

Reachability for Finite-state Process Algebras Using Horn Clauses - DTU Orbit (09/11/2017)

Reachability for Finite-state Process Algebras Using Horn Clauses

In this work we present an algorithm for solving the reachability problem in finite systems that are modelled with process algebras. Our method is based on Static Analysis, in particular, Data Flow Analysis, of the syntax of a process algebraic system with multi-way synchronisation. The results of the Data Flow Analysis are used in order to build a set of Horn clauses whose least model corresponds to an overapproximation of the reachable states. The computed model can be refined after each transition, and the algorithm runs until either a state whose reachability should be checked is encountered or it is not in the least model for all constructed states and thus is definitely unreachable. The advantages of the algorithm are that in many cases only a part of the Labelled Transition System will be built which leads to lower time and memory consumption. Also, it is not necessary to save all the encountered states which leads to further reduction of the memory requirements of the algorithm.

General information

State: Published

Organisations: Department of Applied Mathematics and Computer Science , Language-Based Technology

Authors: Skrypnyuk, N. (Intern), Nielson, F. (Intern)

Pages: 283-302

Publication date: 2013

Main Research Area: Technical/natural sciences

Publication information

Journal: International Journal of Foundations of Computer Science

Volume: 24

Issue number: 2

ISSN (Print): 0129-0541
