ABSTRACT

Aza-conjugate addition of the lithium anion of *N*-trimethylsilyl-*p*-methoxybenzylamine to *tert*butyl enoate acceptors, in the presence of a stoichiometric amount of enantiopure 1,2dimethoxy-1,2-diphenylethane and excess trimethylsilyl chloride, affords *tert*-butyl-*N*-*p*methoxybenzyl- β -amino esters with excellent levels of enantiocontrol. These *N*-*p*methoxybenzyl- β -amino-esters may be deprotected under oxidative conditions *via* treatment with ceric ammonium nitrate, followed by acid hydrolysis of the resultant imine intermediates, to afford enantiopure β -amino-esters containing hydrogenolytically sensitive functionality.

1. Introduction

Enantiomerically pure β -amino acids and their derivatives are important chiral building blocks for the synthesis of drug molecules and natural products.¹ They are also useful as monomers for the preparation of biologically active β -peptides and $\alpha\beta$ -peptides² that are more resistant to proteolytic cleavage than peptides derived from α -amino acids.³ For example, β peptides have been reported that display antibiotic,⁴ antifungal,⁵ antiviral,⁶ anticancer,⁷ and cholesterol uptake inhibitory activities.⁸ Relatively short β -peptides sequences are also known to display defined secondary structures,9 which enables foldameric β -peptides to be used to investigate medicinally relevant protein-protein interactions.¹⁰ However, the range of naturally occurring β -amino acid derivatives available from the chiral pool is limited, and as a consequence methodology is required for their preparation in enantiopure form.¹¹ Effective strategies that currently exist, include those based on kinetic ¹² stereoselective addition of enolate equivalents to resolution. ¹³ Curtius rearrangement of chiral succinate derivatives, imines. Arndt-Eistert homologation of chiral a-amino acids,¹⁵ and hydrogenation/reduction of N-enamine and N-acyl-enamide derivatives.¹⁰

One of the more popular strategies employed for the synthesis of enantiopure β -amino acid derivatives involves the stereoselective conjugate addition of aza-nucleophile equivalents to α - β unsaturated acid equivalents.¹⁷ Within this area, a range of highly effective protocols have been developed based on the stereoselective addition of lithium amides to enoate acceptors. For example, Yamamoto and coworkers have reported that achiral lithium N-trialkylsilylamides such as 1a add to chiral enoate acceptors that contain γ -stereocentres with good levels of diastereocontrol.¹⁸ Alternatively, Davies and coworkers have lithium employed chiral amides derived from αmethylbenzylamine for the diastereoselective synthesis of an impressive number of β -amino esters.¹⁹ Tomioka and coworkers have developed an elegant external chiral ligand approach that enables achiral lithium amides to be used as aza-nucleophiles for the enantioselective synthesis of β -amino esters. They first of reported that addition lithium N-benzyl-N-(trimethylsilyl)amide 1a to α,β -unsaturated esters 3 in the presence of a stoichiometric amount of the chelating C₂symmetric ligand (R,R)-1,2-dimethoxy-1,2-diphenylethane 2, gave protodesilylated *N*-benzyl- β -amino esters **4** with excellent levels of enantiocontrol (e.g. 93% ee for **4a**).²⁰ These *N*-aryl- β amino esters could then be N-deprotected under hydrogenolytic conditions (Pd(OH)₂/C, 7 atm. H₂) to afford their parent β -amino esters 5a in good yield (Scheme 1a).²⁰ This external chiral ligand controlled methodology has proven to be useful for the synthesis of a range of cyclic β -amino acid derivatives;²¹ and intermediates for the synthesis of the drugs otamixaban, premafloxacin,²² and the alkaloid natural products (–)-aspidospermidine,²³ (–)-kopsinine²⁴ and (–)-lycorine.²⁵ However, the hydrogenolysis conditions used to deprotect *N*-benzyl- β -amino esters **4a** derived from cinnamate acceptors were reported to be problematic because these conditions resulted in competing cleavage of their β -nitrogen bonds to afford unwanted 3-arylpropanoates.²⁶ In order to address this problem, Tomioka and coworkers introduced a range of lithium N-(trialkylsilyl)-amides 1b-d as second generation aza-nucleophiles for the enantioselective synthesis of *N*-protected- β -amino esters **4b-d** with good levels of enantiocontrol (\geq 89% ee) (Schemes 1b-d).^{26,27} A range of different N-deprotection strategies were employed to deprotect these N-protected- β -amino esters 4 to afford their parent chiral *N*H-β-amino esters **5a** in good yield. Chiral *N*-anthraceny-9-yl-βamino-esters 4b could be deprotected under milder hydrogenolytic conditions using H₂(1 atm) and 10% Pd/C over a period of 24 h (Scheme 1b).²⁶ Chiral *N*-mesitylamine-β-aminoesters 4c was deprotected through a three step N-

chlorination/regioselective dehydrochlorination/*trans*-oximation protocol (Scheme 1c);^{27a} conditions that could also be used to deprotect *N*-benzyl- β -amino ester **4a**.²² Alternatively, chiral *N*allyl- β -amino esters **4d** was deprotected using a tandem rhodium catalysed isomerisation/imine hydrolysis approach (Scheme 1d).^{27b} Further to these reports, we now report that lithium *N*-*p*methoxybenzyl-*N*-(trimethylsilyl)amide **1e** can also be used as an achiral aza-nucleophile in these type of chiral ligand mediated aza-conjugate addition reactions to afford chiral *N*-*p*methoxybenzyl β -amino-esters **6** with excellent levels of enantiocontrol. The *p*-methoxybenzyl (PMB) fragments of these *N*-PMB- β -amino esters **5** that can contain hydrogenolytically sensitive functionality (Scheme 1e).

2. Results and Discussion

As part of a research program directed towards the asymmetric synthesis of β -amino acids²⁸ as chiral precursors for the synthesis of novel heterocyclic scaffolds, we required access to a range of β -amino esters containing hydrogenolytically sensitive functionality. Davies and coworkers had previously reported the use of lithium *N*-benzyl-*N*- α -methyl-*p*-methoxybenzylamide **7** as a chiral aza-nucleophile for the diastereoselective synthesis of chiral haloaryl- β -amino esters such as **8**,²⁹ whose *N*-benzyl and *N*-PMB protecting groups could be removed under oxidative conditions *via* stepwise treatment with excess CAN (Scheme

2a).³⁰ This enabled lithium amide **7** (or its enantiomer) to be used for the asymmetric syntheses of a range of hydrogenolytically sensitive haloaryl and pyridinyl containing β -amino-acids, β lactams and heterocycles with good levels of stereocontrol.^{29,31} Given this precedent, we reasoned that lithium *N*-(4methoxybenzyl-1,1,1-trimethyl-silanamide **1e** might be useful as an aza-nucleophile for Tomioka's chiral ligand conjugate addition methodology, since it would enable the *N*-PMB groups of its corresponding β -amino-ester adducts **6** to be removed using CAN under oxidative conditions (Scheme 1e).

