## DECLARATION

I hereby declare that the thesis submitted for the D.Litt.et Phil. Degree to the RAU, apart from the help recognised, is my own work and has not been formerly submitted to another university for a degree.

Glenda Myers

## SUMMARY

The practice of medicine changes constantly and rapidly. Consequently, it is difficult for clinicians to learn about innovations, given the vast quantity of information available. Evidence-based medicine (EBM) is the process by which practitioners turn clinical problems into questions, and then systematically integrate personal clinical expertise with the best available external evidence as the basis for clinical decisions. To practice EBM, the practitioner is required to search the literature for relevant material, and then to synthesise knowledge and apply findings to each patient. Clinicians require fast and specific access to multiple data sources, but the availability of electronic full text documents has substantially exacerbated the lack of time to read the clinical literature owing to the demands of clinical practice, and is further compounded by the fact that the Web contains much health-related misinformation. Clinicians therefore require a means of searching the literature that will enhance the retrieval of accurate and evaluated clinical data from ranked resources, whereby the most relevant information is retrieved first from the most likely source. Strong correlations exist between four primary steps in EBM, and the formula commonly used in search strategy design in the field of information seeking. The similarities inherent in these steps suggest that an evidence-based approach to information seeking might enable end-users in the health professions to enhance their searching skills and to translate the clinical question into an appropriate information-seeking strategy.

A main problem and two sub-problems were investigated, namely whether:

- a Web-based EBM information-seeking model could be designed to enhance the information-seeking skills of healthcare practitioners
- it was possible to design an information-seeking model more closely aligned with the clinical decision-making model familiar to healthcare practitioners
- it was possible to design such a model in a manner that could further enhance the translation of the clinical question into an appropriate information-seeking strategy.

Various models in medicine and the domain of information seeking were investigated. It was found that the model of the clinical decision-making process accorded with all six phases of the information-seeking process (ISP), whereas other information-seeking models only addressed the ISP from the formulation of the problem onwards, thus ignoring prior stages of initiation, selection and exploration in the ISP. A Web-based EBM information-seeking model (Model C) was devised and tested for compatibility against a general Web-based

information-seeking model, and was found to be valid. Model C was further empirically assessed against a Web site design methodology, and was again found to be compatible.

A unique approach to EBM information seeking is thus offered by Model C, which incorporates all aspects of the clinical-decision-making metaphor, as well as the “PICO” EBM filters (**P**atient/**P**roblem, **I**ntervention, **C**omparative Intervention and **O**utcome), into a facet analysis template for the design of a clinical search strategy. Prior to selection of the EBM information resource, Model C further allows for the ranking of each resource and for the design of individual browsing and/or analytical search strategies, as appropriate, so as to enhance EBM information seeking amongst healthcare practitioners.

Web-Based Model

## ACKNOWLEDGEMENTS

My thanks are due to all who supported me in so many ways during the completion of this thesis. In particular, mention must be made of my promoter, Prof Pieter van Brakel, for his patience, sense of humour, assistance and encouragement at all times.

Acknowledgement is made to the University of the Witwatersrand for partial financial support. I wish to express my deep appreciation to Prof Peter Cleaton-Jones of the Dental Research Institute at the University of the Witwatersrand, for his suggestions concerning a baseline questionnaire in preparation for this study, and for his continuing encouragement, motivation, insight, and willingness to share of his time and expertise in so many ways. In addition, Drs Myles Connor and Anne Wright of the Faculty of Health Sciences, University of the Witwatersrand, gave generously of their valuable time in order to share their experience of the practice of evidence-based medicine. My staff at the Witwatersrand Health Sciences Library has also been most supportive, in particular Mr Devind Peter, Ms Fiona Bester, and Ms Suzanne Saunders.

I would like to acknowledge the encouragement received from Jon Brassey of TRIP, and Andrew Booth of ScHARR, who willingly shared their experience with me by email. My thanks are also due to Prof Ellen Gay Detlefsen of the School of Information Sciences, Center for Biomedical Informatics, University of Pittsburgh, for sending me by airmail her valuable bibliography of studies on health-related information behaviours at no cost.

My deepest gratitude goes to friends and family for their understanding, tolerance, help and interest. Special thanks are due to my brother Errol, for his patient re-execution of the diagrams in this thesis to exacting and rigorous standards, and for assistance with exasperating word processing problems; to my nephew Andrew for his generosity in sharing his IT and Web knowledge and expertise at all times; and to my nephew Lance for his advice and animated and stimulating intellectual challenges.

Lastly, I would like to dedicate this thesis to the memory of my parents, and in so doing acknowledge in particular my debt of gratitude to my mother, who sacrificed so much in order to ensure that her daughter received an education.

## TABLE OF CONTENTS

<b>SUMMARY</b>	iii
<b>1. INTRODUCTION</b>	1
1.1 BACKGROUND	1
1.1.1 Evidence-Based Medicine	1
1.1.2 Evidence-Based Learning	3
1.2 IDENTIFICATION OF THE PROBLEM	4
1.3 STATEMENT OF THE PROBLEM	7
1.3.1 Main Problem	7
1.3.2 Sub-Problems	7
1.4 RELEVANCE OF RESEARCH TO THE OVERALL FIELD OF REFERENCE	7
1.5 JUSTIFICATION OF THE RESEARCH PROJECT	10
1.6 DELIMITATION OF THE FIELD OF STUDY	12
1.7 GLOSSARY AND DEFINITIONS	12
1.8 OUTLINE OF FOLLOWING CHAPTERS	13
<b>2. REVIEW OF THE LITERATURE OF EVIDENCE-BASED MEDICINE AND INFORMATION-SEEKING BEHAVIOUR</b>	16
2.1 INTRODUCTION	16
2.1.1 Definitions	16
2.2 THE LITERATURE OF EVIDENCE-BASED MEDICINE	17
2.2.1 The Cochrane Library of Evidence-Based Medicine	26
2.2.2 Evidence-Based Medicine in the Field of Information Practice	27
2.3 THE LITERATURE OF INFORMATION-SEEKING BEHAVIOUR	31
2.3.1 Analytical Search Strategy Design	32
2.3.2 Browsing Strategies	34
2.3.3 Information Seeking and End-User Searching in the Healthcare Professions	36
2.3.4 Information Seeking and End-User Searching in the Healthcare Professions in South Africa	42
2.3.5 Information Seeking and Evidence-Based Medicine	44
2.4 SUMMARY	45

<b>3.</b>	<b>EXISTING MODELS IN EVIDENCE-BASED MEDICINE AND INFORMATION SEEKING</b>	<b>46</b>
