Farmers as experts: interpreting the 'hidden' messages of participatory video across African contexts

Journal:	Area
Manuscript ID	AREA-RP-Feb-2018-0015.R2
Manuscript Type:	Regular Paper
Keywords:	Participatory Video, Participation, Empowerment, Africa
Abstract:	<p>Recent scholarship has contributed important insights into the political dynamics inherent in the process of making and showing participatory videos (PV). As a research method and an instrument for social change, participatory video has both potential and limitations for overturning the power dynamics embedded within research and in development processes. This paper focuses on experiences of incorporating participatory video in land management projects in four countries in Africa. Along with other participatory methods, the videos represented an effort to include community perspectives and objectives into the research process. Analysis of PV has largely focused on examining the tensions and contradictions involved in the process of making participatory videos. There has been less focus on the content of the videos themselves and what it might suggest for empowerment, voice and representation. This paper attempts to address this gap by examining the implications of the narratives that emerge in five different videos. On the surface, the participants appear to repeat dominant national and global narratives about land degradation. However, the fact that farmers present themselves as experts on these topics and the ways in which they appropriate and reconfigure the dominant narratives, can be seen as an act of empowerment. In this way, they preclude the need for external intervention on how to manage their resources.</p>

FARMERS AS EXPERTS: INTERPRETING THE 'HIDDEN' MESSAGES OF PARTICIPATORY VIDEO ACROSS AFRICAN CONTEXTS

Participatory video (PV) has gained attention in the last decade and is of increasing interest and use globally in both academic research and in development and social justice projects. Several critical papers (Kindon, 2003; Mistry and Berardi, 2012; Wynne-Jones et al, 2015; Plush, 2015; Kindon 2016; Milne, 2016; Mistry et al 2016; Rogers, 2016; Shaw, 2016; Walsh, 2016) have shed light on the nuances of power embedded in participatory video exercises and the limitations of the method for achieving social change (Tremblay and Harris, 2018). Walsh (2016), Shaw (2016) and Mistry et al, (2016) have all called for more nuanced analyses of power dynamics inherent in producing participatory videos and have underlined the importance of understanding the multiple objectives of all those involved. This body of literature, while still small, has begun an important debate on the usefulness of PV and its ability to challenge inherent power differences.

PV aims to enable participants to represent themselves and to identify what they think are important issues in their lives. The assumption underlying PV is that by allowing people to speak for themselves, rather than having researchers or development agents speak for them, their capacity to influence decisions shaping their lives will be improved (Lunch and Lunch, 2006; Milne et al, 2012; White, 1996; Wheeler, 2011; Mistry et al, 2016). The PV process is considered empowering because it fosters reflection on problems and enables participants to develop the voice to present those problems. Although amplifying voice and taking control over representation are critical steps in empowerment, these features on their own do not, in and of themselves, address underlying structural drivers of inequality. Indeed, conceptualising PV primarily in terms of voice and representation has been problematised as contributing to problems such as co-option and the dilution of transformative possibilities (Shaw, 2012; Shaw 2015a).

1
2
3
4
5 Recent analysis of PV has done a great deal to highlight several challenges, including: the limitations of
6 video leading to social change; individual versus community empowerment; the tendency of videos to
7
8 perpetuate simplified notions of community through the presentation of homogeneous “community
9
10 voice”; and the institutional constraints present in development projects (Kindon, 2003; Mistry and
11
12 Berardi, 2012; Wynne-Jones et al, 2015; Plush, 2015a, 2015b; Kindon 2016; Milne, 2016; Mistry et al
13
14 2016; Rogers, 2016; Shaw, 2016; Walsh, 2016). As with participatory approaches more broadly, there is
15
16 a risk that PV may “render technical” complex political and social problems and so overlook systemic
17
18 power relations and thus re-produce rather than challenge dominant norms (Cooke and Kothari, 2001;
19
20 Ferguson, 1990; Li, 2007; Leal, 2011; Mosse, 2011). While recent PV literature has analysed the *process*
21
22 of making videos, there has been less attention directed to the actual *products* emerging from PV
23
24 initiatives and what they might tell us. As Baselga (2015) notes, few theoretical works acknowledge the
25
26 importance of PV as a specific form of audiovisual product. This is perhaps, in part, because the
27
28 methodology intentionally places an emphasis on process rather than product.
29