Tomioka and coworkers previously attempted to employ lithium amide 1e as an aza-nucleophile using their standard conditions (3 eq. amide, 3.6 eq. chiral ligand 2, toluene, -78 °C), but reported that it was unsuccessful in delivering any chiral β-amino ester product (Scheme 2b), even when more forcing conditions were employed.²⁶ However, we noticed that they had reported that addition of an excess of trimethylsilyl chloride (TMSCl) had the potential to improve both the yield and stereoselectivity of these types of aza-conjugate addition reactions. For example, reaction of 1.5 equivalents of lithium amide 1a with tert-butyl-cinnamate 3a and 1.8 equivalents of ligand 2 in toluene at -78 °C afforded N-benzyl-\beta-amino ester 4a in 81% yield and 82% ee, which could be improved to 97% yield and 97% ee in the presence of 5.0 equivalents of TMSCI (Scheme 2c).²⁰ Consequently, we decided to investigate whether carrying out aza-conjugate addition reactions of lithium amide 1e with 3a in the presence of excess TMSCl might afford chiral N-PMB-β-amino-esters 6 in good yield and high ee.

a. Davies' 2nd generation oxidative deprotection methodology for the diastereoselective synthesis of chiral bromoaryl- β -amino ester 5^{29}

b. Tomioka's unsuccessful attempt to use lithium amide 1e for the asymmetric synthesis of β amino ester $6a^{26}$

c. Excess trimethylsilylchloride improves the enantioselectivity of conjugate addition reactions of lithium amide $1a^{20}$

Scheme 2: A range of successful and unsuccessful aza-conjugate addition reactions that have been investigated for synthesis of β -amino esters **4a** and **8**.

N-Trimethylsilyl-p-methoxybenzylamine 9 was first prepared by treating *p*-methoxybenzylamine with *n*-butyllithium in THF at 0 °C, followed by addition of TMSCl and heating at reflux for 12 hours. Its corresponding lithium amide 1e was then generated via treatment of 1.5 equivalents of amine 9 with *n*-butyllithium in toluene at -78 °C. A solution of 1.8 equivalents of chiral ligand 2 in toluene was then added to this solution of lithium amide 1e in toluene at -78 °C, followed by further addition of a solution of tert-butyl-cinnamate 3a in toluene at -78 °C. The reaction was then stirred for 5 h before work-up at -78 °C using NH₄Cl(aq). Promisingly, and in contrast to Tomioka's previous report that no aza-conjugate addition reaction occurred,²⁶ this reaction produced some of the desired protodesilylated N-PMB-β-amino ester 6a, albeit in low 35% yield and poor enantioselectivity (25% ee) (Scheme 3a). Encouraged by this result, we repeated this azaconjugate reaction under identical conditions, except that we employed a solution of tert-butyl-cinnamate and 5.0 equivalents of TMSCl in the final addition step. To our delight, the presence of excess TMSCl resulted in formation of the desired (R)-N-PMB-β-amino ester 6a in a much improved 77% yield and 95% ee (Scheme 3b).

(a) Lithium amide 1e affords a low yield of scalemic β -amino ester 6a (25% ee)

(b) Lithium amide 1e in the presence of excess TMSCI affords a good yield of enantiopure β -amino ester 6a~(95%~ee)

Scheme 3: Chiral ligand 2 mediated aza-conjugate addition reaction of lithium amide 1e to *tert*-butyl enoate 3a in the presence of excess TMSCI affords β -amino ester 6a in good yield and high ee.

The scope and limitation of this aza-conjugate addition reaction was then investigated by reacting lithium amide **1e** with a range of α,β -unsaturated *tert*-butyl enoates **3b-h** in the presence of excess TMSCl, including some substrates that contained hydrogenolytically sensitive functionality (Table 1). Therefore, tert-butyl cinnamate ester substrates containing halo-aryl 3b-c and cyano-aryl substituents **3d** afforded their corresponding β amino esters 6b-d in good yields (62-79%) and with 95% ee (Table 1, Entries 2-4). However, (E)-tert-butyl 3-(4nitrophenyl)acrylate 3e proved less reactive, affording N-PMB-βamino ester 6e in only 40% yield and 95% ee (Table 1, Entry 5), with the poor yield being due to the presence of unreacted tertbutyl enoate 3e. Aza-conjugate addition reactions of heteroatom containing tert-butyl enoates were also successful, with (E)-tertbutyl 3-(thiophen-2-yl)acrylate 3f and (E)-tert-butyl 3-(furan-2yl)acrylate 3g affording their corresponding β -amino esters 6f (95% ee) and 6g (95% ee) in 86% and 73% yield respectively (Table 1, Entries 6-7). Finally, it was shown that the simple acyclic (E)-tert-butyl hept-2-enoate 3h afforded its corresponding N-PMB-β-amino ester 6h in 68% yield and 95% ee.

Tomioka and coworkers have recently employed ⁶Li NMR spectroscopy to demonstrate that addition of chiral ligand 2 to lithium amide 1e initially results in formation of a mixture of cisand trans- cyclic heterodimeric complexes (only cis-dimer 10 shown in Figure 1).³² They proposed that addition of *tert*-butyl enoate 3 results in dissociation of these heterodimeric complexes to afford a new monomeric complex 11 containing one equivalent of lithium amide, one equivalent of chiral ligand and one equivalent of enoate. Intramolecular transfer of the amide fragment of complex 11 to its enoate fragment then occurs in a highly enantiofacial manner to afford a (Z)-enolate 12 that is then protonated on work-up with NH₄Cl(aq) to afford the desired N-PMB- β -amino ester 6 (Figure 1). The role of TMSCl in improving the yield and enantioselectivity of these type of azaconjugate addition reactions is unclear, however it is possible that it acts as an electrophilic O-silylating agent to trap out (Z)-

enolate 12 as its corresponding (Z)-silyl-ketene acetal 13 in situ. This would perturb the equilibria of the potentially reversible intramolecular aza-conjugate addition step $(11 \leftarrow 12)$, by preventing the reverse E1cB-elimination reaction of (Z)-enolate 12 from occurring. Furthermore, it has been shown that enolates such as 12 can react with lithium amide complexes of ligand 2 to afford competing dimeric lithium complexes such as 14,³³ which could potentially be responsible for competing nonstereoselective aza-conjugate addition pathways that afford N-PMB- β -amino ester 6 with poorer levels of control in the absence of TMSCI. Therefore, we propose that the presence of excess TMSCl ensures that (Z)-enolate 12 is rapidly trapped out as its Osilvl ketene acetal 13^{34} , which ensures that the concentration of free enolate 12 remains sufficiently low to ensure that the enantioselective pathway to *N*-PMB-β-amino ester 6

predominates (Figure 1).

Figure 1: Potential role of TMSCl in improving yields and enantioselectivities of chiral ligand 2 mediated aza-conjugate addition reactions of lithium amide 1e with *tert*-butyl enoates 3.

