ACOUSTIC SCATTERING BY AN INHOMOGENEOUS LAYER ON A RIGID PLATE*

BO ZHANG[†] AND SIMON N. CHANDLER-WILDE[†]

Abstract. The problem of scattering of time-harmonic acoustic waves by an inhomogeneous fluid layer on a rigid plate in \mathbf{R}^2 is considered. The density is assumed to be unity in the media: within the layer the sound speed is assumed to be an arbitrary bounded measurable function. The problem is modelled by the reduced wave equation with variable wavenumber in the layer and a Neumann condition on the plate. To formulate the problem and prove uniqueness of solution a radiation condition appropriate for scattering by infinite rough surfaces is introduced, a generalization of the Rayleigh expansion condition for diffraction gratings. With the help of the radiation condition the problem is reformulated as a system of two second kind integral equations over the layer and the plate. Under additional assumptions on the wavenumber in the layer, uniqueness of solution is proved and the nonexistence of guided wave solutions of the homogeneous problem established. General results on the solvability of systems of integral equations on unbounded domains are used to establish existence and continuous dependence in a weighted norm of the solution on the given data.

Key words. radiation condition, rough surface scattering, inhomogeneous layer, integral equations, existence, uniqueness, guided waves, Neumann condition

1. Introduction. Consider the scattering problem of a time-harmonic acoustic plane wave incident to an inhomogeneous fluid layer sitting on a rigid plate in \mathbf{R}^2 . The density is assumed to be unity in the media, and the sound speed is supposed an arbitrary bounded measurable function in the layer and a constant above the layer, so that the medium, above the layer, is homogeneous. In this paper an integral equation method is used to study the existence of a unique solution to the problem, in particular for the case where the inhomogeneity extends to infinity without decaying. A radiation condition appropriate for scattering by infinite one-dimensional rough surfaces is introduced, which is a generalization of the standard radiation condition used in the study of plane wave diffraction by one-dimensional periodic gratings (see [2, 3, 20, 21]). The problem is then reformulated as an equivalent system of two second kind integral equations, over the infinite layer and the plate, respectively. Uniqueness of solution is proved, and then existence of solution is obtained by applying a form of Fredholm alternative based on general results on the solvability of systems of integral equations on unbounded domains [9].

Integral equation methods have been widely used in the theoretical and numerical study of wave scattering by finite obstacles or local inhomogeneities (see, e.g., [13, 14] and the references quoted there). More recently they have been employed to study scattering by periodic structures [12, 18, 20, 21, 22] and by a nonstratified local inhomogeneity in a stratified medium [26]. Integral equation formulations have also been used extensively in computations of plane wave scattering by infinite one-dimensional rough surfaces and interfaces (see, e.g., [15]), but little attention appears to have

[†]Department of Mathematics and Statistics, Brunel University, Uxbridge UB8 3PH, UK (bo.zhang@brunel.ac.uk, simon.chandler-wilde@brunel.ac.uk).

been paid in the literature to their mathematical justification (a recent exception is [16]). This present paper is intended as a contribution to the mathematical analysis of such problems. It is related, in terms of results and methods of argument, to recent studies of scattering by an inhomogeneous impedance half-plane in a homogeneous medium [4]; by a one-dimensional rough surface which is small perturbation of a flat half-plane [5, 7]; and of electromagnetic waves by an inhomogeneous conducting or dielectric layer on a perfectly conducting plate [6]. In particular, this paper is an extension of the study in [6] for the Dirichlet case to that of the Neumann case. Related work on plane wave scattering by a periodic inhomogeneous layer is contained in [21, 25].

The outline of this paper is as follows. In the next section the scattering problem is introduced and the radiation condition discussed. Section 3 is devoted to the derivation of an integral equation formulation which is equivalent to the scattering problem. In section 4, under assumptions on the wavenumber variation in the layer, we establish a basic inequality satisfied by the solution. Using this inequality, results from [9] which are summarized in Appendix A, a key lemma from [7], and extensions of arguments in [6], general uniqueness and existence results are established in sections 5 and 6, respectively. In particular the results apply to any bounded space variation of the wavenumber, provided the real part of the square of the wavenumber is everywhere nondecreasing in the x_2 direction and has some minimum net increase over the depth of the layer. Our uniqueness results also establish (by virtue of results in Appendix B) that, under these same conditions, guided wave solutions of the homogeneous problem are not supported by the inhomogeneous layer.

We conclude this section by introducing some notations. For $h \in \mathbf{R}$, define $\Gamma_h = \{x \in \mathbf{R}^2 | x_2 = h\}$ and $U_h = \{x \in \mathbf{R}^2 | x_2 > h\}$. We write U and Γ for U_0 and Γ_0 , respectively. We also write $E_h = U \setminus \overline{U_h}$ for $h > 0$ and define $D_A = \{x \in \mathbf{R}^2 | |x_1| < A\}$, $A > 0$, and $\Gamma_h(A) = \Gamma_h \cap D_A$, $E_h(A) = E_h \cap D_A$. For $v \in L_\infty(U)$ denote by $\partial_j v$, $j = 1, 2$, the (distributional) derivative $\partial v(x) / \partial x_j$. Finally, for $A > 0$, $x \in \mathbf{R}^2$, let $B_A(x) = \{y \in \mathbf{R}^2 | |y - x| < A\}$.

2. The scattering problem and radiation condition. Suppose that the half-plane U is filled with an inhomogeneous acoustic medium of (possibly complex) sound speed $c(x)$ and density unity. Let k denote the wavenumber of the medium. Then $k(x) = \omega / c(x)$, where $\omega > 0$ is the angular frequency, and the time-harmonic acoustic wave propagation (with time dependence $\exp(-i\omega t)$ suppressed) is governed by the reduced wave equation

$$(1) \quad \Delta u + k^2 u = 0 \quad \text{in } U.$$

Suppose also that the inhomogeneous medium has a rigid boundary. Then the Neumann boundary condition is satisfied at the boundary:

$$(2) \quad \frac{\partial u}{\partial n} = 0 \quad \text{on } \Gamma,$$

where n is the unit normal at Γ directed out of U .

We assume that the wavenumber k satisfies that $\Re k, \Im k \geq 0$, so that $\Im(k^2) \geq 0$. We make additionally throughout the following assumptions on k , the second of which implies that the medium is homogeneous above some finite layer E_B .

(A1) $k \in L_\infty(U)$.

(A2) There are two positive constants B and k_+ such that $k(x) = k_+$ for all $x \in E_B$.

These two assumptions are sufficient (together with the radiation condition we introduce below) to derive, in section 3, an equivalent integral equation formulation of the problem. In sections 4 and 5 we address the question of uniqueness of solution which is related to the question of existence or otherwise of guided wave solutions of the homogeneous problem.

We remark that the radiation condition we will impose will ensure that the scattered field does not contain a downwards propagating component, but (in common with the usual radiation condition for plane wave incidence on periodic gratings) will not rule out guided waves localized in the inhomogeneous layer (see Theorem B.2 in Appendix B, where a precise definition of a guided wave in this context is given). Thus, to prove any uniqueness result, we will have to impose additional conditions (on k) which rule out guided waves. In other words (and more positively), any uniqueness proof will simultaneously establish conditions for the nonexistence of guided waves.

The additional assumptions we require for our uniqueness proof (sections 4 and 5) and to prove existence of solution (section 6) are that Assumption (A3) or Assumptions (A4) and (A5) below are satisfied.

(A3) There is a positive constant λ_1 such that $\Im(k^2(x)) \geq \lambda_1$ for almost all $x \in E_B$.

(A4) $\Re(k^2(x))$ is monotonic increasing as x_2 increases; precisely,

$$\operatorname{ess\,inf}_{x \in U} \Re[k^2(x + e_2 h) - k^2(x)] \geq 0$$

for all $h > 0$, where $e_2 = (0, 1)$.

(A5) There are positive constants λ_2 , d with $d < B$ such that

$$\operatorname{ess\,sup}_{x \in E_d} \Re[k^2(x)] \leq k_+^2 - \lambda_2.$$

Assumption (A3) is a requirement that the layer E_B is lossy (energy absorbing). In the case when k is real, Assumption (A4) is a requirement that in the physical problem the wave speed $c(x)$ is nonincreasing as x_2 increases, and (A5) requires, additionally, some minimum net decrease in the wave speed over the depth of the layer.

Regarding the practical relevance of the above problem, we remark that this configuration has been used as a model of outdoor sound propagation over level terrain in the presence of wind gradients. In this context it is usual to model the ground surface as a porous half-space or layer and common to represent its effect by an impedance or Robin boundary condition (see, e.g., [1, 23, 24]): in the limiting case of high flow resistivity of the porous medium or low frequency of the incident wave, this condition reduces to the Neumann condition (2). The case when c decreases with height corresponds to the case of downwind propagation. Of course, it is well known, for the case of a purely vertical stratification ($c(x)$ depending only on x_2), that guided waves are not supported when c decreases with height. Our uniqueness results will show that this remains true when horizontal variations in $c(x)$ are also permitted.

