mu_{\Omega, \delta}^{\vec{b}}(f_1)(x)| + |\mu_{\Omega, \delta}^{\vec{b}}(f_2)(x) - \mu_{\Omega, \delta}^{\vec{b}}(f_2)(x_0)|.$$

So

$$\begin{aligned}
 & 2^{\epsilon_0(\alpha+n/q_2)} \left( \frac{1}{2^{\epsilon_0 n}} \int_{|x| < 2^{\epsilon_0}} |\mu_{\Omega, \delta}^{\vec{b}}(f)(x) - \mu_{\Omega, \delta}^{\vec{b}}(f_2)(x_0)|^{q_2} dx \right)^{1/q_2} \\
 & \leq 2^{\epsilon_0(\alpha+n/q_2)} \left( \frac{1}{2^{\epsilon_0 n}} \int_{|x| < 2^{\epsilon_0}} |\mu_{\Omega, \delta}^{\vec{b}}(f_1)(x)|^{q_2} dx \right)^{1/q_2} \\
 & \quad + 2^{\epsilon_0(\alpha+n/q_2)} \left( \frac{1}{2^{\epsilon_0 n}} \int_{|x| < 2^{\epsilon_0}} |\mu_{\Omega, \delta}^{\vec{b}}(f_2)(x) - \mu_{\Omega, \delta}^{\vec{b}}(f_2)(x_0)|^{q_2} dx \right)^{1/q_2} \\
 & = J_1 + J_2.
 \end{aligned}$$

For  $J_1$ , by the  $(L^{q_1}, L^{q_2})$ -boundedness of  $\mu_{\Omega, \delta}^{\vec{b}}$  (see Lemma 4) and Lemma 2, we get

$$\begin{aligned}
 J_1 & \leq C 2^{\epsilon_0(\alpha+n/q_2)} 2^{-\epsilon_0 n/q_2} \left( \int_{\mathbb{R}^n} |f_1(x)|^{q_1} dx \right)^{1/q_1} \\
 & \leq C 2^{\epsilon_0 \alpha} \|f\chi_{B_{\epsilon_0}}\|_{L^{q_1}} \leq C \|f\|_{\dot{K}_{q_1}^{\alpha, \infty}}.
 \end{aligned}$$

For  $J_2$ , similar to the estimates of Theorem 1, we obtain using Hölder's inequality and recalling that  $\max(-n/q_2 - 1/2, -n/q_2 - \gamma) < \alpha \leq -n/q_2$ ,  $1/q_2 = 1/q_1 - (\delta + m\beta)/n$ ,

$$\begin{aligned}
 & |\mu_{\Omega, \delta}^{\vec{b}}(f_2)(x) - \mu_{\Omega, \delta}^{\vec{b}}(f_2)(x_0)| \\
 & \leq |\mu_{\Omega, \delta}( \prod_{j=1}^m (b_j - (b_j)_B)(f_2)(x) - \mu_{\Omega, \delta}( \prod_{j=1}^m (b_j - (b_j)_B)(f_2)(x_0) )| \\
 & \quad + | \prod_{j=1}^m (b_j(x) - (b_j)_B) | |\mu_{\Omega, \delta}(f_2)(x) - \mu_{\Omega, \delta}(f_2)(x_0)| = W_1(x) + W_2(x).
 \end{aligned}$$

For  $W_1(x)$ , similar to the proof of  $S_4(x)$  in Theorem 1, set  $1/v_1 + \dots + 1/v_m + 1/q_1 = 1$ , by the Minkowski's inequality, we have

$$W_1(x) \leq V_1 + V_2 + V_3.$$

For  $V_1$ , we have

$$\begin{aligned}
 V_1 & \leq C \sum_{k=1}^{\infty} \int_{B_{\epsilon_0+k}} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| \frac{|Q|^{1/2n} |f(y)|}{|x_0 - y|^{n+1/2-\delta}} dy \\
 & \leq C \sum_{k=1}^{\infty} \int_{B_{\epsilon_0+k}} \frac{2^{\epsilon_0/2}}{2^{(\epsilon_0+k)(n+1/2-\delta)}} \left| \prod_{j=1}^m (b_j(y) - (b_j)_B) \right| |f(y)| dy
 \end{aligned}$$

$$\begin{aligned}
&\leq C \sum_{k=1}^{\infty} 2^{k(\delta+m\beta-n/q_1-\alpha-1/2)} 2^{\epsilon_0(\delta+m\beta-n/q_1-\alpha)} \|\vec{b}\|_{\dot{\lambda}_\beta} 2^{(\epsilon_0+k)\alpha} \|f\chi_{\epsilon_0+k}\|_{L^{q_1}} \\
&\leq C 2^{\epsilon_0(-n/q_2-\alpha)} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}}.
\end{aligned}$$

Similarly, we have  $V_2 \leq C 2^{\epsilon_0(-n/q_2-\alpha)} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}}$ .

