# Births: Final Data for 2006 

by Joyce A. Martin, M.P.H.; Brady E. Hamilton, Ph.D.; Paul D. Sutton, Ph.D.; Stephanie J. Ventura, M.A.; Fay Menacker, Dr. P.H.; Sharon Kirmeyer, Ph.D.; and T.J. Mathews, M.S., Division of Vital Statistics

#### Abstract

Objectives—This report presents 2006 data on U.S. births according to a wide variety of characteristics. Data are presented for maternal demographic characteristics including age, live-birth order, race, Hispanic origin, marital status, and educational attainment; maternal lifestyle and health characteristics (medical risk factors, weight gain, and tobacco use); medical care utilization by pregnant women (prenatal care, obstetric procedures, characteristics of labor and/or delivery, attendant at birth, and method of delivery); and infant characteristics (period of gestation, birthweight, Apgar score, congenital anomalies, and multiple births). Also presented are birth and fertility rates by age, live-birth order, race, Hispanic origin, and marital status. Selected data by mother's state of residence are shown, as well as data on month and day of birth, sex ratio, and age of father. Trends in fertility patterns and maternal and infant characteristics are described and interpreted.

Methods-Descriptive tabulations of data reported on the birth certificates of the 4.3 million births that occurred in 2006 are presented. Denominators for population-based rates are postcensal estimates derived from the U.S. 2000 census.

Results-In 2006, births and fertility rates increased for most states, age groups, and race and Hispanic origin groups. A total of 4,265,555 births were registered in the United States in 2006, 3 percent more than in 2005, and the largest number of births in more than four decades. The crude birth rate was 14.2 , up slightly from the previous year; the general fertility rate was 68.5, up 3 percent. Birth rates increased for women in nearly all age groups, with the largest increases for teenagers and for women aged 20-24 and 40-44 years. Teenage childbearing increased, interrupting the 14-year decline from 19912005. The mean age at first birth for U.S. women was down in 2006, to 25.0 years. The total fertility rate increased to 2,100.5 births per 1,000 women. All measures of unmarried childbearing reached record levels in 2006. Women were less likely to receive timely prenatal care in 2006. The cesarean delivery rate climbed to 31.1 percent, another all-time high. Preterm and low birthweight rates continued to rise; the twin birth rate was unchanged for the second consecutive year; the rate of triplet and higher order multiple births declined 5 percent.

Keywords: births • birth certificate • maternal and infant health • birth rates • maternal characteristics

## Highlights

- In 2006, the number of births and birth and fertility rates increased for nearly all age groups, live-birth orders, race, and Hispanic origin groups and reporting areas. In some cases, rates rose to levels not seen in three or more decades.
- A total of $4,265,555$ births were registered in the United States in 2006, 3 percent higher than in 2005. This is the largest single-

## Acknowledgments

This report was prepared under the general direction of Charles J. Rothwell, Director of the Division of Vital Statistics (DVS) and Stephanie J. Ventura, Chief of the Reproductive Statistics Branch (RSB). Nicholas F. Pace, Chief of the Systems, Programming, and Statistical Resources Branch (SPSRB), and Steve Steimel, Candace Cosgrove, Sergey Yagodin, Jordan Sacks, Annie Liu, Manju Sharma, Bonita Gross, and Thomas D. Dunn provided computer programming support and statistical tables. Yashodhara Patel of RSB also provided statistical tables. Steve Steimel of SPSRB prepared the natality file. Sharon Kirmeyer, Yashodhara Patel, and T.J. Mathews of RSB provided content review. Staff of the Data Acquisition and Evaluation Branch carried out quality evaluation and acceptance procedures for the state data files on which this report is based. The Registration Methods staff of DVS consulted with state vital statistics offices regarding the collection of birth certificate data. This report was edited by Demarius V. Miller, CDC/CCHIS/NCHM/ Division of Creative Services, Write-Editor Services Branch; typeset by Jacqueline M. Davis, CDC/CCHIS/NCHM/Division of Creative Services; and graphics were produced by Zorica Tomic-Whalen, CDC/CCHIS/NCHM/ Division of Creative Services, NOVA contractor.
year increase in births since 1989 and the largest number since 1961. Births increased for all race and Hispanic origin groups between 2005 and 2006.

- The crude birth rate for the U.S. was 14.2 live births per 1,000 persons in 2006, up slightly from 2005. The general fertility rate was 68.5 births per 1,000 women aged 15-44 years, an increase of 3 percent over 2005 and the highest rate reported since 1991. Fertility rates for nearly all race and Hispanic origin groups increased.
- Birth rates increased for women of most age groups between 2005 and 2006. The only exceptions were the youngest mothers (under age 15 years) for whom the rate declined slightly, and mothers aged 45-49 years, for whom the birth rate was unchanged.
- The birth rate for teenagers 15-19 years increased 3 percent in 2006, interrupting the 14-year period of continuous decline from 1991 through 2005. Only the rate for the youngest adolescents declined in 2006, to 0.6 per 1,000 aged 10-14 years. Rates for teenagers 15-17 and 18-19 years rose 3 to 4 percent each. These increases follow declines of 45 and 26 percent, respectively, in the rates between 1991 and 2005. Between 2005 and 2006, birth rates increased 3 to 5 percent each for non-Hispanic white, nonHispanic black, and American Indian or Alaska Native teenagers and 2 percent for Hispanic teenagers. The rate for Asian or Pacific Islander teenagers was unchanged. Teenage birth rates increased significantly between 2005 and 2006 in 26 states, representing nearly every region of the country.
- The first birth rate for women aged 15-44 years increased 3 percent to 27.4 births per 1,000 women. First birth rates increased for nearly all age groups.
- The mean age of mother at first birth for U.S. women was down in 2006, to 25.0 years from 25.2 in 2005, marking the first decline in the mean age at first birth since the measure has been available.
- The birth rate for unmarried women increased 7 percent between 2005 and 2006, reaching 50.6 births per 1,000 unmarried women aged 15-44 years.
The rate has jumped 16 percent since 2002, the most recent low. The number of nonmarital births in 2006, 1,641,946, was almost 8 percent higher than in 2005 and 20 percent more than in 2002.

The proportion of all births to unmarried women reached 38.5 percent of all U.S. births in 2006, up from 36.9 percent in 2005. All of these measures were at record levels for the United States in 2006.

- The percentage of mothers beginning prenatal care in the first trimester of pregnancy declined for both revised and unrevised reporting areas; levels of late (care beginning in the third trimester of pregnancy) and no care increased in both areas. Prenatal care utilization had risen fairly steadily from 1990 to 2003; levels for 2004 and 2005 were unchanged.
- Labor was induced for 22.5 percent of births in 2006, a slight increase over 2005, and double the rate for 1990. Induction rates are up substantially for all gestational ages, including preterm births, since 1990.
- The cesarean delivery rate rose 3 percent to 31.1 percent of all births, another record high. The cesarean rate has climbed 50 percent since the 1996 low. Rates for primary cesareans were up and vaginal births after previous cesarean were down for both revised and unrevised reporting areas. Cesarean rates have risen at all gestational ages over the last decade. See Figure 1.
- The preterm birth rate rose again in 2006 to 12.8 percent of all births. The percentage of infants delivered at less than 37 completed weeks of gestation has climbed 20 percent since 1990. Most of this rise is attributable to the increases in late preterm births (34-36 weeks), up 25 percent since 1990. Preterm birth rates rose slightly for Hispanic infants, but were unchanged among non-Hispanic white and non-Hispanic black infants. The singleton preterm rate also increased in 2006, to 11.1 percent. This rate has climbed 14 percent since 1990.
- The low birthweight (LBW) rate also continued to rise, climbing to 8.3 percent in 2006, the highest level in four decades. The percentage of infants born at less than 2,500 grams has risen 19 percent since 1990. All of the rise for 2005-2006 was among moderately LBW (1,500-2,499 grams) infants. LBW rates rose slightly for Hispanic infants, but were unchanged for non-Hispanic white and non-Hispanic black infants. The LBW rate for infants born in single deliveries also increased in 2006; singleton LBW has risen 10 percent since 1990.
- The rapid rise in multiple birth rates over the last several decades may have ended. The 2006 twin birth rate ( 32.1 twins per 1,000 births) remained essentially unchanged from 2005. The twin birth rate climbed 70 percent between 1980 and 2004. The triplet plus/+ birth rate declined 5 percent for 2005-2006, to 153.3 per 100,000 total births. This rate soared more than 400 percent between 1980 and 1998, but is down 21 percent since then.

## Introduction

This report presents detailed data on numbers and characteristics of births in 2006, birth and fertility rates, maternal lifestyle and health characteristics, medical services utilization by pregnant women, and infant health characteristics. These data provide important information on fertility patterns among American women by such characteristics as age, live-birth order, race, Hispanic origin, marital status, and educational attainment. Up-to-date information on these fertility patterns is critical to understanding population growth and change in this country and in individual states. Data on maternal
characteristics such as weight gain, tobacco use, and medical risk factors are useful in accounting for differences in birth outcomes. Information on use of prenatal care, obstetric procedures, characteristics of labor and delivery, attendant at birth and place of delivery, and method of delivery by maternal demographic characteristics can also help to explain differences in birth outcomes. It is very important that data on birth outcomes, especially levels of low birthweight (LBW) and preterm birth, be continuously monitored, because these variables are important predictors of infant mortality and morbidity.

A report of preliminary birth statistics for 2006 presented data on selected topics based on a substantial sample ( 99.9 percent) of the 2006 birth file (1). Findings for the selected measures (age, race, Hispanic origin, marital status of mother, live-birth order, cesarean delivery, preterm births, and LBW) based on the preliminary data are very similar to those presented here based on final data. In addition to the tabulations included in this report, more detailed analysis is possible by using the Natality public-use file that is issued for each year. The data file may be downloaded at http://www.cdc.gov/nchs/about/ major/dvs/Vitalstatsonline.htm and is also available in CD-ROM upon request (2). Note that beginning with 2005, the public-use file no longer includes geographic detail; such files may be available upon special request (2). A selection of tables of detailed data is also available on the National Center of Health Statistics (NCHS) home page (3).

A new data access and analysis tool-VitalStats-has recently become available http://www.cdc.gov/nchs/VitalStats.htm (4). VitalStats currently includes birth data for 1990 through 2006 with access to interactive pre-built tables, and the ability to build tables using more than 100 variables from the Natality public-use files along with geographic information by state and for counties with populations of 100,000 or more. VitalStats also includes interactive charting and mapping tools.

## The 1989 and the 2003 Revisions of the U.S. Certificate of Live Birth

This report includes 2006 data on items that are collected on both the 1989 Revision of the U.S. Standard Certificate of Live birth (unrevised) and the 2003 Revision of the U.S. Standard Certificate of Live Birth (revised). The 2003 Revision is described in detail elsewhere (5-7). Nineteen states, California (selected items only with full implementation in 2007), Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming, and Puerto Rico implemented the revised birth certificate as of January 1, 2006. The 19 revised states (excluding Puerto Rico) represent 49 percent of all U.S. births.

Data items exclusive to either the 1989 (i.e., maternal anemia, ultrasound, and alcohol use) or the 2003 birth certificate revision (i.e., NICU admission and maternal morbidity) are not shown in this report. Supplemental 2006 tables for data exclusive to the 1989 Revision are available on the NCHS website, including alcohol use during pregnancy. A recent report presented selected information exclusive to the 2003 Revision for 2005 (8); a forthcoming report will present these data for 2006.

## Methods

Data shown in this report are based on 100 percent of the birth certificates registered in all states and the District of Columbia. More than 99 percent of births occurring in this country are registered (9). Tables showing data by state also provide separate information for Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Marianas. However, these areas are not included in totals for the United States.

Race and Hispanic origin are reported independently on the birth certificate. In tabulations of birth data by race and Hispanic origin, data for Hispanic persons are not further classified by race because the majority of women of Hispanic origin are reported as white. Most tables in this report show data for these categories: non-Hispanic white, non-Hispanic black, and Hispanic. Data are also presented in some tables for American Indian or Alaska Native (AIAN) and Asian or Pacific Islander (API) births and for four specific Hispanic subgroups: Mexican, Puerto Rican, Cuban, and Central and South American, and for an additional subgroup "other and unknown Hispanic." Data for AIAN and API births are not shown separately by Hispanic origin because the majority of these populations are non-Hispanic. Text references to black births and black mothers or white births and white mothers are used interchangeably for ease in writing; see "Technical Notes."

The 2003 Revision of the U.S. Standard Certificate of Live Birth allows the reporting of more than one race (multiple races) for each parent (5) in accordance with the revised standards issued by the Office of Management and Budget (OMB) in $1997(10,11)$. Information on this change is presented in several recent reports (12-16).

In 2006, multiple race was reported by California, Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York State (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming, which used the 2003 Revision of the U.S. Standard Certificate of Live Birth, as well as Hawaii, Michigan (for births at selected facilities only), Minnesota and Utah, which used the 1989 Revision of the U.S. Standard Certificate of Live Birth. The 23 states represent 55 percent of all U.S. resident births in 2006. Data from the vital records of the remaining 27 states, New York City, the District of Columbia, and the territories followed the 1977 OMB standards in which a single race is reported $(10,11)$. (Puerto Rico, which revised its birth certificate in 2005, reported race according to the 1977 OMB standards.) In addition, these areas also report the minimum set of four races as stipulated in the 1977 standards, compared with the minimum of five races for the 1997 standards.

To provide uniformity and comparability of the data during the transition period, before multiple-race data are available for all reporting areas, it is necessary to "bridge" the responses of those who reported more than one race to a single race. In brief, multiple race is imputed to a single race (one of the following: AIAN, API, black, or white) according to the combination of races, Hispanic origin, sex, and age indicated on the birth certificate of the mother or father (12-15), see "Technical Notes." A recent report describes characteristics of births to multiple-race women for 2003 (16).

Data on educational attainment, prenatal care, tobacco use, primary cesarean delivery and vaginal birth after previous cesarean delivery, while collected on both the 1989 and the 2003 Revisions of the U.S. Standard Certificates of Live Birth, are not considered comparable between revisions, and, accordingly, are presented separately
in this report. Analysis of these items over time is compromised by the changing composition of the revised and unrevised reporting areas.

Information on the measurement of marital status, gestational age, and birthweight; the computation of derived statistics and rates; population denominators; random variation and relative standard error; and the definitions of terms are presented in the "Technical Notes."

Information by age, race, or marital status of mother is imputed if it is not reported on the birth certificate. These items were not reported for less than 1 percent of U.S. births in 2006. (See "Technical Notes" for additional information.) All other maternal, paternal, and infant characteristics (except items on which length of gestation is calculated) are not imputed. Births for which a particular characteristic is unknown are subtracted from the figures for total births that are used as denominators before percentages and percent distributions are computed. Levels of incomplete reporting vary substantially by specific item and by state. Table III in the "Technical Notes" provides information on the percentage of records with missing information for each item by state for 2006.

## Demographic Characteristics

## Births and birth rates

## Number of births

A total of $4,265,555$ births were registered in the United States in 2006, 127,206 more births (or 3 percent higher) than in 2005. This is the largest single-year increase in the number of births since 1989-1990. After a downward trend from 1990 to 1997, the total number of births has generally increased. The number of births in 2006 is the largest since $1961(4,268,326)$ (See Tables 1-15 for national and state data by age, live-birth order, race, and Hispanic origin.)

The number of births increased for all race and Hispanic origin groups between 2005 and 2006 with increases of 1 percent for nonHispanic white, and 5 to 6 percent for non-Hispanic black and Hispanic women (Table 5). Births to Asian or Pacific Islander (API) and American Indian or Alaska Native (AIAN) women increased 4 and 6 percent, respectively. Among the specified Hispanic groups, births increased 4 to 6 percent for Mexican, Cuban, and Puerto Rican women and 9 percent for Central and South American women.

## Crude birth rate

The crude birth rate (CBR) was 14.2 live births per 1,000 persons (total population) in 2006, up slightly (1 percent) from 2005. After dropping steadily from 1990 (16.7) to 1997 (14.2), the CBR has fluctuated between 13.9 and 14.4 per 1,000 (Tables 1 and 5).

## Fertility rate

The general fertility rate (GFR) was 68.5 live births per 1,000 women of childbearing age (15-44 years) in 2006, a 3 percent increase from 2005 (66.7) and the highest rate reported since 1991. The GFR decreased substantially from 1990 (70.9) to 1997 (63.6) but has generally increased since (Figure 2 and Tables 1 and 5).

The GFRs for nearly all race and Hispanic origin groups increased between 2005 and 2006. The rate increased 1 to 2 percent for API,

NOTE: Beginning with 1959, trend lines are based on registered live births; trend lines for 1930-1959 are based on live births adjusted for underregistration. SOURCE: CDC/NCHS, National Vital Statistics System.

Figure 2. Live births and fertility rates: United States, 1930-2006
non-Hispanic white and Hispanic women, and 5 percent for nonHispanic black and AIAN women (Tables 1 and 5). Among the specified Hispanic groups, fertility rates for Mexican, Puerto Rican, and "other" Hispanic (Central and South American and unspecified Hispanic subgroups) women rose by 1,3 , and 6 percent, respectively. The GFR for Cuban women declined 2 percent, the only rate to do so in 2006.

## Age of mother

Birth rates increased for women in nearly all age groups between 2005 and 2006, with especially large increases for teenagers and for women aged 20-24 and 40-44 years. In some cases, rates were up to levels not seen in three or more decades.

Teenagers-The birth rate for teenagers aged 15-19 years rose 3 percent in 2006, interrupting the long-term decline that had extended from 1991 through 2005. The rate in 2006 was 41.9 births per 1,000 females aged 15-19 years, up from 40.5 in 2005. The teen birth rate had dropped 34 percent from 1991 (61.8) to 2005 (Figure 3, Tables A, B, 3, 4, and 8).

The 3-percent increase in the birth rate for teenagers 15-19 years in 2006 followed 14 years of continuous, though not steady, declines beginning after 1991. The reduction during 1991-2005 averaged 3 percent overall per year; however, the declines were much steeper during 1994-2003 and slowed to about 1 percent annually beginning in 2003-2004.

The number of births to teenagers 15-19 years rose 5 percent to 435,436 in 2006, compared with 414,593 in 2005. This was the largest single-year increase in the number since 1989-1990. Births to 15-19-year-olds in the U.S. peaked in $1970(644,708)(17)$. (See Table 2 for 2006 data.)

Teenage pregnancy and childbearing are ongoing public concerns and the focus of considerable public policy debate. Babies born to teenage mothers are at elevated risk of poor birth outcomes, including

Figure 3. Birth rates for teenagers 15-19 years by race and Hispanic origin: United States, 1991, 2000, 2005, and 2006
higher rates of low birthweight, preterm birth, and death in infancy (17-19) (see later sections of this report). The limited educational, social, and financial resources often available to teenage mothers add to their higher risk profile. A recent study found that the public costs of teenage childbearing in the U.S. are about 9.1 billion annually (20).

The birth rate for the youngest teenagers declined to 0.6 births per 1,000 females aged 10-14 years in 2006 compared with 0.7 in 2006. This is the only age group among teenagers for whom the birth rate fell. The 2006 rate was half the rate reported a decade earlier (1.2 per 1,000 in 1996) $(3,19)$. The number of births to adolescents 10-14 years was 6,396 , about 5 percent fewer than the 6,722 births reported in 2005 (see Table 2 for 2006 data). The vast majority of these births were to teenagers 13-14 years, 98 percent in 2006.

The birth rate for teenagers 15-17 years rose 3 percent in 2006, from 21.4 per 1,000 in 2005 to 22.0 (Tables A and 4). During 1991-2005, this rate dropped 45 percent (from 38.6 per 1,000). The increase in the birth rate along with a 2 -percent increase in the number of teenagers resulted in a 4-percent upturn in the number of births, to 138,943 , about the same number as reported in $2002(138,731)$.

The birth rate for older teenagers 18-19 years increased 4 percent in 2006, to 73.0 per 1,000 compared with 69.9 in 2005. During the years 1991-2005, the rate fell 26 percent. The number of births to older teenagers increased 5 percent from 2005 to 2006, to 296,493.

Birth rates for white and black non-Hispanic teenagers 15-19 years increased 3 and 5 percent, respectively, in 2006, to 26.6 and 63.7 per 1,000, respectively (Table A, Figure 3). The rate for AIAN teenagers increased 4 percent (55.0), while the rate for Hispanic teenagers rose 2 percent (83.0). The rate for API teenagers was unchanged (17.0). Among Hispanic subgroups, the decline in the rate for Mexican teenagers (92.9 per 1,000 aged 15-19 years) was not statistically
significant, whereas the rate for Puerto Rican teenagers (69.3) rose. Mexican teenagers continue to have the highest birth rate, whereas the rate for API teenagers is lowest, 17.0; see Table 7 for 2006 data.