We remark that in the Dirichlet boundary condition case, when (2) is replaced by the condition $u = 0$ on Γ , the assumption (A4) is sufficient to ensure uniqueness as demonstrated in [6]. In the Neumann boundary condition case the radiation condition (3) below and (A4) are not together sufficient to guarantee a unique solution as is shown by the simple example $u(x) = \exp(\pm i k_+ x_1)$, which satisfies (1)–(2) with $k \equiv k_+$ and, by Remark 2.3 below, the radiation condition (3).

Let $u^i(x) = \exp(ik_+ x \cdot \alpha)$ be the time-harmonic incoming plane wave, incident from U_B on the finite inhomogeneous layer E_B , where $x \in \mathbf{R}^2$, $\alpha = (\cos \theta, -\sin \theta) \in$

\mathbf{R}^2 , and $\theta \in (0, \pi)$ is the incident angle. We are interested in finding the total field u satisfying the reduced wave equation (1) and the Neumann condition (2).

In order to determine the physical solution u , a radiation condition as x_2 tends to infinity has to be imposed on the scattered field $u^s = u - u^i$, that is, the scattered field u^s should behave as an outgoing wave as $x_2 \rightarrow \infty$. The standard Sommerfeld radiation condition is not appropriate in this context as we cannot expect that u^s will decay in the x_1 direction. We will use the radiation condition proposed in [3] (see also [4] and [6]), which we will refer to as the *upward propagating radiation condition* (UPRC), and will usefully relate this condition to the Sommerfeld radiation condition below. To this end introduce the following definitions.

DEFINITION 2.1. *Given a domain $G \subset \mathbf{R}^2$, call $v \in C^2(G) \cap L_\infty(G)$ a radiating solution of the Helmholtz equation in G if $\Delta v + k_+^2 v = 0$ in G and*

$$v(x) = O(r^{-1/2}),$$

$$\frac{\partial v(x)}{\partial r} - ik_+ v(x) = o(r^{-1/2})$$

as $r = |x| \rightarrow \infty$, uniformly in $x/|x|$.

Let $\Phi(x, y)$ denote the free-space Green's function for $\Delta + k_+^2$, that is,

$$\Phi(x, y) = \frac{i}{4} H_0^{(1)}(k_+ |x - y|), \quad x, y \in \mathbf{R}^2, \quad x \neq y,$$

where $H_0^{(1)}$ is the Hankel function of the first kind of order zero.

DEFINITION 2.2. *Given a domain $G \subset \mathbf{R}^2$, say that $v : G \rightarrow \mathbf{C}$ satisfies the UPRC in G if, for some $h \in \mathbf{R}$ and $\phi \in L_\infty(\Gamma_h)$, $U_h \subset G$ and*

$$(3) \quad v(x) = 2 \int_{\Gamma_h} \frac{\partial \Phi(x, y)}{\partial y_2} \phi(y) ds(y), \quad x \in U_h.$$

Note that the existence of the integral in (3) for arbitrary $\phi \in L_\infty(\Gamma_h)$ is assured by the bound which follows from the asymptotic behavior of the Hankel function for small and large argument,

$$(4) \quad \left| \frac{\partial \Phi(x, y)}{\partial y_2} \right| \leq C|x_2 - y_2|(|x - y|^{-2} + |x - y|^{-3/2}), \quad x, y \in \mathbf{R}^2, \quad x \neq y,$$

which holds for some constant $C > 0$ dependent only on k_+ .

The following result explores properties of the upward propagating radiation condition and, in particular, shows that any radiating solution satisfies the UPRC.

LEMMA 2.3. *Given $H \in \mathbf{R}$ and $v : U_H \rightarrow \mathbf{C}$, the following statements are equivalent:*

(i) $v \in C^2(U_H)$, $v \in L_\infty(U_H \setminus U_a)$ for all $a > H$, $\Delta v + k_+^2 v = 0$ in U_H , and v satisfies the UPRC in U_H ;

(ii) there exists a sequence (v_n) of radiating solutions such that $v_n(x) \rightarrow v(x)$ uniformly on compact subsets of U_H and

$$(5) \quad \sup_{x \in U_H \setminus U_a, n \in \mathbf{N}} |v_n(x)| < \infty$$

for all $a > H$;

(iii) v satisfies (3) for $h = H$ and some $\phi \in L_\infty(\Gamma_H)$;

(iv) $v \in L_\infty(U_H \setminus U_a)$ for some $a > H$ and v satisfies (3) for each $h > H$, with $\phi = v|_{\Gamma_h}$, the restriction of v to Γ_h ;

(v) $v \in C^2(U_H)$, $v \in L_\infty(U_H \setminus U_a)$ for all $a > H$, $\Delta v + k_+^2 v = 0$ in U_H , and, for every $h > H$ and radiating solution in U_H , w , such that the restrictions of w and $\partial_2 w$ to Γ_h are in $L_1(\Gamma_h)$, it holds that

$$(6) \quad \int_{\Gamma_h} \left(v \frac{\partial w}{\partial n} - w \frac{\partial v}{\partial n} \right) ds = 0.$$

This lemma was proved as Theorem 2.1 in [6], using Green’s second theorem and the local regularity estimate contained in the next lemma (see [19, Theorem 3.9 and Lemma 4.1]) which is also needed later.

LEMMA 2.4. *If $G \subset \mathbf{R}^2$ is open and bounded, $v \in L_\infty(G)$, and $\Delta v = f \in L_\infty(G)$ (in a distributional sense) then $v \in C^1(G)$ and*

$$|\nabla v(x)| \leq C(d(x))^{-1} (\|v\|_\infty + \|d^2 f\|_\infty), \quad x \in G,$$

where C is an absolute constant and $d(x) = \text{dist}(x, \partial G)$.

Remark 2.1. A consequence of Lemma 2.4 is that if $\Delta v + k^2 v = 0$ in some region G and $v \in L_\infty(G)$, $k \in L_\infty(G)$, then $v \in C^1(G)$ and ∇v is bounded in every compact subset of G . Further, if the sequence $(v_n) \subset L_\infty(G)$ is uniformly bounded, $\Delta v_n + k_*^2 v_n = 0$ in G for some $k_* \in \mathbf{C}$ and each n , and $v_n(x) \rightarrow v(x)$ uniformly on compact subsets of G , then $v \in C^2(G)$ and $\Delta v + k_*^2 v = 0$ in G .

Let $\mathcal{R}(U) = \{v \in C(\bar{U}) \cap C^1(U) | \partial_2 v \in C(\bar{U})\}$. Then our problem of scattering of a time-harmonic plane wave by an inhomogeneous layer can now be formulated as the following boundary value problem.

Problem (P): Find $u \in \mathcal{R}(U)$ such that (i) u satisfies the reduced wave equation (1) in a distributional sense and the Neumann condition (2); (ii) u^s satisfies the upward propagating radiation condition (3); and (iii) u is bounded in E_A for every $A > 0$.

Remark 2.2. From (iii), Lemma 2.4, and a reflection argument based on the Neumann condition (2), it follows that $u \in C^1(\bar{U}) \cap C^2(U_B)$ and that

$$(7) \quad \sup_{x \in E_A} [|\nabla u(x)| + |u(x)|] < \infty$$

for every $A > 0$. By (1), the same reflection principle, and standard local regularity results [19], we have also that $u \in H_{\text{loc}}^2(U)$.

Remark 2.3. The radiation condition (3) is a generalization of the standard radiation condition for one-dimensional periodic gratings. Precisely, it was proved in [3] that if u^s has the usual representation as a Rayleigh expansion [2, 20, 21] in some U_b then it also satisfies (3) for all $h > b$ and so satisfies the UPRC. As a consequence any upward or horizontally propagating plane wave satisfies the UPRC. Thus, in the case $k \equiv k_+$, $u = u^i + u^r$ is a solution of problem (P) with the Neumann boundary condition (2) replaced by the impedance condition

$$(8) \quad \partial_2 u + ik_+ u = 0, \quad x \in \Gamma,$$

where u^r is the reflected wave $u^r(x) = \beta \exp(ik_+ x \cdot \alpha')$, with $\alpha' = (\cos \theta, \sin \theta)$ and $\beta = (\sin \theta - 1)/(\sin \theta + 1)$.

