Abstract: *the absence of books and book chapters in the Web of Science Citation Indexes (SCI, SSCI and A&HCI) has always been considered an important flaw but the Thomson Reuters 'Book Citation Index' database was finally available in October of 2010 indexing 29,618 books and 379,082 book chapters. The Book Citation Index opens a new window of opportunities for analyzing these fields from a bibliometric point of view. The main objective of this article is to analyze different impact indicators referred to the scientific publishers included in the Book Citation Index for the Social Sciences and Humanities fields during 2006-2011. This way we construct what we have called the 'Book Publishers Citation Reports'. For this, we present a total of 19 rankings according to the different disciplines in Humanities & Arts and Social Sciences & Law with six indicators for scientific publishers.*

Keywords: *Books, Monographs, Book Citation Index, Citation Analysis, Thomson Reuters, Rankings, Journal Citation Reports, Research Evaluation, Social Sciences, Humanities, Publisher, Scientific Communication.*

1. Introduction

The absence of books and book chapters in the *Web of Science Citation Indexes* (SCI, SSCI and A&HCI) has always been considered an important flaw when using this database for bibliometric purposes and especially when assessing fields such as Social Sciences or Humanities in which this publication type plays a major role. In this sense, **Eugene Garfield** as creator of the citation indexes was well aware of this shortcoming and insisted on the necessity of developing a further citation index that would cover this important loophole when stating:

"From the perspective of the social scientist or humanities scholar, the failure to include monographs as sources in the ISI citation indexes may be a drawback in drawing conclusions about the impact of certain work. Nevertheless, the inclusion of books as cited references in ISI's citation indexes has permitted studies of most-cited books to be accepted as reasonable surrogates for more comprehensive studies that might have included books as sources. Undoubtedly, the creation of a Book Citation Index is a major challenge for the future and would be an expected by-product of the new electronic media with hypertext capability!"

Garfield, 1996

In May 2010 **Thomson Reuters**, intending to put an end to this long criticism, announced at the *Frankfurt Book Fair* the launch of the long-awaited *Book Citation Index* and by the way, getting in ahead of the field. The database was finally available in October of that same year indexing 29,618 books and 379,082 book chapters and covering a time period from 2005 to the present (currently it goes back to 2003) (**Giménez-Toledo & Torres-Salinas, 2011**). The emergence of such a product is of great interest not just as an information retrieval tool for Social Sciences and Humanities researchers who finally have an information source to which turn to. But also to bibliometricians and scientific publishers who now have a new tool that includes a long neglected but important publication type such as books which meant a great shortcoming in their studies (**Glänzel & Schoepflin, 1999**). The important role books play in Social Sciences and Humanities meant a great threat to any type of approach for research evaluation in these fields as no reliable information source covered them (**Hicks, 2004**) and therefore, were not even considered.

The *Book Citation Index* opens a new window of opportunities for analyzing these fields from a bibliometric point of view (see **Leydesdorff & Felt, 2012**). In this sense, the introduction of books in the *Web of Science* platform could lead to some kind of Book Publishers Citation Reports in which scientific publishers would be ranked according to some bibliometric indicator similarly to what the *Journal Citation Reports* does. This would provide another perspective for assessing publishers to those previously presented, for instance analyzing their visibility through their presence in library catalogues (**Torres-Salinas & Moed, 2009**) or through surveys to researchers¹. However, books and journals have different natures that lead to different citation

¹ Scholarly Publisher Indicators: <http://epuc.cchs.csic.es/SPI/ranking.html>

behaviors and must be analyzed and treated carefully. In this line of thought, we present this article in which we pose the possibility of drawing an analogy between scientific publishers and journals. Therefore, our proposal would derive from the traditional journal rankings based on citations. To that effect, the main objective is to analyze different impact indicators referred to the scientific publishers included in the *Book Citation Index* for the Social Sciences and Humanities fields. This way we construct what we have called the '*Book Publishers Citation Reports*'. For this, we present a total of 19 rankings according to the different disciplines in 'Humanities & Arts' and 'Social Sciences & Law' with six indicators for scientific publishers.

We believe that databases such as the *Book Citation Index* may lead to the development of new bibliometric tools in order to improve research evaluation exercises. Specially regarding scientific publishers where no tools can be found for measuring objectively and quantitatively their impact within the research community or their level of specialization. In this sense, the '*Book Publishers Citation Reports*' could be hypothetically used similarly in the same way than the current *Journal Citation Reports*, that is, directed to:

- Librarians for facilitating their acquisition process. We must not forget that this was **Eugene Garfield's** original purpose when he created the Journal Impact Factor. These rankings help librarians to differ the core literature in certain disciplines and maximize their budget.
- Researchers for orientating them within the scientific literature. These rankings allow them to rapidly locate which publishers have more visibility and therefore are a good tool when choosing where to send their manuscripts for publication.
- Research managers and bibliometricians as they are powerful tools for research evaluation purposes. In this sense, the '*Book Publishers Citation Reports*' could be used as a proxy for measuring the capability of researchers for instance, to publish in highly cited publishers.

