This Event is brought to you for free and open access by the Fish Passage Community at UMass Amherst at ScholarWorks@UMass Amherst. It has been accepted for inclusion in International Conference on Engineering and Ecohydrology for Fish Passage by an authorized administrator of ScholarWorks@UMass Amherst. For more information, please contact scholarworks@library.umass.edu.

Can We Predict Swimming Performance of Small-Bodied Fishes?

Ashley D. Ficke - PhD Candidate¹

Dr. Chris A. Myrick, PhD¹

Matt Kondratieff²

Tyler Swarr¹

¹Dept. of Fish, Wildlife, and Conservation Biology, Colorado State University

²Colorado Parks and Wildlife

Overview

- ◆ Quick introduction to western Great Plains streams
- ◆ Stream alterations in these systems
 - ◆ Fragmentation
- ◆ Improving fish passage for small, nonsalmonid fishes
 - ◆ Predictive swimming model
 - ◆ Review of swimming abilities
 - ◆ Field study of existing rock ramps
 - ◆ Lab study using experimental rock ramps

Photo: Matt Kondratieff

Western Great Plains Streams

- ◆ Many semi-arid systems
 - ◆ Some have mountain headwaters
 - ◆ Large inter- and intra-annual flow variability
 - ◆ Large range of physicochemical conditions
- ◆ Many of these streams are highly fragmented

Western Great Plains Fishes

- ◆ Many small-bodied fishes
 - ◆ Adult TL \sim 100 – 150 mm
- ◆ Movement essential part of life history for most species

Facilitating Fish Passage

- ◆ Typically accomplished with fishways
- ◆ Multiple fishway types
- ◆ Incorporating swimming data into design is ideal
- ◆ Many questions remain
 - ◆ Swimming ability quantified for few species
 - ◆ Collection of swimming ability data requires expensive, long-term studies

Facilitating Fish Passage: Goal

- ◆ Develop a predictive model of swimming performance for small-bodied North American fishes.
 - ◆ Predictor variables = simple to collect
 - ◆ Combination of shape and physiological measurements

Photo by Jon Wardell

Methods: A Predictive Swimming Model

- ◆ Aerobic and sprint swimming as a function of...
- ◆ Morphology
 - ◆ Landmark Analyses
- ◆ Physiology
 - ◆ Hematocrit, Hb⁺
 - ◆ Percent red muscle
 - ◆ Percent white muscle