3. An integral equation formulation. In order to derive an equivalent integral equation formulation for problem (P), define

$$G(x, y) := \Phi(x, y) + \Phi(x, y') + P(x - y'), \quad x, y \in \bar{U}, \quad x \neq y,$$

where, for $x \in \bar{U}$, $x' = (x_1, -x_2)$, and

$$(9) \quad P(x) := -\frac{ik_+}{2\pi} \int_{-\infty}^{\infty} \frac{\exp(i[x_1s + x_2\sqrt{k_+^2 - s^2}])}{\sqrt{k_+^2 - s^2}(\sqrt{k_+^2 - s^2} + k_+)} ds,$$

with $\Im\sqrt{k_+^2 - s^2} \geq 0$. It is shown in [10] (or see [4]) that $P \in C(\bar{U}) \cap C^\infty(\bar{U} \setminus \{0\})$ and that P is a radiating solution of the Helmholtz equation in U . Further [10], $\partial P(x)/\partial x_1$ is bounded in $\bar{U} \setminus \{0\}$ and (see [11, equation (39)]) $\partial P(x)/\partial x_2$ satisfies

$$(10) \quad \frac{\partial P(x)}{\partial x_2} + ik_+G(0, x) = 0, \quad x \in \bar{U}, \quad x \neq 0.$$

Methods for computing P and its gradient efficiently are developed in [11].

From the above equations and properties (see [10] or [4] for further detail) it follows that G is the impedance Green's function for the Helmholtz equation in U and in particular that

$$(11) \quad \Delta_x G(x, y) + k_+^2 G(x, y) = 0, \quad x, y \in U, \quad x \neq y,$$

and

$$(12) \quad \frac{\partial G}{\partial x_2}(x, y) + ik_+G(x, y) = 0, \quad x \in \Gamma, \quad y \in U, \quad x \neq y.$$

An important property of G is its rapid asymptotic decay rate as $|x - y| \rightarrow \infty$ with x and y close to the boundary Γ . In particular, it follows from [5, Lemma 3.1] that, for some constant C depending only on k_+ ,

$$(13) \quad |G(x, y)|, \quad |\nabla_x G(x, y)|, \quad |\nabla_y G(x, y)| \leq C \frac{(1 + x_2)(1 + y_2)}{|x - y|^{3/2}},$$

for all $x, y \in U$ with $|x - y| \geq 1$. On the other hand, from the definition of G , asymptotic properties of the Hankel function and the above properties of P , it follows that

$$(14) \quad |G(x, y)| \leq C(1 + |\log|x - y||), \quad |\nabla_x G(x, y)|, \quad |\nabla_y G(x, y)| \leq C|x - y|^{-1},$$

for all $x, y \in U$ with $|x - y| \leq 1$. From (13) and (14) it follows that, for $y \in E_B$, $x_1 \in \mathbf{R}$, $x_2 = a > B$,

$$(15) \quad |G(x, y)|, \quad |\nabla_x G(x, y)|, \quad |\nabla_y G(x, y)| \leq C_a(1 + |x_1 - y_1|)^{-3/2},$$

where C_a is a positive constant depending only on a, B , and k_+ .

Before establishing the integral equation formulation in Theorem 3.3 below we first investigate properties of volume and surface potentials of the type appearing in (17).

LEMMA 3.1. *Define the volume potential v with density $\phi \in L_\infty(E_B)$ by*

$$v(x) = \int_{E_B} G(x, y)\phi(y)dy, \quad x \in \bar{U},$$

and extend the definition of ϕ to U by setting $\phi(x) = 0, x \in U_B$. Then $v \in C^1(\bar{U}) \cap L_\infty(E_a)$ for $a > 0, \partial_2 v + ik_+ v = 0$ on $\Gamma, \Delta v + k_+^2 v = -\phi$ in U , and v satisfies the UPRC.

Proof. By making use of the bounds (13) and (14), and the differentiability of $G(x, y)$ for $x \neq y$, together with the dominated convergence theorem, it can easily be shown that $v \in C^1(\bar{U}) \cap L_\infty(E_a), a > 0$, and, on noting (12), that $\partial_2 v + ik_+ v = 0$ on Γ . For $n \in \mathbf{N}$ define

$$v_n(x) = \int_{E_B(n)} G(x, y)\phi(y)dy, \quad x \in \bar{U}.$$

Given an arbitrary $A > 0$ choose the positive integer $M \in \mathbf{N}$ so that $M > A$. Then from standard results on volume potentials [13], in $D_A \cap U$ it holds that $\Delta v_M + k_+^2 v_M = -\phi$ and $(\Delta + k_+^2)(v_n - v_M) = 0$, for $n = M + 1, M + 2, \dots$. Further, $v_n(x) \rightarrow v(x)$ as $n \rightarrow \infty$, uniformly on compact subsets of D_A , so that, by Remark 2.1, $(\Delta + k_+^2)(v - v_M) = 0$ in D_A . Since $A > 0$ is arbitrary, we have shown that $\Delta v + k_+^2 v = -\phi$ in U . Further, for $n = 1, 2, \dots, v_n$ is a radiating solution in U_B and, using the bounds (13) and (14), it is easily seen that (5) is satisfied for all $a > 0$. It follows from the equivalence of (i) and (ii) in Lemma 2.3 that v satisfies the UPRC. The proof is complete. \square

LEMMA 3.2. Define the single layer potential S with density $\psi \in BC(\Gamma)$ by

$$S(x) = \int_{\Gamma} G(x, y)\psi(y)ds(y), \quad x \in \bar{U}.$$

Then $S \in \mathcal{R}(U) \cap L_\infty(E_a)$ for $a > 0, \partial_2 S + ik_+ S = -\psi$ on $\Gamma, \Delta S + k_+^2 S = 0$ in U , and S satisfies the UPRC.

Proof. By means of the bounds (13) and (14), and the differentiability of $G(x, y)$ for $x \neq y$, together with the dominated convergence theorem, it is easy to show that $S \in C(\bar{U}) \cap C^1(U) \cap L_\infty(E_a), a > 0$. To see that S satisfies the Helmholtz equation, let us define, for $n \in \mathbf{N}$,

$$S_n(x) = \int_{\Gamma(n)} G(x, y)\psi(y)ds(y), \quad x \in \bar{U}.$$

Then $S_n \in C^2(U)$ and $(\Delta + k_+^2)S_n = 0$ in U . Further, $S_n(x) \rightarrow S(x)$ as $n \rightarrow \infty$, uniformly on compact subsets of U , so that, by Remark 2.1, $S \in C^2(U)$ and $(\Delta + k_+^2)S = 0$ in U . Moreover, for $n = 1, 2, \dots, S_n$ is a radiating solution in U and, using the bounds (13) and (14), it is easily seen that (5) is satisfied for all $a > 0$. It follows from the equivalence of (i) and (ii) in Lemma 2.3 that S satisfies the UPRC.

From (10) it follows that, for $x \in U$ and $y \in \Gamma$,

$$(16) \quad \frac{\partial G(x, y)}{\partial x_2} = 2 \frac{\partial \Phi(x, y)}{\partial x_2} + \frac{\partial P(x - y')}{\partial x_2} = -2 \frac{\partial \Phi(x, y)}{\partial y_2} - ik_+ G(x, y).$$

By making use of (16), the bounds (13) and (14), the dominated convergence theorem, and the jump relation for standard double-layer potentials [13, Theorem 2.13], it can be easily derived that $\partial_2 S \in C(\bar{U})$ and $\partial_2 S + ik_+ S = -\psi$ on Γ . The proof is thus complete. \square

THEOREM 3.3. Let u be a solution of problem (P). Then we have

$$(17) \quad u(x) = u^i(x) + u^r(x) + \int_{E_B} u(y)[k^2(y) - k_+^2]G(x, y)dy - ik_+ \int_{\Gamma} u(y)G(x, y)ds(y), \quad x \in \bar{U}.$$

Proof. Take $x \in U$, choose $a > \max(x_2, B)$, $A > |x_1|$, and $\epsilon > 0$ sufficiently small and apply Green's second theorem to $G(x, \cdot)$ and u in the bounded region $E_a(A) \setminus \overline{B_\epsilon(x)}$, and then let $\epsilon \rightarrow 0$ to obtain that

$$(18) \quad u(x) = \int_{E_B(A)} u(y)[k^2(y) - k_+^2]G(x, y)dy + \int_{\partial(E_a(A))} \left[G(x, y) \frac{\partial u}{\partial n}(y) - u(y) \frac{\partial G(x, y)}{\partial n(y)} \right] ds(y).$$

Letting $A \rightarrow \infty$ in (18), in view of (13), (2), and (12), we find that

$$(19) \quad u(x) = \int_{E_B} u(y)[k^2(y) - k_+^2]G(x, y)dy - ik_+ \int_{\Gamma} u(y)G(x, y)ds(y) + I_a,$$

where

$$(20) \quad I_a = \int_{\Gamma_a} \left[G(x, y) \frac{\partial u}{\partial n}(y) - u(y) \frac{\partial G(x, y)}{\partial n(y)} \right] ds(y).$$

Recall that, by Remark 2.3, $u^i + u^r$ is a solution of problem (P) with $k \equiv k_+$ and the Neumann condition (2) replaced by the impedance condition (8). By the same argument as used to derive (19) we can show that $u^i(x) + u^r(x) = \tilde{I}_a$, where \tilde{I}_a is given by (20) but with u replaced by $u^i + u^r$. It follows that

$$(21) \quad I_a = u^i(x) + u^r(x) + \int_{\Gamma_a} \left[G(x, y) \frac{\partial w}{\partial n}(y) - w(y) \frac{\partial G(x, y)}{\partial n(y)} \right] ds(y),$$

where $w = u^s - u^r$. Further, w satisfies the UPRC and $G(x, \cdot)$ is a radiating solution in U_b for $b > x_2$ so that, in view of (13) and the equivalence of (i) and (v) in Lemma 2.3, the integral in (21) vanishes. Thus (17) follows for $x \in U$. That (17) holds also for $x \in \Gamma$ follows from the continuity in \overline{U} of u, u^i, u^r , and of the volume and surface potentials appearing in (17). \square

From Remark 2.3 and Lemmas 3.1 and 3.2 we have the following converse result.