Currently, teenage pregnancy rates are available through 2004, the most recent year for which detailed national abortion estimates are available (21-24). Pregnancy rates are computed from the sums of live births, induced abortions, and fetal losses. Because more recent abortion data are not available, it is not possible to assess whether, and to what extent, the teenage pregnancy rate may have increased in 2006 as the teenage birth rate did, or what factors may account for the most recent trends. Trends in pregnancy rates and the influences on these rates through 2004 have been described elsewhere (21-29).

Women aged 20 years and over-women in their twentiesThe birth rate for women aged 20-24 years was 105.9 births per 1,000 women in 2006, a 4 percent increase over 2005 (102.2). The rate had risen slightly (less than 1 percent) from 2004 to 2005. The rate for this age group had generally trended downward between 1990 (the most recent high) and 2004 (the record low) (Tables 3, 4, 7, and 8). The rate for women aged 25-29 years also increased in 2006, but by a more moderate 1 percent, to 116.7 births per 1,000 women, from 115.5 in 2005. The 2006 rate is the highest reported since 1991. The rate for this age group declined steadily between 1990 and 1997, but has generally fluctuated since. Women aged 20-29 years, the principal childbearing ages, historically account for the largest share of all births. However, the proportion of births to these women has generally declined over the last three decades, down from 65.1 percent to 53.0 percent between 1976 and 2006.

Women in their thirties-Birth rates for women in their thirties rose from 2005 to 2006 to the highest levels reported in more than four decades. The birth rate for women aged 30-34 years was 97.7 births per 1,000 women in 2006, an increase of 2 percent over 2005 (95.8)

Table A. Birth rates for women aged 10-19 years, by age and race and Hispanic origin: United States, 1991, 2004, 2005, and 2006 and percent change in rates, 1991-2005 and 2005-2006

${ }^{1}$ Includes Hispanic origin not stated.
${ }^{2}$ Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006; see "Technical Notes."
${ }^{3}$ Includes births to Aleuts and Eskimos.
${ }^{4}$ Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."
${ }^{5}$ Includes all persons of Hispanic origin of any race; see "Technical Notes."
and the highest rate reported since 1964 (103.4) (Tables 4 and 8). The birth rate for women aged 30-34 years has risen 21 percent since 1990. The number of births increased much less, by 7 percent, because the population of women 30-34 years fell 11 percent during this period. The birth rate for women aged 35-39 years also increased 2 percent in 2006, to 47.3 births per 1,000 women from 46.3 in 2005 and was also the highest rate reported in more than four decades (49.9 in 1964). The rate for women aged 35-39 years has increased each year (3 percent average annually) since 1978 and has risen nearly 50 percent since only 1990. The number of births to these women also increased in 2006, to almost half a million births, another record high (Tables 2 and 6 for 2006 data). From 1990 to 2006, the number of births to this age group rose 57 percent, whereas the population of women 35-39 years of age increased only 5 percent $(30,31)$

Women in their forties-The birth rate for women aged 40-44 years was 9.4 live births per 1,000 women in 2006, an increase of 3 percent from 2005 (9.1) and the highest rate reported since 1968 (9.6). The birth rate for this age group has more than doubled since 1981, and has climbed more than 70 percent since 1990. The number
of births to women aged 40-44 years increased 1 percent in 2006, to 105,539, more than twice the number reported for 1990, and another record high for the United States (31). The increase in the number was due solely to the rising birth rate; the number of women aged 40-44 years declined 2 percent between 2005 and 2006. The birth rate for women aged 45-49 years was 0.6 births per 1,000 women in 2006, unchanged from 2005. The rate was up slightly from 2000, and has tripled since 1990. The number of births to women aged 45-49 years increased 6 percent in 2006, to 6,480, a record high for the United States, and nearly four times the number in 1990.

Births to women aged 50 years and over-The number of births to women aged 50-54 years increased 18 percent in 2006, to 494, from 417 in 2005 (Tables 2 and 6). The number of births to women in this age group has increased an average of 15 percent annually since 1997 (from 144), when data for women aged 50-54 years became available again. (From 1964 to 1996, age of mother was imputed if the reported age was under 10 years or 50 years and over; see "Technical Notes.")

Because of small numbers, births to women aged 50-54 years historically, and for rates shown in all tables in this report, have been

Table B. Birth rates for teenagers 15-19 years by state, 1991, 2005, and 2006, and percentage change 1991-2005 and 2005-2006: United States and each state and territory

NOTE: Population data for computing birth rates were provided by the U.S. Census Bureau. Rates by state may differ from rates computed on the basis of other population estimates.
included with births to women 45-49 years when computing birth rates by age of mother (the denominator for the rate is women aged 45-49 years). To estimate birth rates for women aged 45-49 and 50-54 years separately, we calculated rates for these age groups for 2005 and 2006. Rates are expressed per 10,000 women because of the small number of births to women 50-54 years. The birth rate for women aged 50-54 years was 0.5 births per 10,000 women in 2006, up from 0.4 in 2005.

The increase in birth rates for women 35 years of age and over during the last 20 years has been linked, in part, to the use of fertility-enhancing therapies $(32,33)$. Multiple deliveries, an outcome associated with infertility treatment, represented 1 out of 18 births to women aged 35 years and over in 2006, compared with 1 out of 32 births in 1990 (see section on "Multiple births").

## Live-birth order

The first birth rate for the U.S. in 2006 was 27.4 births per 1,000 women aged 15-44 years, a 3-percent increase over 2005 (26.5), but still lower than the recent high in 1990 (29.0) (Tables 3, 7, and 9). From 1990 to 1997, the first birth rate decreased steadily, but has fluctuated since 1998.

First birth rates for women aged 15-19 and 20-24 years increased between 2005 and 2006, 4 and 5 percent, respectively; rates for women
aged 25-29, 30-34, and 35-39 years increased 1 percent each. The rate for women aged 40-44 was unchanged, whereas that for women aged 45-49 rose from 0.1 per 1,000 to 0.2 in 2006 (Table 9).

The second- and third-order birth rates for women aged 15-44 years increased in 2006 as well, 2 to 3 percent, respectively; fourthand fifth-order birth rates rose by 4 and 6 percent, respectively. The rate of sixth- and seventh-order births increased from 0.9 to 1.0, whereas that for eighth- and higher order births was unchanged.

The mean age at first birth, another useful measure in interpreting childbearing patterns was down in 2006, to 25.0 years from 25.2 in 2005, marking the first decline in the mean age at first birth since the measure has been available (1968) (Tables 10, 14, and 15) (3,34). The mean is the arithmetic average of the age of mothers at the time of birth and is computed directly from the frequency of first births by age of mother. This decline in the mean age of first-time mothers reflects the large increase in first births for women aged 15-19 and 20-24 years compared with relatively stable numbers for women aged 25 years and over.

Among the race and Hispanic origin groups, a substantial range and variation in age at first birth exists. AIAN women had the lowest mean age at first birth in 2006 (21.9 years), whereas API women had the highest ( 28.5 years). The average age of first-time mothers for the three largest race and Hispanic origin groups in 2006 was 22.7 years
for non-Hispanic black, 23.1 years for Hispanic, and 26.0 years for non-Hispanic white women. The mean age at first birth declined slightly for non-Hispanic white, Cuban, and Central and South American women between 2005 and 2006, but increased slightly for AIAN women. The mean age at first birth was essentially unchanged for the other race and Hispanic origin groups. See Tables 14 and 15 for 2006 data.

The mean age at first birth also varies substantially by state (Table C and Figure 4). The lowest mean age at first birth was reported for women in Mississippi (22.6 years), whereas the highest was for women in Massachusetts (27.7 years) (Table C). Distinct patterns by region emerge when these data are mapped. The mean age at first birth in 2006 tended to be highest in the North and Northeast and lowest in the South and Southwest. These geographic patterns largely reflect each state's race and Hispanic origin composition.

The mean age at first birth significantly decreased from 2005 to 2006 for 22 states (Alabama, Arkansas, California, Connecticut, Florida, Georgia, Illinois, Indiana, Kentucky, Louisiana, Massachusetts, Maryland, Michigan, Minnesota, Missouri, North Carolina, New Hampshire, New Jersey, Pennsylvania, Texas, Utah, and Virginia) and the District of Columbia with no distinct patterns by region (data not shown). The mean age for the other states either did not significantly change, or increased (North Dakota and Tennessee). See Table C for 2006 data.

## Total fertility rate

The total fertility rate (TFR) summarizes the potential impact of current fertility patterns on completed family size. The TFR estimates the number of births that a hypothetical cohort of 1,000 women would have if they experienced throughout their childbearing years the
same age-specific birth rates observed in a given year. The rate can be expressed as the average number of children that would be born per woman. Because it is computed from age-specific birth rates, the TFR is age-adjusted and can be readily compared among populations across time or among geographic areas.

The TFR was 2,100.5 (or 2.1 births per woman) in 2006, a 2 percent increase compared with $2005(2,053.5)$ and the highest reported since 1971 (2,266.5) (Tables 4, 8, 14, and 15). This is the first year the U.S. TFR has been above replacement since 1971. Replacement is the level at which a given generation can exactly replace itself, generally considered to be 2,100 births per 1,000 women.

From 1990 to 1997, the TFR decreased substantially (from 2,081.0 to $1,971.0$ ), but has generally increased since 1998. The increase in the TFR in 2006 reflects the increase in birth rates for nearly all age groups, especially for those women aged 15-19 and 20-24 years (see section on "Age of Mother").

The TFR also increased for nearly all race and Hispanic origin groups between 2005 and 2006 with the rate increasing 1 percent for non-Hispanic white, 3 percent for Hispanic, and 5 percent for nonHispanic black women. Rates for API and AIAN women rose 2 and 5 percent, respectively. Rates for Puerto Rican and Mexican women increased 1 and 2 percent, respectively, whereas the rate for Cuban women was essentially unchanged. The rate for "other" Hispanics rose 7 percent.

Differences among these groups are even more apparent when their rates are compared with the "replacement" rate. As previously mentioned, the U.S. TFR in 2006 was above replacement for the first time since 1971. The TFRs for non-Hispanic black $(2,115.0)$ and Hispanic women $(2,959.5)$, as well as women in the following specified

Table C. Mean age of mother at first birth by state: United States, 2006
[Mean age at first birth is the arithmetic average of the age of mother at the time of the birth, computed directly from the frequency of first births by age of mother]

| State | Mean age | State | Mean age |
| :---: | :---: | :---: | :---: |
| United States | 25.0 | Missouri | 24.1 |

Figure 4. Mean age of mother at first birth by state: United States, 2006

Hispanic origin groups, Mexican (3,107.5), Puerto Rican (2,167.0), and "other" Hispanic $(3,014.0)$ were above replacement in 2006 (Tables 4, 8,14 , and 15).

## Births and birth rates by state

The national increase of 3 percent in the number of births reflects increases in the majority of states. The number of births increased in 37 states and the District of Columbia, and was essentially unchanged in the remaining 13 states. The 13 states without significant increase were Delaware, Illinois, Michigan, Nebraska, New Jersey, North Dakota, West Virginia, and all 6 of the New England states (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont). See Tables 11-13 for 2006 data.

In 2006, crude birth rates ranged from 10.4 births per 1,000 total population in Vermont, to 21.0 in Utah (Table 11). Between 2005 and 2006 rates increased in 32 states and were unchanged in 18 states and the District of Columbia. Of the 32 states with higher birth rates in 2006 the largest increases were for Mississippi and Louisiana, which rose 9 and 10 percent respectively. The large annual increases in Mississippi and Louisiana follow sizable declines in the birth rate in
2005. These large fluctuations between 2005 and 2006 likely are tied to the large population shifts and subsequent resettlement following Hurricane Katrina in August of 2005. An upcoming report will examine the impact of Hurricane Katrina on births for the affected area.

Fertility rates per 1,000 women aged 15-44 years in 2006 ranged from a low of 52.2 in Vermont to a high of 94.1 in Utah (Table 11). Between 2005 and 2006 fertility rates increased in all but 8 states (Alaska, Connecticut, Hawaii, Illinois, Maine, New Hampshire, Rhode Island, and West Virginia), the District of Columbia, Virgin Islands, American Samoa, and the Northern Marianas. Similar to the crude birth rate, the largest increases in the fertility rate between 2005 and 2006 were observed for Mississippi and Louisiana, for which rates rose 12 and 13 percent respectively.

In 2006, the TFR ranged from 1,691.5 (1.7 births per woman) in Vermont to $2,628.5$ ( 2.6 births per woman) in Utah (Table 11). When compared with the United States TFR of 2,100.5, 24 states, the District of Columbia, Puerto Rico, and the Northern Marianas had lower rates; 21 states, the Virgin Islands, Guam and American Samoa had higher rates; the TFRs for Colorado, Delaware, Louisiana, Montana, and North Dakota were not significantly different.

## Birth rate for teenagers by state

In 2006, the U.S. birth rate for teenagers 15-19 years increased 3 percent to 41.9 per 1,000 . This increase in the teenage rate between 2005 and 2006 was broad-based geographically, with significant increases observed for 26 states representing nearly every region of the country (Figure 5 and Table B). Teenage birth rates were essentially unchanged for 21 states; only 3 states (New York, North Dakota, and Rhode Island) and the District of Columbia reported significant declines in 2006.

As in previous years, teenage birth rates vary considerably by state (Tables B and 11). For 2006, rates ranged from 18.7 in New Hampshire to 68.4 in Mississippi. Birth rates for teenagers tend to be lowest in the North and Northeast, and highest in the South and Southwest. These patterns are in part a reflection of each state's race and Hispanic origin composition. Also, see discussion of teenage births in the "Age of mother" section of this report. Population data for computing birth rates were provided by the U.S. Census Bureau. Rates by state for teenagers may differ from rates computed on the basis of other population estimates. Rates for states with smaller populations are more likely to be affected by differences in population bases.

## Sex ratio

In 2006, there were 2,184,237 male and 2,081,318 female live births. There were 102,919 more male births, the highest number of "excess" male births since 1963. The sex ratio, however, was the same as in 2005 at 1,049 males per 1,000 females (Tables 14 and 15). The sex ratio has fluctuated narrowly over the past half century, ranging from 1,046 to 1,059 . Small yearly variations have occurred, but significant long-term trends have been observed, including a decline from 1942 to 1959, an increase from 1959 to 1971, and a decline from 1971 to 2002 (35). The sex ratio by race and ethnicity has a much wider range than the range in the overall trend: API mothers had the highest sex ratio in $2006(1,063)$ and AIAN mothers the lowest $(1,038)$.

## Month of birth

In 2006, the average number of births per month increased significantly to 355,463 from 344,862 in 2005 . The actual number of births occurring each month ranged from 319,235 in February, to 387,798 in August (Table 16). Observed monthly birth and fertility rates, which take into account the different number of days in the

Figure 5. Percent change in teenage birth rates: United States, 2005 and 2006
month, increased significantly over the same month in the previous year for every month except April in which both birth and fertility rates declined. Observed fertility rates ranged from a low of 64.4 per 1,000 women aged 15-44 years in January to a high of 73.3 in August. The 2006 data showing fertility rates at their lowest in early winter and highest in late summer are consistent with well-established patterns of seasonal fluctuation in these rates.

## Day of the week of birth

There is considerable variation in the number of infants born on a given day of the week. In 2006, there was almost double the average number of births born on a Wednesday $(13,482)$ than on a Sunday $(7,587)$ (See Table 17). In 2006, Wednesday, not Tuesday, became the most common day to deliver. Since at least 1990, the highest average number of births had occurred on Tuesday.

An average of 11,686 infants was born each day in 2006. This overall average is used to compute the index of occurrence, a measure in the variation in the daily pattern of births. The index is defined as the ratio of the average number of births per day of the week to the average number of births per day of the year, with the base set at 100 . In 2006, Wednesday had the highest index at 115.4; Sunday's index was much lower at 64.9. This indicates that on Wednesday, there were 15.4 percent more births born than on the average day. In comparison, 35.1 percent fewer births on average were born on Sunday.

Fewer births on average occur on both Saturday and Sunday relative to weekdays. This weekend deficit is true for both vaginal and cesarean births. Between 1990 and 2006, cesarean weekend deliveries became less frequent. For example, the Sunday index for cesareans has fallen by 22 percent to 46.6; the Sunday index for vaginal births by 15 percent, to 73.3.

## Births to unmarried women

More than 1.6 million babies were born to unmarried women in 2006, the highest number ever recorded in the United States. The 2006 total ( $1,641,946$ births) was nearly 8 percent greater than in 2005 ( $1,527,034$ ) and a 20-percent increase from 2002 when the recent steep increases began (Table D). The birth rate for unmarried women, which relates nonmarital births to unmarried women in the childbearing ages, climbed nearly 7 percent between 2005 and 2006 to 50.6 births per 1,000 unmarried women aged 15-44 years. This measure has also risen substantially since 2002, by 16 percent. The third key measure of nonmarital childbearing, the percentage of all births to unmarried women, also rose in 2006, to 38.5 percent, up from 36.9 percent in 2005 and 34.0 percent in 2002. These increases follow a period of relative stability during the years 1998-2002 (Table D).

The number of births, the birth rate, and the percentage of births to unmarried women are all important indicators of childbearing patterns and changes in family formation. The number of births to unmarried women nearly doubled during the 1980s and then the rate of increase slowed markedly from the mid-1990s to the early 2000s before the current increases began. The steep growth in the number of births during the 1980s and early 1990s was fueled mainly by the increase in the birth rate for unmarried women. The rate rose nearly 50 percent from 1980 (29.4 per 1,000) to the mid-1990s (43.8 per 1,000 in 1996)

Table D. Number, rate, and percentage of births to unmarried women and birth rate for married women: United States, 1980 and 1985-2006

|  | Year | Births to unmarried women |  |  | Birth rate for married women ${ }^{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Number | Rate ${ }^{1}$ | Percent ${ }^{2}$ |  |
| 2006 |  | 1,641,946 | 50.6 | 38.5 | 88.0 |
| 2005 |  | 1,527,034 | 47.5 | 36.9 | 87.3 |
| 2004 |  | 1,470,189 | 46.1 | 35.8 | 87.6 |
| 2003 |  | 1,415,995 | 44.9 | 34.6 | 88.1 |
| 2002 |  | 1,365,966 | 43.7 | 34.0 | 86.3 |
| 2001 |  | 1,349,249 | 43.8 | 33.5 | 86.7 |
| 2000 |  | 1,347,043 | 44.1 | 33.2 | 87.4 |
| 1999 |  | 1,308,560 | 43.3 | 33.0 | 84.8 |
| 1998 |  | 1,293,567 | 43.3 | 32.8 | 84.2 |
| 1997 |  | 1,257,444 | 42.9 | 32.4 | 82.7 |
| 1996 |  | 1,260,306 | 43.8 | 32.4 | 82.3 |
| 1995 |  | 1,253,976 | 44.3 | 32.2 | 82.6 |
| 1994 |  | 1,289,592 | 46.2 | 32.6 | 82.9 |
| 1993 |  | 1,240,172 | 44.8 | 31.0 | 86.1 |
| 1992 |  | 1,224,876 | 44.9 | 30.1 | 88.5 |
| 1991 |  | 1,213,769 | 45.0 | 29.5 | 89.6 |
| 1990 |  | 1,165,384 | 43.8 | 28.0 | 93.2 |
| 1989 |  | 1,094,169 | 41.6 | 27.1 | 91.9 |
| 1988 |  | 1,005,299 | 38.5 | 25.7 | 90.8 |
| 1987 |  | 933,013 | 36.0 | 24.5 | 90.0 |
| 1986 |  | 878,477 | 34.2 | 23.4 | 90.7 |
| 1985 |  | 828,174 | 32.8 | 22.0 | 93.3 |
| 1980 |  | 665,747 | 29.4 | 18.4 | 97.0 |

${ }^{1}$ Births to unmarried women per 1,000 unmarried women aged 15-44 years.
${ }^{2}$ Percentage of all births to unmarried women.
${ }^{3}$ Births to married women per 1,000 married women aged 15-44 years.
and then the rate stabilized for the next 6 years (Table D). The other factor in the long-term increase in the number of births was the growth in the number of unmarried women of childbearing age. Since 2002, the increase in the number of births reflects mostly the increase in the birth rate along with modest growth in the unmarried female population (36-38).