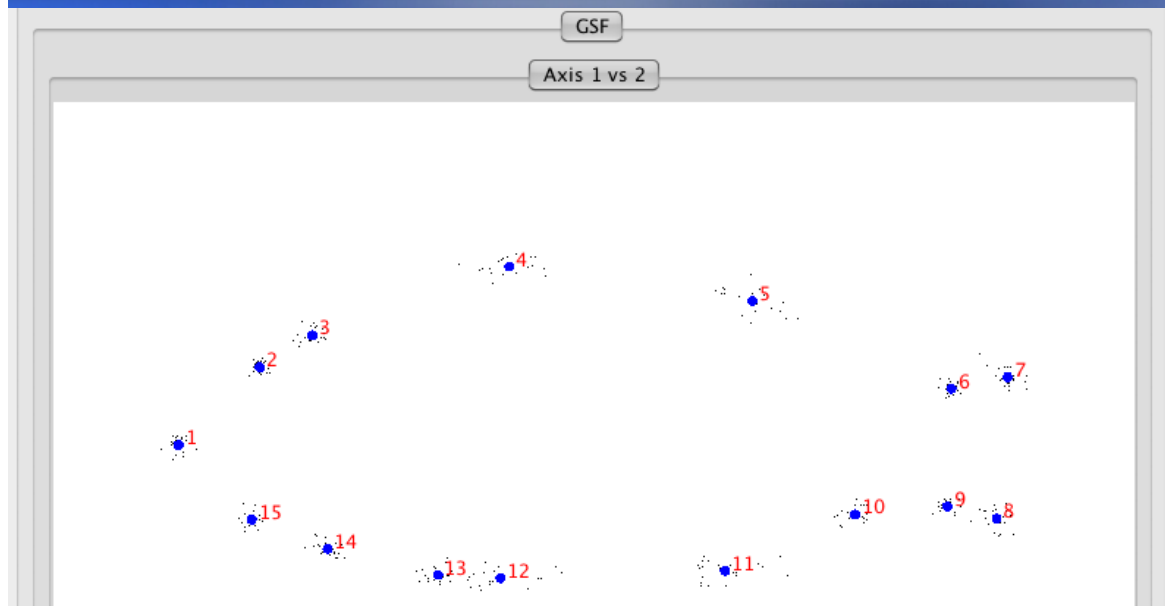

Dependent Variables: Swimming Abilities

- ◆ Loligo Model 32 & Model 90 swim tunnels
 - ◆ Constant acceleration tests (CATs)
 - ◆ Start velocity = 11 cm/s
 - ◆ Increments = 5 cm/s every 5 s
- ◆ Measurements
 - ◆ Aerobic ability = gait transition speed
 - ◆ Sprint ability = speed at "exhaustion"

Independent Variables: Morphology

- ◆ Total length
- ◆ Landmark analysis
 - ◆ 15 landmarks per fish
 - ◆ Procrustes analysis provides “typical shape” for species
 - ◆ PCA converts (x , y) coordinates to scores
 - ◆ Scores can be used in statistical analyses

Independent Variables: Morphology

Independent Variables: Physiology

- ◆ Hematocrit
 - ◆ Hematocrit tubes centrifuged
 - ◆ Packed cell volume read
- ◆ Hemoglobin concentration
 - ◆ Quantichrom Hemoglobin Assay
- ◆ Red and white muscle
 - ◆ Percent @ 50% of TL
 - ◆ Preserved & stained cross sections analyzed with ArcGIS

Integrated Analysis

- ◆ Boosted regression trees
 - ◆ Strong predictive power
- ◆ Two analyses
 - ◆ Aerobic swimming ability
 - ◆ Sprint swimming ability
- ◆ Independent variables for both analyses:
 - ◆ Total length
 - ◆ Average body shape scores (PCA scores) for each species
 - ◆ Hematocrit
 - ◆ Hemoglobin concentration
 - ◆ Red and white muscle percentages