THEOREM 3.4. *If u satisfies (17) and $u \in BC(E_B)$, then u satisfies problem (P).*

Remark 3.1. From Theorems 3.3 and 3.4 it follows that problem (P) is equivalent to the integral equation (17).

4. A basic inequality. In this section we prove a basic inequality satisfied by the solution of the problem (1)–(2) which plays an essential role in the proof of the uniqueness theorem.

Suppose that $u \in \mathcal{R}(U)$ satisfies (1) and (2). Then, by Remark 2.2, $u \in C^1(\overline{U}) \cap H_{loc}^2(U)$. Let $a > B$ and define, for $A > 0$,

$$(22) \quad J_A = \Im \int_{\Gamma_a(A)} \overline{u} \partial_2 u ds, \quad I_A = \int_{\Gamma_a(A)} \{ |\partial_2 u|^2 - |\partial_1 u|^2 + k_+^2 |u|^2 \} ds,$$

$$(23) \quad L_A = \Re \int_{\Gamma_a(A)} \overline{u} \partial_2 u ds, \quad K_A = \int_{E_B(A)} |u|^2 dx + \int_{\Gamma(A)} |u|^2 ds.$$

For $b \in \mathbf{R}$, let $\gamma(b) = \{(b, x_2) | 0 \leq x_2 \leq a\}$.

THEOREM 4.1. *Assume that (A3) holds or that both (A4) and (A5) hold. Then, for some nonnegative constants $C_j, j = 1, 2, 3, 4, 5$, there holds*

$$(24) \quad K_A \leq C_1 I_A + C_2 L_A - C_3 J_A + C_4 R_1(A) + C_5 R_2(A)$$

for all $A > 0$, where

$$R_1(A) = \left[\int_{\gamma(A)} + \int_{\gamma(-A)} \right] |\bar{u}\partial_1 u| ds$$

and

$$R_2(A) = \Re \left[\int_{\gamma(A)} - \int_{\gamma(-A)} \right] (2x_2\partial_2\bar{u}\partial_1 u + \bar{u}\partial_1 u) ds.$$

Proof. We will deduce the inequality (24) first of all in the case that (A3) holds.

Apply Green's first theorem to u and \bar{u} in $E_a(A)$, and take the imaginary part of the result thus obtained to get, since $\Im(k^2(x)) = 0$ for $x_2 > B$ and $\partial u/\partial n = 0$ on Γ ,

$$(25) \quad \int_{E_B(A)} \Im(k^2)|u|^2 dx + J_A \leq R_1(A).$$

Let $\eta \in C^1[0, \infty)$ be such that $0 \leq \eta(t) \leq 1$ for $t \geq 0$, $\eta(t) = 1$ for $0 \leq t \leq B/2$, $\eta(t) = 0$ for $t \geq B$, and $|\eta'(t)| \leq C\eta^{1/2}(t)$ for $t \geq 0$ and some constant C . Then, by applying Green's first theorem to u and $\eta(x_2)\bar{u}$ in $E_B(A)$, we obtain that

$$\begin{aligned} \int_{E_B(A)} \eta(x_2)|\nabla u|^2 dx &\leq \int_{E_B(A)} |k|^2\eta(x_2)|u|^2 dx \\ &\quad + \int_{E_B(A)} |\eta'(x_2)\bar{u}\partial_2 u| dx + R_1(A). \end{aligned}$$

From the fact that $|\eta'| \leq C\eta^{1/2}$ it follows, by using the Cauchy-Schwarz inequality, that

$$\int_{E_B(A)} |\eta'(x_2)\bar{u}\partial_2 u| dx \leq \frac{1}{2} \int_{E_B(A)} \eta(x_2)|\partial_2 u|^2 dx + \frac{C^2}{2} \int_{E_B(A)} |u|^2 dx,$$

so that

$$(26) \quad \begin{aligned} \int_{E_{B/2}(A)} |\nabla u|^2 dx &\leq \int_{E_B(A)} \eta(x_2)|\nabla u|^2 dx \\ &\leq (2\|k\|_\infty^2 + C^2) \int_{E_B(A)} |u|^2 dx + 2R_1(A). \end{aligned}$$

Now, for any $h > 0$,

$$(27) \quad u((x_1, h)) - u((x_1, 0)) = \int_0^h \partial_2 u(x) dx_2, \quad x_1 \in \mathbf{R},$$

so that, using the Cauchy-Schwarz inequality,

$$(28) \quad |u((x_1, 0))|^2 \leq 2|u((x_1, h))|^2 + 2h \int_0^h |\partial_2 u(x)|^2 dx_2, \quad x_1 \in \mathbf{R}.$$

From (28) it follows that

$$(29) \quad \int_{\Gamma(A)} |u|^2 ds \leq 2 \int_{\Gamma_h(A)} |u|^2 ds + 2h \int_{E_h(A)} |\partial_2 u|^2 dx$$

for any $h > 0$ and therefore that

$$(30) \quad B \int_{\Gamma(A)} |u|^2 ds \leq 4 \int_{E_{B/2}(A)} |u|^2 dx + \frac{B^2}{2} \int_{E_{B/2}(A)} |\partial_2 u|^2 dx.$$

Thus, assuming that (A3) holds, the required inequality (24), with $C_1 = C_2 = C_5 = 0$, follows from (30), (26), and (25).

Suppose now that (A4) and (A5) hold. Multiplying (1) by $2x_2 \partial_2 \bar{u} + \bar{u}$, integrating over $E_a(A)$, and taking the real part, we obtain

$$(31) \quad \begin{aligned} 2 \int_{E_a(A)} |\partial_2 u|^2 dx &= \Re \int_{E_a(A)} [2\nabla \cdot (x_2 \partial_2 \bar{u} \nabla u) - \partial_2(x_2 |\nabla u|^2) + \nabla \cdot (\bar{u} \nabla u)] dx \\ &\quad + \int_{E_a(A)} \Re(k^2) \partial_2(x_2 |u|^2) dx + 2 \int_{E_a(A)} x_2 \Im(k^2) \Im\{\bar{u} \partial_2 u\} dx \\ &= a \int_{\Gamma_a(A)} (|\partial_2 u|^2 - |\partial_1 u|^2) ds + L_A + R_2(A) \\ &\quad + \int_{E_a(A)} \Re(k^2) \partial_2(x_2 |u|^2) dx + 2 \int_{E_a(A)} x_2 \Im(k^2) \Im\{\bar{u} \partial_2 u\} dx. \end{aligned}$$

Now if $\Re(k^2) \in C^1(\overline{E_a(A)})$ then from (A4) we have that $\partial_2(\Re(k^2)) \geq 0$ and, integrating by parts, we obtain that

$$(32) \quad \int_{E_a(A)} \Re(k^2) \partial_2(x_2 |u|^2) dx \leq k_+^2 a \int_{\Gamma_a(A)} |u|^2 ds = \int_{E_a(A)} k_+^2 \partial_2(x_2 |u|^2) dx.$$

Thus

$$(33) \quad G_A := \int_{E_a(A)} [k_+^2 - \Re(k^2)] \partial_2(x_2 |u|^2) dx \geq 0.$$

In the general case when $k \in L_\infty(U)$, let $\phi(x) = \Re(k^2(x))$, $\psi(x) = x_2 |u(x)|^2$ and, for $h \in \mathbf{R}$, let $\phi_h(x) = \phi(x + h e_2)$, $\psi_h(x) = \psi(x + h e_2)$. Then, since $\phi(\psi_h - \psi) + \phi_h(\psi_h - \psi) = 2(\phi_h \psi_h - \phi \psi) - (\phi_h - \phi)(\psi + \psi_h)$, we have that

$$(34) \quad \begin{aligned} &\int_{E_a(A)} \phi(\psi_h - \psi) dx + \int_{E_{a+h}(A) \setminus E_h(A)} \phi(\psi - \psi_h) dx \\ &= 2 \int_{E_{a+h}(A) \setminus E_a(A)} \phi \psi dx - 2 \int_{E_h(A)} \phi \psi dx - \int_{E_a(A)} (\phi_h - \phi)(\psi + \psi_h) dx \\ &\leq 2k_+^2 \int_{E_{a+h}(A) \setminus E_a(A)} \psi dx + 2\|k\|_\infty^2 \int_{E_h(A)} \psi dx \end{aligned}$$

on using (A2) and (A4). Since $\psi \in C^1(\overline{U})$ and $\psi = 0$ on Γ , dividing (34) by $2h$ and taking the limit $h \rightarrow 0$ we obtain that (32) and (33) hold in the general case.

