THE OFFICIAL LIST OF THE BIRDS OF NEBRASKA

The following is a list of species of birds whose occurrence in Nebraska has been proven to the satisfaction of the Nebraska Ornithologists' Union Records Committee. It includes records considered through 31 Dec. 1987. The sequence and nomenclature follow that used in the *A.O.U. Checklist of North American Birds*, 6th ed., 1983, and its supplements through the 36th.

The list includes 406 species; several other species are currently under review. The list also indicates how frequently each species has been acceptably reported in the past decade (1977-1987) to give some idea of current status. Frequency of occurrence is indicated by the following terms:

- Regular - acceptably reported in 9-10 of the past 10 years;
- Casual - acceptably reported in 4-7 of the past 10 years;
- Accidental - acceptably reported in 0-2 of the past 10 years;
- Extirpated - not acceptably reported in the past 50 years;
- Extinct - no longer found alive anywhere in the world.

The status of species which were acceptably reported in three or eight of the past 10 years was discussed and placed in the category felt to be most appropriate by the committee. The list doubtless has some species of Regular occurrence which are secretive and/or difficult to identify which have been placed in the Casual or Accidental category due to lack of documentation. It is our expectation that these will be upgraded to Regular status by the submission of acceptable documentation in the future. The committee seeks documentation for all species of less than Regular occurrence, as well as for those species whose occurrence has not yet been documented.

The terms used to indicate firmness of data have been defined elsewhere (Bray, et al., 1986; NOURC, 1986). Briefly stated, an adequately labelled, diagnostic specimen (I-S), photo (I-P), or recording (I-R), is the highest category; followed by II (more than three acceptable written documentations) and III (one or two acceptable written documentations). Four additional species (indicated by **), whose occurrence in the state is indisputable, have been included even though no documentary evidence could be found by the committee. In most cases a specimen is the best possible evidence, but in some groups (e.g. flycatchers and dowitchers) a sound recording may be more diagnostic.

In terms of frequency of occurrence, there are 294 Regular, 30 Casual, 76 Accidental, 4 Extirpated and 2 Extinct species listed. Broken down by firmness of evidence, there are 351 Class I-S, 25 Class I-P, 1 Class I-R, 7 Class II and 18 Class III species listed, as well as the four asterisked species for which the committee could not locate acceptable documentary evidence. The supporting evidence is largely referenced in *The Birds of Nebraska: A Critically Evaluated List* (Bray, Padelford and Silcock, 1986). More recent changes which have been reviewed by the committee, as well as future updates, appear in committee reports.

Acknowledgments

The committee is extremely appreciative of the painstaking research conducted by Tanya Bray, Babs Padelford and Ross Silcock in preparing their book. Their work greatly facilitated the task of the committee. Thanks is additionally extended to Tanya Bray for kindly providing an updated working draft as a basis for the discussions which produced this list.