32
33
34
35
36

37 This paper reflects on the content of video outputs emerging from PV processes across four countries in
38
39 Sub-Saharan Africa. We analyse the explicit and implicit messages contained within the videos and argue
40
41 that these messages, or narratives, shed light on development dynamics. A focus on narratives is
42
43 nothing new, development literature abounds with references to and critiques of ‘narratives of
44
45 development’ and the practices they promote (Roe, 1991). Carr (2010) indicates that narratives, or
46
47 stories, can provide a way of understanding people’s experiences of development and their encounters
48
49 with development professionals. Mistry et al (2015) also illustrate that focusing on “what is in” audio-
50
51 visual material produced by PV participants provides a way of exploring nuanced community narratives.
52
53
54
55
56
57
58
59
60

1
2
3 With this in mind, we believe that outputs emerging from PV provide a particularly interesting window
4
5 into investigating issues of politics, power and representation.
6
7

8
9
10 The videos that form the basis of our analysis were all made by farmers in the context of sustainable
11
12 land management projects, an arena where the figure of the expert and notions of expert knowledge
13
14 loom large (Assche et al, 2017; Chambers, 1983; Sillitoe, 2017). PV was intended to provide an
15
16 opportunity for farmers to describe their land management challenges and suggest their own solutions.
17
18 Reflecting on the PV process combined with our own knowledge of the context, gained over a multi-year
19
20 time period, pertinent issues emerge. Particular attention is paid to how farmers represent themselves
21
22 “on screen” in the context of dominant discourses on land management. We explore what these
23
24 narratives might reveal about relations between farmers and “experts” and argue that although the
25
26 videos may appear to repeat dominant narratives, there is often rather more going on beneath the
27
28 surface than meets the eye. In making the videos, the participants are producing both explicit and
29
30 implicit messages for local and global viewers in order to assert their own roles as experts on land
31
32 management problems.
33
34
35
36
37
38

39 **THE PROCESS**

40
41 From 2011 to 2016, multidisciplinary teams carried out field research on sustainable land management
42
43 projects in Ethiopia, Malawi, Ghana and Tanzania.¹ These projects investigated the drivers of land-use
44
45 management decisions and the constraints to adoption of more sustainable choices. Thus engagement
46
47 with farmers, as primary land managers, was central throughout the projects. PV was one of a number
48
49 of participatory methods deployed which also included transect walks, participatory mapping, and
50
51 various ranking and sorting exercises carried out with community members. Other qualitative methods
52
53 included interviews, focus groups, institutional analysis, and historical timelines. Household surveys
54
55
56
57
58
59
60

1
2
3 produced quantitative data on farm production and basic social and economic data. Biophysical
4
5 scientists carried out land use/land cover studies and soil analysis.
6
7
8
9

10 The inclusion of PV aimed to address the lack of farmer-voiced perspectives on land use and to overturn
11 the “rule of experts” (Mitchell, 2002) so common in development projects. It aimed to bring local
12 solutions to locally identified problems into the discussion on land management challenges. Because the
13 projects had engaged with rural communities over the course of three years, the PV participants were
14 very familiar with project goals to address land degradation. The videos produced, not surprisingly,
15 focused on the central topic of land use. Thus, the content, from the start, was in part pre-determined,
16 which veers from the ideal of PV. We also could not have justified producing videos on any given topic
17 proposed by communities, particularly as the PV process was undertaken by international research
18 institutions operating under agreements with host governments. This demonstrates how funding
19 arrangements and institutional agendas modify how PV is implemented (Plush 2015b).