It follows from (31) and (32) that

$$(35) \quad 2 \int_{E_a(A)} |\partial_2 u|^2 dx + G_A = aI_A + L_A + R_2(A) + 2 \int_{E_a(A)} x_2 \Im(k^2) \Im\{\bar{u} \partial_2 u\} dx.$$

Since $0 \leq \Im(k^2) \leq \|k\|_\infty^2$, the Cauchy-Schwarz inequality yields that

$$(36) \quad 2 \int_{E_a(A)} x_2 \Im(k^2) \Im\{\bar{u} \partial_2 u\} dx \leq \int_{E_a(A)} |\partial_2 u|^2 dx + a^2 \|k\|_\infty^2 \int_{E_a(A)} \Im(k^2) |u|^2 dx.$$

Thus, it follows from (35), (36), and (25) that

$$(37) \quad \int_{E_a(A)} |\partial_2 u|^2 dx + G_A \leq aI_A + L_A - a^2 \|k\|_\infty^2 J_A + R_2(A) + a^2 \|k\|_\infty^2 R_1(A) =: F_A.$$

Now, from (37) and the fact that $G_A \geq 0$, it is seen that

$$(38) \quad \int_{E_a(A)} |\partial_2 u|^2 dx \leq F_A.$$

On the other hand, since $2|x_2 \Re(\bar{u} \partial_2 u)| \leq |u|^2/2 + 2a^2 |\partial_2 u|^2$ for $x \in E_a$, we have

$$\partial_2(x_2 |u|^2) = |u|^2 + 2x_2 \Re(\bar{u} \partial_2 u) \geq |u|^2/2 - 2a^2 |\partial_2 u|^2$$

for $x \in E_a$, so that, on noting that $k_+^2 \geq \Re(k^2)$ by (A4),

$$G_A \geq \frac{1}{2} \int_{E_a(A)} [k_+^2 - \Re(k^2)] |u|^2 dx - 4a^2 \|k\|_\infty^2 \int_{E_a(A)} |\partial_2 u|^2 dx.$$

This, together with (37), implies that

$$(39) \quad \begin{aligned} \int_{E_a(A)} [k_+^2 - \Re(k^2)] |u|^2 dx &\leq 2F_A + 8a^2 \|k\|_\infty^2 \int_{E_a(A)} |\partial_2 u|^2 dx \\ &\leq 2(1 + 4a^2 \|k\|_\infty^2) F_A. \end{aligned}$$

We now make use of (38) and (39) to derive the required inequality (24). First, using (28) we obtain that, for any $0 < h \leq a$,

$$(40) \quad \begin{aligned} \int_{E_h(A)} [k_+^2 - \Re(k^2)] |u(x_1, 0)|^2 dx &\leq \int_{E_a(A)} [k_+^2 - \Re(k^2)] |u(x_1, 0)|^2 dx \\ &\leq 2 \int_{E_a(A)} [k_+^2 - \Re(k^2)] |u|^2 dx + 4a^2 \|k\|_\infty^2 \int_{E_a(A)} |\partial_2 u|^2 dx. \end{aligned}$$

Taking $h = d$ in (40) and using (A5) yield that

$$(41) \quad d\lambda_2 \int_{\Gamma(A)} |u|^2 ds \leq 2 \int_{E_a(A)} [k_+^2 - \Re(k^2)] |u|^2 dx + 4a^2 \|k\|_\infty^2 \int_{E_a(A)} |\partial_2 u|^2 dx.$$

Next, using (27) we get (cf. (29))

$$\int_{\Gamma_h(A)} |u|^2 ds \leq 2 \int_{\Gamma(A)} |u|^2 ds + 2h \int_{E_h(A)} |\partial_2 u|^2 dx$$

for any $h > 0$, and therefore

$$(42) \quad \int_{E_a(A)} |u|^2 dx \leq 2a \int_{\Gamma(A)} |u|^2 ds + a^2 \int_{E_a(A)} |\partial_2 u|^2 dx.$$

Thus, utilizing (38) and (39) together with (41) and (42), the required result (24) follows. The proof is complete. \square

5. Uniqueness of solution. In this section we establish the following uniqueness theorem for problem (P).

THEOREM 5.1. *If (A3) holds or both (A4) and (A5) hold, then problem (P) has at most one solution.*

We prove this theorem by showing that the homogeneous version of problem (P) has only the trivial solution. Since guided waves are solutions of the homogeneous problem (see the definition and Theorem B.2 in Appendix B), we have immediately the following corollary.

COROLLARY 5.2. *If (A3) holds or both (A4) and (A5) hold, then there are no guided wave solutions to the homogeneous problem.*

In the proof of Theorem 5.1 we utilize the following two lemmas, of which the first is a consequence of the UPRC and was proved as Lemma 6.1 in [6] and the second is a special case of Lemma A in [7].

LEMMA 5.3. *If $\phi \in L_2(\Gamma_h) \cap L_\infty(\Gamma_h)$ and v is defined by (3), then the restrictions of v , $\partial_1 v$, and $\partial_2 v$ to Γ_a are in $L_2(\Gamma_a) \cap BC(\Gamma_a)$ for $a > h$ and*

$$(43) \quad \Im \int_{\Gamma_a} \bar{v} \partial_2 v ds \geq 0, \quad \Re \int_{\Gamma_a} \bar{v} \partial_2 v ds \leq 0,$$

$$(44) \quad \int_{\Gamma_a} [|\partial_2 v|^2 - |\partial_1 v|^2 + k_+^2 |v|^2] ds \leq 2k_+ \Im \int_{\Gamma_a} \bar{v} \partial_2 v ds.$$

LEMMA 5.4. *Suppose that $F \in L_\infty(\mathbf{R})$ and that, for some nonnegative constants c , ϵ , and A_0 ,*

$$\int_{-A}^A |F|^2 \leq c \int_{\mathbf{R} \setminus [-A, A]} G_A^2 + c \int_{-A}^A (G_\infty - G_A) G_\infty + \epsilon, \quad A > A_0,$$

where, for $A_0 < A \leq +\infty$,

$$G_A(s) = \int_{-A}^A (1 + |s - t|)^{-3/2} |F(t)| dt, \quad s \in \mathbf{R}.$$

Then $F \in L_2(\mathbf{R})$ and

$$\int_{-\infty}^{+\infty} |F|^2 \leq \epsilon.$$

Proof (of Theorem 5.1). Suppose that u_1 and u_2 are solutions of problem (P). Then, by Remark 2.2, $u = u_1 - u_2 \in C^1(\bar{U})$ and satisfies (1)–(2), the bound (7), and the UPRC. Also, by Theorem 3.3,

$$(45) \quad u(x) = \int_{E_B} u(y) [k^2(y) - k_+^2] G(x, y) dy - ik_+ \int_{\Gamma} u(y) G(x, y) ds(y), \quad x \in \bar{U},$$

and, by Theorem 4.1, for some constants $a > B$ and $C_j \geq 0$, $j = 1, 2, 3, 4, 5$,

$$(46) \quad K_A \leq C_1 I_A + C_2 L_A - C_3 J_A + C_4 R_1(A) + C_5 R_2(A),$$

where J_A , I_A , L_A , and K_A are given by (22) and (23). Clearly, for $j = 1, 2$,

$$(47) \quad R_j(A) = O(1) \text{ as } A \rightarrow \infty$$

and, by (25),

$$(48) \quad J_A = R_1(A) - \int_{E_B(A)} \Im(k^2)|u|^2 dx \leq R_1(A).$$

Now to make use of Lemma 5.3 and the bound (46) we define

$$(49) \quad v(x) = \int_{E_B(A)} u(y)[k^2(y) - k_+^2]G(x, y)dy - ik_+ \int_{\Gamma(A)} u(y)G(x, y)ds(y), \quad x \in \bar{U}.$$