A review of trends in birth rates by age shows strikingly different patterns. During the years 1990-2002, birth rates for unmarried teenagers declined while rates for women aged 20 years and over increased, although modestly (Figure 6 and Table 19). Rates for older women rose 1 to 2 percent per year. Since 2002, rates have increased for women in all age groups 18-19 years and older. The increase for ages 18-19 years averaged about 1 percent per year, with steadily larger annual increases as maternal age advanced. Birth rates for women in age groups 25-29 through 35-39 climbed 5 to 8 percent annually. Rates in 2006 for women aged 25 years and over were at least double the rates reported in 1980 (Figure 6). The sharp rise in nonmarital birth rates for adult women in combination with declines or comparatively smaller increases among teenagers has resulted in a continued shift in the age distribution of unmarried mothers. Whereas 4 in 10 nonmarital births were to teenagers in 1980, by 2006, this fraction dropped by nearly one-half, to just over 2 in 10 (39) (Table 18 for 2006 data).

Nonmarital birth rates continue to vary widely by race and Hispanic origin. Rates increased for all population groups in 2006 by 4 to 6 percent each, to 25.9 per 1,000 for API women, 32.0 for non-Hispanic white women, 71.5 for black women, and 106.1 for Hispanic women. A closer look at the patterns by maternal age shows fairly similar trends

Figure 6. Birth rates for unmarried women by age: United States, 1980, 1990, 2002, and 2006
since 2002 among the population groups. However the increases were especially steep among non-Hispanic white and Hispanic women in age groups 20 years and over (Table 19). Rates also rose considerably among older Hispanic teenagers.

The combination of sharply rising birth rates for unmarried women together with relatively stable rates for married women has resulted in continued increases in the proportion of births that are to unmarried women. Like the number and birth rate, the proportion changed relatively little during the years 1998-2002, but has since climbed sharply, reaching 38.5 percent compared with 34.0 in 2002 (Table D). While the overwhelming majority of teenage births have long been nonmarital (rising from two-thirds in 1990 to 84 percent in 2006) (Table 18 for 2006 data), these proportions have risen very steeply for women aged 20 years and over. For example, among women aged 20-24 years, the proportion increased from 37 percent in 1990 to 58 percent in 2006. Similar increases are seen for other age groups: from 18 to 31 percent for ages 25-29 and from 13 to 18 percent for women aged 30-34 years. Among all births to women in their twenties in 2006, 44 percent were nonmarital. The proportions of nonmarital births among population subgroups ranged widely: 16.5 percent for API; 26.6 percent for nonHispanic white, 49.9 percent for Hispanic, 64.6 percent for AIAN, and 70.7 percent for non-Hispanic black births.

Levels of nonmarital births typically vary considerably across states. In 2006, the proportions by state were lowest in Utah (19 percent) and New Hampshire ( 29 percent) and highest in Louisiana, Mississippi, and New Mexico (50-53 percent each) (Table 20). The percentage for the District of Columbia was 57.6. In large part these differences reflect variations in race and Hispanic origin composition among states.

## Age of father

The birth rate per 1,000 men aged 15-54 years was 49.9 in 2006, a 2-percent increase from 2005 (48.7). This rate has fluctuated modestly since the all-time low of 48.4 in 2002 (Table 21). In 2006, birth rates increased for all but the oldest fathers (aged 55 years and over) for whom the birth rate declined. Birth rates are higher for black men (65.0) compared with white men (47.5), but differences are much greater among younger and older men. For example, the birth rate for black men aged $20-24$ years (117.0) was 70 percent higher than that for white men in this age group (69.0). Differences by race essentially disappear at age 30-34 years however (105.3 and 105.0, respectively).

Information on age of father is often missing on birth certificates of children born to women less than 25 years of age and to unmarried women. In 2006, age of father was not reported for 14 percent of all births, 25 percent of births to all women less than 25 years of age, and 36 percent of all nonmarital births. For computing birth rates by age of father, births where age of father is not stated are distributed in the same proportion as births with known age within 5 -year-age classification of mother. This procedure minimizes the distortion that would result if the relationship between age of mother and father were disregarded. The procedures for computing birth rates by age of father are described in detail in the "Technical Notes."

## Educational attainment

Information on educational attainment is reported on both the 2003 Standard Certificate of Live Birth (revised) and the 1989 Standard Certificate of Live Birth (unrevised). However, the format of the education item on the revised standard certificate substantively
differs from that of the unrevised certificate (see "Technical Notes") (6). The 1989 certificate item asks for the highest grade completed at the time of the birth; the 2003 certificate item asks for the highest degree or level of school completed at the time of the birth (e.g., high school diploma, bachelor degree, etc.). Accordingly, education data for the states that have implemented the revised certificates are not directly comparable with the data for the states that are not yet using the revised certificate. This report presents 2006 data available for the 19 states that were revised as of January, 2006. These 19 states represent 49 percent of all births.

For the 19 revised states in 2006, 73.6 percent of women who gave birth had at least a high school diploma or higher and 23.3 percent had a bachelor's degree or higher (Table I). Trend analysis in educational attainment for 2003-2006 is compromised by the changing composition of the revised and unrevised reporting areas. However, vital statistics and other data sources indicate that the educational attainment of women giving birth has risen substantially over the last few decades; the increase has slowed somewhat over the last decade, however. This trend in part reflects increases in educational attainment of all women during this time $(33,40)$.

Maternal education has long been considered an important factor in fertility and maternal and infant health and has been shown to have a profound effect on the number of births and the risk of adverse birth outcome. Women with higher educational attainment are more likely to desire and give birth to fewer children, and are less likely to engage in behaviors detrimental to health and pregnancy $(41,42)$.

Among the largest racial and Hispanic origin groups, substantial variation in educational attainment is seen. For the 19 revised states in 2006, 87.5 percent of non-Hispanic white compared with 74.5 percent of non-Hispanic black, and 48.5 percent of Hispanic mothers had a high school diploma or higher. Levels of advanced educational attainment also differed, with 32.9 percent of non-Hispanic white, 11.1 of non-Hispanic black, and 7.7 of Hispanic mothers reporting a bachelor's degree or higher (data not shown).

## Maternal Lifestyle and Health Characteristics

## Weight gain in pregnancy

In 1990, the Institute of Medicine (IOM) issued recommendations for gestational weight gain (43). These guidelines are based on the mother's body mass index (BMI), which takes into account both the mother's height and weight. A recent workshop held by the IOM and National Academy of Sciences developed a research agenda emphasizing the need to make specific recommendations for subgroups such as: adolescent mothers, mothers in diverse racial and ethnic groups, and mothers carrying twins or higher order multiples (44).

Currently, national birth certificate data are available only for total weight gain during pregnancy. These data show that in 2006, 13 percent of all mothers gained less than 16 pounds, which is considered inadequate for most women, and 21 percent had weight gains of more than 40 pounds, considered excessive for all women (Tables 22-24) (43). Thus, approximately one-third of all mothers had weight gains outside of the guidelines, regardless of their height.

Birth certificate data show that the distribution of reported weight gain in pregnancy has changed markedly between 1990 and 2006
(trend data not shown). For mothers of at least term (37 or more weeks gestation), singleton births, the percentage who gained less than 16 pounds increased nearly 50 percent (from 8.3 to 12.3 percent), and the percentage gaining more than 40 pounds rose 30 percent (from 16.0 to 20.7 percent). Annual data demonstrate a consistent decline in moderate weight gains in pregnancy over this 16-year period.

Excessive and insufficient weight gain during pregnancy can negatively influence both maternal and pregnancy outcome. Inadequate weight gain is associated with increased risks to the infant such as intrauterine growth retardation, shortened period of gestation, low birthweight, spontaneous preterm birth, fetal distress, precipitous labor, assisted ventilation, and mortality (45-47). High weight gain during pregnancy is linked with elevated risks for the mother of gestational diabetes, hypertensive disorders, labor dystocia, induced labor, cesarean delivery, postoperative complications, and long-term maternal weight retention (48-50).

In 2006, 14.1 percent of infants born to mothers who gained less than 16 pounds were low birthweight, compared with 7.8 percent of infants to mothers who had gains of 16 to 40 pounds. Similarly, 18.6 percent of infants of mothers who gained less than 16 pounds were preterm, compared with 12.3 percent of infants whose mothers gained a moderate amount of weight (data not shown).

Weight gain during pregnancy continued to differ widely by racial and ethnic groups in 2006. Non-Hispanic white and API women have relatively low proportions of women with gains of less than 16 pounds (11 and 10 percent, respectively) compared with levels of 17-19 percent for AIAN and non-Hispanic black women (Tables 22-24). NonHispanic white women were the most likely to gain more than 40 pounds (23 percent). Studies have shown, however, that non-Hispanic black women tend to retain more weight postpartum than do nonHispanic white women, regardless of their prepregnancy BMI category (51).

## Risk factors in this pregnancy

The 2003 Revision of the U.S. Standard Certificate of Live Birth allows for separate reporting of prepregnancy (diagnosed prior to pregnancy) and gestational (diagnosed during pregnancy) diabetes; the 1989 revision includes only one checkbox for diabetes, intended to capture information for both prepregnancy and gestational diabetes. The 2003 format, plus improved approaches to collecting this information appears to have improved reporting in those states that adopted the revised certificate. The more recent upturn in this rate described below likely is influenced by improved reporting of this pregnancy risk factor among states that have implemented the revised birth certificate, as well as increases in diabetes in these states.

In 2006, diabetes during pregnancy (diabetes diagnosed both prior to and during pregnancy), was reported at a rate of 42.3 per 1,000 women, (just over 4 percent) compared with 38.5 per 1,000 in 2005 (Table 23-25). During the 1990s, the diabetes rate increased by an average of 3 percent per year. Between 2000 and 2002, the pace of increase rose to 6 percent per year. Since the introduction of the revised birth certificate in 2003, the average annual rate of increase for both revised and unrevised reporting areas, was 6 to 7 percent per year. Accordingly, regardless of the possible impact of changes in reporting, it is evident that the diabetes rate has risen markedly for the nation since 1990, and that the increase has quickened in recent years.

Maternal age is an important factor in diabetes risk. In 2006, the diabetes rate for mothers 40 years of age and over was 94.3 per 1,000, 6 times higher than that for mothers under 20 years of age ( 13.3 per 1,000 ). The increase in the overall diabetes rate since 1990 has not been driven by increases for any specific age group, but by large increases at all ages.

Diabetes rates also differ by maternal race and ethnicity (Tables 23-24). As in previous years, rates were highest for API mothers (7.1 percent), followed by AIAN ( 6.4 percent), Hispanic ( 4.3 percent), non-Hispanic white ( 4.0 percent), and non-Hispanic black mothers ( 3.7 percent). Among the Hispanic subgroups, percentages ranged from 4.0 for Cuban to 4.9 for Puerto Rican mothers.

Pregnancy-associated and chronic hypertension are the only other pregnancy risk factors available in a comparable form for all reporting areas. These are closely related hypertensive disorders, but pregnancy-associated hypertension is the more common of the two conditions occurring in 2006 at a rate of 39.1 per 1,000, compared with 10.8 for chronic hypertension (Table 25).

Since 2000, pregnancy-associated hypertension has increased an average of 1 percent per year, compared with nearly 4 percent annually throughout the 1990s. In contrast, the annual increase in the rate of chronic hypertension has accelerated from about 2 percent per year in the 1990s, to 6 percent per year since 2000.

## Tobacco use during pregnancy

Information on smoking during pregnancy was reported on the birth certificate according to two different and noncomparable questions in 2006. For 33 reporting areas ( 31 states, New York City, and the District of Columbia), smoking status was based on the 1989 U.S. Standard Certificate (unrevised), whereas data for 17 states are drawn from the 2003 revision of the birth certificate (revised). Data for Florida are not included at all because the state's birth certificate question on smoking is not comparable to either the 1989 or 2003 revision questions; see "Technical Notes." This report also excludes data for California, which did not report smoking on the birth certificate in 2006. The 1989 revision asks a simple "yes/no" question on tobacco use during pregnancy, while the 2003 revision asks for tobacco use during each trimester of pregnancy (as well as the 3 -month period prior to pregnancy). For the revised tobacco use item, if the mother reported smoking in any of the three trimesters of pregnancy she was recorded as a smoker. Data are shown separately in this report for the areas using the 1989 certificate (unrevised) and for the areas using the 2003 certificate (revised).

For the 17 states for which revised information on tobacco use is available for 2006, the overall smoking rate was 13.2 percent (Table I). As noted above, the revised question on smoking differs considerably from the question on the 1989 certificate. Although there are differences in smoking levels between the revised and unrevised reporting areas, the variations among population subgroups by race and Hispanic ethnicity observed for many years persist for the revised states (Table I). For the 2006 revised tobacco use reporting area, the rate for non-Hispanic white women ( 18.1 percent) was 1.7 and 6.5 as high as that for non-Hispanic black and Hispanic women respectively.

Smoking patterns among population subgroups based on birth certificate data have been confirmed by surveillance and survey data, although there may be some underreporting of smoking on the birth
certificate $(52,53)$. It is believed that the new question on prenatal smoking provides more reliable information because there is a specific time reference for each trimester and women have the chance to report that they quit smoking during their pregnancy $(54,55)$.

## Medical Services Utilization

## Prenatal care

The 2003 revision of the birth certificate introduced substantive changes to information on the timing of prenatal care (6); see "Technical Notes." Accordingly, prenatal care data based on the 1989 and 2003 Standard Certificates of Live Birth are not directly comparable, and are presented separately in this report. See Tables I, II, 26(a), and 26(b) for detailed information on reporting areas. Prenatal care data based on the revised certificate show a markedly less favorable picture of prenatal care utilization in the U.S. than data from the unrevised certificate. Most of the difference can be attributed to changes in reporting and not to changes in prenatal care utilization. Trend analysis of these data are compromised by the changing composition of the revised and unrevised reporting areas.

For the 18 states for which revised prenatal care data are available ( 35 percent of all 2006 births), 69.0 percent of mothers were reported to have begun care within the first 3 months of pregnancy. The percentage of women who began care in the first trimester of pregnancy declined in both the revised and unrevised reporting areas between 2005 and 2006; the percentage of women with late or no care (care beginning in the third trimester of pregnancy) increased for both reporting areas, see Table II. The trend towards less timely receipt of prenatal care was fairly widespread across reporting areas between 2005 and 2006, although many differences by state between years were not statistically significant. (State-specific levels for 2006 are presented in Tables 26(a) and 26(b); see reference (7) for 2005 data.) Prenatal care utilization had risen fairly steadily during the 1990s through 2003 (56); the decline in 2006 follows two consecutive years (2004 and 2005) in which prenatal care levels did not improve $(7,57)$.

Early, ongoing prenatal care may enhance pregnancy outcome and maternal health by assessing risk, providing health care advice, and managing chronic and pregnancy-related health conditions $(43,58)$. Preconception care, that is, health care before pregnancy care, is also recommended (59); information on preconception care is not available from birth certificate data.

Large disparities by race and Hispanic origin persisted in prenatal care receipt. In 2006, as in earlier years, non-Hispanic black and Hispanic women were more than twice as likely as non-Hispanic white women to receive late or no care (Table I).

The percentages of women with first trimester care declined, and the percentage with late or no care generally increased between 2005 and 2006 for non-Hispanic white, non-Hispanic black, and Hispanic women in both the revised and unrevised reporting areas (Table II). Prenatal care utilization had improved for all groups between 1990 and 2003, especially among those which historically have less timely care $(56,60)$. These gains were linked to the expansion of Medicaid for pregnant women in the late 1980s (61); studies suggest that more recent changes to welfare and Medicaid policy might limit further improvements in timely care $(62,63)$.

## Obstetric procedures

In this report, data are presented for induction of labor and tocolysis, the two obstetric procedures reported on both the 1989 and 2003 U.S. Standard Certificates of Live Birth, see "Technical Notes." For 2006, the rate of induction of labor rose 1 percent to 225.3, from 222.7 per thousand births in 2005 (or 22.5 and 22.3 percent of all births). See Table 25 for 2006 data. This rate has more than doubled since 1990 ( 9.5 percent of births), and since 1999, one in five births has been induced.

Induction rates were highest for non-Hispanic white mothers (26.9) compared to their non-Hispanic black (19.8), and Hispanic counterparts (16.1) (Table 25). Between 2005 and 2006, rates increased significantly for Hispanic and non-Hispanic white mothers (by 4 percent and 1 percent respectively); rates were slightly, but not significantly higher for non-Hispanic black mothers. Among all births and for singletons only, induction rates have more than doubled for each racial and Hispanic origin group between 1990 and 2006 (Figure 7).

Between 1990 and 2006, induction rates increased for births at all gestational age categories. When only singleton births were examined (management of births in plural deliveries differs from management of singleton births), the trend was similar. Following large increases during the 1990s (110 percent between 1990 and 1999), induction levels for singleton preterm births (less than 37 completed weeks of gestation) were down or unchanged for 2000 to 2003. Preterm induction rates then rose between 2003 and 2005, and were unchanged between 2005 and 2006. Rates for infants at term (gestational age of 37 to 41 completed weeks) and higher gestations also showed large increases in the 1990s, but the pace of the increase has generally slowed since 2000. In 2006, 16 percent of preterm and 24 percent of term and higher deliveries were induced.

Figure 7. Rates of induction of labor by race and Hispanic origin, United States: 1990, 1996, 2000 and 2006

It has been suggested that the shifting of deliveries towards earlier gestational ages may be due to increased use of induction, and other obstetric interventions such as cesarean delivery. See also sections on "Method of Delivery" and "Period of Gestation." Higher induction rates may be partially related to an increase in inductions done for other than medical or obstetrical reasons (elective inductions) (64). Elective induction may increase the risk of cesarean delivery in nulliparous women (65).

Agents employed to inhibit or postpone uterine contractions to prevent preterm delivery (tocolytics) are customarily used at gestational ages of less than 34 completed weeks of gestation. The rate of tocolysis trended upward between 1990 and 1999 (from 16.0 to 23.6 per 1,000). This level has since trended downward, to 17.1 per 1,000 in 2006 (Table 25 for 2006 data). The use, effectiveness, and limitations of tocolytics were discussed in a recent review (66).

## Characteristics of labor and delivery

Moderate or heavy meconium staining, precipitous labor, and breech and malpresentation are three characteristics of labor and delivery that are comparably defined across the 1989 and 2003 revisions of the U.S. Standard Certificate of Live Birth. For each, the severity of the condition may require medical intervention and can affect the health of the infant.

Meconium staining occurred in 44.8 per 1,000 of all births in 2006 (Table 25). This rate has declined sharply, by 26 percent, from 60.4 per 1,000 since 1990. The presence of meconium during labor and delivery can directly alter the amniotic fluid, reduce antibacterial activity (and subsequently increase the risk of perinatal bacterial infection), and damage the infant's lungs if inhaled (67). Fetal distress from meconium aspiration syndrome often leads to delivery by cesarean section (68).

Meconium staining is most prevalent for younger mothers; rates decrease slightly with increasing age of mother. Among the three largest racial and ethnic groups, rates were highest among nonHispanic black ( 55.6 per 1,000), and Hispanic mothers (51.4), compared with non-Hispanic white mothers (38.8).

As would be expected, there is an association between meconium aspiration and low Apgar scores. In 2006, 2.5 percent of infants with meconium staining had Apgar scores under 7 points compared with those without meconium (1.5 percent.)

Breech and malpresentation was reported at a level of 54.0 per 1,000 births and precipitous labor at 20.9 per 1,000. Table 25 shows breech rates rising steadily with maternal age: the 2006 breech/malpresentation rate for mothers 40 years of age and older (83.3 per 1,000) was almost double that for mothers under 20 (42.7 per 1,000 ). Older mothers are also more likely to experience precipitous labor, but differences by age are less pronounced.

Increases in breech/malpresentation rates observed since 2003 (the first year states began implementing the revised birth certificates) may be, at least in part, a reporting artifact. The 1989 Revision of the U.S. Standard Certificate of Live Birth (unrevised) provides a single checkbox for "Breech/Malpresentation" under Complications of Labor and Delivery. In comparison, on the 2003 revision of the birth certificate (revised), this information is collected as two separate checkboxes: "Breech" and "Other" in the Fetal Presentation subsection of Method and Delivery. Although by definition, the revised "Breech" and "Other"
items combined are comparable to the unrevised, levels for revised states tend to be higher in general than those for nonrevised states. See also "Technical Notes."

## Attendant at birth and place of delivery

In 2006, as over the past several decades, 99 percent of all births were delivered in hospitals. Of all 2006 births, 91.5 were delivered by physicians in hospitals, compared with 91.6 in 2005 (Table 27). This level has risen slightly since 2001-2002 (91.3 percent). In 2006, as in previous years, almost all physician-attended births were attended by doctors of medicine (M.D.s). The percentage of physician-attended births attended by doctors of osteopathy (D.O.s) was 5.3. This level has increased by one-third over the past decade (4.0 percent in 1996), and may indicate an increasing number of osteopathic physicians specializing in obstetrics (69).