26
27
28
29
30
31
32
33

34 In Ethiopia, the video-making process took place with twelve participants over ten days in Fogera district
35 in Amhara Region, an area north of the city of Bahir Dar. It was integrated into multi-stakeholder
36 platforms created by the project to bring different interest groups together to discuss land management
37 challenges and design joint solutions. We felt that PV could provide a way for farmers to present their
38 views, believing that they, as Wheeler (2011) also suggests, are more knowledgeable about their
39 realities.
40
41
42
43
44
45
46
47
48
49

50 None of the participants had ever used a camera before so we used games and exercises to teach
51 rudimentary camera skills before progressing to video production, interviewing, presentation and
52 sequence shooting. The research team facilitated the process of issue selection. Once the issues,
53
54
55
56
57
58
59
60

1
2
3 associated messages and audience had been determined, participants planned what to record, where,
4 when and how. The facilitator team reviewed, transcribed and edited the resulting film, titled “A Rope
5 To Tie A Lion” (<https://www.youtube.com/watch?v=7SSOm1hsCsE>).
6
7
8
9

10
11
12 Following the video-making process, over the course of several weeks, participants reviewed the edited
13 film and, after a process of informed consent, it was screened to members of the wider community in
14 each of the districts. Viewers then discussed the content of the film, responded to it and added their
15 views, which were recorded by the PV participants. This enabled other members of the wider
16 community to comment, disagree and suggest alterations. A version of the film was screened to
17 members of the research project at an internal screening in Addis Ababa to get feedback. The final film
18 was then screened to members of the Fogera stakeholder platform that included district administrators,
19 agricultural extension agents and experts from national research institutes. After the video was shown
20 and discussed, platform members were interviewed and their responses were filmed.
21

29
30
31
32
33

34 In Ghana, Malawi and Tanzania, the process was similar to that described for Ethiopia, with one key
35 difference: because of institutional pressures, the video making process was shortened to six days rather
36 than ten due to constraints in time and funding. In these countries, a team of researchers from an
37 international research institution together with local university partners facilitated the process. In all
38 countries, an equal number of men and women, ranging from nine to twelve total participants,
39 comprised the community teams that made the videos. The process followed the same sequences and
40 involved playback throughout all days for participants to assess the content and make any changes they
41 wanted going forward. The videos were screened to the wider community in which they took place and
42 to district level planners and implementers, researchers outside of the project, NGOs, and national level
43 policy makers and officials. These screenings and responses from viewers were not filmed and included

4 taken of responses.
5
6
7
8
9

10 International researchers and local counterparts facilitated the PV process. National partners (extension
11 officers and researchers from national institutes) chose the participants from the local communities,
12 using certain criteria – on gender, socio-economic status, and age – in an effort to reflect community
13 composition. This strategy was obviously problematic as adequate representation in a small group is not
14 really possible given the diversity within rural communities. Additionally, national partners tended to
15 choose farmers that they had worked with in the past or who they thought best able to carry out the
16 task. In all countries, perceptions about who was best placed to participate was usually based on an
17 individual's status in the community, their knowledge, and an ability to "speak well". So, in Tanzania, we
18 had some local leaders, members of women's groups, an extension officer and other fairly successful
19 farmers. In Upper East Ghana, there was a local chief and an assemblyman and a mixture of community
20 members who had engaged in past projects. In Ethiopia, there was a "model farmer", members of local
21 women's groups and the leader of a government initiated youth group.

36
37
38

39 The video making process in each of the countries followed a short-term, 'single-loop' process (Shaw,
40 2015), in many ways comparable to models of "shallow participation" outlined by Cornwall and Jewkes
41 (1995). We found it difficult to implement, longer and more engaged "double-loop" processes due to
42 the time and budgetary constraints of the respective projects. We were cognizant of the fact that the PV
43 literature indicates that one round of video-making tends to reproduce dominant norms and indeed, on
44 the surface, each of the videos appears to do just that. However, the video products also captured
45 valuable insights into development dynamics in each of the respective countries. With this in mind, we
46 have analysed the video outputs with the aim of highlighting some of the underlying, but often hidden

3 messages. This analysis focused on how dominant narratives are communicated, through participants'
4 oration, through skits and characters in these skits, and the messages highlighted in on-screen
5 interviews. We looked for key words, topics and themes from ongoing national debates on land-use.
6
7 Each video emphasizes specific messages, related to land management dynamics of the respective
8 country, with which both national level decision-makers and local community members are familiar.