Then, by (13), (14), and Lemmas 3.1 and 3.2, $v|_{\Gamma_B} \in L_2(\Gamma_B) \cap BC(\Gamma_B)$; and by Remark 2.3, Lemmas 3.1 and 3.2, and the equivalence of (i) and (iv) in Theorem 2.3, v satisfies (3) with $h = B$ and $\phi = v|_{\Gamma_B}$. Set

$$\begin{aligned} J'_A &= \Im \int_{\Gamma_a(A)} \bar{v}\partial_2 v ds, & J''_A &= \Im \int_{\Gamma_a} \bar{v}\partial_2 v ds, \\ I'_A &= \int_{\Gamma_a(A)} \{|\partial_2 v|^2 - |\partial_1 v|^2 + k_+^2|v|^2\} ds, & I''_A &= \int_{\Gamma_a} \{|\partial_2 v|^2 - |\partial_1 v|^2 + k_+^2|v|^2\} ds, \\ L'_A &= \Re \int_{\Gamma_a(A)} \bar{v}\partial_2 v ds, & L''_A &= \Re \int_{\Gamma_a} \bar{v}\partial_2 v ds. \end{aligned}$$

Then, by Lemma 5.3,

$$J''_A \geq 0, \quad L''_A \leq 0, \quad I''_A \leq 2k_+ J''_A,$$

so that, by (46) and (48),

$$(50) \quad \begin{aligned} K_A &\leq C_1(I_A - I''_A) + (2C_1k_+ + C_3)(J''_A - J_A) \\ &\quad + C_2(L_A - L''_A) + (2C_1k_+ + C_4)R_1(A) + C_5R_2(A). \end{aligned}$$

Now note that

$$K_A = \int_{-A}^A |w(x_1)|^2 dx_1,$$

where

$$w(x_1) = \left\{ \int_0^B |u(x)|^2 dx_2 + |u(x_1, 0)|^2 \right\}^{1/2}, \quad x_1 \in \mathbf{R},$$

and that, by (15) and the Cauchy-Schwarz inequality,

$$\begin{aligned} |v(x)|, |\nabla v(x)| &\leq C_k(B + 1)^{1/2}W_A(x_1), & x &\in \Gamma_a, \\ |u(x) - v(x)|, |\nabla u(x) - \nabla v(x)| &\leq C_k(B + 1)^{1/2}(W_\infty(x_1) - W_A(x_1)), & x &\in \Gamma_a, \end{aligned}$$

where $C_k = C_a \max(k_+, \|k_+^2 - k^2\|_\infty)$ and, for $0 \leq A \leq +\infty$,

$$W_A(x_1) = \int_{-A}^A (1 + |x_1 - y_1|)^{-3/2}w(y_1)dy_1, \quad x_1 \in \mathbf{R}.$$

It follows that

$$|I'_A - I''_A|, |J'_A - J''_A|, |L'_A - L''_A| \leq C \int_{\mathbf{R} \setminus [-A, A]} (W_A(x_1))^2 dx_1,$$

where $C = C_k^2(B + 1)(2 + k_+^2)$, and that

$$|I_A - I'_A|, |J_A - J'_A|, |L_A - L'_A| \leq 2C \int_{-A}^A (W_\infty(x_1) - W_A(x_1))W_\infty(x_1) dx_1,$$

so that, for some constant $c > 0$ and all $A > 0$,

$$(51) \quad K_A \leq c \left\{ \int_{\mathbf{R} \setminus [-A, A]} W_A^2 + \int_{-A}^A (W_\infty - W_A)W_\infty + |R_1(A)| + |R_2(A)| \right\}.$$

Applying Lemma 5.4 to (51) we obtain that $w \in L_2(\mathbf{R})$ (i.e. $u \in L_2(E_B) \cap L_2(\Gamma)$) and, for all $A_0 > 0$,

$$(52) \quad \int_{E_B} |u|^2 dx + \int_\Gamma |u|^2 ds = \int_{-\infty}^{+\infty} |w|^2 \leq c \sup_{A > A_0} (|R_1(A)| + |R_2(A)|).$$

Since $u \in L_2(E_B) \cap L_2(\Gamma)$, it follows from (45), the bounds (13) and (14), and applications of Young's theorem, that $u \in L_2(\overline{E_a})$, for every $a > 0$. Since also $\nabla u \in BC(E_a)$ so that u is uniformly continuous in $\overline{E_a}$, it follows that $u(x) \rightarrow 0$ as $x_1 \rightarrow \infty$, uniformly in x_2 for $0 \leq x_2 \leq a$, for every $a > 0$. Noting also Lemma 2.4, it follows that $R_j(A) \rightarrow 0$ as $A \rightarrow \infty$, $j = 1, 2$, and thus, from (52), that $u = 0$ in E_B and on Γ and hence, from (45), that $u \equiv 0$ in \overline{U} . The proof is complete. \square

6. Existence of solution. In this section we apply Theorems A.1 and A.2 in Appendix A to show the existence of a solution to problem (P). First, we note that (see Remark 3.1) problem (P) and (17) are equivalent. Let $N = 2$, $\Omega_1 = E_B \subset \mathbf{R}^2$, $\Omega_2 = \mathbf{R}$, $\omega_1 = \{x \in \Omega_1 | 0 \leq x_1 < B, 0 < x_2 < B\}$, $\omega_2 = [0, B)$, $a_1^{(1)} = (B, 0)$, and $a_1^{(2)} = B$. Define $\tilde{y} := y$ for $y \in \Omega_1 \subset \mathbf{R}^2$ and $\tilde{y} := (y, 0)$ for $y \in \Omega_2 = \mathbf{R}$, and let $k_{ij}(x, y) = G(\tilde{x}, \tilde{y})$ for all $x \in \Omega_i$, $y \in \Omega_j$, $\tilde{x} \neq \tilde{y}$, $i, j = 1, 2$. Then conditions (C.1) and (C.2) in Appendix A are satisfied with these choices of k_{ij} and Ω_j ($i, j = 1, 2$). Set $w_1(y) = k^2(y) - k_+^2$ for $y \in \Omega_1$ and $w_2(y) = -ik_+$ for $y \in \Omega_2$. Then the integral equation (17) is equivalent to the equation

$$(53) \quad u(x) = u^i(x) + u^r(x) + \int_{\Omega_1} \psi_1(y)w_1(y)G(x, y)d\mu_2(y) + \int_{\Omega_2} \psi_2(y)w_2(y)G(x, \tilde{y})d\mu_1(y)$$

for $x \in \overline{U}$, where $\psi_1(y) = u(y)$ for $y \in \overline{\Omega_1}$, $\psi_2(y) = u(\tilde{y})$ for $y \in \Omega_2$, and $d\mu_j$ is j -dimensional Lebesgue measure.

With X and Y the product spaces as defined in Appendix A, let us now consider the system of integral equations

$$(54) \quad (I - K_w)\psi = \phi, \quad \psi = (\psi_1, \psi_2)^t, \quad \phi = (\phi_1, \phi_2)^t \in Y, \quad w = (w_1, w_2)^t \in X,$$

where $\phi_j(y) = u^i(\tilde{y}) + u^r(\tilde{y})$ for $y \in \overline{\Omega_j}$ ($j = 1, 2$), and I and K_w are the matrix operators defined by (A.4) and (A.5). Then it is clear that (54) is just a restriction of (53) to $\overline{E_B}$ and Γ , so that if we can solve (54) for ψ , then u , defined by (53), is a solution to problem (P). Therefore, in order to prove the existence of a solution to

problem (P), it is enough to show that the system of integral equations (54) has a solution.

THEOREM 6.1. *Assume that (A3) holds or that both (A4) and (A5) hold. Then $(I - K_w)^{-1} \in B(Y)$ so that the system of integral equations (54) has a unique solution $\psi \in Y$. Furthermore, for any $M > 0$, there is a constant $C > 0$ depending only on M, k_+, B , and λ_1 in the case that (A3) is satisfied or on M, k_+, B, λ_2 , and d in the case that (A4) and (A5) are satisfied, such that, provided $\|k\|_\infty \leq M$, it holds that $\|(I - K_w)^{-1}\| \leq C$, so that $\|\psi\| \leq C\|\phi\|$.*

Proof. Theorem 6.1 is proved by means of Theorems A.1 and A.2 in Appendix A. To this end, suppose without loss of generality that $M > \lambda_1$, and set

$$Q = Q_3 := \{\mu \in L_\infty(\Omega_1) \mid \Im\mu \geq \lambda_1, \|\mu\|_\infty \leq M^2\}$$

in the case that (A3) is satisfied. In the case that (A4) and (A5) are satisfied, suppose without loss of generality that $M > k_+$, and set

$$Q = Q_4 := \{\mu \in L_\infty(U) \mid \Im\mu \geq 0, \mu(x) = k_+^2, x \in U_B, \|\mu\|_\infty \leq M^2, \text{ess sup}_{x \in E_d} \Re(\mu(x)) \leq k_+^2 - \lambda_2, \text{ess inf}_{x \in U} \Re[\mu(x + e_2h) - \mu(x)] \geq 0, h > 0\}.$$

With $X_j = L_\infty(\Omega_j), j = 1, 2$, set

$$\begin{aligned} W_1 &= \{z_1 \in X_1 \mid z_1 = \mu|_{\Omega_1} - k_+^2, \mu \in Q\}, \\ W_2 &= \{z_2 \in X_2 \mid z_2(x) = -ik_+, x \in \Omega_2\}, \\ W &= \{z = (z_1, z_2)^t \in X \mid z_1 \in W_1, z_2 \in W_2\}. \end{aligned}$$

Then $T_a W = W$ for $a \in \tau = \{(a_1^{(1)}, a_1^{(2)})^t\}$. Also, it follows easily from Theorems 3.4 and 5.1 that $I - K_z$ is injective for all $z \in W$.