2. Methodology

Here we present an analysis of the impact of the scientific publishers included in the *Book Citation Index* for 'Humanities & Arts' and 'Social Sciences & Law' in the 2006-2011 time period. We analyzed a total of 19 disciplines which may or may not correspond to the subject categories assigned by the database. In appendix 2 we show the correspondence between the *Web of Science* BKCI subject categories and the disciplines analyzed in this study. In table 1 we present the complete list of disciplines analyzed in this article.

Table 1 Set of discipline of Humanities & Arts and Social Sciences & Law selected for the creation of publisher rankings

Humanities & Arts	Social Sciences & Law
Anthropology	Area & Cultural Studies
Archeology	Communication
Arts	Economics & Bussiness
Geography	Education
History	Law
History & Philosophy of Science	Information Science & Library Science
Languague & Linguistics	Managment
Literature	Political Science & International Relations
Philosophy & Ethics	Sociology
Religion	

Regarding data collecting and processing, in May 2012 the *Book Citation Index* was downloaded and introduced into a relational database where data were processed and indicators calculated. Publishers' names were normalized as many had different variants according to their various headquarters in each country. For instance, for Springer we found variants such as: Springer-Verlag Wien, Springer-Verlag Tokyo, Springer Publishing Co, etc. In table 2 we include the indicators used in our rankings. Regarding the impact indicators, these are the ones obtained at the time of the data download process.

Table 2 Set of bibliometric indicators for analyzing the production and impact of publishers included in the Book Citation Index

	INDICATOR	ACRONYM	DEFINITION
PRODUCTION	Number of items indexed	Total Items	Total records indexed in the Book Citation Index. That is the sum of records indexed as 'book' and 'book chapter'.
	Number of books indexed	Books	Records indexed as document type 'book' in the Book Citation Index
	Number of book chapters indexed	Chap	Records indexed as document type 'book chapter' in the Book Citation Index
IMPACT	Total citations received by all items	Total Citations	Total citations received by all records included in the Book Citation Index.
	Average citations per item	AvgCit	Average of citations items receive according to their discipline. That is, the result of dividing Total Items between Total Citations.
	Percentage of non cited items	NonCit	Proportion of items indexed as document type 'book' or 'book chapter' that have received no citations from the total of items of the given discipline.

3. Results

The BKCI has a total of 396,421 records divided in 28,805 books and 367,616 book chapters for the 2006-2011 time period, averaging 12 chapters per book. Considering only the 'Humanities & Arts' and 'Social Sciences & Law fields', they are a total of 17,005 books and 202,830 chapters, averaging 11 chapters per book. This means that Humanities and Social Sciences represent 55% of the total *Book Citation Index*. In table 3 we offer a general perspective of the analyzed disciplines and their production and impact indicators. In this sense, 'Economics & Business', 'Education' and 'History' are the ones with more items indexed and also, and probably as a consequence, the fields with more citations received along with 'Sociology'. On the other side, 'Anthropology' has the highest citation average with 1.68. The non-cited rate ranges from 91% in 'Arts' to 74% in 'Archeology'.

Table 3 General overview of the discipline analyzed in this study

	PRODUCTION			IMPACT		
	Total Items	Books	Chap	Total Citations	AvgCit	NonCit
Anthropology	3146	234	2912	5280	1,68	75%
Archeology	2336	154	2182	2367	1,01	74%
Area & Cultural Studies	15029	1273	13756	7572	0,50	88%
Arts	1932	140	1792	514	0,27	91%
Communication	8703	596	8107	4462	0,51	85%
Economics & Bussiness	35129	2577	32552	24498	0,70	86%
Education	21068	1416	19652	10360	0,49	84%
Geography	2670	215	2455	2754	1,03	79%
History	20346	1643	18703	12067	0,59	89%
History & Philosophy of Science	5819	446	5373	3081	0,53	88%
Information Science & Library Science	4235	267	3968	1745	0,41	85%
Languague & Linguistics	11468	760	10708	7932	0,69	83%
Law	9824	772	9052	3922	0,40	88%
Literature	11654	1026	10628	3689	0,32	90%
Managment	7597	543	7054	4389	0,58	84%
Philosophy & Ethics	12392	944	11448	6887	0,56	87%
Political Science & Inter. Relations	31790	2750	29040	26851	1,08	84%
Religion	8684	721	7963	3795	0,44	91%
Sociology	9080	707	8373	13464	1,48	78%

