**[Abstract]** Starch constitutes the most important carbon reserve in plants and is composed of branched amylopectin and linear amylose. The latter is synthesized exclusively by the Granule-Bound Starch Synthase (GBSS, EC 2.4.1.21). Here we report a readily reproducible, specific and highly sensitive protocol, which includes the isolation of intact starch granules from *Arabidopsis thaliana* leaves and the subsequent determination of GBSS activity. We have applied this method to study GBSS activity in diurnal cycles in vegetative growth and during the photoperiodic transition to flowering in *Arabidopsis* (Tenorio *et al.*, 2003; Ortiz-Marchena *et al.*, 2014).

### **Materials and Reagents**

1. Plant materials

*Note: Arabidopsis thaliana (A. thaliana) were grown in controlled cabinets on peat-based compost.*

2. Liquid N<sub>2</sub>

3. HEPES (Sigma-Aldrich, catalog number: H4034)

4. Potassium hydroxide pellets (Panreac Applichem, catalog number: A0566)

5. Triton™ X-100 (Sigma-Aldrich, catalog number: X100)

6. Miracloth (Merck KGaA, catalog number: 475855)

7. Percoll® (Sigma-Aldrich, catalog number: P1644)

8. Glycogen (from rabbit liver Type III) (Sigma-Aldrich, catalog number: G8876)

9. Tricine (Sigma-Aldrich, catalog number: T0377)

10. Potassium acetate (Sigma-Aldrich, catalog number: P1147)

11. DL-Dithiothreitol (DTT) (Sigma-Aldrich, catalog number: D0632)

12. Ethylenediaminetetraacetic acid disodium salt dihydrate (EDTA) (Sigma-Aldrich, catalog number: E5134)

13. Sodium hydroxide pellets (Panreac Applichem, catalog number: 131687)

14. Maltotriose (Sigma-Aldrich, catalog number: M8378)

15. Adenosine 5' diphospho, [D-glucose-<sup>14</sup>C(U)] ammonium salt (ADP [<sup>14</sup>C] glucose) (American Radiolabeled Chemicals, catalog number: ARC 3297)
16. Methanol (CARLO ERBA Reagents, catalog number: 412532)
17. Potassium chloride (AppliChem GmbH, catalog number: A2939)
18. Ecolite(+)™ liquid scintillation cocktail (MP Biomedicals, catalog number: 882475)
19. 1 M HEPES-KOH (see Recipes)
20. 1 M Tricine (see Recipes)
21. 0.25 M Potassium acetate (see Recipes)
22. 1 M DTT (see Recipes)
23. 0.5 M EDTA (see Recipes)
24. 0.1 M Maltotriose (see Recipes)
25. 3 M KCl (see Recipes)
26. 20 mg/ml Glycogen solution (see Recipes)
27. Extraction buffer (see Recipes)
28. Percoll buffer (see Recipes)
29. Washing buffer (see Recipes)
30. Precipitation buffer (see Recipes)

### **Equipment**

1. Small mortar and pestle
2. 1.5 ml microfuge tubes
3. Automatic pipettes
4. Precision scale
5. Centrifuge (Eppendorf, model: 5810 R)
6. Microcentrifuge (Eppendorf, model: 5424)
7. Scintillation Counter (Beckman Coulter, model: LS 6000 IC)
8. Scintillation vials (Sigma-Aldrich, catalog number: Z376817)

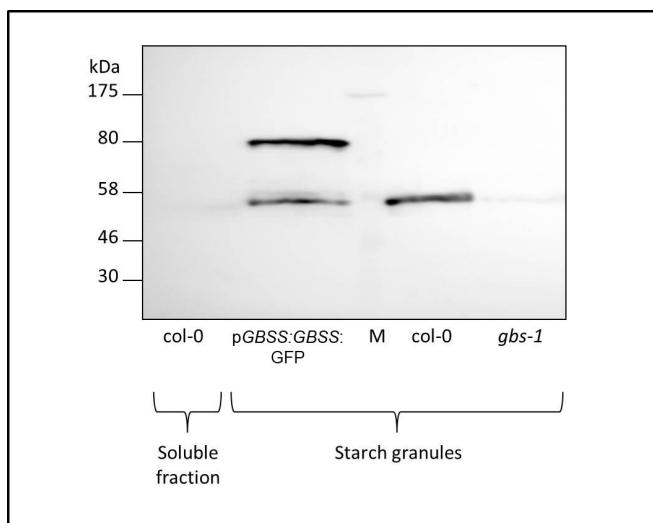

### **Procedure**

#### A. Starch granules isolation

Starch granules were purified following a modification of the Percoll method described by Tenorio *et al.* (2003).