15

16 **MAKING THE VIDEOS – EMERGENT NARRATIVES**

17
18 In discussions about what challenges land users face, what affects their decisions and what they see as
19 the most important issues to highlight, participants unsurprisingly selected topics that were already part
20 of district or national discussion and dominant development agendas, and were linked in various ways
21 to the specific socio-political and historical contexts of each country.
22
23
24
25
26
27
28
29

30 In northern Ghana (<https://www.youtube.com/watch?v=8hw4ytnCU6A&t=1s>,
31 <https://www.youtube.com/watch?v=RrZQt3dHJoA>), bush burning was a prominent theme. This issue
32 has dominated agricultural development and environmental management programs from the colonial
33 era onwards. Amanor's (2002) illuminating overview of colonial and post-colonial policies and practices
34 regarding burning, describes how the scientific literature from the 50s and 60s that questioned the
35 validity of banning fire, has been superseded by publications advocating for its eradication. NGOs and
36 government widely promote programs to address "peasant backwardness" and their "entrenched
37 cultural beliefs" on burning (Amanor, 2002: 67-69). While more recent research, particularly in Mali
38 (Laris, 2002; Laris and Wardell, 2006), indicates that mosaic burning across the landscape has significant
39 benefits, this work has not gained traction in the way that anti-fire narratives have. The discourse
40 surrounding farmer ignorance and backwardness has clearly penetrated rural communities:
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 Many of the youth.....have been educated in schools about the cultural ills of fire. They have
4 become intolerant of the use of fire, which they consider to be culturally backward and rustic.
5
6 Since the anti-bushfire discourse strengthens the power of chiefs and the District Assembly over
7
8 the rural population they have become firm converts to its objectives (Amanor, 2002: 71).
9
10
11
12
13

14 In the videos, bush burning and its negative consequences figure as central concerns. Interestingly,
15
16 community members chose to reiterate and appropriate dominant narratives that have long been used
17
18 to undermine local practices and knowledge, rather than counter them. As the project concerned
19
20 sustainable land management, it is hardly surprising that community participants chose to draw upon
21
22 well-established narratives. Burning is presented as a threat to livelihoods by decreasing soil quality and
23
24 damaging valuable tree species. Like external experts, either foreign or domestic, the video makers
25
26 admonish their fellow farmers to abandon practices of burning and tree cutting. Interpreting these
27
28 positions is hardly straightforward, but it could be argued that the video makers, by adopting the anti-
29
30 bush burning discourse assert their own role as “experts”. They adopt both the language of experts in
31
32 their reference to soil quality but also in their disapproval and instruction against “bad practices”. In so
33
34 doing, they preclude the need for external experts by emphasizing their own “local” knowledge of the
35
36 negative consequences of burning. These narratives can serve two purposes depending on the audience.
37
38 For external viewers, they suggest “awareness raising” by outsiders is not necessary. For internal
39
40 audiences, the video-makers, who included a local chief, strengthen their authority by proclaiming their
41
42 role as communicators of national messages.
43
44
45
46
47
48
49

50 Whilst videos from all four countries drew attention to issues surrounding trees, the video made in
51
52 Malawi was perhaps the most focused on issues of deforestation. This reflects politically charged
53
54 debates that have generated both crisis narratives and counter-narratives (Zulu, 2010). In the video,
55
56
57
58
59
60

1
2
3 farmers depict the cutting of trees for firewood or charcoal or clearing land, and the need to plant and
4 preserve them, but place particular emphasis on the link between tree cover and poverty. Entitled “Let’s
5 Conserve the Environment by Finding Solutions to Poverty”
6
7
8
9
10 (https://www.youtube.com/watch?v=0EZD5lv_xAQ), it details, in a skit, how people struggle to produce
11 enough food, or the cash to buy food, so they often turn to charcoal production. In the skit, a woman
12 arrives on the scene of a family cutting down a tree and tells them to stop destroying the environment.
13 She admonishes them saying “the government and NGOs are against this practice”. The woman who is
14 cutting down the tree exclaims, “I thought you were going to talk about food. That is what we need!”
15
16 Although they promote the dominant message about preserving trees, the Malawi video participants
17 emphasize that poverty is the root of their problem and is what drives people to degrade their
18 environment. As one of the women states, “Of course people understand but they lack alternatives and
19 depend on the trees as a primary source of income”. The participants urge NGOs and government to
20 help them find solutions to their poverty and to provide training in technical skills which will relieve their
21 dependence on the environment for their livelihood.
22
23
24
25
26
27
28
29
30
31
32
33
34
35
36