Finally, in table 2 we show as an example, the bibliometric indicators for the 'Information Science & Library Science' discipline. **The rest of the 18 disciplines are shown in appendix 1.** As observed, all book publishers' rankings per discipline are ordered according to the total number of items per publisher. In the case of 'Information Science & Library Science', the most productive publisher according to the *Book Citation Index* is *Chandos Publishing* (1456 items), followed by *IOS Press* (760 items) and *Springer* (653 items). However, it is worth noting that, while the total items list correlates to a great extent with the number of books (0.9) there are some unexpected results. The most significant is that of *IOS Press* which, according to the *Book Citation Index*, has only 4 books indexed with 756 book chapters, which means an average of 189 chapters per book. The reason for this lies on the fact that this publisher has book series, distorting somehow the picture of publishers' coverage for this discipline. According to the distribution and the concentration of citations and output, this distorting effect of certain publishers affects most of the 19 publishers rankings.

Table 4 Output and Impact indicators for publishers in the Information Science & Library Science discipline according to the Book Citation Index

4. Discussion and concluding remarks

Discussion

If we observe the list of rankings presented in appendix 1, we can conclude that it is possible to develop a so-called 'Book Publishers Citation Reports' based on the *Book Citation Index* (Thomson Reuters). That is, when taking into account the technical issues that must be surpassed to do so, however, we must emphasize different problems we have encountered that warns us against the use of such a tool for evaluating purposes. The results offered by the *Book Citation Index* could not be valid or reliable for bibliometric use, although they may be a good tool for academic librarians. The issues we have encountered can be resumed in the following way:

- There is a clear dominance of English-language publishers with a commercial profile. When observed, practically all rankings are led by international commercial publishers such as *Springer*, *Routledge* or *Palgrave*. Poor presence of university presses. Only those from *Princeton*, *Cambridge*, *California* or the *Australian National University* have a notable presence.
- There is almost no representation of those countries with an important scientific background in the Humanities and Social Sciences such as Italy, France or Germany. In fact, France for instance has no publishers indexed, neglecting for example *Editoriales Presses Universitaires de France (PUF)*. In the case of Spain, publishers such as *Ariel* or *Alianza* for example, which are greatly considered by Spanish researchers as shown in the *Scholarly Publishers Indicators project*² are omitted. Therefore, they have not even considered introducing the most important publishers per region or country.
- There is a surprising absence, limited presence or underrepresentation of globally important publishers such as *Peter Lang*, *Pearson*, and *Macmillan* or of specialized publishers such as *John Benjamins* for Linguistics, *Giuffrè* for Law or *Archaeopress* for Archeology.

These problems are especially severe in the case of Humanities and Social Sciences where there is no such a thing as a global scientific community as it happens in Basic and Applied Sciences, and where English is not considered as the main scientific language. We must take into account the effect of the local and national factor and the atomization of knowledge that exist in these areas. According to *Thomson Reuters*' official report they only consider English-language publications 'Because English is the universal language of science at this time, Thomson Reuters will focus on books that

² <http://epuc.cchs.csic.es/SPI/index.html>

publish full text in English³. In our opinion, this is an unfortunate statement when regarding to these fields.

Finally, we must point out several issues when developing publishers' indicators:

- 1) What must we count, books or book chapters? must we add their citations? Should we count book citations and chapters citations separately? should we distinguish between multi-authored books or single-authored book?
- 2) What should we do with those monographs which behave more closely to journals than the rest such as book series as *Annual Reviews*? Should they be excluded in order to end with their distorting effect?
- 3) Although this has not been analyzed in this study, which is the most suitable citation window for measuring books' impact? Can we preserve the Journal Impact Factor analogy?

Concluding remarks

- ▶ Thanks to the launch of the *Book Citation Index*, it is currently possible to develop scientific publisher's rankings similar to the Thomson Reuters '*Journal Citation Reports*'. We called these rankings '*Book Publishers Citation Reports*'.
- ▶ The 19 rankings presented in this paper could be only useful for characterize the Anglosaxon domain because there is a strong bias to commercial and English speaking countries. So is not possible to develop a global '*Book Publishers Citation Reports*'.
- ▶ There is a lack of important publishers so we obtain a partial picture of the publisher's impact scenario. A '*Book Publishers Citation Report*' based in the BKCI maybe is no useful for research evaluation purposes in the same way as the JCR is.
