INTRODUCTION

One of the most efficient methods for the construction of 1-substituted isochromenes (and related heteroaryl compounds such as pyrano[4,3-b]pyridines) is the metal catalyzed regioselective domino cycloisomerization/nucleophilic addition reaction of a properly substituted 2-alkynyl(hetero)arylaldehyde in the presence of a suitable nucleophile.[1] The reaction with oxygen nucleophiles is the most studied and several metal catalyst, i.e., Pd(II),[2] Cu(I),[3] Ag(I),[4] Au(I)[5] and In(III),[6] demonstrated to be effective for synthesis of 1-alkoxyisochromenes. Conversely, the reaction with carbon nucleophiles,[7] and in particular with enolizable carbonyl compounds, is relatively less investigated.[8] In connection with our ongoing interest in the development domino addition/annulation reactions starting from 1-acyl-2-alkynylarene derivatives, we present here a silver(I) catalyzed synthesis of isochromenes starting from 2-alkynyl(hetero)arylcarbaldehydes and enolizable carbonyl compounds.