37 In Ethiopia, the video makers also repeat dominant government narratives, in this case about “free
38 grazing” and land degradation. Since the 1990s, the implementation of soil and water conservation
39 (SWC) measures has been undertaken as part of the government’s agricultural extension package
40
41 (Bewket, 2007). In the north of Ethiopia, particular emphasis has been on restricting livestock grazing to
42 prevent damage to physical SWC structures. In the video, despite repeating certain narratives, farmers
43 also warn of the consequences of restricting grazing for marginalized community members who rely on
44 communal grazing areas for fodder and collection of dung cakes for fuel. Ethiopia is a particularly acute
45 example of top-down, hierarchical planning and implementation (Snyder et al, 2014). Indeed, many
46
47
48
49
50
51
52
53
54
55 “experts” assume that farmers’ “ignorance” and “poor” decision-making is at the root of land
56
57
58
59
60

1
2
3 degradation and challenges to agricultural production (Rahmato, 2006). However, the restrictive
4 political situation inhibits farmer voice and as a result they are not able to openly express critical
5 opinions of government initiatives. Although participants voiced critical opinions behind the scenes
6 during the video making process, the narratives that feature in the video are deliberately measured.
7
8 Farmers express the pros and cons of restricting grazing and emphasize that efforts to solve natural
9 resource management problems should start with communities. In their balanced approach, farmers
10 mirror narrative strategies commonly used by politicians and other powerful “experts”, thereby
11 positioning themselves as people who know and can also “speak well”.
12
13
14
15
16
17
18
19
20
21
22

23 In Tanzania (<https://www.youtube.com/watch?v=Erjbnr15jY>), the video team performed a skit,
24 highlighting the difference between a “poorly” managed farm where the farmer continued to carry out
25 practices from “their grandfather’s time” doing little to conserve soil on steep slopes. This field is
26 contrasted with that of a neighboring farmer who practices “expert” (*kitaalamu*) farming by
27 constructing terraces and planting trees. They explained that “experts” taught them these practices and
28 that their land has become more productive because of them. The juxtaposition of “traditional” with
29 “modern” is a very common and longstanding theme in Tanzania, particularly pertaining to farming
30 (Bishop, 2007; Raikes, 1978). The central figure in the skits is the extension officer, farmers appear as
31 largely voiceless and submissive characters, often standing in the background and nodding their
32 agreement. The team visits the extension officer’s compound where he practices agriculture as a
33 “business”. The video tours his farm, focusing on the abundant maize harvest, the “modern”, stall-fed
34 cows and goats and the “Israeli” chickens. Adopting “modern” (*ya kisasa*) farming practices is a central
35 message of the video and a widely circulated national preoccupation. Repeating national narratives
36 allows the video makers to assert themselves as “modern” and already carrying out the practices that
37 “experts” recommend. Yet, as one farmer asks the extension officer, “If we wanted goats, chickens or
38

2
3 cows like this, is it possible?" The question possibly hints at the resource and labor costs involved which
4
5 are often beyond the reach of many households (Green, 2017). Knowledge is not what they lack but
6
7 rather the capital to invest in "modern" farming.²
8
9