1. Homogenize 600 mg (fresh weight) of *Arabidopsis* leaves in a mortar and pestle in the presence of liquid N<sub>2</sub> to a fine powder and add 1 ml of extraction buffer. Leaf material was

- collected from fully developed rosette leaves from at least three different plants at growth stage 3.50 [according to Boyes *et al.* (2001)].
2. Filter the homogenate through two layers of Miracloth on 15 ml Falcon-type tubes.
  3. Add 5 ml of Percoll buffer (4 °C) to the filtrate and mix.
  4. Centrifuge samples for 5 min, 805  $\times$  g at 4 °C (2,000 rpm, Eppendorf-5810 R centrifuge) and discard the supernatant.
  5. Wash the pellet by resuspension in 5 ml washing buffer (4 °C), centrifuge as in step A4 and discard the supernatant. Repeat three times.
  6. Air-dry the pellet (do not let it dry completely) containing the starch granules (Figure 1) and use it immediately for determination of GBSS activity as described below.

**Figure 1. Immunodetection of GBSS in starch granules isolated from *Arabidopsis Col-0* leaves.** Western blot employing GBSS-specific antibodies in protein extracts from starch granules isolated from wild-type (Col-0), GBSS mutant (*gbs-1*) and a recombinant line in which GBSS is fused to GFP. Molecular Mass (MM) markers are shown in kDa (left). Notice GBSS MM around 55 kDa and GBSS-GFP around 80 kDa. GBSS detection is strictly associated to starch granules fractions (three rightmost lanes) and cannot be detected in a soluble protein fraction (leftmost lane).

#### B. GBSS activity assay

The granule-bound starch synthase activity was immediately measured from freshly purified starch granules.

1. Starch granules were resuspended in 200  $\mu$ l of 100 mM Tricine (pH 8.4), 25 mM potassium acetate, 10 mM DTT, 5 mM EDTA and 10 mM ADP [ $^{14}$ C] glucose (specific activity 7.4 GBq/mol).

2. 100  $\mu$ l aliquot was quickly extracted and boiled for 5 min to represent DPMtotal of the assay.
3. The rest of the reaction was incubated at 30 °C for 20-60 min.
4. The reaction was stopped by boiling for 5 min.
5. Starch granules were precipitated by adding 1.875 ml of precipitation buffer and 25  $\mu$ l of glycogen solution as an inert carrier to increase recovery from alcohol precipitation.
6. Tubes were centrifuged 3 min, 2,000  $\times g$  at 4 °C (4,615 rpm, Eppendorf-5424) and the supernatant discarded.
7. The pellet was resuspended in 0.2 ml deionized water and washed by an additional precipitation with 1.750 ml precipitation buffer without glycogen.
8. Tubes were centrifuged as in step B5. The pellet was air-dried for a short time, resuspended in 1 ml of deionized water and transferred into an appropriate scintillation vial.
9. 5 ml of EcoLite liquid scintillation cocktail was added to enhance  $^{14}\text{C}$  counting efficiency.
10. Finally, the radioactivity incorporated into the starch granules was determined with a scintillation counter.
11. GBSS activity (see Table 1 and Figure 2) is calculated by using the following formula:

$$\text{Activity (nmol/min/gfw)} = \frac{\text{DPMreac} * \text{nmol}}{\text{DPMzero} * t * \text{gfw}}$$

DPMreac = disintegration per minute of the reaction sample minus DPM blank (Table 1)

nmol = nmoles of ADP [ $^{14}\text{C}$ ]glucose (1,000 nmol according to the protocol)

DPMtotal = total DPM of added ADP[ $^{14}\text{C}$ ]glucose (step B2)

t = reaction time (min) (20-60 min according to the protocol)

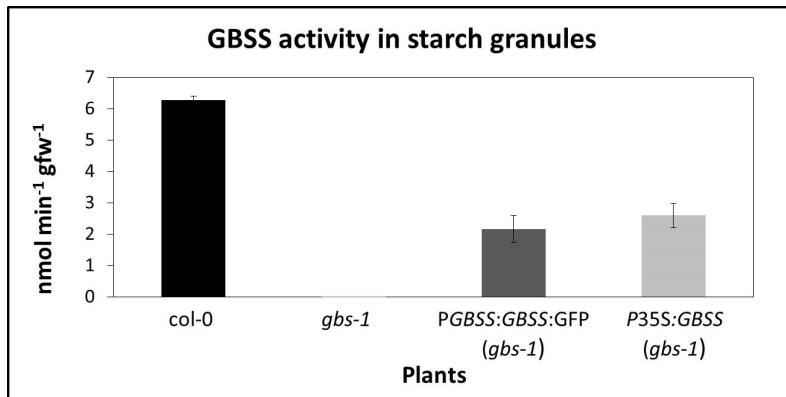

gfw = fresh weight (g) (0.3 g according to the protocol)

**Table 1. Determination of GBSS activity in starch granules from wild type (Col-0) and *gbs-1* mutant**

| Plant        | Blank <sup>a</sup><br>(DPM) | Sample <sup>b</sup><br>(DPM) | DPMtotal <sup>c</sup><br>(DPM) | DPMreac <sup>d</sup><br>(DPM) | gfw<br>(g) | Reactio<br>n time<br>(min) | nmol<br>ADP-gluc<br>(nmol) | Activity<br>(nmol/min/gfw) |
|--------------|-----------------------------|------------------------------|--------------------------------|-------------------------------|------------|----------------------------|----------------------------|----------------------------|
| Col-0        | 178.44                      | 2,641.02                     | 57,645.40                      | 2,462.58                      | 0.332      | 20                         | 1,000                      | 6.43                       |
| <i>gbs-1</i> | 193.92                      | 197.94                       | 57,645.40                      | 4.02                          | 0.266      | 20                         | 1,000                      | 0.01                       |