Less than 1 percent ( 0.9 percent) of all births in the U.S. were out-of-hospital births in 2006. Of these out-of-hospital births, nearly two-thirds (64.7 percent) were in a residence (home) and 28.0 percent were in a freestanding birthing center. The remaining out-of-hospital births ( 7.3 percent) occurred in a clinic or doctor's office, or a place not specified (Table 27). In 2006, midwives attended 60.9 percent and physicians attended 7.6 percent of home births. Compared with 1996 rates ( 47.9 and 13.3 percent respectively), the 2006 rates represent a 27 percent increase in midwife-attended home births and a 43 percent decrease in physician-attended home births over the past decade.

The 2006 percentage of all births attended by midwives, 7.9 percent, has not changed since 2004. Between 1975 and 2002, midwifeattended births steadily increased (from less than 1.0 to 8.1 percent). Because almost all cesarean deliveries are performed by physicians, the percentage of all vaginal births attended by midwives was computed. This rate was 11.3 percent in 2006, almost double the 1991 rate (5.7). These data should be considered lower estimates of the actual number of midwife-attended births because of underreporting of midwife-attended deliveries $(9,70)$.

Most midwife-attended births are by certified nurse midwives (CNMs). For 2006, the percentage of midwife-attended births by CNMs was 94.3 percent. This rate has remained at 90 percent or more since 1989. Most midwife-attended births occur in hospitals (93 percent in 2006).

The percentage of all CNM-attended births by race and Hispanic origin is presented in Tables 23 and 24. Data for CNM-attended hospital births show that they are more than twice as frequent among AIAN women (17 percent) than among Hispanic women (8 percent) and non-Hispanic white and black women (7 percent). Rates were lowest for API women (6 percent). Among the Hispanic subgroups, Puerto Rican and Central and South American women were slightly more likely to have a hospital CNM-attended birth (10 and 9 percent, respectively) than Mexican women (8 percent). (Table 23 and 24 and data not shown).

## Method of delivery

The total cesarean delivery rate for 2006, 31.1 percent, is the highest level ever reported in the United States. This is a 3-percent increase from the 2005 rate (30.3). This rate fell from 1989 to 1996, then increased by 50 percent from the 1996 low of 20.7 (Table 28).

The latest available National Hospital Discharge Survey data show similar trends in cesarean delivery for 1990-2005 (71).

Information on Method of Delivery is collected on both the 2003 Standard Certificate of Live Birth (revised) and 1989 Standard Certificate of Live Birth (unrevised). However, the format and wording of the "Method of Delivery" item on the revised standard certificate differ from those of the unrevised standard certificate. As a result, although data on total cesarean delivery appear very comparable, data on VBAC, primary, and repeat cesarean deliveries are not directly comparable between revisions, and are presented separately for revised and unrevised reporting areas (see "Technical Notes").

The continuing rise in the total cesarean rate is a result of trends in the primary cesarean rate and the rate of VBAC. The latest complete national data (2004) show the primary cesarean rate decreased between 1989 and 1996 and then increased between 1996 and 2004. The rate of VBAC increased between 1989 and 1996, but fell sharply between 1996 and 2004 (57). Data from both revised and unrevised reporting areas for 2004-2006 show a continuation of these trends (7) (See below).

Although the risks, benefits, and long-term consequences of VBAC delivery have been debated for over 20 years, in recent years the increasing rate has stimulated discussion on whether cesarean delivery should be performed when there is no medical or obstetrical indication for the procedure (72). In 2006, a National Institutes of Health expert panel recommended that nonmedically indicated cesareans should not be performed for pregnancies of less than 39 weeks of gestation and for women desiring several children (73).

Revised data are available for 2006 for the 19 states that had implemented the new birth certificate as of January, 2006 (49 percent of all births). For 2006, unrevised data on method of delivery are available for 33 reporting areas ( 31 states, the District of Columbia and New York City). In the 19 states for which revised data are available for 2006, the primary cesarean rate was 23.5 per 100 live births to women who had not had a previous cesarean delivery (Table I). Comparing the 12 states that were revised as of January 2005 with the same states in 2006, the primary cesarean rate increased by 2 percent (Table II). Primary cesarean rates increased by about the same magnitude among the unrevised reporting area. The increase in primary cesarean deliveries may be associated with nonclinical factors such as demographics, physician practice patterns, maternal choice and medical-legal pressures (74-76).

In the 19 revised states, 8.5 percent of women had a VBAC (Table I). For the 12 -state reporting area for which revised data are available for both 2005 and 2006, the VBAC rate fell by 6 percent between 2005 and 2006. The VBAC rate for the unrevised reporting areas also declined substantially between 2005 and 2006 (Table II).

A subsequent delivery for a woman who has had a first (primary) cesarean delivery will be either a repeat cesarean or a vaginal birth after cesarean (VBAC) delivery. Therefore, the sharply declining rate of VBAC means a concomitant steep rise in the rate of repeat cesarean deliveries (the rate of cesarean delivery per 100 women with a previous cesarean). Repeat cesarean rates for both revised and unrevised reporting areas are about 92 percent. In other words, once a woman has a cesarean delivery it is highly likely (there is approximately a 92 percent chance) that her next delivery will be a cesarean delivery. The continuing fall in the VBAC rate (i.e., the increase in the repeat cesarean rate) may be related to reports of risks associated with VBAC, more conservative practice guidelines, legal pressures, as well as the
ongoing controversy regarding the harms and benefits of vaginal birth versus repeat cesarean section (77-79).

Between 2005 and 2006 the total cesarean rate rose for women of all ages (Table 29 for 2006 data). As in past years, total cesarean rates increased with increasing maternal age. For example, the 2006 rate for mothers $40-54$ years of age (47.6) was more than double the rate for mothers under age 20 years (22.2). The elevated rates for older mothers may be related to their increased rate of multiple births, other biologic or medical factors, and maternal or physician concerns (80).

Between 1996 and 2006 cesarean rates increased for births at all gestational ages. When only singleton births were examined (births in plural deliveries are much more likely to be delivered by cesarean section), the trend was similar. Between 1996 and 2006, cesarean rates rose by 34 to 54 percent for each gestational age category, including very preterm infants (less than 32 completed weeks of gestation) (Figure 1). However, the pace of increase has slowed somewhat for 2006 (data not shown). A recent study found that the increase in the preterm birth rate has occurred primarily among infants delivered by cesarean section (81). See also "Period of Gestation" section.

Although very preterm singleton infants had the highest cesarean rate in 2006, 46.6 percent, more than 30 percent of all singletons born at 34 to 36 weeks (late preterm) and at 37 to 39 weeks, were delivered by cesarean, a 50 percent increase since 1996 (Figure 1). About one-fourth of infants born at 40 weeks and greater in 2006 were delivered by cesarean, a 39 percent increase since 1996.

Among the largest racial and Hispanic origin groups, total cesarean rates increased for 2005-2006. For 2006, rates were highest for non-Hispanic black (33.1) compared with non-Hispanic white (31.3) and Hispanic women (29.7) (Table 29). Among Hispanic subgroups, the total cesarean rate ranged between 28.5 percent for Mexican, to 47.4 percent for Cuban mothers. For AIAN women, the overall cesarean rate in 2006 was 27.5 percent; the rate for API mothers was 30.6 percent (Tables 23 and 24).

State-specific total cesarean rates for 2006 are shown in Table 30. Total cesarean rates were up for 37 states in 2006 compared with 2005. There was no significant change in 12 states and the District of Columbia; a small decline was reported for Louisiana. As in prior years, there was considerable variation in cesarean rates by state, from under 23 percent in Idaho and Utah, to over 36 percent for Florida and New Jersey (Table 30). Nearly one-half of births in Puerto Rico were cesarean deliveries ( 48.3 percent). The substantially higher rates in Puerto Rico may be related to variables other than demographic characteristics or pregnancy risk factors (82).

State-specific VBAC rates for 2006 are shown in Tables 31a and 31b. Although not all declines were statistically significant, VBAC rates trended downward for most states in both the revised and unrevised reporting areas for 2005-2006.

In 2006, 193,523 infants were delivered by either forceps or vacuum extraction. Since 1996, as the cesarean rate has increased, the percentage of vaginal births assisted by either of these methods has decreased 52 percent (from 9.4 to 4.5) (Table E). For 2006, the rate of forceps delivery remained at under 1 percent ( 0.8 ); there has been a large steady decline in this rate since 1990 ( 5.1 percent). The rate of delivery by vacuum extraction, which had increased by 59 percent between 1990 (3.9) and 1996-1997 ( 6.2 percent), has since decreased to 3.7 percent for 2006.

## Infant Health Characteristics

## Period of gestation

The preterm birth rate rose again in 2006, to 12.8 percent of all births, from 12.7 percent in 2005. The percentage of births delivered preterm (less than 37 completed weeks of gestation) has risen more than 20 percent since 1990, and 36 percent since the early 1980s.
See Tables F, 23, 24, and 32-34. Small increases were observed between 2005 and 2006 in both the percentage of infants born at less than 34 weeks (from 3.63 to 3.66 percent) and in the percentage delivered at 34 to 36 weeks of gestation, or late preterm (from 9.09 to 9.15 percent). Since 1990, the birth rate at under 34 weeks has increased modestly (from 3.32 percent), whereas the late preterm

| 37-39 weeks. | 54.32 | 53.54 | 48.83 | 41.38 | 55.05 | 54.26 | 49.27 | 41.42 |
| 40 weeks and higher | 32.88 | 33.73 | 39.54 | 48.00 | 33.85 | 34.74 | 40.61 | 48.88 |

rate has climbed 25 percent (from 7.30 percent). See "Technical Notes" for information on gestational age measurement using birth certificate data.

Progress in the effort to develop effective approaches to prevent preterm labor has been limited (83). In the United States, more than one-third of all infant deaths are estimated to be preterm-related (84). The risk of adverse outcome declines as gestational age increases; however, even infants born late preterm, the bulk of preterm births, are at heightened risk of early death compared with those born at later in the pregnancy $(18,85)$ and there is growing evidence that late preterm infants suffer long-term ill effects (86-88).

Figure 8 presents the marked shift in the gestational age distribution of U.S. births between 1990 and 2006. Over this 16-year period, late preterm (34-36 weeks) and early term (37 and 38 weeks) births have risen sharply, whereas births at 40 weeks or more have markedly declined (Table F). Reasons suggested for this shift are many and include the rise in the rate of multiple births, the increased use earlier in pregnancy of procedures to manage labor and delivery such as induction of labor and cesarean delivery, and changes in maternal demographics and health (89-91). See also sections on "Birthweight," "Method of delivery," "Obstetric procedures," and "Multiple births."

The preterm rate rose among births to Hispanic women (from 12.1 to 12.2 percent) between 2005 and 2006; levels for non-Hispanic white (11.7 percent) and non-Hispanic black births (18.5 percent for 2006) were essentially unchanged (Table 33). Since 1990, preterm birth rates have risen 38 percent for non-Hispanic white, and 11 percent for Hispanics infants. Preterm births among non-Hispanic black infants trended slightly downward during the 1990s, from a high of 19.0 percent in 1991 to a low of 17.4 percent in 2000, but recent increases have largely erased this small amelioration in non-Hispanic black preterm births. The much increased risk of premature delivery among infants born to black mothers has been linked to the substantial black and white gap in infant mortality (92). For 2006 as in previous years, non-Hispanic black infants are three times as likely to be born extremely preterm (less

Figure 8. Percent change in the distribution of births by gestational age: United States, 1990 and 2006
than 28 weeks of gestation) ( 1.8 percent) compared with non-Hispanic white and Hispanic infants ( 0.6 percent) (Table 32). Death rates for infants born extremely preterm are about 170 times as high as those of infants born at term (37-41 weeks) (93). Preterm levels for AIAN and API infants, and the Hispanic subgroups for 2006 are shown in Tables 23 and 24; state-specific preterm birth rates by race and Hispanic origin are shown in Table 34.

The preterm birth rate for singleton births rose from 11.0 to 11.1 percent between 2005 and 2006 (Table F); this rate has climbed 14 percent since 1990. The rise in the rate of multiple births over the last two decades has importantly influenced overall preterm birth levels as twins and higher order multiples tend to be born earlier than those in single gestations. For 2005-2006, increases were observed both in singleton births under 34 weeks ( 2.91 to 2.96 percent), and in late preterm births ( 8.09 to 8.14 percent). Nearly all of the increase in singleton preterm rates since 1990, however, has been among late preterm births, up 20 percent since 1990. Late preterm rates among non-Hispanic white and Hispanic singletons have risen 34 and 10 percent respectively, over this period. Among non-Hispanic black births, singleton late preterm rates declined modestly during the 1990s, but have been on the rise in more recent years.

## Birthweight

The low birthweight (LBW) rate rose from 8.2 to 8.3 percent for 2005-2006, the sixth consecutive year of increase and the highest level reported in the U.S. in four decades. The LBW rate, the percentage of infants born at less than 2,500 grams or 5 lb 8 oz , is up 9 percent since 2000, and 24 percent since the mid-1980s, see Tables 32, 33, and 35. All of the 2005-2006 increase was among moderately low birthweight (MLBW) (1,500-2,499 grams) infants ( 6.7 to 6.8 percent); the incidence of very low birthweight (VLBW) (less than 1,500 grams) was unchanged ( 1.49 percent). MLBW has risen from 5.7 percent, and VLBW from 1.27 percent since 1990.

A newborn's weight at birth is closely related to its risk of early death and long-term morbidity (18,93-95); infants born at the lowest weights are the most likely not to survive the first year $(18,93,95)$. The mortality rate for VLBW infants in 2005 was 244.95 per 1,000 births, compared with 14.73 for infants born MLBW, and 1.46 for infants born at 3,500-4,499 grams (93).

Low birthweight levels were unchanged between 2005 and 2006 among non-Hispanic white ( 7.3 percent), and non-Hispanic black infants (14.0 percent), but increased slightly for Hispanics (from 6.9 to 7.0 percent) (Table 33). Since 1990, non-Hispanic white LBW has climbed 30 percent, and Hispanic LBW by 15 percent. The LBW rate for non-Hispanic black infants, which had trended downward slightly during the 1990s, has risen 7 percent since 2000-2001 (13.1 percent). See Tables 23 and 24 for LBW rates for AIAN and APIs infants, and the Hispanic subgroups.

Over the past several decades, national LBW levels have been strongly influenced by the large growth in the rate of multiple births, more than one-half of which are delivered at less than 2,500 grams (see section on multiple births). However, when only births in singleton deliveries are examined, a substantial rise in LBW is also observed (Table G). Between 2005 to 2006, the LBW rate for singletons rose from 6.41 to 6.49 percent; this rate is up 10 percent since 1990

Table G. Rates of very low birthweight and low birthweight and mean birthweight among singletons by race and Hispanic origin of mother, United States: 1990, 1995, 2000, 2005, and 2006

| Characteristic | 2006 | 2005 | 2000 | 1995 | $1990{ }^{1}$ |

| Mean birthweight in grams (standard deviation) | 3,302 (544) | 3,309 (545) | 3,344 (552) | 3,343 (553) | 3,351 (552) |

${ }^{1}$ Data for 1990 by race and Hispanic origin exclude data for New Hampshire and Oklahoma, which did not require reporting of Hispanic origin of mother.
${ }^{2}$ Includes races other than white and black and origin not stated.
${ }^{3}$ Includes all persons of Hispanic origin of any race; see "Technical Notes."
NOTES: Very low birthweight is less than 1,500 grams. Low birthweight is less than 2,500 grams. Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2005-2006; see "Technical Notes."
(5.90 percent). Over the period 1990 to 2006, important increases in LBW rates are seen among singleton births to women under age 20-44 years, see Figure 9.

The full birthweight distribution has changed markedly in recent years for all births and for singletons only. Between 1990 and 2006, the percentage of singleton births weighing less than 3,500 grams has risen, whereas that for heavier infants has declined (7). The decline at $3,500-4,499$ grams ( $7 \mathrm{lb} 12 \mathrm{oz}-9 \mathrm{lb} 14 \mathrm{oz}$ ) is of especial concern because infant mortality is least likely at these weights (93). The reasons behind the shift towards lower birthweights may be similar to those suggested for the national trend towards shorter gestational ages, that is, obstetric intervention earlier in pregnancy, older maternal age at childbearing, and increased use of infertility therapies ( $89,90,96,97$ ). See also sections on "Gestational age," "Obstetric procedures," and "Method of delivery."

Wide differences in VLBW and LBW are seen across the U.S. reporting areas (Tables 36 and 37). Low birthweight rates ranged from higher than 11 percent in Louisiana, Mississippi, and the District of Columbia, to levels of 6.0-6.1 percent in Alaska and Oregon. VLBW was twice as prevalent in Louisiana, Mississippi, and the District of Columbia (2.1-2.5 percent) as in Oregon, Utah, and Washington (1.0 percent). For nearly all jurisdictions, the rate of VLBW for nonHispanic black infants was about twice that of non-Hispanic white and Hispanic newborns.

## Apgar score

The Apgar score is a useful clinical indicator for reporting overall status of the neonate and the need for, and response to, resuscitation efforts. Historically, the score has been measured at 1 minute, 5 minutes, and if needed, at additional 5 -minute intervals after delivery (98). The Apgar score at 5 minutes has been shown to be a valid
predictor of neonatal mortality (99). Information on the 5 -minute score is included in national birth certificate data. The Apgar score measures five easily identifiable characteristics of newborns. A 5 -minute score of 0 to 3 indicates an infant in immediate need of resuscitation; 4 to 6 is considered intermediate, and 7 to 10 is considered normal.

Among the 48 -state reporting area for which trend data are available (information for California and Texas is not available for the

Age in years
NOTES: Singleton births only. Low birthweight is less than 2,500 grams. SOURCE: CDC/NCHS, National Vital Statistics System.

Figure 9. Percentage low birthweight by age of mother: United States: 1990 and 2006
full period 1990-2006), the percentage of births with excellent 5-minute scores (9 and 10) decreased slightly, from 89.1 to 88.6 between 2005 and 2006, remaining lower than the 2001 high of 90.3 percent (the highest level achieved since 1990). See Tables 23 and 24 for 2006 data based on a 49-state reporting area.

The proportion of births with low Apgar scores (below 7) was 1.6 in 2006 (based on the 48-state reporting area). This level had declined from 1.5 percent 1990 to 1.4 in 2002, but has risen since. Low 5-minute Apgar scores are associated with lower birthweight and shorter gestational age, and several obstetric risk factors, such as infections, maternal medications and delivery trauma. Low scores are also associated with congenital anomalies $(98,100,101)$.

Low Apgar scores (under 7) have changed only slightly for most racial and ethnic groups since 1990, and have maintained their relative positions in the range of 1.0 to 1.6 percent. Among non-Hispanic black infants, however, trends in low scores were less stable; the percentage declined from to 2.8 to 2.3 percent between 1990 and 2002, but has risen to 2.6 percent since.

Among racial and ethnic groups for the 2006, 49-state reporting area (excluding California only), non-Hispanic black infants had the highest percent of low Apgar scores (2.6); about twice the level of other groups. API infants had the lowest percent (1.1) of live births in this category (Tables 23 and 24 for 2006 data).

## Congenital anomalies

Congenital anomalies are a major cause of neonatal deaths, physical defects, and metabolic diseases. Early ascertainment and medical treatment are critical for the best infant outcome (102). The infrequency of congenital anomalies requires that rates in this report be calculated per 100,000 live births (Table 25).

Difficulty in recognition and anomaly severity are believed to cause significant underreporting of congenital anomalies on the birth certificate $(103,104)$. However, birth certificate data are a valuable resource for exploratory and confirmatory analysis (105). Five congenital anomalies reported on both the revised and unrevised U.S. Standard Certificate of Live Birth are presented: anencephaly, meningomyelocele/ spina bifida, cleft lip/palate, Down syndrome, and omphalocele/gastroschisis; see "Technical Notes."

The rate of anencephaly was 11.6 in 2006, compared with 11.3 in 2005 and 10.9 in 2004. The rate of meningomyelocele/spina bifida was 17.8 in 2006, compared with 18.0 in 2005 and 19.3 in 2004 (see Table 25 for 2006 data).

Maternal age is an important factor for two congenital anomalies reported here (Table 25). In 2006, Down syndrome rates for mothers aged 40-54 years were 13 to 15 times higher compared with those less than 30 years of age. Younger mothers (under 20 years of age) had rates of omphalocele/gastroschisis that were five to six times higher than mothers more than 30 years of age.