11 **DISCUSSION**

12
13
14 On the surface, the videos may repeat the dominant development discourse, but they also contain
15
16 layered narratives and multiple meanings, if you know what to look for or "read". The videos capture
17
18 dynamics that may not be apparent without knowledge of the context in which they are located. For
19
20 example, knowledge of the history of bush burning and its continued prevalence in national discourse,
21
22 knowledge of government-community relationships and interactions, knowledge of what
23
24 "development" means in the national imaginary, are all contextual knowledge that the researchers
25
26 gained working in these countries for several years and drew upon in analysing the video content. Every
27
28 video viewer will have different knowledge of and interpretations of these contexts. This raises some
29
30 questions: what do different audiences see when they watch these videos? Are there forms of
31
32 resistance to, or subversion of, dominant development narratives within the videos that may not be
33
34 immediately apparent to everyone who watches them? Mitchell (2011), for example, highlights that PV
35
36 outputs can carry a "double message, or meta-message" which may serve to reveal alternative
37
38 narratives and express concerns. Analysis of PV, then, would benefit from an examination of these
39
40 underlying messages and this perhaps demands a more nuanced understanding on the part of PV
41
42 facilitators that multiple messages may evoke multiple readings.
43
44
45
46
47
48
49

50 This element of "double messages" can be seen, in particular, in the performative segments included in
51
52 the videos. The skits present characters acting out common development scenarios and dialogues.
53
54 Through this performative process, PV perhaps provides a space to act out alternative realities and
55
56
57
58
59
60

1
2
3 subvert dominant power dynamics. For example, a woman in the Malawi video confronts a Forest
4 Officer, even going so far as threatening him with a machete saying, “You! Don’t talk so much, otherwise
5 I will hack you. With the hunger situation we have this year, this is the only option we have to survive”.
6
7 This is something she would be extremely unlikely to do in real life. The amusement on the part of her
8 fellow participants is notable and you can imagine the amusement during community video screenings
9 when audiences see a fellow farmer taking on a government official. Waite & Conn (2011) suggest that
10 humor can be read as a subtle source of resistance, which makes it no less powerful than other
11 techniques, and indeed may have even more of an impact on an audience.
12
13
14

16
17
18
19
20
21
22

23 Most of the videos focused on the complexities of the problems they highlighted and emphasized
24 internal measures to take and where, when and how external support was wanted. In Upper East region
25 of Ghana, the participants chose to highlight actions that community members could take themselves
26 (such as manure and crop residue incorporation, building stone bunds, protecting trees) and
27 emphasized that outside assistance was not really needed. This choice to emphasize internal agency
28 versus reliance on external assistance was carefully chosen by the participants during their deliberations
29 on the main messages they wanted to convey. In Malawi, the video makers focused on how the wider
30 context of poverty drives local actions. They called on government to build local capacity to pursue
31 livelihoods not dependent on land use. In Ethiopia, the participants state in no uncertain terms, “it is us
32 who should find the solutions for our problems... the solution is with ourselves”.
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47

48 The relationship of local communities to external experts emerges in most of the. By repeating
49 dominant narratives, the video makers are presenting themselves as experts and suggesting that they
50 do not need further instruction on how to implement sustainable land management practices. Where
51 the video makers do want expert assistance is in accessing resources that go beyond what is available in
52
53
54
55
56
57
58
59
60

1
2
3 their communities (access to seedlings, technical education in trades, access to markets). As Mistry et al
4
5 (2014) have observed, video makers can deploy multiple identities to serve specific goals. In Ghana,
6
7 villagers reinforce certain dominant narratives about “modern” agriculture but also seemingly challenge
8
9 others, choosing to highlight some of the negative aspects of agricultural inputs. They emphasize that
10
11 the herbicide “Condemn” is responsible for livestock deaths, and for the loss of frogs in wetlands. Some
12
13 also voice their skepticism about inorganic fertilizers suggesting they ruin the soil. All the videos
14
15 highlight both local knowledge and awareness of national narratives on land degradation (bush burning,
16
17 tree cutting, soil erosion, etc.) but assert their specific views on what is needed to address them. Unlike
18
19 many development projects, they have no “quick wins”, but instead suggest what they need are ways to
20
21 address and navigate underlying issues of poverty and marginalization rather than more instruction and
22
23 “awareness raising”.
24
25
26
27
28
29

