

Characterizations and application of supported ionic liquid [bmim][CF₃SO₃]/SiO₂ in CO₂ capture

ABSTRACT

Supported ionic liquid (IL) [bmim][CF₃SO₃] on SiO₂ was prepared, characterized and its potential evaluated for CO₂ capture via adsorption and desorption studies using gas adsorption analyzer. The physical and chemical properties were determined using N₂ adsorption/desorption and CO₂-TPD analysis. The increasing IL loading caused a drastic decrease in the surface area as well as pore volume due to the confinement of IL within the micropore and mesopore area. However, the increasing IL loading increased the basicity of the sorbent which significantly enhanced CO₂ chemisorption. Supported [bmim][CF₃SO₃] on SiO₂ revealed the physical and chemical adsorption of CO₂ and resulted in a remarkable CO₂ adsorption capacity at atmospheric pressure and room temperature (66.7 mg CO₂/gadsorbent) which has great potential in industrial applications.
