

Article XXX.— A PRELIMINARY LIST OF THE COLEOPTERA
OF THE WEST INDIES AS RECORDED TO JAN. 1, 1914.

BY CHARLES W. LENG, B. S., HONORARY CURATOR OF COLEOPTERA, AND
ANDREW J. MUTCHLER, ASSISTANT.

PREFACE.

This list was commenced in the form of a card catalogue by the late Martin L. Linell, while employed in the National Museum. Following his death it was continued by E. A. Schwarz as rapidly as other duties permitted. The writer, in the identification of the coleoptera collected by the Museum expeditions in Florida, found a list of West Indian Coleoptera necessary for comparison and compiled such a list from the *Catalogus Coleopterorum* of Gemminger and Harold, Chevrolat's *Coleoptera of Cuba*, Fleutiaux's *Coleoptera of Guadeloupe* and other sources. Through the favor of Dr. Leland O. Howard, the cards prepared by Messrs. Linell and Schwarz were then loaned to us for comparison and the resulting corrected list, compiled from independent sources, may be regarded as substantially complete as far as the older records are concerned. In bringing the list up to recent date, a search of the *Zoölogical Record* and of the *Biologia Centrali-Americana* has been conducted by Andrew J. Mutchler, and all papers bearing upon West Indian species have been examined by the writer, as well as those taxonomic papers dealing in whole or in part with such species. Finally the list has been compared with the *Junk catalogues*, as far as issued, and with *Genera Insectorum*, and for the Cuban species, with the *Coleopteros de Cuba* of Dr. Juan Gundlach, a work that seems to be seldom quoted, though rich in information.

While the list is believed to be fairly complete as far as published records are concerned, it must be admitted that there are many more West Indian species than are here enumerated. This is indicated by the preponderance of records in certain obscure families that have been closely worked in Guadeloupe and Grenada, by which it would appear that the number of species there existing exceeded the number in the larger islands; and it became remarkably evident in the examination the writer was permitted to make, through the kindness of Dr. Carlos de la Torre, of the collection and manuscript note book of Dr. Gundlach, carefully preserved in Havana. Even in Cuba, where the records are comparatively copious, the unrecorded and undescribed species probably exceed in number those that are recorded.

The list is therefore preliminary in actual fact and the object in view in publishing it at this time is to stimulate research, to draw out from hidden sources the information needed to bring its successor nearer to completion, and to indicate to the possessors of such information what of it is new and therefore worthy of publication. This list in its specific names and authorities will also commemorate the early field work among others of Poey, Gundlach and Lanier in Cuba, of L'Herminier, Vitrac and Dufau in Guadeloupe, of Smith in Grenada, as well as the work of Duval, Chevrolat, Grouvelle, Fleutiaux, Arrow, Champion, and Gahan in studying their captures; and will we trust encourage local students to pursue their investigations.

In view of the paucity of West Indian records no comparative tables of distribution can profitably be prepared at present. In a general way it is evident that the relation of West Indian genera with those of the American continent is very intimate, that those of the more southerly islands are closely allied, as a whole, with those of South America, while those of Cuba show a much stronger mixture of North American forms. There is a striking development of certain genera, as *Leucocera* in *Chrysomelidæ*, and *Exophthalmus* in the *Rhynchophora*, by which the number of West Indian species in those genera far exceeds that of all other regions combined; and similar instances occur in other families. Instances of specific identity with American forms are not numerous and occur mainly as the result of commercial introduction. Among the water beetles of notoriously strong flight and seashore species there are further instances of such specific identity; and there are scattered cases throughout the list, the latter being possibly due in part to faulty identifications. There is apparently a tendency also for many species to be restricted to a single island, as certain genera are restricted or nearly so, to the islands in general. An isolated fact of interest is the apparently total absence of the *Silphidæ*, or Burying Beetles. A most interesting field of investigation is open to American Entomologists, and considering its geographical proximity, it is surprising that its working out has been so largely left to European authors, Casey and Schæffer being practically the only recent American authors cited.

No attempt has been made to include the unpublished records of West Indian species contained in the collections of this Museum, or of those in the collections of other Museums or private individuals. We hope to publish such additions later, after the material gathered by our expeditions has been identified; and we shall be thankful for any papers or manuscript notes bearing on the subject that readers may be able to send us.

CHARLES W. LENG.

Jan. 1, 1914.

FAMILIES.

Arranged according to the Leconte classification with such alterations as are generally adopted, for example the transfer of the Rhipidandri to Tenebrionidæ. The genera usually follow the order of the Junk "Catalogus Coleopterorum," as far as issued, or that of the latest published catalogue, as Van den Branden's in the Dytiscidæ, or in default of either, that of the "Catalogus Coleopterorum" of Gemminger & Harold. In the Carabidæ, the order has been reversed to bring the lowest genera first. Synonymy has been included only when necessary to connect the list with the Henshaw list of America north of Mexico and Chevrolat's partial list of Cuban beetles.

Family I. CARABIDÆ.

Subfamily CICINDELINÆ.

Tetracha Hope.