30 In all of the cases described above, participants wanted their videos to be shared broadly. Indeed, they
31
32 hoped they would be seen globally and wanted them posted on YouTube. The videos were shown locally
33
34 to district officials, NGOs, and decision makers in each country, in the context of multi-stakeholder
35
36 platforms. The stakeholders were already familiar with the projects, as researchers had been interacting
37
38 with them over the course of a few years. When we invited them to the screenings, we explained that
39
40 communities had made videos about their land use issues and wanted a wide audience to view them.
41
42 How the messages were received by the various people who viewed, and continue to view the videos, is
43
44 obviously varied. In our observation, when we showed the videos to local development professionals,
45
46 they rarely focused on the content, despite attempts to facilitate discussion following the screenings.
47
48 Rather, they often expressed interest and even surprise that community members had been able to
49
50 master the technology and to make a video on their own. Although some viewers seemed impressed by
51
52 community members’ in-depth knowledge of the problems they described, this did not generate
53
54
55
56
57
58
59
60

1
2
3 meaningful discussion between PV participants and “experts”. In one sense, this reaction, or lack
4 thereof, is not surprising given that what video-makers emphasized is that they already have knowledge,
5 what they need is more tangible assistance for certain specific problems. Often, this tangible assistance
6 is beyond what decision-makers are able to implement, due to funding and other constraints.
7
8
9
10
11
12

13 **CONCLUSION**

14
15
16 The videos in this project intended to provide an opportunity for land users themselves to describe their
17 challenges and to suggest their own solutions to them. How well did these videos achieve that goal? All
18 the videos clearly highlight existing land-use issues that external experts have raised for a long time,
19 from free grazing in Ethiopia to tree cutting and soil erosion. They all illustrate that local community
20 members know the common narratives around land management challenges very well. The videos also
21 suggest that knowledge alone is clearly not enough to address practices that degrade the environment.
22
23 As long as poverty continues and farming and livestock herding options continue to become more
24 limited, resources will remain under threat. In this way, these videos suggest that unless underlying
25 political and economic factors change, people will do what they can to provide for their families and that
26 may mean degrading natural resources, but this does not mean that they lack awareness or knowledge.
27
28 While the projects lacked the time and resources to facilitate a deeper dialogue between farmers and
29 decision-makers, development actors, whether in NGOs or in government are well aware of poverty
30 being an essential driver. Actually addressing poverty remains a challenge.

46
47

48 Participatory methods provide ways for community members to “perform” their roles as “citizens” and
49 to represent “community knowledge” (Kothari, 2001; Kesby, 2005; Green, 2009). Green further argues
50 that in so participating, they “produce a representation of knowledge as a community product and thus
51 community as an object of government” (2009:18). This simplified version of community knowledge
52
53
54
55
56
57
58
59
60

1
2
3 tends to skirt contentious issues. What does this suggest for the negotiation of, or challenging of, power
4 dynamics and dominant narratives? As many scholars have already pointed out, participatory videos can
5 be quite limited in achieving empowerment on a community level. They may act to empower
6 individuals, however temporarily, to use their voice to articulate their challenges themselves, but the
7 videos, at least in this project, did little to provoke a discussion amongst viewers or decision-makers of
8 the core underlying structures affecting people's land-use decisions and how to address them. This lack
9 of discussion does not necessarily reflect decision-makers' lack of understanding of farmer
10 predicaments, but often their own sense of helplessness, or lack of political will, in the face of the scale
11 and significance of the challenges (Snyder et al, 2014). It is perhaps easier instead to discuss with
12 admiration the surprising ability of local communities to make videos than to engage in a discussion
13 about solutions to poverty.

28
29

30 What these video narratives demonstrate is the ways in which this method can shed light on new forms
31 of knowledge, ones that combine messages promoted in national and global narratives on land
32 degradation and ones that have emerged from local land-users' experience over time. They also
33 implicitly convey community knowledge of the broader agendas, power dynamics and politics at play in
34 development processes and where they fit within this context. One could interpret the video-makers'
35 messages as examples of resistance – resistance to the perception that rural people lack knowledge.
36 Nuanced analysis of the messages that emerge from short-term, single-loop participatory video
37 processes may provide a useful starting point for longer-term, more engaged PV processes, and offer a
38 compelling and powerful argument for the inclusion of these processes within land management
39 initiatives.