For  $V_3$ , we obtain

$$\begin{aligned}
V_3 &\leq C \sum_{k=1}^{\infty} \int_{B_{\epsilon_0+k}} \left| \prod_{j=1}^m (b_j(y) - (b_j)_Q) \right| \left( \frac{|Q|^{1/n}}{|x_0-y|^{n+1-\delta}} + \frac{|Q|^{\gamma/n}}{|x_0-y|^{n+\gamma-\delta}} \right) |f(y)| dy \\
&\leq C \sum_{k=1}^{\infty} \int_{B_{\epsilon_0+k}} \left( \frac{2^{\epsilon_0}}{2^{(\epsilon_0+k)(n+1-\delta)}} + \frac{2^{\epsilon_0\gamma}}{2^{(\epsilon_0+k)(n+\gamma-\delta)}} \right) \left| \prod_{j=1}^m (b_j(y) - (b_j)_B) \right| |f(y)| dy \\
&\leq C \sum_{k=1}^{\infty} (2^{k(m\beta+n-n/q_1-n+\delta-1)} + 2^{k(m\beta+n-n/q_1-n+\delta-\gamma)}) \\
&\quad \times 2^{\epsilon_0(m\beta+n-n/q_1-n+\delta)} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\chi_{\epsilon_0+k}\|_{L^{q_1}} \\
&\leq C 2^{\epsilon_0(-n/q_2-\alpha)} \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}}.
\end{aligned}$$

For  $W_2(x)$ , we have,

$$\begin{aligned}
&\|F_{t,\delta}(f_2)(x) - F_{t,\delta}(f_2)(x_0)\| \\
&\leq \left( \int_0^\infty \left[ \int_{|x-y|\leq t, |x_0-y|>t} \frac{|\Omega(x-y)||f_2(y)|}{|x-y|^{n-1-\delta}} dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\
&\quad + \left( \int_0^\infty \left[ \int_{|x-y|>t, |x_0-y|\leq t} \frac{|\Omega(x_0-y)||f_2(y)|}{|x_0-y|^{n-1-\delta}} dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\
&\quad + \left( \int_0^\infty \left[ \int_{|x-y|\leq t, |x_0-y|\leq t} \left| \frac{|\Omega(x-y)|}{|x-y|^{n-1-\delta}} - \frac{|\Omega(x_0-y)|}{|x_0-y|^{n-1-\delta}} \right| |f_2(y)| dy \right]^2 \frac{dt}{t^3} \right)^{1/2} \\
&= V'_1 + V'_2 + V'_3.
\end{aligned}$$

For  $V'_3$ , similar to the proof of  $I_3$  in Theorem 1, we get

$$\begin{aligned}
V'_3 &\leq C \sum_{k=1}^{\infty} \int_{B_{\epsilon_0+k}} \left( \frac{|Q|^{1/n}}{|x_0-y|^{n+1-\delta}} + \frac{|Q|^{\gamma/n}}{|x_0-y|^{n+\gamma-\delta}} \right) |f(y)| dy \\
&\leq C \sum_{k=1}^{\infty} \int_{B_{\epsilon_0+k}} \left( \frac{2^{\epsilon_0}}{2^{(\epsilon_0+k)(n+1-\delta)}} + \frac{2^{\epsilon_0\gamma}}{2^{(\epsilon_0+k)(n+\gamma-\delta)}} \right) 2^{(\epsilon_0+k)(n-n/q_1)} \\
&\quad \left( \int_{B_{\epsilon_0+k}} |f(y)|^{q_1} dy \right)^{1/q_1}
\end{aligned}$$

$$\begin{aligned} &\leq C \sum_{k=1}^{\infty} (2^{k(\delta-n/q_1-\alpha-1)} + 2^{k(\delta-n/q_1-\alpha-\gamma)}) 2^{\epsilon_0(\delta-n/q_1-\alpha)} 2^{(\epsilon_0+k)\alpha} \|f\chi_{\epsilon_0+k}\|_{L^{q_1}} \\ &\leq C 2^{\epsilon_0(\delta-\alpha-n/q_1)} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}}. \end{aligned}$$

The proofs of  $V'_1, V'_2$  are similar to that of  $V'_3$ , we omit the details. Thus, by Hölder's inequality with  $1/v_1 + \dots + 1/v_m = 1$ , we have

$$\begin{aligned} &2^{\epsilon_0(\alpha+n/q_2)} \left( \frac{1}{2^{\epsilon_0 n}} \int_{|x|<2^{\epsilon_0}} |W_2(x)|^{q_2} dx \right)^{1/q_2} \\ &\leq C 2^{\epsilon_0(\alpha+n/q_2)} 2^{\epsilon_0(\delta-\alpha-n/q_1)} \left( \frac{1}{2^{\epsilon_0 n}} \int_{|x|<2^{\epsilon_0}} \left| \prod_{j=1}^m (b_j(x) - (b_j)_B) \right|^{q_2} dx \right)^{1/q_2} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}} \\ &\leq C 2^{\epsilon_0(\alpha+n/q_2)} 2^{\epsilon_0(\delta-\alpha-n/q_1)} 2^{\epsilon_0(m\beta+n/q_2(1/v_1+\dots+1/v_m))} \\ &\quad \times \left( \frac{1}{2^{\epsilon_0 n}} \frac{1}{|B|^{m\beta/n}} \prod_{j=1}^m \left( \frac{1}{|B|} \int_{|x|<2^{\epsilon_0}} |b_j(x) - (b_j)_B|^{q_2 v_j} dx \right)^{1/q_2 v_j} \right) \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}} \\ &\leq C \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}}. \end{aligned}$$

Thus

$$J_2 \leq C \|\vec{b}\|_{\dot{\lambda}_\beta} \|f\|_{\dot{K}_{q_1}^{\alpha,\infty}}.$$

This completes the proof of Theorem 2. □

ACKNOWLEDGEMENT