Having successfully identified conditions that enabled lithium amide **1e** to be used as an effective aza-nucleophile for the enantioselective synthesis of *N*-PMB- β -amino esters **6a-h**, we next investigated their *N*-deprotection under oxidative conditions. Treatment of *N*-PMB- β -amino ester **6a** with 4.0 equivalents of CAN in MeCN/H₂O (5:1) solution, followed by basic work up using NaHCO₃(aq),²⁹ afforded *N*-PMB-imine **15a** in essentially quantitative yield (Scheme 4). A plausible mechanism for this CAN mediated oxidative *N*-deprotection step is presented in Scheme 4, whereby CAN first acts an electron acceptor from the *p*-methoxyphenyl (PMP) group to afford a stabilised radical cation 16. A benzylic proton of 16 is then deprotonated by water to afford **a** stabilized benzylic radical resonance form 17. A second equivalent of CAN then oxidises radical 17 to afford benzylic cation 18 which is resonance stabilized as its iminium species 19 that is subsequently isolated as imine 15a after basic workup. After a short optimisation screen of solvents, acids and reaction time, it was found that stirring a solution of *N*-PMBimine 15a in MeCN/H₂O (5:1) in the presence of 15 eq. of acetic acid at room temperature for 48 h followed by neutralisation with NaHCO₃(aq) and purification by chromatography, furnished (*R*)- β -amino-*tert*-butyl ester 5a in 83% yield and 95% ee. The (*R*)configuration and 95% ee of (*R*)- β -amino-*tert*-butyl ester 5a was confirmed by comparison of the sign and magnitude of its specific rotation of (*R*)-*N*-benzyl- β -amino of $[\alpha]_D^{23} + 20.0$ (*c* 1.2, CHCl₃), with the literature value of $[\alpha]_D^{23} + 19.7$ (*c* 0.96, CHCl₃).²⁹

diastereomeric imino-boronate

acid and enantiopure BINOL to afford a mixture

Table 2: CAN deprotection reactions of *N*-PMB-β-amino esters.

Scheme 4: CAN mediated oxidative *N*-deprotection of *N*-PMB- β -amino ester **6a** to afford an intermediate imine **15a** that is then hydrolysed under aqueous acidic conditions to afford β -amino ester **5a**.

This oxidative *N*-deprotection methodology was then applied to unmask the remaining *N*-PMB- β -amino esters **6b-h** to afford their corresponding deprotected *N*H- β -amino esters **5b-h** in moderate to good yields (36-73%) over two steps (Table 2). It was found that the <60% yields obtained for formation of *N*H- β amino esters **5b**, **5e** and **5f** (Entries 2, 4 and 6) were due to competing acid catalysed cleavage of their *tert*-butyl ester fragments to afford their corresponding acids in the imine hydrolysis step. Evidence for this competing *tert*-butyl cleavage pathway was obtained from ¹H NMR spectroscopic and mass spectrometric analysis of the aqueous washings of the crude reaction products of the imine hydrolysis reactions, which clearly revealed the presence of their corresponding β -amino acids.³⁵

The enantiomeric excesses of β -amino esters **5a-h** were confirmed as 95% ee using a simple three-component chiral derivatisation protocol previously developed in our research group.³⁶ In this approach, a chiral amine of unknown enantiomeric excess is derivatised with 2-formylphenyl boronic

a. Isolated yields of β -amino esters **5a-h** after purification by chromatography; b. Lower yields of β -amino esters due to competing cleavage of their *tert*-butyl ester fragments in the imine hydrolysis step to give their corresponding β -amino acids; c. Ee's determined by derivatisation of β -amino esters **5a-h** with 2-formylphenylboronic acid and (*R*)-BINOL followed by ¹H NMR spectroscopic analysis of the ratio of the resultant mixture of diastereomeric imino-boronate esters;³⁶ d. Error limit of ±3% in ee arising from the detection limit of the ¹H NMR chiral derivatisation protocol.

esters whose ratio can be determined by ¹H NMR spectroscopic analysis. Since no kinetic resolution occurs in this derivatisation process, this diasteromeric ratio corresponds to the enantiomeric ratio of the parent chiral amine. For example, β -amino ester (R)via treatment derivatised 5a was first with 2formylphenylboronic acid 20, (rac)-BINOL, and K₂CO₃ in CDCl₃ for 10 min to afford a 50:50 mixture of the diastereomeric iminoboronate esters (R_{BIN}, R) -21 and (S_{BIN}, R) -22 (Scheme 5a). Analysis of the ¹H NMR spectrum of this mixture revealed well resolved resonances corresponding to the diastereotopic methylene and *tert*-butyl ester protons of the (R_{BIN}, R) -21 (CH^A, $CH^{A'}$ and CH^{B}_{3}) and (S_{BIN},R) -22 $(CH^{C}, CH^{C'})$ and CH^{D}_{3}) diastereomers respectively ($\Delta \delta_{\rm H} = 0.1$ -0.4 ppm), whose integrals could be used to accurately determine their diastereomeric ratio

of

(Figure 2a). A sample of β -amino ester (*R*)-**5a** generated using our enantioselective aza-conjugate addition protocol, was then derivatised with 2-formylphenylboronic acid **20** and enantiopure (*R*)-BINOL, with ¹H NMR spectroscopic analysis revealing that (*R*_{BIN},*R*)-**21** and (*R*_{BIN},*S*)-**22** were present in a diastereomeric ratio of 97.5:2.5 (Scheme 5b). This ratio was accurately determined by comparison of the integral ratios of the well resolved *tert*-butyl proton singlet resonances of (*R*_{BIN},*R*)-**21** (O(CH^B₃) and (*R*_{BIN},*S*)-**22** (O(CH^D₃) at δ 0.85 ppm and δ 1.15 respectively (Figure 2b). Therefore, since no kinetic resolution occur in the derivatisation process, it follows that this 97.5:2.5 diasteromeric ratio corresponds to the enantiomeric ratio of chiral amine **5a**, thus allowing us to conclude that it had been formed in 95% ee.

3. Conclusions

Aza-conjugate addition of lithium amide **1e** to *tert*-butyl enoates, in the presence of a stoichiometric amount of an external chiral ligand **2** and excess trimethylsilyl chloride, affords *tert*-butyl *N*-PMB- β -amino esters **6a-h** with excellent levels of enantiocontrol. The resultant *tert*-butyl *N*-PMB- β -amino esters **6a-h** may be deprotected *via* treatment with CAN, followed by acid hydrolysis of their resultant imine intermediates, to afford their parent chiral β -amino-esters **5a-h** (95% ee). The ability to deprotect *N*-PMB- β -amino esters **6** under oxidative conditions enables this second generation variant of Tomioka's external chiral ligand mediated lithium amide methodology to be used for the enantioselective synthesis of β -amino esters **6** that contain functionalities that are susceptible to hydrogenolysis.