Results: Swimming Performance

Results: Morphology

Effects on Swimming Performance

- ◆ Aerobic

- ◆ Total length
- ◆ Red Muscle
- ◆ PC1 and PC2

- ◆ Sprint

- ◆ PC1
- ◆ Total length
- ◆ HCT and Hb⁺
- ◆ PC3

Effects on Swimming Performance

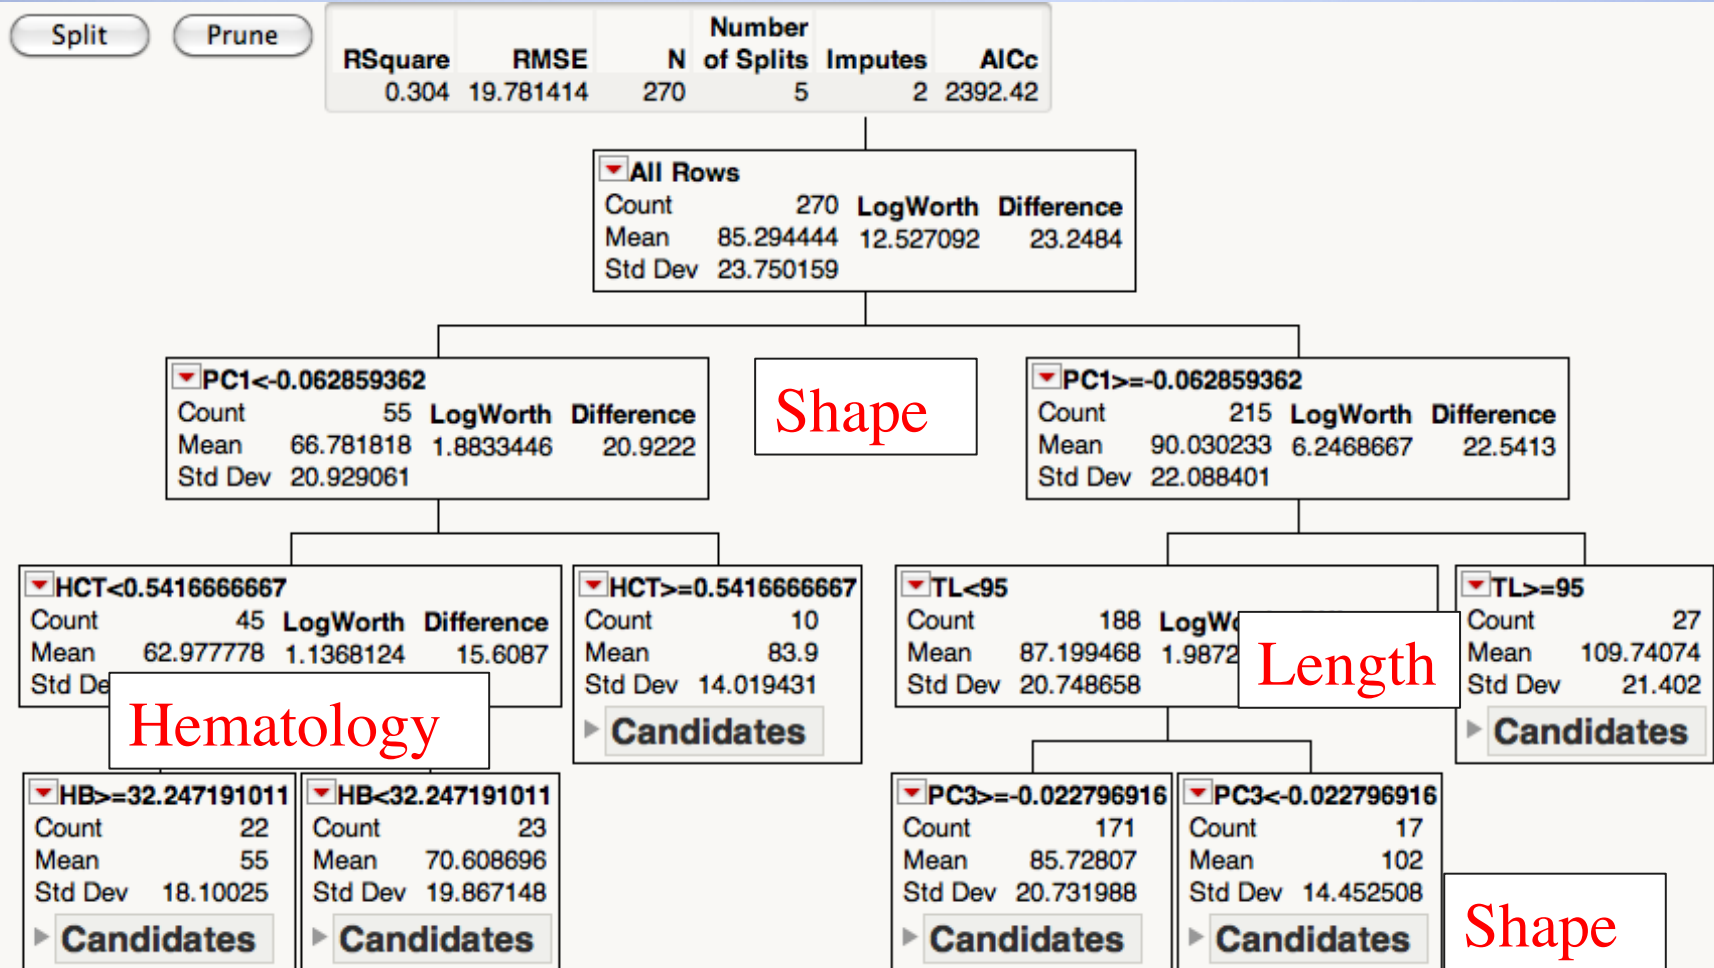

- ◆ Aerobic

- ◆ Total length
- ◆ Red Muscle
- ◆ PC1 and PC2

- ◆ Sprint

- ◆ PC1
- ◆ Total length
- ◆ HCT and Hb⁺
- ◆ PC3

Effects on Sprint Performance

Results: Morphology

Conclusions

- ◆ Different factors may affect aerobic and anaerobic ability
 - ◆ We remain confident that we can produce a predictive model
- ◆ Integrating physiology and morphology important
- ◆ Important but unmeasured...
 - ◆ Behaviors (station-holding, searching)
 - ◆ Fin area and morphology (to be continued...)
- ◆ Estimating ability of untested fish will improve fishway efficacy