Next, we show that W is weak* sequentially compact. From Appendix A, it is sufficient to show that $W_j \subset X_j$ is weak* sequentially compact for $j = 1, 2$. Clearly $W_2 = \{-ik_+\}$ is weak* sequentially compact. As $\{w \in \mathbf{C} \mid |w| \leq M^2, \Im w \geq \lambda_1\}$ is compact and convex, it follows from Lemma 2.13 in [8] in the case $Q = Q_3$ that W_1 is weak* sequentially compact. In the case $Q = Q_4$, let $z_1^{(j)} = \mu^{(j)}|_{\Omega_1} - k_+^2 \in W_1, j = 1, 2, \dots$. Since $(\mu^{(j)}) \subset Q$, which is bounded, it follows from the Alaoglu theorem [17, p. 60] that there is an element $\mu \in L_\infty(U)$ and a subsequence of $(\mu^{(j)})$, denoted simply by itself, such that $(\mu^{(j)})$ converges weak* to μ in $L_\infty(U)$ and $\|\mu\|_\infty \leq M^2$. Thus, for all $\xi \in L_1(U)$,

$$(55) \quad \int_U \mu^{(j)} \xi dx \rightarrow \int_U \mu \xi dx,$$

as $j \rightarrow \infty$, and, in particular, (55) holds if ξ is the characteristic function of any bounded measurable subset of U . This and that $\mu^{(j)} \in Q, j = 1, 2, \dots$ implies that $\Im\mu \geq 0$ in $U, \mu(x) = k_+^2$ for $x \in U_B, \text{ess sup}_{x \in E_d} \Re(\mu(x)) \leq k_+^2 - \lambda_2$, and $\text{ess inf}_{x \in U} \Re[\mu(x + e_2h) - \mu(x)] \geq 0$ for all $h \geq 0$. Hence, $\mu \in Q, z_1 = \mu|_{\Omega_1} - k_+^2 \in W_1$ and $(z_1^{(j)})$ converges weak* to z_1 in X_1 , that is, W_1 is weak* sequentially compact.

Finally, let $z = (z_1, z_2)^t \in W$ with $z_1 = \mu|_{\Omega_1} - k_+^2 \in W_1$ and $z_2 = -ik_+ \in W_2$. For $j = 1, 2, \dots$ set

$$\mu^{(j)}(x) = \begin{cases} \tilde{\mu}(x) & \text{for } |x_1| > j, \\ \mu(x) & \text{for } |x_1| \leq j, \end{cases}$$

where $\tilde{\mu} \equiv i\lambda_1$ in the case that (A3) is satisfied, $\tilde{\mu}(x) = k_+^2 - \lambda_2, x \in E_B, = k_+^2, x \in U_B$ in the case that (A4) and (A5) are satisfied. Then $\tilde{\mu}, \mu^{(j)} \in Q, z_1^{(j)} = \mu^{(j)}|_{\Omega_1} - k_+^2 \in W_1$, and $z_1^{(j)}(x) = z_1^*, |x_1| > j$, where $z_1^* = \mu^* - k_+^2$ and $\mu^* = i\lambda_1$ in the case that (A3) is satisfied and $\mu^* = k_+^2 - \lambda_2$ in the case that (A4) and (A5) are satisfied. For any $\xi \in L_1(\Omega_1)$ we have

$$\int_{\Omega_1} (z_1^{(j)} - z_1)\xi dx = \int_{E_B \setminus E_B(j)} (\mu - \mu^*)\xi dx \leq 2M^2 \int_{E_B \setminus E_B(j)} |\xi| dx \rightarrow 0$$

as $j \rightarrow \infty$, that is, $(z_1^{(j)})$ converges weak* to z_1 in X_1 . Now for $j = 1, 2, \dots$ set $z^{(j)} = (z_1^{(j)}, z_2)^t$. Then $z^{(j)} \in W$ and $(z^{(j)})$ converges weak* to z in X . Set $z^* = (z_1^*, z_2)^t$. Since $z^* \in W$ so that $I - K_{z^*}$ is injective, it follows from Theorem A.2 in Appendix A that $I - K_{z^{(j)}}$ injective implies $I - K_{z^{(j)}}$ surjective, for $j = 1, 2, \dots$. Thus all the assumptions in Theorem A.1 have been verified, and Theorem 6.1 follows from Theorem A.1. The proof is complete. \square

THEOREM 6.2. *Assume that (A3) holds or both (A4) and (A5) hold. Then problem (P) has exactly one solution. Further, for any $M > 0$, there exists a constant $C > 0$ depending only on M, k_+, B , and λ_1 in the case that (A3) is satisfied or on M, k_+, B, λ_2 , and d in the case that (A4) and (A5) are satisfied, such that, provided $\|k\|_\infty \leq M$,*

$$(56) \quad |u(x)| \leq C(1 + x_2)^{1/2}, \quad x \in \bar{U}.$$

Proof. The existence of a unique solution to problem (P) follows from Theorems 3.3, 3.4, and 6.1. To derive the estimate (56) we note from the equivalence of (i) and (iv) in Lemma 2.3 that

$$(57) \quad u^s(x) = 2 \int_{\Gamma_B} \frac{\partial \Phi(x, y)}{\partial y_2} u^s(y) ds(y), \quad x \in U_B.$$

It follows from (4) and (57) (see [4]) that

$$(58) \quad |u^s(x)| \leq C(1 + (x_2 - B))^{1/2} \|u_B^s\|_\infty, \quad x \in U_B,$$

for some constant $C > 0$ dependent only on k_+ , which together with Theorem 6.1 implies the estimate (56). The proof is complete. \square

We remark that in [6] it is shown for the Dirichlet boundary condition case that, for a particular choice of k , the growth rate in (56) for the solution can be achieved, so that the exponent 1/2 in the bound (56) is the best possible for the general case.

Appendix A. Some solvability results for integral equations on unbounded domains.

In this appendix we summarize general results on the solvability of a class of systems of second kind integral equations on unbounded domains established in [9] and used in section 6 to show existence of solution for the scattering problem.

Let us consider the system of second kind integral equations

$$(A.1) \quad \psi_i(x) = \phi_i(x) + \sum_{j=1}^N \int_{\Omega_j} k_{ij}(x, y) z_j(y) \psi_j(y) d\mu_j(y), \quad x \in \bar{\Omega}_i, \quad i = 1, \dots, N,$$

where Ω_j is an open subset of \mathbf{R}^{n_j} ($n_j \geq 1$), $d\mu_j$ is n_j -dimensional Lebesgue measure, the functions $k_{ij} : \bar{\Omega}_i \times \Omega_j \rightarrow \mathbf{C}, \phi_j \in Y_j := BC(\bar{\Omega}_j)$, and $z_j \in X_j := L_\infty(\Omega_j)$ are

known, and $\psi_j \in Y_j$ is to be determined ($i, j = 1, \dots, N$). As usual, for $a \in \mathbf{R}^n$ and $V \subset \mathbf{R}^n$, denote by $V + a$ the translate of the set V by the vector a . We assume throughout this appendix that $k_{ij}(x, \cdot) \in L_1(\Omega_j)$ for every $x \in \bar{\Omega}_i$ ($i, j = 1, \dots, N$), so that the integrals in (A.1) are well defined. We also assume that the following conditions on k_{ij} and Ω_j hold.

$$(C.1) \sup_{x \in \bar{\Omega}_i} \int_{\Omega_j} |k_{ij}(x, y)| d\mu_j(y) < \infty; \text{ and, for all } x \in \bar{\Omega}_i,$$

$$\int_{\Omega_j} |k_{ij}(x, y) - k_{ij}(x', y)| d\mu_j(y) \rightarrow 0$$

as $x' \rightarrow x$ with $x' \in \bar{\Omega}_i$ ($i, j = 1, \dots, N$).