4. Experimental

General methods

Reactions that required the use of dry solvents were conducted in oven dried glassware under an atmosphere of nitrogen using inert atmosphere techniques. Dry solvents were obtained by passing them through anhydrous alumina columns using an Innovative Technology Inc. PS-400-7 solvent purification system. Petrol refers to the fraction of petroleum ether boiling at 40-60 °C. Hexanes refers to the hexane fraction of petroleum. Solvents were evaporated on a Büchi Rotorvapor. All commercially available compounds were used as obtained from chemical suppliers. ¹H and ¹³C NMR spectra were run in CDCl₃ using Bruker Avance 250/300/400/500 MHz spectrometers. Chemical shifts (δ) are quoted in parts per million and are referenced to the residual solvent peak. Coupling constants (J) are quoted to the nearest 0.1 Hz. Infra-red spectra were recorded on a Perkin Elmer Spectrum 100 FT-IR spectrometer, using a Universal ATR accessory for sampling, with only selected absorbances quoted as v in cm⁻¹. Mass spectra were recorded on a micrOTOF electrospray time-of-flight (ESI-TOF) mass spectrometer (Bruker Daltonik GmbH, Bremen, Germany), using acetonitrile or water to dissolve the sample. TLC was carried out using commercially available polyethylene backed plates coated with Merck Kieselgel 60 GF254. Plates were visualised under UV light (at 254 nm) or by staining with potassium permanganate, ninhydrin or phosphomolybdic acid followed by gentle heating. Flash chromatography was performed under manually generated medium pressure using Merck 60 H silica gel (35-75 µm) unless otherwise stated.

(R,R)-1,2-Dimethoxy-1,2-diphenylethane **2**

(R,R)-Hydrobenzoin (1.00 g, 4.67 mmol) was added dropwise (5 min) to a stirred refluxing suspension of sodium hydride (60% dispersion, 0.467 g, 11.7 mmol) in dry THF (10 mL). This mixture was heated at reflux for a further 30 minutes and then cooled to 0 °C prior to the addition of methyl iodide (15.0 mL, 100 mmol). The reaction was then stirred at room temperature overnight, whereupon TLC analysis showed consumption of the starting material. The mixture was cooled to 0 °C and quenched with water (10 mL), extracted with EtOAc (3 x 50 mL), washed with brine, dried over anhydrous MgSO₄, filtered and concentrated in vacuo. The residue was recrystallised from hexane/Et₂O to afford the title compound as a white crystalline solid (0.68 g, 60%). $[\alpha]_D^{25}\text{-}15.1$ (c 1.8, CHCl_3) (Lit. 37 $[\alpha]_D^{23}$ -15.2 $(c 2.1, CHCl_3)$; ¹H NMR (300 MHz, CDCl₃) $\delta H = 7.23-7.15$ (6H, m, Ph), 7.08-6.98 (4H, m, Ph), 4.34 (2H, s, CHOCH₃), 3.30 (6H, s, OCH₃); ¹³C NMR (75 MHz, CDCl₃) $\delta C = 138.2, 127.9, 127.8,$ 127.6, 87.7, 57.2; IR (thin film) umax (cm⁻¹): 1492 (w, C=C), 1455 (w, C=C); HRMS (ESI): m/z 265.1188, C₁₆H₁₈NaO₂ $[M+Na]^+$ requires 265.1199.

N-(4-Methoxybenzyl)-1,1,1-trimethylsilanamine 9

n-Butyllithium solution (2.3 M in hexanes, 6.6 mL, 38.2 mmol) was added to a stirred solution of *para*-methoxybenzylamine (5.00 g, 36.4 mmol) in THF (140 mL) at 0 °C. The reaction was stirred at room temperature for 8 hours before being cooled to 0 °C and a solution of addition of TMSCl (4.67 mL, 36.8 mmol) in

(thin film) v_{max} (cm⁻¹): 1706 (s, C=O); HRMS (ESI): m/zTHF (40 mL) added dropwise. The reaction was heated at reflux

for 12 hours, concentrated, triturated with pentane (2 x 100 mL) and solvent removed in vacuo to afford the title compound as a yellow oil (5.59 g, 73% yield). ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} =$ 7.16 (2H, d, *J* = 8.6 Hz, CH₃OCCHC*H*), 6.82 (2H, d, *J* = 8.6 Hz, CH₃OCCH), 3.77 (2H, d, J = 7.8 Hz, CH₂N), 3.7 (3H, s, OCH₃), 1.90 (1H, br. s, NH), 0.00 (9H, s, Si(CH₃)₃); ¹³C NMR (75 MHz, $CDCl_3$) $\delta_C = 158.2, 136.5, 129.1, 113.85, 55.2, 45.3, 0.0; IR$ (thin film) v_{max} (cm⁻¹): 3305 (w, NH), 1505, 1499 (m, m, C=C).

(E)-tert-Butyl 3-phenylacrylate 3a

A solution of iodobenzene (2.69 g, 13.2 mmol) diisopropylethylamine (6.90 mL, 39.6 mmol), tert-butyl acrylate (2.12 mL, 14.5 mmol), tri(o-tolyl)phosphine (0.40 g, 13.2 mmol) and palladium(II) acetate (0.15 g, 0.66 mmol) in MeCN (80 mL) was heated at reflux for 17 hours. The suspension was then cooled to room temperature, diluted with water (60 mL) and extracted with EtOAc (3 x 50 mL). The combined organic extracts were washed with brine and water, dried over anhydrous MgSO₄ and concentrated in vacuo. The residue was purified by flash chromatography (EtOAc-petrol, 1:30) to afford the title compound as a yellow oil (1.94 g, 72% yield). ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.51 (1H, d, J = 16.0 Hz, CH=CHCO₂), 7.47-7.25 (5H, m, Ph), 6.30 (1H, d, J = 16.0 Hz, CH=CHCO₂), 1.46 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{C} = 166.3$, 143.6, 134.7, 123.0, 128.8, 128.0, 120.2, 80.5, 28.2; IR (thin film) v_{max} (cm⁻¹): 1703 (s, C=O); HRMS (ESI): m/z 227.1025, C₁₃H₁₆NaO₂ $[M+Na]^+$ requires 227.1043.

General Procedure 1: Synthesis of tert-butyl enoates 3b-g.

Methylmagnesium bromide (1 eq.) was added to a solution of tert-butyl 2-(diethoxyphosphoryl)acetate (1 eq.) in dry THF (0.1 M) at room temperature under an inert atmosphere and the mixture stirred for 15 minutes. A dry THF (0.2 M) solution of the appropriate aryl aldehyde (1 eq) was then added dropwise (5 min) and the reaction mixture heated at reflux for 18 hours. After cooling to room temperature, saturated NH₄Cl(aq) was added and the mixture extracted with Et₂O (3 x 30 mL). The combined organic extracts were washed with brine and water, dried over anhydrous MgSO₄, filtered and concentrated in vacuo. The residue was then purified by silica gel chromatography (EtOAcpetrol, 1:30) to afford the desired *tert*-butyl enoate 3.

(E)-tert-Butyl 3-(4-bromophenyl)acrylate **3b**

4-Bromobenzaldehyde (0.36 g, 2 mmol) was used to prepare the title compound as a white solid (0.404 g, 72% yield) using general procedure 1. Mp. 53-55 °C; ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 7.47$ (1H, d, J = 15.8 Hz, CH=CHCO₂), 7.42 (2H, d, J = 6.8Hz, BrCCHCH), 7.29 (2H, d, J = 6.8 Hz, BrCCHCH), 6.31 (1H, d, J = 15.8 Hz, CH=CHCO₂), 1.46 (9H, s, C(CH₃)₃); ¹³C NMR $(75 \text{ MHz}, \text{CDCl}_3) \delta_c = 166.1, 142.2, 133.6, 132.1, 129.36, 124.2,$ 120.9, 80.8, 28.2; IR (thin film) v_{max} (cm⁻¹): 1704 (s, C=O); HRMS (ESI): m/z 305.0129, $C_{13}H_{15}BrNaO_2$ [M+Na]⁺ requires 305.0153.