## Multiple births

The rapid, unprecedented rise in multiple birth rates of the last several decades may have ended, at least temporarily. The 2006 twin birth rate was essentially unchanged for the second straight year at 32.1 per 1,000 births; this rate (births in twin deliveries per 1,000 births) had risen 70 percent from 1980 to 2004 (from 18.9 per 1,000 ). See Tables 38 and 39. The rate of triplet and higher order
multiple births (triplet/+) declined 5 percent in 2006, to 153.3 per 100,000 total births, from 161.8 in 2005 . The triplet/+ rate (the number of triplets, quadruplets, and quintuplets and other higher order multiples per 100,000 live births) climbed more than 400 percent during the 1980s and 1990s, but has declined 21 percent since the all-time high in 1998 (193.5). Declines of 20 to 30 percent are observed in triplet/+ birth rates for women in age groups 25 years and over since 1998; see Figure 10.

Although the twin birth rate was essentially unchanged in 2006, the number of births in twin deliveries was up 3 percent for 2005-2006 to 137,085 births, another record high, and more than twice the number reported for $1980(68,339)$. The number of triplet/+ births declined 2 percent from the previous year to the lowest reported in a decade (6,540 in 2006), and included 6,118 triplets, 355 quadruplets and 67 quintuplets (Table 39). The number and rate of births in quadruplet and higher order deliveries have also declined in recent years, see Table H.

The upsurge in multiple births, particularly higher order multiples, has been attributed to older age at childbearing (women in their thirties are more likely than younger women to conceive multiples spontaneously) and the growing availability and use of fertility-enhancing therapies (106-107) (both assisted reproductive technologies (ART) such as in vitro fertilization), and non-ART therapies such as ovulation-inducing drugs and artificial insemination. Less than 20 percent of all triplets/+ born between 1997-2003 are estimated to have been naturally conceived $(107,108)$. In response to the unparalleled rise in higher order multiple births and their attendant risk of poor outcome, The American Society of Reproductive Medicine published guidelines in the late 1990s (later updated) (109-111), intended to reduce the incidence of triplets/+ resulting from ART by limiting the number of embryos transferred. Studies have since documented substantial declines in such transfers $(112,113)$.

Triplet/+ birth rates declined between 2005 and 2006 for nonHispanic white (208.1 per 100,000 in 2006) and non-Hispanic black

Figure 10. Triplet/+ birth rates for mothers 25 years of age and older: United States, 1980, 1990, 1998, and 2006

Table H. Numbers of triplet, quadruplet, quintuplet, and other higher order multiple births: United States, 1990 and 1995-2006

|  | Year | Triplets | Quadruplets | Quintuplets and other higher multiple births ${ }^{1}$ | Triplet birth rate ${ }^{2}$ | Quadruplet and higher order multiple birth rate ${ }^{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2006 |  | 6,118 | 355 | 67 | 143.4 | 9.89 |
| 2005 |  | 6,208 | 418 | 68 | 150.0 | 11.7 |
| 2004 |  | 6,750 | 439 | 86 | 164.2 | 12.8 |
| 2003 |  | 7,110 | 468 | 85 | 173.8 | 13.5 |
| 2002 |  | 6,898 | 434 | 69 | 171.5 | 12.5 |
| 2001 |  | 6,885 | 501 | 85 | 171.0 | 14.6 |
| 2000 |  | 6,742 | 506 | 77 | 166.1 | 14.4 |
| 1999 |  | 6,742 | 512 | 67 | 170.3 | 14.6 |
| 1998 |  | 6,919 | 627 | 79 | 175.5 | 17.9 |
| 1997 |  | 6,148 | 510 | 79 | 158.4 | 15.2 |
| 1996 |  | 5,298 | 560 | 81 | 136.1 | 16.5 |
| 1995 |  | 4,551 | 365 | 57 | 116.7 | 10.8 |
| 1990 |  | 2,830 | 185 | 13 | 71.6 | 5.0 |

${ }^{1}$ Quintuplets, sextuplets, and higher order multiple births are not differentiated in the national data set.
${ }^{2}$ Triplet births per 100,000 total births.
${ }^{3}$ Quadruplet and higher order multiple births per 100,000 total births.
(94.0) women; the downturn for Hispanics was not statistically significant (from 77.2 to 75.7). Between 1980 and 1998, large increases in triplet/+ birth rates were observed for each of these groups, but the most striking increase was among white mothers, up nearly 500 percent (Table 39) (114). Since 1998, triplet/+ birth rates have declined fairly steadily among non-Hispanic white women but, have fluctuated among non-Hispanic black and Hispanic women.

Twin birth rates were essentially unchanged among the three largest racial and Hispanic origin groups for 2005-2006; non-Hispanic white (36.0 per 1,000 in 2006), non-Hispanic black (36.8), and Hispanic (21.8). Since 1990, rates have risen 57 percent for non-Hispanic white, and 38 and 21 percent, respectively, for non-Hispanic black and Hispanic women.

Multiple birth rates tend to rise with increasing maternal age. This difference has widened in recent years with increases most pronounced for women 30 years and over. Between 1980 and 2006, twin birth rates rose 27 percent for mothers under age 20 years compared with 80 percent for women in their thirties, and 190 percent for mothers aged 40
years and over. In 2006, 20 percent of births to women aged 45-54 years was a twin, compared with about 2 percent of births to women aged 20-24 years, see Table 38.

The high risk of adverse outcome for multiple births is demonstrated in Table J. One out of every 8 twins, and one of every 3 triplets are born very preterm (less than 32 weeks of gestation), compared with fewer than 2 of every 100 singletons. Accordingly, death during infancy is much more common among twins (29.8 per 1,000) and triplets (59.6 per 1,000 ) than among singletons ( 6.0 per 1,000 ) (18).

Table 40 combines the 3 most current years of data available to produce statistically reliable twin and triplet/+ birth rates by state. For years 2004 to 2006, twins accounted for more than 4 percent of all births (or more than 40 per 1,000) in Connecticut, Massachusetts, and New Jersey. In contrast, less than 2.5 percent of births to New Mexico residents were twins. The highest triplet/+ birth rates (over 250 per 100,000 ) were reported for Massachusetts, Nebraska, and New Jersey; the lowest, for New Mexico (72.3).

Table J. Gestational age and birthweight characteristics by plurality: United States, 2006

| Characteristic | Twins | Triplets | Quadruplets | Quintuplets and higher order multiples ${ }^{1}$ | Singletons |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Number of births. | 137,085 | 6,118 | 355 | 67 | 4,121,930 |
| Percent, very preterm ${ }^{2}$ | 12.1 | 36.3 | 79.2 | 79.1 | 1.6 |
| Percent, preterm ${ }^{3}$ | 60.4 | 92.6 | 94.9 | 89.6 | 11.1 |
| Mean gestational age in weeks (standard deviation). | 35.2 (3.6) | 32.0 (3.9) | 29.3 (4.1) | 29.4 (5.3) | 38.7 (2.4) |
| Percent, very low birthweight ${ }^{4}$ | 10.2 | 34.8 | 73.4 | 84.8 | 1.1 |
| Percent, low birthweight ${ }^{5}$. | 57.5 | 95.4 | 98.0 | 95.5 | 6.5 |
| Mean birthweight in grams (standard deviation). | 2,323 (629) | 1,655 (557) | 1,225 (543) | 1,147 (641) | 3,298 (565) |

## List of Detailed Tables

1. Live births, birth rates, and fertility rates, by race: United States, specified years 1940-1955 and each year, 1960-2006.
2. Live births by age of mother, live-birth order, and race of mother: United States, 2006
3. Fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 2006
4. Total fertility rates and birth rates by age of mother: United States, 1970-2006, and by age and race of mother: United States, 1980-2006
5. Live births, birth rates, and fertility rates by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989-2006
6. Live births by age of mother, live-birth order, and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 2006
7. Fertility rates and birth rates by age of mother, live-birth order, and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 2006
8. Total fertility rates, fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989-2006
9. Fertility rates and birth rates by live-birth order and by race and Hispanic origin of mother: United States, 1980-2006
10. Mean age of mother, by live-birth order and race and Hispanic origin of mother: United States, 1980-2006
11. Number of births, birth rates, fertility rates, total fertility rates, and birth rates for teenagers 15-19 years by age of mother: United States, each state and territory, 2006
12. Live births by race of mother: United States, each state and territory, 2006

50
13. Live births by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, each state and territory, 2006

$$
51
$$

14. Total number of births, rates (birth, fertility, and total fertility), and percentage of births with selected demographic characteristics, by race of mother: United States, 2006
15. Total number of births, rates (birth, fertility, and total fertility), and percentage of births with selected demographic characteristics, by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 2006
16. Live births and observed and seasonally adjusted birth and fertility rates, by month: United States, 2006
17. Live births by day of week and index of occurrence by method of delivery: United States, 2006
18. Number, birth rate, and percentage of births to unmarried women by age, race, and Hispanic origin of mother: United States, 2006
19. Birth rates for unmarried women by age of mother: United States, 1970, 1975, and 1980-2006, and by age, race, and Hispanic origin of mother: United States, 1980-2006
20. Number and percentage of births to unmarried women by race and Hispanic origin of mother: United States, each state and territory, 2006
21. Birth rates by age and race of father: United States, 1980-2006
22. Number of live births and percent distribution, by weight gain of mother during pregnancy, according to period of gestation and race and Hispanic origin of mother: 49 reporting states and the District of Columbia, 2006
23. Percentage of births with selected medical or health characteristics, by race of mother: United States, 2006
24. Percentage of births with selected medical or health characteristics, by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 2006
25. Number and rate of live births to mothers with selected risk factors during pregnancy, obstetric procedures, characteristics of labor and delivery, and congenital anomalies, by age and race and Hispanic origin of mother: United States, 2006
26 (a). Percentage of mothers beginning prenatal care in the first trimester and percentage of mothers with late or no prenatal care, by race and Hispanic origin of mother: 18 states and Puerto Rico (data based on the 2003 Revision of the U.S. Standard Certificate of Live Birth), 2006
26 (b). Percentage of mothers beginning prenatal care in the first trimester and percentage of mothers with late or no prenatal care by race and Hispanic origin of mother: 32 states, District of Columbia, New York City, and territories (data based on the 1989 Revision of the U.S. Standard Certificate of Live Birth), 2006
26. Number of live births by attendant, place of delivery, and race and Hispanic origin of mother: United States, 2006
27. Live births by method of delivery and rates of cesarean delivery by race and Hispanic origin of mother: United States, 1989-2006
28. Number of live births by method of delivery and rates of cesarean delivery by age and race and Hispanic origin of mother: United States, 2006
29. Rates of cesarean delivery by race and Hispanic origin of mother: United States, each state and territory, 2006 . . . . . . .
31 (a). Rates of vaginal birth after cesarean delivery (VBAC), by race and Hispanic origin of mother: 19 states and Puerto Rico (data based on the 2003 Revision of the U.S. Standard Certificate of Live Birth), 2006
31 (b). Rates of vaginal birth after cesarean delivery (VBAC), by race and Hispanic origin of mother: 31 states, the District of Columbia, New York City, and territories (data based on the 1989 Revision of the U.S. Standard Certificate of Live Birth), 2006
30. Live births by birthweight and percentage very low and low birthweight, by period of gestation and race and Hispanic origin of mother: United States, 2006
31. Percentage of live births very preterm and preterm and percentage of live births of very low birthweight and low birthweight, by race and Hispanic origin of mother: United States, 1981-2006
32. Number and percentage of births delivered preterm, by race and Hispanic origin of mother: United States, each state and territory, 2006
33. Number and percentage low birthweight and number of live births by birthweight, by age and race and Hispanic origin of mother: United States, 2006
34. Number and percentage of births of low birthweight, by race and Hispanic origin of mother: United States, each state and territory, 2006
35. Number and percentage of births of very low birthweight, by race and Hispanic origin of mother: United States, each state and territory, 2006
36. Live births by plurality of birth and ratios, by age and race and Hispanic origin of mother: United States, 2006
37. Numbers and rates of twin and triplet and higher-order multiple births by race and Hispanic origin of mother, United States: 1980-2006
38. Twin and triplet and higher order multiple birth rates by state: United States and each state, 2004-2006.

-- Data not available.
${ }^{1}$ Data for 1960-1991 includes births to races not shown separately. For 1992 and later years, unknown race of mother is imputed; see "Technical Notes."
${ }^{2}$ Based on 100 percent of births in selected states and on a 50 -percent sample of births in all other states; see "Technical Notes."
${ }^{3}$ Based on a 50 -percent sample of births.
${ }^{4}$ Based on a 20 - to 50 -percent sample of births.
${ }^{5}$ Figures by race exclude New Jersey.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006,23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. In this table all women (including Hispanic women) are classified only according to their race. See "Technical Notes" for more information on multiple-race data.

Table 2. Live births by age of mother, live-birth order, and race of mother: United States, 2006
[Live-birth order refers to number of children born alive to mother]

| Live-birth order and race of mother | $\begin{gathered} \text { All } \\ \text { ages } \end{gathered}$ | Age of mother |  |  |  |  |  |  |  |  |  |  |  |  |  |

- Quantity zero.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006,23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. In this table all women (including Hispanic women) are classified only according to their race. See "Technical Notes" for more information on multiple-race data.

Table 3. Fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 2006
[Rates are live births per 1,000 women in specified age and racial group. Fertility rate computed by relating total births, regardless of age of mother, to women aged 15-44 years. Population estimated as of July 1. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed]

| Live-birth order and race of mother | 15-44 <br> years | Age of mother |  |  |  |  |  |  |  |  |  |

[^1]NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. In this table all women (including Hispanic women) are classified only according to their race. See "Technical Notes" for more information on multiple-race data.

Table 4. Total fertility rates and birth rates by age of mother: United States, 1970-2006, and by age and race of mother: United States, 1980-2006
[Total fertility rates are sums of birth rates for 5 -year age groups multiplied by 5 . Birth rates are live births per 1,000 women in specified group. Population enumerated as of April 1 for census years and estimated as of July 1 for all other years]

See footnotes at end of table.

Table 4. Total fertility rates and birth rates by age of mother: United States, 1970-2006, and by age and race of mother: United States, 1980-2006-Con.
[Total fertility rates are sums of birth rates for 5 -year age groups multiplied by 5 . Birth rates are live births per 1,000 women in specified group. Population enumerated as of April 1 for census years and estimated as of July 1 for all other years]

| Year and race |  | Total fertility rate | Age of mother |  |  |  |  |  |  |  |  |  |

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in numerator.
${ }^{1}$ Beginning 1997, rates computed by relating births to women aged 45-54 years to women aged 45-49 years.
${ }^{2}$ For 1970-1991 includes births to races not shown separately. For 1992 and later years, unknown race of mother is imputed; see "Technical Notes."
${ }^{3}$ Based on 100 percent of births in selected states and on a 50 -percent sample of births in all other states; see "Technical Notes."
${ }^{4}$ Based on a 50 -percent sample of births.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. In this table all women (including Hispanic women) are classified only according to their race. See "Technical Notes" for more information on multiple-race data.

Table 5. Live births, birth rates, and fertility rates by Hispanic origin of mother and by race for mothers of
non-Hispanic origin: United States, 1989-2006
[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15-44 years in specified group. Population enumerated as of April 1 for census years, and estimated as of July 1 for all other years]

## ${ }^{1}$ Includes origin not stated

${ }^{2}$ Includes races other than white and black.
${ }^{3}$ Excludes data for New Hampshire, which did not report Hispanic origin
${ }^{4}$ Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.
${ }^{5}$ Excludes data for Louisiana, New Hampshire, and Oklahoma, which did not report Hispanic origin.
${ }^{6}$ Rates for the Central and South American population includes other and unknown Hispanic.
${ }^{7}$ Rates are estimated for the United States based on birth data for 49 states and the District of Columbia. Births for New Hampshire that did not report Hispanic origin are included in the rates for non-Hispanic women; see "Technical Notes."
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race. In 2006,23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. See "Technical Notes" for more information on multiple-race data.

- Quantity zero.
${ }^{1}$ Includes races other than white and black.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. See "Technical Notes" for more information on multiple-race data.

Table 7. Fertility rates and birth rates by age of mother, live-birth order, and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 2006
[Fertility rates are computed by relating total births, regardless of age of mother, to women aged 15-44 years. Birth rates are live births per 1,000 women in specified age and racial group. Populations estimated as of July 1. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed]

See footnotes at end of table.

Table 8. Total fertility rates, fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989-2006-Con.
[Fertility rates are live births per 1,000 women aged 15-44 years in specified racial group and birth rates are live births per 1,000 women in specified age group. Population enumerated as of April 1 for census years, and estimated as of July 1 for all other years. Total fertility rates are sums of birth rates for 5 -year age groups multiplied by 5]

See footnotes at end of table.

Table 8. Total fertility rates, fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989-2006-Con.
[Fertility rates are live births per 1,000 women aged $15-44$ years in specified racial group and birth rates are live births per 1,000 women in specified age group. Population enumerated as of April 1 for census years, and estimated as of July 1 for all other years. Total fertility rates are sums of birth rates for 5 -year age groups multiplied by 5]

## -- - Data not available.

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator or, for the Hispanic subgroups, fewer than 50 women for census years and 75,000 women for noncensus years in the denominator; see "Technical Notes." These guidelines for denominator size follow the suggestions of the U.S. Census Bureau.
${ }^{1}$ Fertility rates computed by relating total births, regardless of age of mother, to women 15-44 years.
${ }^{2}$ Beginning 1997, rates computed by relating births to women aged 45-54 years to women aged 45-49 years.
${ }^{3}$ Excludes data for New Hampshire, which did not report Hispanic origin.
${ }^{4}$ Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.
${ }^{5}$ Excludes data for Louisiana, New Hampshire, and Oklahoma, which did not report Hispanic origin.
${ }^{6}$ Includes Central and South American and other and unknown Hispanic.
${ }^{7}$ Includes origin not stated.
${ }^{8}$ Includes races other than white and black.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. See "Technical Notes" for more information on multiple-race data.

Table 9. Fertility rates and birth rates by live-birth order and by race and Hispanic origin of mother: United States, 1980-2006
[Rates are live births per 1,000 women aged 15-44 years. Population enumerated as of April 1 for census years, and estimated as of July 1 for all other years. Figures for live-birth order not stated are distributed]

${ }^{1}$ Includes races other than white and black.
${ }^{2}$ Includes origin not stated.
${ }^{3}$ Based on 100 percent of births in selected states and on a 50 -percent sample of births in all other states; see "Technical Notes."
${ }^{4}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. See "Technical Notes" for more information on multiple-race data.
${ }^{5}$ Excludes data for New Hampshire, which did not report Hispanic origin.
${ }^{6}$ Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.
${ }^{7}$ Includes all persons of Hispanic origin of any race.

Table 10. Mean age of mother, by live-birth order and race and Hispanic origin of mother: United States, 1980-2006
[Mean age at birth is the arithmetic average of the age of mothers at the time of the birth, computed directly from the frequency of births by age of mother and live-birth order. Live-birth order refers to number of children born alive to mother]

|  |  | Live-birth order |  |  |  |  |  |  |  |

${ }^{1}$ Includes races other than white and black and origin not stated.
${ }^{2}$ Based on 100 percent of births in selected states and on a 50 -percent sample of births in all other states; see "Technical Notes."
${ }^{3}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. See "Technical Notes" for more information on multiple-race data.
${ }^{4}$ Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.
${ }^{5}$ Includes all persons of Hispanic origin of any race.

Table 11. Number of births, birth rates, fertility rates, total fertility rates, and birth rates for teenagers 15-19 years by age of mother: United States, each state and territory, 2006
[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15-44 years estimated in each area; total fertility rates are sums of birth rates for 5 -year age groups multiplied by 5 ; birth rates by age are live births per 1,000 women in specified age group estimated in each area. Populations estimated as of July 1]

[^6]NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. In this table all women (including Hispanic women) are classified only according to their race. See "Technical Notes" for more information on multiple-race data.

Table 13. Live births by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, each state and territory, 2006
[By place of residence]

- Quantity zero. - - Data not available. ${ }^{1}$ Includes races other than white and black. ${ }^{2}$ Excludes data for the territories.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006,23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race. See "Technical Notes" for more information on multiple-race data.