(C.2) For some $m \leq \min_j n_j$ and $i = 1, \dots, N$, there exists $a_j^{(i)} \in \mathbf{R}^{n_i}$, $j = 1, \dots, m$, and a bounded set $\omega_i \subset \Omega_i$ such that

(i) $\Omega_i = \bigcup_{P \in \mathbf{Z}^m} \omega_i^{(P)}$, where $\omega_i^{(P)} := \omega_i + \sum_{j=1}^m a_j^{(i)} p_j$ for $P = (p_1, \dots, p_m) \in \mathbf{Z}^m$;

(ii) $\omega_i^{(Q)} \cap \omega_i^{(P)} = \emptyset$ for $Q, P \in \mathbf{Z}^m$, $Q \neq P$;

(iii) $k_{ij}(x + a_l^{(i)}, y + a_l^{(j)}) = k_{ij}(x, y)$, $x \in \bar{\Omega}_i$, $y \in \bar{\Omega}_j$, $i, j = 1, \dots, N$, $l = 1, \dots, m$.

Define the integral operator $K_{ij} : X_j \rightarrow Y_i$ by

$$K_{ij}\psi(x) = \int_{\Omega_j} k_{ij}(x, y)\psi(y)d\mu_j(y), \quad x \in \bar{\Omega}_i, \quad i, j = 1, \dots, N.$$

Then (A.1) can be abbreviated as

$$(A.2) \quad \psi_i = \phi_i + \sum_{j=1}^N K_{ij}(z_j\psi_j), \quad i = 1, \dots, N.$$

Let $Y := \prod_{j=1}^N Y_j$ and $X := \prod_{j=1}^N X_j$ be the product spaces. For $\phi \in X_j$, we denote by $\|\phi\|_j$ the essential supremum norm, $\|\phi\|_j := \text{ess sup}_{x \in \Omega_j} |\phi(x)|$, $j = 1, \dots, N$, and by $\|\phi\|$ the product norm on X , defined by $\|\phi\| = \sum_{j=1}^N \|\phi_j\|_j$, $\phi = (\phi_1, \dots, \phi_N)^t \in X$, where $(\cdot, \dots, \cdot)^t$ denotes the transpose of (\cdot, \dots, \cdot) . Equipped with the product norm $\|\cdot\|$, the product space X is a Banach space, and Y is a closed subspace of X . Since X_j can be identified with $(L_1(\Omega_j))'$, the dual space of $L_1(\Omega_j)$ ($j = 1, \dots, N$), it follows that X can be identified with $\prod_{j=1}^N (L_1(\Omega_j))' \equiv (\prod_{j=1}^N L_1(\Omega_j))'$, the dual space of the product space $\prod_{j=1}^N L_1(\Omega_j)$. Thus, for a sequence $(\phi_n) \subset X$ and $\phi \in X$ with $\phi_n = (\phi_n^{(1)}, \dots, \phi_n^{(N)})^t$ and $\phi = (\phi^{(1)}, \dots, \phi^{(N)})^t$, (ϕ_n) converges to ϕ in the weak* topology on X ($\phi_n \xrightarrow{w*} \phi$) if and only if

$$\int_{\Omega_j} \phi_n^{(j)} \psi \rightarrow \int_{\Omega_j} \phi^{(j)} \psi \quad \text{for all } \psi \in L_1(\Omega_j), \quad j = 1, \dots, N,$$

i.e. if and only if $\phi_n^{(j)} \xrightarrow{w*} \phi^{(j)}$ in X_j , $j = 1, \dots, N$.

Now define the matrix operator K on X by

$$K = \begin{pmatrix} K_{11} & \cdots & K_{1N} \\ & \ddots & \\ K_{N1} & \cdots & K_{NN} \end{pmatrix}.$$

Then (A.2) can be further abbreviated in matrix operator notation as

$$(A.3) \quad \psi = \phi + K_z \psi = \phi + K(\hat{z}\psi),$$

where, for $z = (z_1, \dots, z_N)^t \in X$, \hat{z} is defined as

$$\hat{z} = \begin{pmatrix} z_1 & & 0 \\ & \ddots & \\ 0 & & z_N \end{pmatrix}$$

and $K_z : Y \rightarrow Y$ is defined by

$$(A.4) \quad K_z \psi = K(\hat{z}\psi), \quad \psi \in Y.$$

For $l = 1, \dots, m$, define the translation operator $T_{a_l^{(j)}} : X_j \rightarrow X_j$ by

$$T_{a_l^{(j)}} \psi(x) = \psi(x - a_l^{(j)}), \quad x \in \bar{\Omega}_j \quad (j = 1, \dots, N),$$

and, for $a = (a_1, \dots, a_N) \in \tau := \{(a_l^{(1)}, \dots, a_l^{(N)})^t | l = 1, \dots, m\}$, the matrix operator $T_a : X \rightarrow X$ by

$$T_a = \begin{pmatrix} T_{a_1} & & 0 \\ & \ddots & \\ 0 & & T_{a_N} \end{pmatrix}.$$

Then by (C.2) (iii), $T_a K = K T_a$ for $a \in \tau$. Let $B(Y)$ denote the Banach space of bounded linear operators on Y and I the identity matrix operator on Y , given by

$$(A.5) \quad I = \begin{pmatrix} I_1 & & 0 \\ & \ddots & \\ 0 & & I_N \end{pmatrix}$$

where I_j is the identity operator on Y_j ($j = 1, \dots, N$). Then the following results have been proved in [9] on the solvability of the system of integral equations (A.3). These results are straightforward extensions to a system of integral equations of results for a single integral equation established in [8].

THEOREM A.1. *Suppose that (C.1)–(C.2) are satisfied and that $W \subset X$ is weak* sequentially compact, $T_a W = W$ for all $a \in \tau$, and $I - K_z$ is injective for all $z \in W$. Then $(I - K_z)^{-1}$ exists as an operator on the range space $(I - K_z)Y$ for all $z \in W$ and*

$$\sup_{z \in W} \|(I - K_z)^{-1}\| < \infty.$$

If also, for every $z \in W$, there exists a sequence $(z_j) \subset W$ such that z_j converges weak to z and*

$$\text{for all } j, \quad I - K_{z_j} \text{ injective} \implies I - K_{z_j} \text{ surjective,}$$

then also $I - K_z$ is surjective for each $z \in W$ so that $(I - K_z)^{-1} \in B(Y)$.

THEOREM A.2. *If (C.1)–(C.2) are satisfied, $z = (z_1, \dots, z_N)^t \in X$, $\lambda = (\lambda_1, \dots, \lambda_N)^t \in \mathbf{C}^N$, and, for $j = 1, \dots, N$,*

$$\text{ess sup}_{|x| \geq A, x \in \Omega_j} |z_j(x) - \lambda_j| \rightarrow 0$$

as $A \rightarrow \infty$, then

$$I - K_\lambda, I - K_z \text{ injective} \Rightarrow I - K_z \text{ surjective, } (I - K_z)^{-1} \in B(Y).$$

Appendix B. Guided waves.

By a guided wave we mean a solution of the homogeneous problem which has its energy localized in or near the layer E_B . Precisely, for $a < b$, $S \subset \mathbf{R}^2$, let $S(a, b) = \{x \in S \mid a < x_1 < b\}$. Then our definition is as follows.

DEFINITION B.1. Call $v \in C^1(\bar{U})$ a guided wave if $v \neq 0$, v satisfies (1) and (2), v is bounded in E_h for every $h > 0$,

$$(B.1) \quad \sup_{n \in \mathbf{Z}} \int_{U(n, n+1)} (|v|^2 + |\nabla v|^2) dx < \infty$$

and

$$(B.2) \quad c_h := \sup_{n \in \mathbf{Z}} \int_{U_h(n, n+1)} (|v|^2 + |\nabla v|^2) dx \rightarrow 0$$

as $h \rightarrow \infty$.

Remark B.1. In the case when the scatterer is a diffraction grating, i.e., k is periodic in the x_1 -direction with some period L , it is usual to assume that v is correspondingly quasi-periodic (i.e., that $v(x) \exp(-ik_+ \cos \theta x_1)$ is periodic). Then (B.1) and (B.2) reduce to the condition that

$$\int_{U(0, L)} (|v|^2 + |\nabla v|^2) dx < \infty,$$

i.e., that the energy is finite in a single period of the grating.

Remark B.2. Conditions (B.1) and (B.2) are satisfied if v decreases sufficiently rapidly in the vertical direction, in particular if, for some constants $C > 0$ and $p > 1/2$,

$$|v(x)| \leq C(1 + x_2)^{-p}, \quad x \in U.$$

The following result is shown in [6].

THEOREM B.2. If v is a guided wave, then v satisfies the UPRC.