(E)-tert-Butyl 3-(2,4-dichlorophenyl)acrylate **3c**

2,4-Dichlorobenzaldehyde (0.52 g, 3 mmol) was used to prepare the title compound as a colourless oil (0.59 g, 78% yield) using general procedure 1. ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 7.92$ (1H, d, J = 16.0 Hz, CH=CHCO₂), 7.54 (1H, d, J = 8.5 Hz, CHCCl), 7.43 (1H, d, J = 2.0 Hz, CClCHCCl), 7.25 (1H, dd, J = 8.6 and 2.0 Hz, CCHCH), 6.35 (1H, d, J = 16.1 Hz, CH=CHCO₂), 1.54 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{C} = 165.6, 138.1,$ 136.0, 135.4, 131.5, 129.9, 128.3, 127.5, 123.2, 81.0, 28.2; IR

295.0244, $C_{13}H_{14}Cl_2NaO_2[M+Na]^+$ requires 295.0269.

(E)-tert-Butyl 3-(4-cyanophenyl)acrylate 3d

4-Formylbenzonitrile (0.39 g, 3 mmol) was used to prepare the title compound as a white solid (0.59 g, 82% yield) using general procedure 1. Mp. 140-142 °C; ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} =$ 7.67 (2H, d, J = 7.6 Hz, NCCCH), 7.58 (2H, d, J = 7.6 Hz, NCCCHCH), 7.55 (1H, d, J = 16.1 Hz, CH=CHCO₂), 6.45 (1H, d, J = 16.1 Hz, CH=CHCO₂), 1.54 (9H, s, C(CH₃)₃); ¹³C NMR $(75 \text{ MHz}, \text{CDCl}_3) \delta_c = 165.4, 141.1, 139.0, 132.6, 128.3, 123.8,$ 118.4, 113.1, 81.2, 28.1; IR (thin film) v_{max} (cm⁻¹): 2226 (m, CN), 1702 (s, C=O); HRMS (ESI): m/z 252.0990, C₁₄H₁₅NNaO₂ $[M+Na]^+$ requires 252.1000.

(E)-tert-Butyl 3-(4-nitrophenyl)acrylate 3e

4-Nitrobenzaldehyde (0.30 g, 2 mmol) was used to prepare the title compound as a colourless oil (0.35 g, 70% yield) using general procedure 1. ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 8.14$ (2H, d, *J* = 8.7 Hz, O₂NCCH), 7.57 (2H, d, *J* = 8.7 Hz, O₂NCCHCH), 7.53 (1H, d, J = 16.0 Hz, $CH=CHCO_2$), 6.42 (1H, d, J = 15.9 Hz, $CH=CHCO_2$), 1.46 (9H, s, $C(CH_3)_3$); ¹³C NMR (75 MHz, $CDCl_3$) $\delta_{\rm C} = 165.3, 148.3, 140.9, 140.6, 128.5, 124.5, 124.1, 81.5, 28.1;$ IR (thin film) v_{max} (cm⁻¹): 1708 (s, C=O); HRMS (ESI): m/z272.0878, C₁₃H₁₅NNaO₄ [M+Na]⁺ requires 272.0899.

(E)-tert-Butyl 3-(thiophen-2-yl)acrylate 3f

Thiophene-2-carboxaldehyde (0.44 g, 4 mmol) was used to prepare the title compound as a colourless oil (0.60 g, 71% yield) using general procedure 1. ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 7.67$ (1H, d, J = 15.7 Hz, CH=CHCO₂), 7.32 (1H, d, J = 5.1 Hz, CHS), 7.20 (1H, d, J = 3.5 Hz, CHCS), 7.02 (1H, dd, J = 5.1 and 3.6 Hz, CHCHCHS), 6.16 (1H, d, J = 15.7 Hz, CH=CHCO₂), 1.51 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{C} = 166.2$, 139.8, 136.1, 130.5, 128.0, 119.0, 80.5, 28.2; IR (thin film) v_{max} (cm⁻¹): 1699 (s, C=O); HRMS (ESI): *m/z* 233.0591, C₁₁H₁₄NaO₂S $[M+Na]^+$ requires 233.0612.

(E)-tert-Butyl 3-(furan-2-yl)acrylate 3g

Furan-2-carboxaldehyde (0.48 g, 5 mmol) was used to prepare the title compound as a yellow oil (0.52 g, 65% yield) using general procedure 1. ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 7.38$ (1H, d, J = 1.6 Hz, CHO), 7.26 (1H, d, J = 15.9 Hz, CH=CHCO₂), 6.50 (1H, d, J = 3.4 Hz, CHCO), 6.38 (1H, dd, J = 3.4 and 1.8 Hz, CHCHCHO), 6.18 (1H, d, J = 15.9 Hz, CH=CHCO₂), 1.44 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C} = 166.4, 151.2,$ 144.4, 130.1, 118.0, 114.0, 112.1, 80.4, 28.2; IR (thin film) υ_{max} (cm⁻¹): 1701 (s, C=O); HRMS (ESI): *m*/*z* 217.0875, C₁₁H₁₄NaO₃ $[M+Na]^+$ requires 217.0841.

(*E*)-tert-Butyl hept-2-enoate **3h**

tert-Butyl acrylate (5.92 mL, 40.8 mmol) and Grubbs 2nd generation catalyst (0.10 g) were added to a solution of hex-1-ene (2.89 mL, 13.6 mmol) in CH₂Cl₂ (29 mL) under an inert atmosphere. The reaction mixture was stirred at room temperature for 24 hours and then filtered through celite and concentrated in vacuo. Distillation of the residue afforded the title compound as a colourless oil (1.42 g, 55% yield). Bp. 90 °C @ 0.8 Torr; ¹H NMR (250 MHz, CDCl₃) $\delta_{\rm H} = 6.78$ (1H, dt, J =15.7 and 6.9 Hz, $CH_2CH=CH$), 5.66 (1H, dt, J = 15.7 and 1.5 Hz, CH₂CH=CH), 2.10 (2H, qd, J = 7.1 and 1.5 Hz, CH₂-CH₂-CH), 1.49 (9H, s, C(CH₃)₃), 1.37-1.18 (4H, m, CH₃CH₂CH₂), 0.93 (3H, t, J = 7.1 Hz, CH_3CH_2); ¹³C NMR (75 MHz, $CDCl_3$) $\delta_C = 166.6$, 148.5, 123.3, 80.3, 32.2, 30.6, 28.5, 22.6, 14.2; IR (thin film) v_{max}

(cm⁻¹): 1706 (s, C=O); HRMS (ESI): Am/z [207]1343, [14] (1H) $C_{11}H_{20}NaO_2$ [M+Na]⁺ requires 207.1361. CHO

General Procedure 2: Enantioselective Synthesis of *N*-*p*-methoxybenyl- β -amino esters **6a-h**.