## Table 14. Total number of births, rates (birth, fertility, and total fertility), and percentage of births with selected demographic characteristics, by race of mother: United States, 2006

[Birth rates are live births per 1,000 population. Fertility rates are computed by relating total births, regardless of age of mother, to women aged 15-44 years. Total fertility rates are sums of birth rates for 5 -year age groups multiplied by 5 . Populations estimated as of July 1 . Mean age at first birth is the arithmetic average of the age of mothers at the time of the birth, computed directly from the frequency of first births by age of mother]

| Characteristic | $\begin{aligned} & \text { All } \\ & \text { races } \end{aligned}$ | White | Black | American Indian or Alaska Native | Asian or Pacific Islander |

.- - Data not available.
${ }^{1}$ Includes races other than white and black and origin not stated.
${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. See "Technical Notes" for more information on multiple-race data.
${ }^{3}$ Includes all persons of Hispanic origin of any race.
${ }^{4}$ Birth rates computed by relating total births to unmarried mothers, regardless of age of mother, to unmarried women aged 15-44 years.
${ }^{5}$ Birth rates computed by relating births to unmarried mothers aged 40 years and over to unmarried women aged 40-44 years.
NOTES: For 48 states and the District of Columbia, marital status is reported in the birth registration process; for Michigan and New York, mother's marital status is inferred; see "Technical Notes." Rates cannot be computed for unmarried non-Hispanic black women or for American Indian or Alaska Native women because the necessary populations are not available.

Table 19. Birth rates for unmarried women by age of mother: United States, 1970, 1975, and 1980-2006, and by age, race, and Hispanic origin of mother: United States, 1980-2006

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
-- Data not available. $\quad 1$ Includes races other than white and black and origin not stated.
${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
${ }^{3}$ Includes all persons of Hispanic origin of any race.
${ }^{4}$ Excludes data for the territories.

Table 21. Birth rates by age and race of father: United States, 1980-2006
[Rates are live births per 1,000 men in specified group. Populations enumerated as of April 1 for 1980, 1990, and 2000, and estimated as of July 1 for all other years. Figures for age of father not stated are distributed]

${ }^{1}$ Rates computed by relating total births, regardless of age of father, to men aged 15-54 years.
${ }^{2}$ Rates computed by relating births of fathers under 20 years of age to men aged 15-19 years.
${ }^{3}$ Includes races other than white and black.
${ }^{4}$ Based on 100 percent of births in selected states and on a 50 -percent sample of births in all other states; see "Technical Notes."
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. In this table all men (including Hispanic men) are classified only according to their race. For more information on multiple-race data, see "Technical Notes." Age of father was not stated for percent of births in 2006.

Table 22. Number of live births and percent distribution, by weight gain of mother during pregnancy, according to period of gestation and race and Hispanic origin of mother: 49 reporting states and the District of Columbia, 2006

| Period of gestation ${ }^{1}$ and race and Hispanic origin of mother | All births | Weight gain during pregnancy |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^10]NOTE: Excludes data for California, which did not require reporting of weight gain during pregnancy.

Table 23. Percentage of births with selected medical or health characteristics, by race of mother: United States, 2006

| Characteristic | All races | White | Bian or |
| :---: | :---: | ---: | ---: | ---: |
| All births |  |  | American Indian <br> or Alaska Native |
| Mother |  |  |  |
| Pacific Islander |  |  |  |

${ }^{1}$ Excludes data for California, which did not report weight gain on the birth certificate. ${ }^{2}$ Births delivered by certified nurse midwives.
${ }^{3}$ Born prior to 32 completed weeks of gestation. $\quad{ }^{4}$ Born prior to 37 completed weeks of gestation.
${ }^{5}$ Birthweight of less than 1,500 grams ( 3 lb 4 oz ). ${ }^{6}$ Birthweight of less than 2,500 grams ( 5 lb 8 oz ).
${ }^{7}$ Equivalent to $8 \mathrm{lb} 14 \mathrm{oz} . \quad{ }^{8}$ Score of less than 7 on a 10 point scale.
${ }^{9}$ Excludes data for California, which did not report 5-minute Apgar score on the birth certificate.
${ }^{10}$ Live births in twin deliveries per 1,000 live births.
${ }^{11}$ Live births in triplet and other higher order multiple deliveries per 100,000 live births.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. In this table all women (including Hispanic women) are classified only according to their race. For more information on race data, see "Technical Notes."

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
${ }^{1}$ Care beginning in 3d trimester.
${ }^{2}$ Includes races other than white and black and origin not stated.
${ }^{3}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget
(OMB) standards. All of the states shown in this table reported multiple-race data for 2006. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB
standards for comparability with other states; see "Technical Notes."
${ }^{4}$ Includes all persons of Hispanic origin of any race.
${ }^{5}$ Excludes data for Puerto Rico
NOTE: Excludes the 32 states, New York City, and the District of Columbia for which prenatal care data are based on the 1989 Revision of the U.S. Certificate of Live Birth; see "Technical Notes." Prenatal care data based on the 1989 Revision of the U.S. Certificate of Live Birth are not comparable with those based on the 2003 Revision of the U.S. Certificate of Live Birth.

Table 26(b). Percentage of mothers beginning prenatal care in the first trimester and percentage of mothers with late or no prenatal care by race and Hispanic origin of mother: 32 states, District of Columbia, New York City, and territories (data based on the 1989 Revision of the U.S. Standard Certificate of Live Birth), 2006

${ }^{1}$ Includes races other than white and black and origin not stated.
${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. For more information on multiple-race data, see "Technical Notes."
${ }^{3}$ Includes all persons of Hispanic origin of any race.
${ }^{4}$ Percentage of all live births by cesarean delivery.
${ }^{5}$ Excludes data for New Hampshire, which did not report Hispanic origin.
${ }^{6}$ Excludes data for Oklahoma, which did not report method of delivery; data by Hispanic origin also exclude New Hampshire, which did not report Hispanic origin.
${ }^{7}$ Excludes data for Louisiana, Maryland, Nebraska, Nevada, and Oklahoma, which did not report method of delivery on the birth certificate; data by Hispanic origin also excludes New Hampshire, which did not report Hispanic origin.

Table 29. Number of live births by method of delivery and rates of cesarean delivery by age and race and Hispanic origin of mother: United States, 2006

-- Data not available.

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
${ }^{1}$ Number of vaginal births after previous cesarean delivery per 100 live births to women with a previous cesarean delivery.
${ }^{2}$ Data are based on the 1989 Revision of the U.S. Certificate of Live Birth; these data are not comparable with those based on the 2003 Revision of the U.S. Certificate of Live Birth.
${ }^{3}$ Includes races other than white and black and origin not stated.
${ }^{4}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Four of these states are shown in this table. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
${ }^{5}$ Includes all persons of Hispanic origin of any race.
${ }^{6}$ Excludes data for the territories.
NOTE: Excludes data for California, Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming, which implemented the 2003 Revision of the U.S. Certificate of Live Birth; see "Technical Notes."

Table 32. Live births by birthweight and percentage very low and low birthweight, by period of gestation and race and Hispanic origin of mother: United States, 2006

## - Quantity zero

0.0 Quantity more than zero but less than 0.05 .
${ }^{1}$ Equivalents of the gram weights in pounds and ounces are shown in the "Technical Notes."
${ }^{2}$ Expressed in completed weeks.
${ }^{3}$ Includes races other than white and black and origin not stated.
${ }^{4}$ Birthweight of less than 1,500 grams ( 3 lb 4 oz ).
${ }^{5}$ Birthweight of less than 2,500 grams ( 5 lb 8 oz ).
${ }^{6}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
${ }^{7}$ Includes all persons of Hispanic origin of any race.

-- Data not available. ${ }^{1}$ Births of less than 32 completed weeks of gestation. ${ }^{2}$ Births of less than 37 completed weeks of gestation.
${ }^{3}$ Includes races other than white and black and origin not stated.
${ }^{4}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple race reporting areas vary for 2003-2006. For more information on multiple-race data, see "Technical Notes."
${ }^{5}$ Includes all persons of Hispanic origin of any race. ${ }^{6}$ Less than 1,500 grams ( 3 lb .4 oz .). ${ }^{7}$ Less than 2,500 grams ( 5 lb .8 oz .).
${ }^{8}$ Data by Hispanic origin exclude New Hampshire, which did not report Hispanic origin. $\quad{ }^{9}$ Data by Hispanic origin exclude New Hampshire and Oklahoma, which did not report Hispanic origin.
${ }^{10}$ Data by Hispanic origin exclude New Hampshire, Oklahoma, and Louisiana, which did not report Hispanic origin.

Table 34. Number and percentage of births delivered preterm, by race and Hispanic origin of mother: United States, each state and territory, 2006
[By place of residence. Preterm is less than 37 completed weeks of gestation]

| State | Number |  |  |  | Percent |  |  |  |

[^16]Table 38. Live births by plurality of birth and ratios, by age and race and Hispanic origin of mother: United States, 2006

- Quantity zero.
* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
${ }^{1}$ Includes races other than white and black and origin not stated.
${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
${ }^{3}$ Includes all persons of Hispanic origin of any race.
${ }^{4}$ Births in greater than twin deliveries.

Table 39. Numbers and rates of twin and triplet and higher-order multiple births by race and Hispanic origin of mother, United States: 1980-2006

| Year and race and Hispanic origin of mother | Total births | Twin births | Triplet and higher order births | Twin birth rate ${ }^{1}$ | Multiple birth rate ${ }^{2}$ | Triplet or higher order birth rate ${ }^{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All races ${ }^{4}$ |  |  |  |  |  |  |

## Technical Notes

## Source of data

Data shown in this report for 2006 are based on 100 percent of the birth cerifificates filed in all states and the District of Columbia. The data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). In 1984 and earlier years, the VSCP included varying numbers of states that provided data based on 100 percent of their birth certificates. Data for states not in the VSCP were based on a 50 -percent sample of birth certificates filed in those states. Information on the percentage of records with missing information for maternal and infant characteristics included in this report is shown by state in Table III. Data are not shown for the variables race, age, and marital status of mother. Missing data are imputed in these cases; see separate sections in the "Technical Notes" for more information.

## The 1989 and 2003 Revisions of the U.S. Standard Certificates of Live Birth

This report includes 2006 data on items that are collected on both the 1989 Revision of the U.S. Standard Certificate of Live birth (unrevised) and the 2003 Revision of the U.S. Standard Certificate of Live Birth (revised). The 2003 revision is described in detail elsewhere $(5,6,56)$. Nineteen states, California (partial revision of selected items only with full implementation in 2007), Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming, and Puerto Rico implemented the revised birth certificate as of January 1, 2006. The 19 revised states represent 49 percent of all births.

Data for educational attainment, prenatal care, and tobacco use, although collected on both the revised and unrevised certificates, are not considered comparable between revisions, and are presented separately in this report. Although data on total cesareans are considered comparable, data on the type of vaginal or cesarean birth, that is, if the birth is a vaginal birth after previous cesarean (VBAC) or primary cesareans are not comparable, and are presented separately. See following discussion of the specific data items.

Data items exclusive to either the 1989 or the 2003 birth certificate revision are not shown in this report. Supplemental 2006 tables for data exclusive to the 1989 revision are available on the NCHS website (http://www.cdc.gov/nchs). A coming report will present selected data exclusive to the 2003 revision.

## Age of mother

Age of mother is computed in most cases from the mother's and infant's dates of birth as reported on the birth certificate. The mother's age is directly reported by two states (Nevada and Virginia) and American Samoa. From 1964 to 1996, mother's age was edited for ages 10-49 years. Births reported to occur to mothers younger than age 10 or older than age 49 years had age imputed according to the age of mother from the previous record with the same race and total birth order (total of live births and fetal deaths). Beginning in 1997, age of mother is imputed for ages 9 years or under and 55 years and

Table I. Educational attainment, smoking during pregnancy, timing of prenatal care, and primary cesarean and vaginal birth after previous cesarean (VBAC) by race and Hispanic origin of mother: 19 (revised) states, 2006

| Hispanic ${ }^{3}$. . . . | 21.6 | 7.5 |

${ }^{1}$ Data are based on the 2003 Revision of the U.S. Certificate of Live Birth. Includes California, Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York State (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming.
${ }^{2}$ Includes races other than white and black and origin not stated.
${ }^{3}$ Includes all persons of Hispanic origin of any race; see "Technical Notes."
${ }^{4}$ Excludes data for California and Florida.
${ }^{5}$ Excludes data for California.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. These states reported multiple race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
over. A review and verification of unedited birth data for 1996 showed that the vast majority of births reported as occurring to women aged 50 years and over were to women aged 50-54 years. The numbers

Table II. Timing of prenatal care and primary cesarean and vaginal birth after previous cesarean (VBAC), by race and Hispanic origin of mother: 12 states (revised) and 34 states (unrevised), District of Columbia, and New York City, 2005 and 2006

| Race and Hispanic origin of mother | Timing of prenatal care (PNC) |  |  |  |  |  |  |  |

| Race and Hispanic origin of mother | 2006 | 2005 | 2006 | 2005 | 2006 | 2005 | 2006 | 2005 |
| All races and origins ${ }^{4}$ | 24.8 | 24.3 | 9.5 | 10.1 | 20.8 | 20.3 | 7.6 | 8.4 |
| Non-Hispanic white. . | 25.0 | 24.5 | 8.8 | 9.6 | 21.4 | 20.8 | 7.0 | 7.8 |
| Non-Hispanic black. . | 26.2 | 25.7 | 10.4 | 10.7 | 23.1 | 22.7 | 7.0 | 7.9 |
| Hispanic ${ }^{5}$. . . . . . | 23.6 | 23.3 | 10.1 | 10.7 | 16.9 | 16.5 | 9.2 | 10.4 |

${ }^{1}$ Data are based on the 2003 Revision of the U.S. Certificate of Live Birth; these data are not comparable with those based on the 1989 Revision of the U.S. Certificate of Live Birth.
${ }^{2}$ Data are for all reporting areas that had implemented the 2003 Revision of the U.S. Certificate of Live Birth as of January 2005; Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York State (excluding New York City), Pennsylvania, South Carolina, Tennessee, Texas, and Washington.
${ }^{3}$ Data are for all reporting areas that had not implemented the 2003 Revision of the U.S. Certificate of Live Birth as of January 2006. Also includes data for California, which implemented a partial revision of the 2003 Revision of the U.S. Certificate of Live Birth in 2006. Data are based on the 1989 Revision of the U.S. Certificate of Live Birth; these data are not comparable with those based on the 2003 Revision of the U.S. Certificate of Live Birth. Excludes data from Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York State (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming.
${ }^{4}$ Includes races other than white and black and origin not stated.
${ }^{5}$ Includes all persons of Hispanic origin of any race; see "Technical Notes."
${ }^{6}$ Excludes data for California.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. Twenty-three states reported multiple-race data for 2006. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes." Multiple-race reporting areas vary for 2005 and 2006; see "Technical Notes."
of births to women aged 50-54 years have been too small historically to compute age-specific birth rates. These births have been included with births to women aged 45-49 years for computing birth rates.

In 2006, age of mother was not reported on 0.01 percent of the records; for these records age of mother was imputed according to the last record with the same race and total birth order.

## Hispanic origin and race

## Hispanic origin

Hispanic origin and race are reported separately on the birth certificate. Data for specified Hispanic groups are shown in most cases for five groups: Mexican, Puerto Rican, Cuban, Central and South American, and "other and unknown Hispanic." In tabulations of birth data by race and Hispanic origin, data for persons of Hispanic origin are not further classified by race because the vast majority of births to Hispanic women are reported as white. In tabulations of birth data by race only, data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race. In tabulations that include Hispanic origin, data for non-Hispanic
persons are classified according to the race of the mother, because there are substantial differences in fertility and maternal and infant health characteristics between Hispanic and non-Hispanic white women.

Items asking for the Hispanic origin of the mother and the father have been included on the birth certificates of all states and the District of Columbia, the Virgin Islands, and Guam since 1993, and on the birth certificate of Puerto Rico starting in 2005 (9,115). American Samoa and the Northern Marianas do not collect this information. The 2003 revised certificate of Hispanic origin item used by California, Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York State (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, Wyoming, and Puerto Rico for 2006 does not preclude respondents from selecting one or more Hispanic origin categories $(9,116)$. (The Hispanic origin question on the revised certificate asks respondents to select only one response, in comparison with the race question that explicitly asks respondents to select one or more race categories, see section on Single, Multiple, and "Bridged" race of mother and father. However, when more than one Hispanic origin response is given, all responses are collected.) Respondents who selected more than one

${ }^{1}$ Excludes data for Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Marianas.
${ }^{2}$ Data are for states using the 1989 Standard Certificate of Live Birth. Births to residents of states using the 1989 Standard Certificate of Live Birth occurring in states using the 2003 Standard Certificate of Live Birth are coded as not stated for this item. See "Technical Notes."
${ }^{3}$ Data are for states using the 2003 Standard Certificate of Live Birth. Births to residents of states using the 2003 Standard Certificate of Live Birth occurring in states using the 1989 Standard Certificate of Live Birth are coded as not stated for this item. See "Technical Notes."
${ }^{4}$ California reports date last normal menses began but does not report clinical estimate of gestation.
${ }^{5}$ Not stated levels for states that implemented the 2003 U.S. Standard Certificate of Live Birth are derived from the item "Final route and method of delivery."
${ }^{6}$ The Florida tobacco use item is not consistent with the tobacco use items on either the 1989 or 2003 U.S. Standard Certificates of Live Birth.
${ }^{7}$ Indiana reports tobacco use but does not report the average number of cigarettes smoked per day in standard categories.
${ }^{8}$ The Commonwealth of the Northern Marianas reports tobacco use but does not report the average number of cigarettes smoked per day.

Hispanic origin, that is, a specified Hispanic group (Mexican, Puerto Rican, Cuban, or Central and South American) in combination with one or more other specified Hispanic group, are classified as "other Hispanic."

Minnesota, which used the 1989 Revision of the U.S. Standard Certificate of Live Birth, also allowed the reporting of multiple Hispanic groups in 2006.

The 19 revised states and Minnesota account in 2006 for 63 percent of Hispanic births in the United States. The percentage of records for which Hispanic origin of the parents was not reported in 2006 is shown by state in Table III.

Changes in the reporting of Hispanic origin, including the reporting of more than one Hispanic origin, have affected the distribution of births among specified Hispanic categories, resulting in increases for Other and unknown Hispanic and small decreases for the specified Hispanic origin groups. Between 2005 and 2006, births to Other and unknown Hispanic women in the U.S. increased from 61,703 to 71,742 .

## Single, multiple, and "bridged" race of mother and father

In 1997, the Office of Management and Budget (OMB) issued "Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity," which revised the "1977 Statistical Policy Directive 15, Race and Ethnic Standards for Federal Statistics and Administrative Reporting" (10-12). These documents specify guidelines for collection, tabulation, and presentation of race and ethnicity data within the federal statistical system. The 1997 revised standards incorporated two major changes designed to reflect the changing racial and ethnic profile of the United States. First, the revision increased from four to five the minimum set of categories to be used by federal agencies for identification of race. The 1977 standards required federal agencies to report race-specific tabulations using a minimum set of four single-race categories: American Indian or Alaska Native (AIAN), Asian or Pacific Islander (API), Black, and White. The five categories for race specified in the 1997 standards
are: American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, and White. The revised standards called for reporting of Asians separately from Native Hawaiians or Other Pacific Islanders. Collection of additional detail on race and ethnicity is permitted, as before, so long as the additional categories can be aggregated into the minimum categories. The revised standards also require federal data collection programs to allow respondents to select one or more race categories.

For the 2000 decennial census, the U.S. Census Bureau collected race and ethnicity data in accordance with the 1997 revised standards. However, the National Vital Statistics System, which is based on data collected by the states, will not be fully compliant with the new standards until all of the states revise their birth certificates to reflect the new standards. Thus, beginning with the 2000 data year, the numerators (births) for birth rates are incompatible with the denominators (populations) (see "Population denominators"). In order to compute rates, it is necessary to "bridge" population data for multiple-race persons to single-race categories. This has been done for birth rates by race presented in this report. Once all states revise their birth registration systems to be compliant with the 1997 OMB standards, the use of "bridged" populations can be discontinued.

In 2006, multiple race was reported by California, Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York State (excluding New York City), North Dakota, Ohio, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Washington, and Wyoming, which used the 2003 Revision of the U.S. Standard Certificate of Live Birth, as well as, Hawaii, Michigan (for births at selected facilities only), Minnesota, and Utah, which used the 1989 Revision of the U.S. Standard Certificate of Live Birth. Puerto Rico, which revised its birth certificate in 2005, reported race according to the 1989 revision of the U.S. Standard Certificate of Live Birth. More than one race was reported for 1.6 percent of mothers in the 23 states that reported multiple race (Table IV), with levels ranging from less than 0.1 percent (North Dakota) to 34.8 (Hawaii). These 23 states represent 55 percent of all U.S. resident births in 2006. Prior to 2006, the

## Table IV. Number and percentage of live births by race of mother: 23 states, 2006

0.0 Quantity more than zero but less than 0.5 .

* Figure does not meet standards of reliability or precision. Based on fewer than 20 births in the numerator.
${ }^{1}$ Includes all births to residents of the states that reported multiple race for the entire year. Percentages are based on the number of births occurring in the states that reported multiple race for the entire year to residents of the states. Births that occurred in states that did not report multiple race to residents of the multiple-race reporting states are not shown separately but are included in the total.
NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1997 Office of Management and Budget standards. Twenty-three states reported multiple-race data for 2006. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes." This table excludes data for Michigan, which reported multiple race for selected facilities only.
multiple-race reporting states varied, with 6 states reporting more than one race in 2003, 15 in 2004, and 19 in 2005. Data from the vital records of the remaining 27 states, New York City, and the District of Columbia followed the 1977 OMB standards in which only a single race is reported ( 10,11 ). In addition, these areas also report the minimum set of four races as stipulated in the 1977 standards, compared with the minimum of five races for the 1997 standards.

