Abstract

$\text{C}_8\text{H}_{18}\text{Cl}_4\text{N}_2\text{O}_4\text{Pt}$, monoclinic, $P12_1/n1$ (no. 14), $a = 8.181(3)$ Å, $b = 10.303(5)$ Å, $c = 9.073(6)$ Å, $\beta = 103.2(1)$ °, $V = 744.6$ Å³, $Z = 2$, $R_{\text{gt}}(F) = 0.080$, $wR_{\text{ref}}(F^2) = 0.247$, $T = 293$ K.

Source of material

Potassium tetrachloroplatinate(II) (0.200 g, 0.482 mmol) and ethylenediamine-*N,N'*-di-3-propionic acid dihydrochloride (0.133 g, 0.482 mmol) were dissolved in 20 ml of water. The reaction mixture was left at room temperature for a few days. After one week, orange crystals were formed from the mother liquor. Upon crystallization crystals were filtered off.

Experimental details

The relatively large R values can be explained by rather bad quality of single crystals.

Discussion

Only one crystal structure with the ethylenediammonium-*N,N'*-di-3-propionic acid cation counter to a metal complex anion is described in the literature, (ethylenediammonium-*N,N'*-di-3-propionic acid) tetrachloropalladate(II) complex [1], H₄eddp[PdCl₄]. The title complex consists of two entities: the anion [PtCl₄]²⁻ and dication H₄eddp²⁺. The [PtCl₄]²⁻ anion exhibits a square-planar coordination with slight deviations from ideal values of 90° with respect to *cis*-coordinated Cl atoms. The H₄eddp²⁺ ion is nearly linear. The β-alaninate part of the cation forms *gauche* conformation ($\angle \text{N}1-\text{C}3-\text{C}2-\text{C}1 = -64.9(8)$ °). The C4-N1-C3-C2 torsion angle of $-171(1)$ ° shows a nearly *antiperiplanar* conformation of the H₄eddp²⁺ ion. Deviation in the Cl-Pt-Cl angle can be explained by intermolecular hydrogen bond interactions between N1-H1···Cl1. Structural fragment -C(3)H₂-C(2)H₂-C(1)OOH is nearly planar and its plane is parallel with the [PtCl₄] coordina-

tion plane. Every [PtCl₄] species is located between two above-mentioned fragments. It is interesting to note that one of two H atoms from the C(2)H₂ group is directed to the Pt atom occupying approximately axial position. The Pt-H distance is 3.012(2) Å that is shorter than sum of the van der Waals radii. The C2-H···Pt angle is 127.2(5)°. In this way the Pt atom is situated in a deformed octahedral surrounding formed by four equatorial Cl and two H atoms located on the axial positions. Isostructural complexes, H₄eddp[PtCl₄] and H₄eddp[PdCl₄], have nearly equal M-L bond distances and corresponding angles. This is in agreement with the ionic radii of the central atom.

Table 1. Data collection and handling.

Crystal:	orange prism, size 0.12 × 0.56 × 0.56 mm
Wavelength:	Mo $K\alpha$ radiation (0.71073 Å)
μ :	101.50 cm ⁻¹
Diffractometer, scan mode:	Enraf-Nonius CAD4, $\omega/2\theta$
$2\theta_{\text{max}}$:	52°
$N(hkl)$ measured, $N(hkl)$ unique:	1562, 1461
Criterion for I_{obs} , $N(hkl)$ gt:	$I_{\text{obs}} > 2\sigma(I_{\text{obs}})$, 1332
$N(\text{param})$ refined:	89
Programs:	SHELXS-97 [2], SHELXL-97 [3], ORTEP-3 [4]