n-Butyllithium (2.5 M in hexanes, 1.5 eq.) was added dropwise (5 min) to a solution of N-(4-methoxybenzyl)-1,1,1-trimethylsilanamine 9 (1.5 eq.) in dry toluene (0.33 M) at -78 °C. After stirring the mixture at -78 °C for 30 minutes, a solution of chiral ligand 2 (1.8 eq.) in dry toluene (1 M) was added dropwise (5 min). After stirring the mixture for a further 30 minutes at -78 °C, a solution of the appropriate *tert*-butyl ester 1 (1 eq.) and TMSCl (5 eq.) in dry toluene (2 M) was then added dropwise (5 min). The reaction mixture was stirred for 5 hours at -78 °C and then quenched via the careful addition of saturated NH₄Cl(aq). After allowing the suspension to stir and warm to room temperature, saturated NaHCO₃(aq) was added carefully and extracted with EtOAc (3 x 100 mL). The combined organic extracts were washed with brine and water, dried over anhydrous MgSO4, filtered and concentrated in vacuo and then purified by silica gel chromatography to afford the desired N-PMB-\beta-amino ester 6ah.

(R)-tert-Butyl 3-((4-methoxybenzyl)amino)-3-phenylpropanoate 6a

(*E*)-*tert*-Butyl 3-phenylacrylate **1a** (1.18 g, 5.8 mmol) was used to prepare the title compound as a yellow oil (1.52 g, 77% yield) using general procedure 2. $[\alpha]_D^{26}$ +25.9 (*c* 3.2, CH₂Cl₂); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.43-7.26 (5H, m, Ph), 7.22 (2H, d, *J* = 8.6 Hz, CHCHCOCH₃), 6.87 (2H, d, *J* = 8.6 Hz, CHCHCOCH₃), 4.09 (1H, dd, *J* = 8.6 and 5.5 Hz, CHNH), 3.82 (3H, s, OCH₃), 3.61 (1H, d, *J* = 12.9 Hz, NHCH^AH^B), 3.51 (1H, d, *J* = 12.9 Hz, NHCH^AH^B), 2.68 (1H, dd, *J* = 15.3 and 8.7 Hz, CH^ACH^BCO₂), 2.56 (1H, dd, *J* = 15.3 and 5.6 Hz, CH^ACH^BCO₂), 2.20 (1H, br. s, NH), 1.40 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 171.1, 158.6, 142.8, 132.6, 129.3, 128.5, 127.4, 113.8, 80.6, 59.1, 55.3, 50.8, 44.3, 28.0; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 1721 (s, C=O); HRMS (ESI): *m*/*z* 364.1911, C₂₁H₂₇NNaO₃ [M+Na]⁺ requires 364.1889.

(*R*)-tert-Butyl 3-(4-bromophenyl)-3-((4-methoxybenzyl)amino)propanoate **6b**

(*E*)-*tert*-Butyl 3-(4-bromophenyl)acrylate **1b** (0.55 g, 1.95 mmol) was used to prepare the title compound as a white solid (0.64 g, 79% yield) using general procedure 2. $[\alpha]_D^{26}$ +38.6 (*c* 1.71, EtOAc); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.40 (2H, d, *J* = 8.3 Hz, CHCHCBr), 7.18 (2H, d, *J* = 8.3 Hz, CHCHCBr), 7.09 (2H, d, *J* = 8.5 Hz, CHCHCOCH₃), 6.77 (2H, d, *J* = 8.5 Hz, CHCHCOCH₃), 3.95 (1H, dd, *J* = 12.5 Hz, NHCH^AH^B), 3.38 (1H, d, *J* = 12.5 Hz, NHCH^AH^B), 3.38 (1H, d, *J* = 15.4 and 5.4 Hz, CH^ACH^BCO₂), 1.94 (1H, br. s, NH), 1.30 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 170.8, 158.6, 141.8, 132.2, 131.6, 129.3, 129.1, 121.1, 113.8, 80.9, 58.5, 55.3, 50.8, 44.1, 28.0; IR (thin film) $\upsilon_{\rm max}$ (cm⁻¹): 1739 (s, C=O); HRMS (ESI): *m/z* 442.1006, C₂₁H₂₆BrNNaO₃ [M+Na]⁺ requires 442.0994.

(R)-tert-Butyl 3-(2,4-dichlorophenyl)-3-((4-methoxybenzyl)-amino)propanoate ${\bf 6c}$

(*E*)-*tert*-Butyl 3-(2,4-dichlorophenyl)acrylate **1c** (0.45 g, 1.67 mmol) was used to prepare the title compound as a yellow oil (0.52 g, 76% yield) using general procedure 2. $[\alpha]_D^{27}$ +24.1 (*c* 1.58, CH₂Cl₂); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.48 (1H, d, *J* = 8.5 Hz, CHCHCCl), 7.29 (1H, d, *J* = 2.1 Hz, CClCHCCl), 7.19

(1H, dd, J = 8.4 and 2.1 Hz, CHCHCCl), 7.09 (2H, d, J = 8.6 Hz, CHCHCOCH₃), 6.75 (2H, d, J = 8.6 Hz, CHCHCOCH₃), 4.44 (1H, dd, J = 8.6 and 4.5 Hz, CHNH), 3.70 (3H, s, OCH₃), 3.46 (1H, d, J = 12.5 Hz, NHCH^AH^B), 3.41 (1H, d, J = 12.8 Hz, NHCH^AH^B), 2.51 (1H, dd, J = 15.6 and 4.7 Hz, CH^ACH^BCO₂), 2.40 (1H, dd, J = 15.5 and 8.8 Hz, CH^ACH^BCO₂), 1.31 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C} = 170.6$, 158.7, 138.5, 134.2, 133.3, 129.4, 129.3, 127.5, 113.8, 81.0, 55.3, 55.1, 51.0, 42.2, 28.1; IR (thin film) $\upsilon_{\rm max}$ (cm⁻¹): 1723 (s, C=O); HRMS (ESI): m/z 432.1128, C₂₁H₂₅Cl₂NNaO₃ [M+Na]⁺ requires 432.1110.

(*R*)-tert-Butyl 3-(4-cyanophenyl)-3-((4-methoxybenzyl)amino)propanoate **6d**

(*E*)-*tert*-Butyl 3-(4-cyanophenyl)acrylate **1d** (0.23 g, 1 mmol) was used to prepare the title compound as a yellow oil (0.23 g, 62% yield) using general procedure 2. $[\alpha]_D^{26}$ +42.7 (*c* 3.35, EtOAc); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.56 (2H, d, *J* = 8.4 Hz, CHCHCCN), 7.42 (2H, d, *J* = 8.4 Hz, CHCHCCN), 7.07 (2H, d, *J* = 8.6 Hz, CHCHCOCH₃), 6.76 (2H, d, *J* = 8.6 Hz, CHCHCOCH₃), 4.03 (1H, dd, *J* = 12.9 Hz, NHCH^AH^B), 3.38 (1H, d, *J* = 12.9 Hz, NHCH^AH^B), 3.38 (1H, d, *J* = 15.4 and 5.4 Hz, CH^ACH^BCO₂), 2.09 (1H, br. s, NH), 1.29 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 170.4, 158.7, 148.5, 132.4, 131.8, 129.3, 128.2, 118.9, 113.8, 111.2, 81.2, 58.8, 55.3, 50.9, 43.8, 28.0; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 2226 (m, CN), 1703 (s, C=O); HRMS (ESI): m/z 389.1855, C₂₂H₂₆N₂NaO₃ [M+Na]⁺ requires 389.1841.