In order to provide uniformity and comparability of the data during the transition period, before multiple-race data are available for all reporting areas, it is necessary to "bridge" the responses of those who reported more than one race to a single race. The bridging procedure for multiple-race mothers and fathers is based on the procedure used to bridge the multiracial population estimates (see "Population denominators") $(12,13)$. Multiple race is imputed to a single race (one of the following: AIAN, API, black, or white) according to the combination of races, Hispanic origin, sex, and age of the mother or father indicated on the birth certificate. The imputation procedure is described in detail elsewhere $(14,15)$.

Mothers of a specified API subgroup (that is, Chinese, Japanese, Hawaiian, or Filipino) in combination with another race (that is, AIAN, black, or white) or another API subgroup are not imputed to a single API subgroup. API mothers are slightly overrepresented in the 23 states with complete reporting of multiple-race for 2006 ( 6.3 percent of births in those states) compared with the remaining 27 states, New York City, and the District of Columbia (4.8 percent). For this report, data are not shown for the specified API subgroups (117) because the bridging technique cannot be applied in this detail. However, data for the API subgroups reported alone or in combination with other races or API subgroups, are available in the 2006 Natality public-use data file.

Race of mother is reported by 27 states, the District of Columbia, and New York City in at least eight, single-race categories: white, black or African American, American Indian or Alaska Native, Chinese, Japanese, Hawaiian, Filipino, and "other Asian or Pacific Islander." Of these, five states (Illinois, Missouri, New Jersey, Virginia, and West Virginia) and New York City report data on the expanded API subgroups included in the "other API category" (Asian Indian, Korean, Samoan, Vietnamese, Guamanian, and remaining API). Finally, the 23 states that report multiple-race data report a minimum of 14 categories (white, black or African American, American Indian or Alaska Native, Asian Indian, Chinese, Filipino, Japanese, Korean, Vietnamese, other Asian, Hawaiian, Guamanian, Samoan, and other Pacific Islander). For this report, as discussed above, the multiple-race combinations (for example, white and AIAN or black and Chinese) were bridged to one of four broad categories (bridged white, bridged black, bridged AIAN, and bridged API). Detailed data on race (single or multiple) as reported in the 23 states are available on the 2006 Natality public-use file.

Where race of the mother is not reported, if the race of the father is known, the race of the father is assigned to the mother. When information is not available for either parent, the race of the mother is imputed according to the specific race of the mother on the preceding record with a known race of mother. See "Detailed Technical Notes"-2006-Natality (9).

Beginning with the 1989 data year, NCHS started tabulating its birth data primarily by race of the mother. In 1988 and prior years, births were tabulated by the race of the child, which was determined from the race of the parents as entered on the birth certificate (9).

Trend data by race shown in this report are by race of mother for all years beginning with the 1980 data year. Text references to white births and white mothers or black births and black mothers are used interchangeably for ease in writing.

## Change in Imputation of Race for Hispanic women

Starting with the 2006 data year for data on the revised birth certificate, the race edit was modified slightly to take into account
differences in the race distribution for births to Hispanic women compared with all births. For women of unknown race who report to be of Hispanic origin, race of mother is imputed according to the race of father, or, if race of father is unknown, according to the specific race of the mother on the preceding record of a Hispanic woman with a known race of mother. Previously, unknown race of mother for Hispanic women was imputed according to the preceding record of any woman regardless of Hispanic origin.

Between 2005 and 2006, the increase in the number of births to total white and AIAN women may be slightly overstated and the increase in the number of births to total black and API women may be slightly understated because of the changes in the race edit procedure introduced in 2006 (data for non-Hispanic white and non-Hispanic black women are not affected).

Texas births-The impact of this editing change for Texas (which has a large Hispanic population) was different from that for the other revised states because of the different imputation procedure used by the state in 2005. For Texas in 2005, the race of all Hispanic mothers who reported their race as unknown was imputed as white prior to transmission to NCHS. This imputation procedure was discontinued by the state beginning in 2006.

## Marital status

National estimates of births to unmarried women are based on two methods of determining marital status. For 1994 through 1996, birth certificates in 45 states and the District of Columbia included a question about the mother's marital status. Beginning in 1997, the marital status of women giving birth in California and Nevada is determined by a direct question in the birth registration process. Beginning June 15, 1998, Connecticut discontinued inferring the mother's marital status and added a direct question on mother's marital status to the state's birth certificate.

In 2006, inferential procedures were used to compile birth statistics by marital status in full or in part for New York and Michigan respectively. Michigan added a direct question in 2005 to the birth registration process, but uses inferential procedures to update information collected using the direct question. In both Michigan and New York, a birth is inferred as nonmarital if either of these factors, listed in priority-of-use order, is present: a paternity acknowledgment was received or the father's name is missing. In recent years, a number of states have extended their efforts to identify the fathers when the parents are not married in order to enforce child support obligations. The presence of a paternity acknowledgment therefore is the most reliable indicator that the birth is nonmarital in the states not reporting this information directly; this is now the key indicator in the nonreporting states. Details of the changes in reporting procedures are described in previous reports $(39,118)$.

The mother's marital status was not reported in 2006 on 0.04 percent of the birth records in the 48 states and the District of Columbia where this information is obtained exclusively by a direct question. Marital status was imputed as "married" for records where father's age is known. Where father's age is not known, marital status is imputed as "not married."

## Education

In this report, data on educational attainment of the mother based on the 2003 Revision of the U.S. Standard Certificate of Live

Birth (revised) are presented separately from those based on the 1989 Revision of the U.S. Standard Certificate of Live Birth (unrevised). The revised item asks for the highest degree or level of school completed at the time of birth (e.g., high school diploma, bachelor's degree, etc.), whereas the 1989 standard certificate item asks for the highest grade (i.e., year) completed at the time of birth. This change in format has resulted in data that are not comparable between revisions. See earlier section on "The 1989 and 2003 Revisions of the U.S. Standard Certificates of Live Birth."

## Tobacco use

In this report, data on tobacco use during pregnancy based on the 2003 Revision of the U.S. Standard Certificate of Live Birth (revised) are presented separately from those based on the 1989 Revision of the U.S. Standard Certificate of Live Birth (unrevised). The revised certificate asks for the number of cigarettes smoked at different intervals before and during pregnancy. In comparison, the 1989 standard certificate asked for "Tobacco use during pregnancy," "yes/no," and the average number of cigarettes per day with no specificity on timing during pregnancy. As a result, revised data are not comparable to unrevised data and are presented separately. See earlier section on "The 1989 and 2003 Revisions of the U.S. Standard Certificates of Live Birth."

Florida and California-Data on maternal smoking for Florida are not included in this report or in the public use data file compiled by NCHS. The question on smoking on the Florida birth certificate is not comparable with either the 1989 revision or the 2003 revision questions. Response categories include Yes, No, and Quit. The question however, does not collect information by trimester, an important enhancement of the smoking question in the 2003 revision. Thus, it is not possible to combine the Florida data with data for either the unrevised or revised reporting areas. California did not report tobacco use in 2006.

## Prenatal care

Data on the month that prenatal care began based on the 2003 U.S. Standard Certificate of Live Birth (revised) are presented separately from those based on the 1989 Revision of the U.S. Standard Certificate of Live Birth (unrevised). Substantive changes in both question wording and the sources for this information have resulted in data that are not comparable between revisions. The wording of the prenatal care item was modified to "Date of first prenatal visit" from "Month prenatal care began." In addition, the 2003 revision process resulted in recommendations that the prenatal care information be gathered from the prenatal care or medical records, whereas the 1989 revision did not recommend a source for these data. See earlier section on "The 1989 and 2003 Revisions of the U.S. Standard Certificates of Live Birth."

California births-California implemented a partial revision of the revised birth certificate for 2006; the revised prenatal care item was not implemented for 2006.

## Characteristics of labor and delivery

The 1989 revision of the U.S. Standard Certificate of live birth (unrevised) provides a single checkbox for "Breech/Malpresentation" under Complications of Labor and Delivery. On the 2003 revision of the birth certificate (revised), this information is collected as two
separate checkboxes: "Breech" and "Other" in the "Fetal Presentation" subsection of "Method and Delivery." Although by definition, the revised "Breech" and "Other" items combined are comparable to the unrevised, levels for revised states tend to be higher in general than those for nonrevised states. As a result, increases in the national "Breech/Malpresentation" rates observed since 2003 (the first year states began implementing the revised birth certificates) may be largely a reporting artifact; trends in Breech/Malpresentation rates and comparisons of rates among revised and unrevised States should be viewed with caution.

## Method of delivery

Several rates are computed for method of delivery. The overall cesarean delivery rate or total cesarean rate is computed as the percentage of all births delivered by cesarean. The primary cesarean rate relates the number of women having a first cesarean delivery to all women giving birth who have never had a cesarean delivery. The denominator for this rate includes the sum of primary cesareans and vaginal births without previous cesarean. The rate of vaginal birth after previous cesarean (VBAC) delivery is computed by relating all VBAC deliveries to the sum of VBAC and repeat cesarean deliveries, that is, to women with a previous cesarean delivery.

Information on "Method of Delivery" is reported on both the 2003 Standard Certificate of Live Birth (revised) and 1989 Standard Certificate of Live Birth (unrevised). However, the format and wording of the "Method of Delivery" item on the revised standard certificate differs from that of the unrevised standard certificate. The unrevised item asks a direct question on whether the birth was vaginal, VBAC, or a primary or repeat cesarean delivery. In contrast, the revised "Method of Delivery" item asks if the final route of delivery was a vaginal (with or without forceps or vacuum assistance) or a cesarean delivery. Information on the type of vaginal (vaginal or VBAC) or type of cesarean delivery (primary or repeat) is calculated from the response to a question under a different item, "Risk Factors in this Pregnancy," which asks if the mother had a previous cesarean delivery. As a result of these changes, although data on total cesarean deliveries appear to be very comparable between revisions, information on type of vaginal or cesarean delivery is not. In brief, rates based on data from the revised certificates are substantially higher for VBACs and primary cesareans, and lower for repeat cesareans, than rates based on data from unrevised certificates (55). Accordingly, data on VBAC, primary, and repeat cesarean deliveries are not directly comparable between revisions, and, beginning with the 2005 data year, are presented separately for revised and unrevised reporting areas.

## Gestation

The primary measure used to determine the gestational age of the newborn is the interval between the first day of the mother's last normal menstrual period (LMP) and the date of birth. It is subject to error for several reasons, including imperfect maternal recall or misidentification of the LMP because of post conception bleeding, delayed ovulation, or intervening early miscarriage. These data are edited for LMP-based gestational ages that are clearly inconsistent with the infant's plurality and birthweight (see below), but reporting problems for this item persist and may occur more frequently among some subpopulations and among births with shorter gestations $(119,120)$.

The U.S. Standard Certificate of Live Birth includes an item, "clinical/obstetric estimate of gestation," that was compared with length of gestation computed from the date the last normal menstrual period (LMP) began when the latter appeared to be inconsistent with birthweight. This was done for normal birthweights of apparently short gestations and very low birthweight births reported to be full term. The clinical/obstetric estimate was also used if the LMP date was not reported. The period of gestation for 5.6 percent of the births in 2006 was based on the clinical estimate of gestation. For 97 percent of these records, the clinical estimate was used because the LMP date was not reported. For the remaining 3 percent, the clinical estimate was used because it was compatible with the reported birthweight, whereas the LMP-based gestation was not. In cases where the reported birthweight was inconsistent with both the LMP-computed gestation and the clinical estimate of gestation, the LMP-computed gestation was used and birthweight was reclassified as "not stated." This was necessary for 2,732 births or 0.06 percent of all birth records in 2006. The levels of the adjustments in 2006 data were similar to those for earlier years (7). Despite these edits substantial incongruities in these data persist; research is ongoing to address these data deficiencies. California does not report the clinical/obstetric estimate of gestation.

## Birthweight

Birthweight is reported in some areas in pounds and ounces rather than in grams. However, the metric system has been used in tabulating and presenting the statistics to facilitate comparison with data published by other groups. Equivalents of the gram weights in terms of pounds and ounces are as follows:

Less than 500 grams $=1 \mathrm{lb} 1 \mathrm{oz}$ or less
500-999 grams $=1 \mathrm{lb} 2 \mathrm{oz}-2 \mathrm{lb} 3 \mathrm{oz}$
$1,000-1,499$ grams $=2 \mathrm{lb} 4 \mathrm{oz}-3 \mathrm{lb} 4 \mathrm{oz}$
$1,500-1,999$ grams $=3 \mathrm{lb} 5 \mathrm{oz}-4 \mathrm{lb} 6 \mathrm{oz}$
2,000-2,499 grams $=4 \mathrm{lb} 7 \mathrm{oz}-5 \mathrm{lb} 8 \mathrm{oz}$
2,500-2,999 grams = $5 \mathrm{lb} 9 \mathrm{oz}-6 \mathrm{lb} 9 \mathrm{oz}$
3,000-3,499 grams $=6 \mathrm{lb} 10 \mathrm{oz}-7 \mathrm{lb} 11 \mathrm{oz}$
3,500-3,999 grams $=7 \mathrm{lb} 120 \mathrm{oz}-8 \mathrm{lb} 13 \mathrm{oz}$
$4,000-4,499$ grams $=8 \mathrm{lb} 140 \mathrm{oz}-9 \mathrm{lb} 14 \mathrm{oz}$
$4,500-4,999$ grams $=9 \mathrm{lb} 15 \mathrm{oz}-11 \mathrm{lb} 0 \mathrm{oz}$
5,000 grams or more $=11 \mathrm{lb} 1 \mathrm{oz}$ or more

## Computations of percentages, percent distributions, and means

Births for which a particular characteristic is unknown were subtracted from the figures for total births that were used as denominators before percentages, percent distributions, and means were computed. The percentage of records with missing information for each item is shown by state in Table III. These levels include all births to residents in the reporting area occurring outside of the reporting area (i.e., in a jurisdiction that has not adopted the 2003 U.S. Standard Certificate of Live Birth). This percentage was 1.3 percent for the 19-state reporting area for 2006 with levels ranging from 0.2 (California and Texas) to 10.2 (New Hampshire). The comparatively high level for New Hampshire at least partly reflects the fact that a significant number of births to New Hampshire residents occurred in Massachusetts, which does not yet report revised data.

An asterisk (*) is shown in place of any derived statistic based on fewer than 20 births in the numerator.

## Population denominators

Birth and fertility rates for 2006 shown in Tables A, B, 1, 3-5, $7-9,11,14,15$, and 21 are based on populations estimated from the 2000 census, as of July 1, 2006. These populations are shown in Tables III and IV. The population estimates have been provided by the U.S. Census Bureau (30) and are based on the 2000 census counts by age, race, and sex, which have been modified to be consistent with OMB racial categories as of 1977 and historical categories for birth data. The modification procedures are described in detail elsewhere $(12,13,121,122)$.

Birth and fertility rates by state shown in Tables B and 11 are based on state-level population estimates projected from the 2000 census provided by the U.S. Census Bureau (30). Rates by state shown in this report may differ from rates computed on the basis of other population estimates; rates for smaller population subgroups such as those for teenaged mothers, may be particularly affected by differences in population estimates. Birth and fertility rates by month shown in Table 16 are based on monthly population estimates also based on the 2006 estimates. Rates for unmarried women shown in Tables 18 and 19 are based on distributions of the population by marital status averaged over a 3-year period for 2005-2007 as reported by the U.S. Census Bureau in the March Current Population Survey (CPS) for each year (36-38), which have been adjusted to July 2006 population levels (30) by the Division of Vital Statistics, NCHS $(39,118)$. Birth and fertility rates for the Hispanic population, shown in Tables 5, 7, 8, 9, and 15 are based on estimates of the total Hispanic population as of July 1, 2006 (30). Rates for Hispanic subgroups are based on special population estimates that are presented in Table VI in the "Technical Notes." More information about the populations for Hispanic subgroups is presented elsewhere $(115,123)$.

The populations by race used in this report were produced under a collaborative arrangement with the U.S. Census Bureau and are based on the 2000 census counts. Reflecting the new guidelines issued in 1997 by OMB, the 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members (11). In addition, the 1997 OMB guidelines called for reporting of Asian persons separately from Native Hawaiians or Other Pacific Islanders. In the earlier 1977 OMB guidelines, data for Asian or Pacific Islander persons were collected as a single group (10). Except for 23 states, birth certificates currently report only one race for each parent in the categories specified in the 1977 OMB guidelines (see "Race and Hispanic origin"). In addition, birth certificate data for the unrevised states do not report Asians separately from Native Hawaiians or Other Pacific Islanders. Thus, birth certificate data by race (the numerators for birth and fertility rates) currently are largely incompatible with the population data collected in the 2000 census (the denominators for the rates).

To produce birth and fertility rates for 1991-2006, it was necessary to "bridge" the reported population data for multiple race persons back to single race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB racial categories, that is, to report the data for Asian persons and Native Hawaiians or Other Pacific Islanders as a combined category Asian or Pacific Islanders $(31,122)$. The procedures used to produce the "bridged" populations are described in separate publications $(12,13)$. Beginning with births occurring in 2003, several states began reporting multiple-race data. Once all states revise their birth certificates to be compliant with the 1997 OMB standards, the use of "bridged" populations can be discontinued.

Populations used to calculate the rates for 1991-1999 are based on population estimates as of July 1 of each year and were produced by the U.S. Census Bureau, with support from the National Cancer Institute (12,30,31). These intercensal population estimates for

Table V. Estimated total population by race and estimated female population by age and race: United States, 2006

${ }^{1}$ Includes Central and South American and other and unknown Hispanic.
${ }^{2}$ Includes races other than white and black.
NOTES: These population counts are estimated based on the 2000 census; see "Technical Notes." Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. The multiple-race population estimates were bridged to the single-race categories of the 1977 OMB standards for comparability with the birth data; see "Technical Notes."
SOURCE: U.S. Census Bureau. See reference 127.

1991-1999 are revised based on the April 1, 2000, census. The rates for 1990 and 2000 are based on populations from the censuses in those years as of April 1.

Readers should keep in mind that the population data used to compile birth and fertility rates by race and ethnicity shown in this report are based on special estimation procedures, and are not actual counts. This is the case even for the 2000 populations that are based on the 2000 census. As a result, the estimation procedures used to develop these populations may contain some errors. Smaller populations, for example, AIAN, are likely to be affected much more than larger populations by potential measurement error (12). Although the nature and magnitude of error are unknown, the potential for error should be kept in mind when evaluating trends and differentials. As more accurate information becomes available, further revisions of the estimates may be necessary.

## Computation of rates

In computing birth rates by live-birth order, births with birth order not stated were distributed in the same proportion as births of known live-birth order. This procedure is done separately by race.

In computing birth and fertility rates for the Hispanic population, births with origin of mother not stated are included with non-Hispanic births rather than being distributed. Thus, rates for the U.S. Hispanic population are underestimates of the true rates to the extent that the births with origin of mother not stated ( 0.7 percent) were actually to Hispanic mothers (see Table III). In computing the rates, the censusbased populations with origin not stated are imputed. The effect on the rates is believed to be small.

An asterisk (*) is shown in place of any derived rate based on fewer than 20 births in the numerator, or a population denominator of less than 50 (unweighted) for decennial years and 75,000 (weighted) for all other years for the Hispanic subgroups. Rates based on populations below these minimum levels lack sufficient reliability for analytic
purposes. These guidelines follow the suggestions of the U.S. Census Bureau $(124,125)$. The population estimates for some Hispanic subgroups, especially Cubans, often do not meet the above minimum. Therefore, age-specific rates are not shown for some groups. However, summary fertility measures (i.e., crude birth rate, general fertility rate, and total fertility rate) are possible and these have been included.

Age of father-Information on age of father is often missing on birth certificates of children born to unmarried women (Table III). In computing birth rates by age of father, births where age of father is not stated are distributed in the same proportions as births with known age within each 5 -year-age classification of mother. This procedure is followed because, although father's age is missing on 14 percent of the birth certificates, one quarter of these were on records where the mother is a teenager. This distribution procedure is done separately by race. The resulting distributions are summed to form a composite frequency distribution that is the basis for computing birth rates by age of father. This procedure avoids the distortion in rates that would result if the relationship between age of mother and age of father were disregarded.