- a. DPM for the blank sample. Blank sample is identical to each sample except that it was stopped at time 0, so that the reaction was not allowed to start.
- b. To simplify, a single sample measurement is shown in Table 1. We recommend calculating data from three independent experiments. Sample DPM correspond to the Disintegration Per Minute at the desired reaction time for each sample (experimental data).

- c. DPMtotal is the total amount of DPM provided by the radiolabelled substrate. It actually represents the maximum of DPM for each sample. According to the above example it consists on the total DPM given by 1,000 nmol of ADP[U-<sup>14</sup>C]glucose determined for aliquots from step B2.
- d. DPMreac = DPMsample minus DPMblank

**Figure 2. GBSS activity in starch granules from *Arabidopsis thaliana* leaves.** GBSS activity (nmol/min/gfw) in starch granules from wild-type (Col-0), GBSS mutant (*gbs-1*), GBSS fused to GFP under its own promoter (pGBSS:GBSS:GFP) in *gbs-1* background and GBSS expressed under the 35S promoter (P35S:GBSS) in *gbs-1* background lines. Values are the average of three independent experiments. Bars indicate the standard deviation (±SEM). Starch granules isolation and GBSS activity was carried out as described in text.

### Representative data

1. As shown in Figure 1, a GBSS activity of ca. 6 nmol/min/gfw is expected in starch granules isolated from *A. thaliana* ecotype col-0 leaves.
2. Relative SD (expressed as percentage of the mean) fell in the range of 2-14 per cent for samples from three independent experiments.

### Notes

1. Use dischargeable lab ware and appropriate radioactive secure installations and equipment while manipulating ADP [U-<sup>14</sup>C] glucose.

## Recipes

*Note: The given volumes are sufficient for 50 reactions.*

1. 1 M HEPES-KOH (pH 7.5)

Mix 59.58 g HEPES with 175 ml deionized water

Adjust pH to 7.5 with KOH pellets

Add deionized water to 250 ml

Sterilize through 0.2 µm pore diameter filters

Stored at 4 °C

2. 1 M Tricine (pH 8.4)

Mix 4.48 g Tricine with 20 ml deionized water

Adjust pH to 8.4 with KOH

Add deionized water to 25 ml

Autoclave

Stored at 4 °C

3. 0.25 M Potassium acetate

Mix 1.23 g Potassium acetate with 40 ml deionized water

Sterilize through 0.2 µm pore diameter filters

Stored at Room Temperature (RT)

4. 1 M DTT

Weigh 1.54 g DTT

Add deionized water to 10 ml

Distribute in aliquots and store at -20 °C

5. 0.5 M EDTA (pH 8.0)

Mix 18.61 g EDTA (disodium, dihydrate) with 80 ml deionized water

Adjust to pH 8.0 with NaOH

*Note: It is not easy to dissolve the EDTA. It will not dissolve completely until the pH is around 8.0.*

Autoclave (15 psi, 1-2 h, 120 °C)

Stored at RT

6. 0.1 M Maltotriose

Weigh 0.2655 g Maltotriose

Add deionized water to 5 ml

Sterilize through 0.2 µm pore diameter filters

Distribute in aliquots and store at -20 °C

7. 3 M KCl

Weigh 2.237 g of KCl

- Add deionized water to 10 ml  
Autoclave (15 psi, 1-2 h, 120 °C)  
Stored at RT
8. 20 mg/ml Glycogen solution  
Weigh 25 mg of glycogen  
Add deionized water to 1.25 ml  
Stored at -20 °C
9. Extraction buffer  
Mix 2.5 ml 1 M HEPES-KOH (pH 7.5) with 0.5 ml Triton X-100  
Add deionized water to 50 ml  
Stored at RT
10. Percoll buffer  
Mix 12.5 ml 1 M HEPES-KOH (pH 7.5) with 125 ml Percoll  
Add deionized water to 250 ml
11. Washing buffer  
37.5 ml of 1 M HEPES-KOH (pH 7.5)  
Add deionized water to 750 ml
12. Precipitation buffer  
150 ml Methanol  
Add 9.4 ml 3 M KCl  
Add deionized water to 200 ml  
Stored at RT

### **Acknowledgments**

This work was performed with funding from projects CSD2007-00057, BIO2008-02292, and BIO2011-28847-C02-00 (Spanish Ministry of Economy and Competitiveness, MINECO) and Excellence projects P06-CVI-01450 and P08-AGR-03582 (Junta de Andalucía) partially supported by FEDER funding to F. V. and J. M. R. We also acknowledge the TRANSPLANTA consortium Project CONSOLIDER 28317 (MINECO).