(*R*)-tert-Butyl 3-((4-methoxybenzyl)amino)-3-(4-nitrophenyl)propanoate **6e**

(R)-tert-Butyl 3-((4-methoxybenzyl)amino)heptanoate 6h

(*E*)-*tert*-Butyl hept-2-enoate **1h** (1.01 g, 5.5 mmol) was used to prepare the title compound as a yellow oil (1.2 g, 68% yield) using general procedure 2. $[\alpha]_D^{26}$ -3.5 (*c* 2.02, CH₂Cl₂); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 7.20$ (2H, d, J = 8.6 Hz, CHCHCOCH₃), 6.80 (2H, d, J = 8.6 Hz, CHCHCOCH₃), 3.72 (3H, s, OCH₃), 3.65 (2H, s, NHCH₂), 2.90 (1H, quintet, J = 6.1 Hz, CHNH), 2.29 (2H, d, J = 6.1 Hz, CH₂CO₂), 1.65 (1H, br. s, NH), 1.37 (9H, s, C(CH₃)₃), 1.30-1.14 (6H, m, CH₃CH₂CH₂CH₂), 0.82 (3H, t, J = 7.2 Hz, CH₃CH₂); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C} = 172.4$, 158.9, 133.1, 129.7, 114.1, 80.8, 55.7, 54.8, 50.8, 40.8, 34.4, 28.5, 28.3, 23.2, 14.4; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 1722 (s, C=O); HRMS (ESI): m/z 322.2377, C₁₉H₃₂NO₃ [M+H]⁺ requires 322.2381.

(R,E)-tert-Butyl 3-((4-methoxybenzylidene)amino)-3-phenylpropanoate 15a

Cerium ammonium nitrate (1.72 g, 2.94 mmol) was added to a solution of (R)-tert-Butyl 3-((4-methoxybenzyl)amino)-3phenylpropanoate 6a (0.251 g, 0.736 mmol) in MeCN-H₂O (5:1, 9.4 mL) and the bright orange solution stirred at room temperature for 2 hours, before saturated NaHCO₃(aq) (50 mL) was added. The mixture was partitioned between brine and Et₂O and the aqueous layer further extracted with Et₂O (2 x 20 mL). The combined organic extracts were dried over anhydrous MgSO₄, filtered and concentrated in vacuo to afford the title compound as a yellow oil (0.204 g, 82% yield). $[\alpha]_D^{22}$ -30.0 (c 2.9, CH₂Cl₂); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H} = 8.36$ (1H, s, CH=N), 7.76 (2H, d, J = 8.5 Hz, CHCHCOCH₃), 7.50 (2H, d, J = 7.7 Hz, Ph), 7.41-7.36 (2H, m, Ph), 7.32-7.27 (1H, m, Ph), 6.96 (2H, d, J = 8.5 Hz, CHCHCOCH₃), 4.82 (1H, dd, J = 9.5 and 4.9 Hz, CHN=CH), 3.89 (3H, s, OCH₃), 2.97 (1H, dd, J = 15.0 and 1.5 Hz, $CH^{A}H^{B}$), 2.86 (1H, dd, J = 14.9 and 4.8 Hz, $CH^{A}H^{B}$), 1.39 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C} = 170.7$, 161.7, 160.5, 143.1, 130.1, 129.2, 128.5, 127.2, 127.0, 113.9, 80.6, 71.4, 55.4, 44.8, 28.1; IR (thin film) v_{max} (cm⁻¹): 1723 (s, C=O); HRMS (ESI): m/z 362.1754, $C_{21}H_{25}NNaO_3$ [M+Na]⁺ requires 362.1732.

General Procedure 3: Oxidative deprotection of *tert*-butyl *N*-PMB-β-amino esters **6a-h**

Cerium ammonium nitrate (4 eq.) was added to a solution of the appropriate *N*-PMB- β -amino ester **6** (1 eq.) in MeCN-H₂O (5:1, 0.2 M) and the bright orange solution stirred at room temperature for 2 hours before saturated NaHCO₃(aq) (50 mL) was added. The mixture was partitioned between brine and Et₂O and the aqueous layer further extracted with Et₂O (2 x 20 mL). The combined organic extracts were dried over anhydrous MgSO₄, filtered and concentrated *in vacuo*. The resultant crude product

was then added and the reaction mixture stirred at room temperature for 48 hours. The reaction mixture was then diluted with water (5mL) and washed with Et₂O (3 x 10 mL). The aqueous layer was basified with saturated NaHCO₃(aq), extracted with Et₂O (3 x 20 mL), and the combined organic extracts dried (MgSO₄), filtered and concentrated *in vacuo* to afford a crude product that was purified by chromatography to afford the desired *tert*-butyl β -amino ester **5a-h**.

9

(R)-tert-Butyl 3-amino-3-phenylpropanoate 5a

N-PMB-β-amino ester **6a** (0.1 g, 0.3 mmol) was used to prepare the title compound as a yellow oil (0.044 g, 68% yield) using general procedure 3. $[\alpha]_D^{27}$ +20.0 (*c* 1.2, CHCl₃) (Lit.²⁹ $[\alpha]_D^{20}$ +19.7 (*c* 0.96, CHCl₃); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.15-7.33 (5H, m, Ph), 4.31 (1H, t, *J* = 6.9 Hz, CHNH), 2.52 (2H, d, *J* = 7.0 Hz, CH₂CO₂), 2.41 (2H, br. s, NH₂), 1.35 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 171.4, 145.4, 128.5, 127.3, 126.3, 80.7, 52.8, 45.4, 28.1; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 3312 (w, N-H), 1725 (s, C=O); HRMS (ESI): *m*/*z* 222.1500, C₁₃H₂₀NO₂ [M+H]⁺ requires 222.1489.

(R)-tert-Butyl 3-amino-3-(4-bromophenyl)propanoate 5b

N-PMB-β-amino ester **6b** (0.19 g, 0.46 mmol) was used to prepare the title compound as a colourless oil (0.077 g, 56% yield) using general procedure 3. $[\alpha]_D^{23}$ +21.7 (*c* 0.92, CDCl₃); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.37 (2H, d, *J* = 8.5 Hz, CHCHCBr), 7.17 (2H, d, *J* = 8.5 Hz, CHCHCBr), 4.29 (1H, br. s, CHNH₂), 2.47 (2H, d, *J* = 6.7 Hz, CH₂CO₂), 1.76 (2H, br. s, NH₂), 1.34 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 171.0, 143.7, 131.6, 128.2, 121.0, 81.0, 52.2, 45.1, 28.1; IR (thin film) $v_{\rm max}$ (cm⁻¹): 3662 (m, N-H), 3376 (w, N-H), 1722 (s, C=O); HRMS (ESI): *m/z* 300.0620, C₁₃H₁₉BrNO₂ [M+H]⁺ requires 300.0599.