## Random variation and significance testing for natality data

The number of births reported for an area is essentially a complete count, because more than 99 percent of all births are registered. Although this number is not subject to sampling error, it may be affected by nonsampling errors in the registration process such as mistakes in recording the mother's residence or age during the registration process.

When the number of births is used for analytic purposes (that is, the comparison of numbers, rates, and percentages over time, for different areas, or between different groups), the number of events that actually occurred can be thought of as one outcome in a large series of possible results that could have occurred under the same (or similar)
circumstances. When considered in this way, the number of births is subject to random variation and a probable range of values can be estimated from the actual figures, according to certain statistical assumptions.

The confidence interval is the range of values for the number of births, birth rates, or percentage of births that you could expect in 95 out of 100 cases. The confidence limits are the end points of this range of values (the highest and lowest values). Confidence limits tell you how much the number of events or rates could vary under the same (or similar) circumstances.

Confidence limits for numbers, rates, and percentages can be estimated from the actual number of vital events. Procedures differ for rates and percentages and also differ depending on the number of births on which these statistics are based. Below are detailed procedures and examples for each type of case.

When the number of vital events is large, the distribution is assumed to follow a normal distribution (where the relative standard error is small). When the number of events is small and the probability of the event is small, the distribution is assumed to follow a Poisson probability distribution. Considerable caution should be observed in interpreting the occurrence of infrequent events.

## 95 percent confidence limits for numbers less than 100

When the number of births is less than 100 and the rate is small, the data are assumed to follow a Poisson probability distribution (126). Confidence limits are estimated using the following formulas:

$$
\begin{aligned}
& \text { Lower limit }=B \times L \\
& \text { Upper limit }=B \times U
\end{aligned}
$$

where
$B=$ number of births
$L=$ the value in Table VII that corresponds to the number $B$
$U=$ the value in Table VII that corresponds to the number $B$

## Example

Suppose that the number of first births to American Indian or Alaskan Native (AIAN) women 40-44 years of age was 47. The confidence limits for this number would be:

$$
\begin{aligned}
\text { Lower limit } & =47 \times 0.73476 \\
& =35 \\
\text { Upper limit } & =47 \times 1.32979 \\
& =63
\end{aligned}
$$

This means that the chances are 95 out of 100 that the actual number of first births to AIAN women 40-44 years of age would lie between 35 and 63.

## 95 percent confidence limits for numbers of 100 or more

When the number of events is greater than 100, the data are assumed to approximate a normal distribution. Formulas for 95 percent confidence limits are:

$$
\begin{aligned}
& \text { Lower limit }=B-(1.96 \times \sqrt{B}) \\
& \text { Upper limit }=B+(1.96 \times \sqrt{B})
\end{aligned}
$$

where
$B=$ number of births

## Example

Suppose that the number of first births to white women 40-44 years of age was 14,108 . The 95 percent confidence limits for this number would be:

$$
\begin{aligned}
\text { Lower limit } & =14,108-(1.96 \times \sqrt{14,108}) \\
& =14,108-233 \\
& =13,875 \\
\text { Upper limit } & =14,108+(1.96 \times \sqrt{14,108}) \\
& =14,108+233 \\
& =14,341
\end{aligned}
$$

This means that the chances are 95 out of 100 that the actual number of first births to white women 40-44 years of age would lie between 13,875 and 14,341 .

## Computing confidence intervals for rates

The same statistical assumptions can be used to estimate the variability in birth rates. Again, one formula is used for rates based on numbers of events less than 100, and another formula for rates based on numbers of 100 or greater. For our purposes, assume that the denominators of these rates (the population estimates) have no error. Although this assumption is technically correct only for denominators based on the census that occurs every 10 years, the error in intercensal population estimates is usually small, difficult to measure, and therefore not considered. (See however, discussion of population denominators earlier in the "Technical Notes.")

## 95 percent confidence limits for rates based on fewer than 100 events

When the number of events in the numerator is less than 20 (or the population denominator is less than 50 for decennial years and 75,000 for all other years for the Hispanic subgroups), an asterisk (*) is shown in place of the rate because there were too few births or the population is too small to compute a statistically reliable rate. When the number of events in the numerator is greater than 20 but less than 100 (and the population denominator for the Hispanic subgroups is above the minimum), the confidence interval for a rate can be estimated using the two formulas that follow and the values in Table VII.

Table VII. Values of $L$ and $U$ for calculating 95-percent confidence limits for numbers of events and rates when the
number of events is less than 100

|  | N | L | U |  | N | L | U |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Lower limit $=R \times L$
Upper limit $=R \times U$
where
$R=$ birth rate
$L=$ the value in Table VIII that corresponds to the number of events B
$U=$ the value in Table VII that corresponds to the number of events B

## Example

Suppose that the first birth rate for AIAN women 40-44 years of age was 0.50 per 1,000 , based on 47 births in the numerator. Using Table VII:

$$
\begin{aligned}
\text { Lower limit } & =0.50 \times 0.73476 \\
& =0.37
\end{aligned}
$$

Upper limit $=0.50 \times 1.32979$

$$
=0.66
$$

This means that the chances are 95 out of 100 that the actual first birth rate to AIAN women 40-44 years of age lies between 0.37 and 0.66 .

## 95-percent confidence limits for rates when the numerator is 100 or more

In this case, use the following formula for the birth rate $R$ based on the number of births $B$ :

Lower limit $=R-[1.96 \times(R / \sqrt{B})]$
Upper limit $=R+[1.96 \times(R / \sqrt{B})]$
where
$R=$ birth rate
$B=$ number of births

## Example

Suppose that the first birth rate for white women 40-44 years of age was 1.55 per 1,000, based on 14,108 births in the numerator. Therefore, the 95 -percent confidence interval would be:

$$
\begin{aligned}
\text { Lower limit } & =1.55-[1.96 \times(1.55 / \sqrt{14,108})] \\
& =1.55-0.026 \\
& =1.52 \\
\text { Upper limit } & =1.55+[1.96 \times(1.55 / \sqrt{14,108})] \\
& =1.55+0.026 \\
& =1.58
\end{aligned}
$$

This means that the chances are 95 out of 100 that the actual first birth rate for white women 40-44 years of age lies between 1.52 and 1.58.

## Computing 95 -percent confidence intervals for percentages

In many instances we need to compute the confidence intervals for percentages. Percentages derive from a binomial distribution. As with birth rates, an asterisk (*) will be shown for any percentage that is based on fewer than 20 births in the numerator. We easily compute a 95-percent confidence interval for a percentage when the following conditions are met:
$B \times p \geq 5$ and $B \times q \geq 5$
where
$B=$ number of births in the denominator
$p=$ percent divided by 100
$q=1-p$
For natality data, these conditions will be met except for very rare events in small subgroups. If the conditions are not met, the variation in the percentage will be so large as to render the confidence intervals meaningless. When these conditions are met the 95-percent confidence interval can be computed using the normal approximation of the binomial. The 95-percent confidence intervals are computed by the following formulas:

```
Lower limit \(=p-[1.96 \times(\sqrt{p \times q / B})]\)
Upper limit \(=p+[1.96 \times(\sqrt{p \times q / B})]\)
```

where
$p=$ percent divided by 100
$q=1-p$
$B=$ number of births in the denominator

## Example

Suppose that the percentage of births to Hispanic women in Arizona that were to unmarried women was 49.7 percent. This was based on 14,752 births in the numerator and 29,682 births in the denominator. First we test to make sure we can use the normal approximation of the binomial:

$$
\begin{aligned}
& 29,682 \times 0.497=14,752 \\
& 29,682 \times(1-0.497)=29,682 \times 0.503=14,930
\end{aligned}
$$

Both 14,752 and 14,930 are greater than 5 so we can proceed. The 95-percent confidence interval would be:

$$
\begin{aligned}
\text { Lower limit } & =0.497-[1.96 \times(\sqrt{0.497 \times 0.503 / 29,682})] \\
& =0.497-0.006 \\
& =0.491 \text { or } 49.1 \text { percent } \\
\text { Upper limit } & =0.497+[1.96 \times(\sqrt{0.497 \times 0.503 / 29,682})] \\
& =0.497+0.006 \\
& =0.503 \text { or } 50.3 \text { percent }
\end{aligned}
$$

This means that the chances are 95 out of 100 that the actual percentage of births to unmarried Hispanic women in Arizona lies between 49.1 and 50.3 percent.

## Significance testing

## One or both of the rates is based on fewer than 100 cases

To compare two rates, when one or both of those rates are based on less than 100 cases, you first compute the confidence intervals for both rates. Then you check to see if those intervals overlap. If they do overlap, the difference is not statistically significant at the 95 -percent level. If they do not overlap, the difference is indeed statistically significant.

## Example

Suppose that the first birth rate for AIAN women 40-44 years of age was 0.70 per 1,000 in year $X$ and 0.57 in year $Y$. Is the rate for year X significantly higher than the rate for year Y ? The two rates are based on 63 events in year $X$ and 54 events in year $Y$. Both rates are based on fewer than 100 events; therefore, the first step is to compute the confidence intervals for both rates.

|  | Lower Limit | Upper Limit |
| :--- | :---: | :---: |
| Year X . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . | 0.54 | 0.90 |
| Year Y . . . | 0.43 | 0.74 |

These two confidence intervals overlap. Therefore, the first birth rate for AIAN women aged $40-44$ in year X is not significantly higher (at the 95-percent confidence level) than the rate in year Y .

This method of comparing confidence intervals is a conservative test for statistical significance. That is, the difference between two rates may, in fact, be statistically significant even though confidence intervals for the two rates overlap (127). Thus, caution should be observed when interpreting a nonsignificant difference between two rates, especially when the lower and upper limits being compared overlap only slightly.

## Both rates are based on 100 or more events

When both rates are based on 100 or more events, the difference between the two rates, irrespective of sign $(+/-)$, is considered statistically significant if it exceeds the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two rates.

$$
1.96 \times \sqrt{\frac{R_{1}^{2}}{N_{1}}+\frac{R_{2}^{2}}{N_{2}}}
$$

where
$R_{1}=$ first rate
$R_{2}=$ second rate
$N_{1}=$ first number of births
$\mathrm{N}_{2}=$ se cond number of births
If the difference is greater than this statistic, then the difference would occur by chance less than 5 times out of 100. If the difference is less than or equal to this statistic, the difference might occur by chance more than 5 times out of 100 . We say that the difference is not statistically significant at the 95 percent confidence level.

## Example

Is the first birth rate for black women 40-44 years of age (1.08 per 1,000 ) significantly lower than the comparable rate for white women (1.55)? Both rates are based on more than 100 births (1,535 for black women and 14,108 for white women). The difference between the rates is $1.55-1.08=0.47$. The statistic is then calculated as follows:

$$
\begin{aligned}
& 1.96 \times \sqrt{\frac{1.08^{2}}{1,535}+\frac{1.55^{2}}{14,108}} \\
& =1.96 \times \sqrt{([1.166 / 1,535]+[2.403 / 14,108])} \\
& =1.96 \times \sqrt{0.00076+0.00017} \\
& =1.96 \times \sqrt{0.00093} \\
& =1.96 \times 0.03 \\
& =0.06
\end{aligned}
$$

The difference between the rates (0.47) is greater than this statistic (0.06). Therefore, the difference is statistically significant at the 95 percent confidence level.

## Testing differences between two percentages

When testing the difference between two percentages, both percentages must meet the following conditions:
$B \times p \geq 5$ and $B \times q \geq 5$

When both percentages meet these conditions then the difference between the two percentages is considered statistically significant if it is greater than the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two percentages.

$$
1.96 \times \sqrt{p x(1-p) \times\left(\frac{1}{B_{1}}+\frac{1}{B_{2}}\right)}
$$

where
$B_{1}=$ number of births in the denominator of the first percentage
$B_{2}=$ number of births in the denominator of the second percentage

$$
P=\frac{B_{1} \times p_{1}+B_{2} \times p_{2}}{B_{1}+B_{2}}
$$

$p_{1}=$ the first percent divided by 100
$p_{2}=$ the second percent divided by 100

## Example

Is the percentage of births to Hispanic women that were to unmarried women higher in New Mexico (50.2) than in Arizona (49.7)? Suppose that the number in the denominator was 13,714 in New Mexico and 29,682 in Arizona. The necessary conditions are met for both percentages (calculations not shown). The difference between the two percentages is $0.502-0.497=0.005$. The statistic is then calculated as follows:

$$
\begin{aligned}
1.96 \times \sqrt{0.499 \times(0.501) \times(0.000106609)} & =1.96 \times \sqrt{0.000026652} \\
& =1.96 \times 0.005162563 \\
& =0.010
\end{aligned}
$$

The difference between the percentages (0.005) is less than this statistic (0.010). Therefore, the difference is not statistically significant at the 95 percent confidence level.

Information on computing confidence intervals for and testing differences between rates for Hispanic subgroups is available elsewhere (9).

## Testing differences between two means

A previous report details the formula and procedure in testing differences between two means in which both means are based on 100 or more cases (34).

## Definitions of medical terms

Maternal and infant health characteristics available from both the 1989 and 2003 revisions of the U.S. Standard Certificate of Live Birth are presented in this report. The definitions below are based on those developed for the 2003 Revision of the U.S. Standard Certificate of Live Birth (128). These definitions are similar to, but not the same as those developed for the 1989 Revision of the U.S. Standard Certificate of Live Birth. For definitions used for the 1989 revision see "Births: Final Data for 2003" (56).
where
$B=$ number of births in the denominator
$p=$ percent divided by 100
$q=1-p$

## Risk factors in this pregnancy

Diabetes-Glucose intolerance requiring treatment.
Hypertension, pregnancy-associated-Diagnosis in this pregnancy of elevation of blood pressure above normal for age, gender, and physiological condition.

Hypertension, chronic-Diagnosis prior to the onset of this pregnancy of elevation of blood pressure above normal for age, gender, and physiological condition.

## Obstetric procedures or characteristics of labor and delivery

Induction of labor-Initiation of uterine contractions by medical and/or surgical means for the purpose of delivery before the spontaneous onset of labor (i.e., before labor has begun).

Tocolysis-Administration of any agent with the intent to inhibit preterm uterine contractions to extend the length of the pregnancy.

Meconium, moderate/heavy-staining of the amniotic fluid caused by passage of fetal bowel contents during labor and/or at delivery that is more than enough to cause a greenish color change of an otherwise clear fluid.

Breech/Malpresentation-Presenting part of the fetus listed as breech, complete breech, frank breech, footling breech.

Precipitous labor-Labor lasting less than 3 hours.

## Congenital anomalies

Anencephaly-Partial or complete absence of the brain and skull.

Meningomyecele/Spina bifida-Meningomyelocele is herniation of meninges and spinal cord tissue. Meningocele (herniation of meninges without spinal cord tissue) should also be included in this category. Both open and closed (covered with skin) lesions should be included. Spina bifida is herniation of the meninges and/or spinal cord tissue through a bony defect of spine closure.

Omphalocele/Gastroschisis-Omphalocele is a defect in the anterior abdominal wall, accompanied by herniation of some abdominal organs through a widened umbilical ring into the umbilical stalk. Gastroschisis is an abnormality of the anterior abdominal wall, lateral to the umbilicus, resulting in herniation of the abdominal contents directly into the amniotic cavity.

Cleft lip/palate-Cleft lip is incomplete closure of the lip. May be unilateral, bilateral, or median. Cleft palate is incomplete fusion of the palatal shelves. May be limited to the soft palate, or may extend into the hard palate.

Down syndrome-The most common chromosomal defect (trisomy 21).

## Related reports

Many of the topics discussed in this report are covered in more analytic detail in other reports published by NCHS. Topics include mean age of mother (34); Hispanic origin births (115,129); characteristics of multiple-race mothers (130); twin births (114); trends in teenage and young teenage births (17,21); cesarean deliveries ( 131,132 ); attendant at bith, place of delivery, and obstetric procedures (133); births to unmarried mothers ( 39,122 ); trends in pregnancies and pregnancy rates $(21,134)$; trends in characteristics of births by state (135); fetal and infant mortality (136-138); trends in reproduction and intrinsic rates (139); trends in smoking (140); and expanded health data from the revised birth certificate (8).

[^8]:    See footnotes at end of table.

[^9]:    -     -         - Data not available.
    ${ }^{1}$ Rates computed by relating total births to unmarried mothers, regardless of age of mother, to unmarried women aged 15-44 years.
    ${ }^{2}$ Rates computed by relating births to unmarried mothers aged 40 years and over to unmarried women aged 40-44 years.
    ${ }^{3}$ Includes races other than white, black, and Asian or other Pacific Islander.
    ${ }^{4}$ Data for states in which marital status was not reported have been inferred and included with data from the remaining states; see "Technical Notes."
    ${ }^{5}$ Based on 100 percent of births in selected states and on a 50 -percent sample of births in all other states; see "Technical Notes."
    ${ }^{6}$ Births to unmarried women are estimated for the United States from data for registration areas in which marital status of mother was reported; see "Technical Notes."
    ${ }^{7}$ Based on a 50 -percent sample of births.
    ${ }^{8}$ Rates for 1990 based on data for 48 states and the District of Columbia that reported Hispanic origin on the birth certificate. Rate shown for 1990 for ages $35-39$ years are based on births to unmarried women aged 35-44 years.
    ${ }^{9}$ Includes all persons of Hispanic origin of any race.
    NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. Persons of Hispanic origin may be of any race. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. See "Technical Notes" for more information on multiple-race data. Rates cannot be computed for unmarried non-Hispanic black women or for American Indian or Alaska Native women because the necessary populations are not available.

[^10]:    Category not applicable.
    ${ }^{1}$ Expressed in completed weeks.
    ${ }^{2}$ Includes births with period of gestation not stated.
    ${ }^{3}$ Includes races other than white and black and origin not stated.
    ${ }^{4}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
    ${ }^{5}$ Includes all persons of Hispanic origin of any race.

[^11]:    See footnotes at end of table.

[^12]:    * Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
    ${ }^{1}$ Total number of births to residents of areas reporting risk factors, procedure or anomaly.
    ${ }^{2}$ No response reported for specific item.
    ${ }^{3}$ Includes races not shown.
    ${ }^{4}$ Excludes data for New Mexico, which did not report congenital anomalies.
    ${ }^{5}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
    ${ }^{6}$ Includes all persons of Hispanic origin of any race.

[^13]:    * Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
    ${ }^{1}$ Number of vaginal births after previous cesarean delivery per 100 live births to women with a previous cesarean delivery.
    ${ }^{2}$ Data are based on the 2003 Revision of the U.S. Certificate of Live Birth; these data are not comparable with those based on the 1989 Revision of the U.S. Certificate of Live Birth.
    ${ }^{3}$ Includes races other than white and black and origin not stated.
    ${ }^{4}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget
    (OMB) standards. All of the states shown in this table reported multiple-race data for 2006. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
    ${ }^{5}$ Includes all persons of Hispanic origin of any race.
    ${ }^{6}$ Excludes data for Puerto Rico.

[^14]:    * Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
    -- - Data not available.
    ${ }^{1}$ Includes races other than white and black and origin not stated.
    ${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes." ${ }^{3}$ Includes all persons of Hispanic origin of any race. ${ }^{4}$ Excludes data for the territories.

[^15]:    * Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
    -- Data not available. $\quad{ }^{1}$ Includes races other than white and black and origin not stated.
    ${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
    ${ }^{3}$ Includes all persons of Hispanic origin of any race.
    ${ }^{4}$ Excludes data for the territories.

[^16]:    * Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator. - Quantity zero. -- Data not available.
    ${ }^{1}$ Includes races other than white and black and origin not stated.
    ${ }^{2}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."
    ${ }^{3}$ Includes all persons of Hispanic origin of any race.
    ${ }^{4}$ Excludes data for the territories.

[^17]:    ${ }^{1}$ The number of live births in twin deliveries per 1,000 live births.
    ${ }^{2}$ The number of live births in all multiple deliveries per 1,000 live births.
    ${ }^{3}$ The number of live births in triplet and other higher-order deliveries per 100,000 live births.
    ${ }^{4}$ Includes races other than white and black and origin not stated.
    ${ }^{5}$ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2006, 23 states reported multiple-race data. Multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states. Multiple-race reporting areas vary for 2003-2006. For more information on multiple-race data, see "Technical Notes."
    ${ }^{6}$ Excludes data for New Hampshire, which did not report Hispanic origin.
    ${ }^{7}$ Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.
    ${ }^{8}$ Includes all persons of Hispanic origin of any race.

[^18]:    * Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.
    ${ }^{1}$ Includes triplet and quadruplet and other higher order multiple births.