(R)-tert-Butyl 3-amino-3-(2,4-dichlorophenyl)propanoate 5c

N-PMB-β-amino ester **6c** (0.14 g, 0.33 mmol) was used to prepare the title compound as a yellow oil (0.066 g, 68% yield) using general procedure 3. $[α]_D^{24}$ +37.6 (*c* 0.85, CDCl₃); ¹H NMR (300 MHz, CDCl₃) δ_H = 7.44 (1H, d, *J* = 8.4 Hz, CHCHCCl), 7.20 (1H, d, *J* = 1.8 Hz, CClCHCCl), 7.8 (1H, dd, *J* = 8.4 and 1.9 Hz, CClCHCH), 4.70 (1H, br. s, CHNH₂), 2.60 (1H, dd, *J* = 16.0 and 4.0 Hz, NHCH^AH^B), 2.44 (1H, dd, *J* = 16.0 and 9.0 Hz, NHCH^AH^B), 2.29 (2H, br. s, NH₂), 1.36 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) δ_C = 170.8, 136.4, 133.4, 133.3, 129.4, 128.4, 127.5, 81.2, 48.7, 42.8, 28.1; IR (thin film) v_{max} (cm⁻¹): 3383 (w, N-H), 1725 (s, C=O); HRMS (ESI): *m*/z 312.0525, C₁₃H₁₇Cl₂NNaO₂ [M+Na]⁺ requires 312.0534.

(R)-tert-Butyl 3-amino-3-(4-cyanophenyl)propanoate 5d

N-PMB-β-amino ester **6d** (0.16 g, 0.45 mmol) was used to prepare the title compound as a yellow oil (0.057 g, 51% yield) using general procedure 3. $[\alpha]_D^{21}$ +16.0 (*c* 0.5, CDCl₃); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.68 (2H, d, *J* = 8.0 Hz, CHCHCCN), 7.55 (2H, d, *J* = 8.0 Hz, CHCHCCN), 4.50 (1H, br. s, CHNH₂), 2.63 (2H, d, *J* = 6.6 Hz, CH₂CO₂), 2.14 (2H, br. s, NH₂), 1.46 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 171.6, 145.2, 132.4, 127.3, 118.8, 111.3, 81.3, 52.5, 44.8, 28.1; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 2228 (m, CN), 1723 (s, C=O); HRMS (ESI): *m/z* 247.1448, C₁₄H₁₉N₂O₂ [M+H]⁺ requires 247.1447.

(R)-tert-Butyl 3-amino-3-(4-nitrophenyl)propanoate 5e

N-PMB- β -amino ester **6e** (0.13 g, 0.33 mmol) was used to prepare the title compound as a yellow oil (0.057 g, 65% yield)

(*R*)-tert-Butyl 3-amino-3-(furan-2-yl)propanoate **5g**³⁸

N-PMB-β-amino ester **6g** (0.1 g, 0.31 mmol) was used to prepare the title compound as a pale green oil (0.048 g, 73% yield) using general procedure 3. $[\alpha]_{D}^{25}$ +12.4 (*c* 1.05, CDCl₃); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 7.12 (1H, dd, *J* = 4.5 and 1.9 Hz, CHCHO), 6.89-6.84 (2H, m, CHOCCH), 4.58 (1H, dd, *J* = 8.4 and 4.9 Hz, CHNH₂), 2.65 (1H, dd, *J* = 15.9 and 4.9 Hz, CH⁴H^BCO₂), 2.57 (1H, dd, *J* = 15.9 and 8.4 Hz, CH^AH^BCO₂), 2.22 (2H, br. s, NH₂), 1.36 (9H, s, C(CH₃)₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 170.8, 144.0, 142.6, 124.0, 110.2, 81.0, 48.7, 45.6, 28.1; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 3385 (w, N-H), 1723 (s, C=O); HRMS (ESI): *m/z* 212.1286, C₁₁H₁₈NO₃ [M+H]⁺ requires 212.1287.

(R)-tert-Butyl 3-aminoheptanoate 5h

N-PMB-β-amino ester **6h** (0.21 g, 0.66 mmol) was used to prepare the title compound as a colourless oil (0.089 g, 60% yield) using general procedure 3. $[\alpha]_D^{23}$ +33.3 (*c* 1.2, CDCl₃); ¹H NMR (300 MHz, CDCl₃) $\delta_{\rm H}$ = 3.13-3.00 (1H, m, C*H*NH₂), 2.31 (1H, dd, *J* = 15.6 and 4.0 Hz, C*H*⁴H^BCO₂), 2.10 (1H, dd, *J* = 15.6 and 8.8 Hz, CH^AH^BCO₂), 1.61 (2H, br. s, NH₂), 1.39 (9H, s, C(CH₃)₃), 1.36-1.19 (6H, m, CH₂CH₂CH₂CH₃), 0.83 (3H, t, *J* = 6.3 Hz, CH₂CH₃); ¹³C NMR (75 MHz, CDCl₃) $\delta_{\rm C}$ = 172.1, 80.5, 48.4, 43.8, 37.2, 28.2, 28.1, 22.7, 14.0; IR (thin film) $\nu_{\rm max}$ (cm⁻¹): 3385 (w, N-H), 1723 (s, C=O); HRMS (ESI): *m*/*z* 202.1801, C₁₁H₂₄NO₂ [M+H]⁺ requires 202.1807.

General Procedure 4: Determination of the Enantiomeric Excess of (*R*)-*tert*-butyl β -Amino Esters.^{36b}

Each (*R*)-*tert*-butyl β -amino ester (1 eq.) and K₂CO₃ (1.1 eq.) were suspended in a minimum amount of CDCl₃. 2-Formylphenylboronic acid (1.1 eq.), (*R*)-(BINOL) (1.1 eq.), 4 Å molecular sieves, and CDCl₃ were then added in order to produce a 0.1 M solution of the β -amino ester. The solution was stirred for 10 min before being filtered through a small pad of Celite and the solution analyzed by ¹H NMR spectroscopy.

34. The use of 5 equivalents of TMSCl in these aza-conjugate addition reactions proved optimal, with the use of fewer equivalents of TMSCl leading to lower yields of *N*-PMB- β -amino ester **5a**. This suggests that the presence of excess TMSCl results in efficient formation of a reactive enantioselective lithium amide species, rather than simply acting as a source of LiCl, whose presence is also known to affect the aggregation state and reactivity of lithium amide species. See: Clegg, W.; Greer, J. C.; Hayes, J. M; Mair, F. S.; Nolan, P. M. O'Neil, P. A. *Inorg. Chim. Acta.*, **1997**, *258*, 1.

35. *Tert*-butyl enoate esters **3** were used as acceptors in these studies to ensure that competing 1,2-addition of silyl-lithium amide **1e** to their carbonyl groups did not occur. For a previous report where addition of a lithium amide **1a** to a methyl dienoate acceptor resulted in a mixture of β -amino ester and amide products see: Y.Yamamoto, N. Asao, T. Uyehara, *J. Am. Chem. Soc.*, **1992**, *114*, 5427.
