NEBRASKA SOYBEAN VARIETY TESTS

1989

UNIVERSITY OF NEBR.
LIBRARIES

MAR 01 1990

University of Nebraska-Lincoln
Institute of Agriculture and Natural Resources
Agricultural Research Division
Cooperative Extension Service

Issued in furtherance of Cooperative Extension work, Acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture. Leo E. Lucas, Director of Cooperative Extension, University of Nebraska, Institute of Agriculture and Natural Resources.

Cooperative Extension provides information and educational programs to all people without regard to race, color, national origin, sex or handicap.

NEBRASKA SOYBEAN VARIETY TESTS

January 1990

AUTHORS

L. A. Nelson	Department of Agronomy, Lincoln
R. W. Elmore	South Central Research and Extension Center, Clay Center
R. S. Moomaw	Northeast Research and Extension Center, Concord
G. W. Hergert	West Central Research and Extension Center, North Platte
R. N. Klein	West Central Research and Extension Center, North Platte

ACKNOWLEDGMENTS

This circular is a progress report of soybean variety trials conducted by personnel of the Agronomy Department and the Northeast, South Central and West Central Research and Extension Centers. Conduct of experiments and publication of results is a joint effort of the Agricultural Research Division and the Cooperative Extension Service.

Tests were supported in part by fees collected from entrants. A grant from the Nebraska Soybean Development Utilization and Marketing Board enabled the purchase of planting and harvesting equipment needed for conduct of East Central and Southeast trials. Soybean check-off grants also support variety trials conducted by the Soybean Breeding Project and

sprinkler irrigation experiments established by the West Central Research and Extension Center. The Soybean check-off grants were used to fund the protein and oil analysis. Acknowledgment is made to farmers who furnished land for experiments; also to extension agents and other I.A.N.R. personnel who assisted with the tests.

This is the first year for the off-station sites in the North Platte area. Bob Klein has made a significant contribution to this year's data with Rock, Furnas, and Perkins County locations.

The authors wish to recognize the contributions of the technical staff, John Eis, Patrick Tenopir, Ray Brentlinger, Robert Hendrickson, George Hoffmeister, and Don Thrailkill.

METRIC EQUIVALENTS

1 centimeter = 0.394 inches	cm = inches x 2.54
1 hectare = 2.471 acres	ha = acres x 0.405
1 kilogram = 2.205 pounds	kg = pounds x 0.454
1 hectoliter = 2.838 bushels	hl = bushels x 0.352

Kilogram/hectare (kg/ha) = bu/A x 67.26 (60# bushel)

NEBRASKA SOYBEAN PRODUCTION

The following data were obtained from Nebraska Agricultural Statistics.
In 1940, 13,000 acres of soybeans also were cut for hay.

Year	Harvested acres (ha)	Average yield bushels (kg/ha)	Production Bushels (metric tons)
	000	000	000
1940	4 (2)	14.0 (942)	56 (2)
1950	50 (20)	24.0 (1614)	1,200 (33)
1955	180 (73)	10.5 (706)	1,890 (51)
1956	146 (59)	11.5 (773)	1,679 (46)
1957	142 (58)	26.0 (1749)	3,692 (101)
1958	206 (83)	29.0 (1951)	5,974 (163)
1959	146 (59)	24.0 (1614)	3,504 (95)
1960	164 (66)	28.0 (1883)	4,592 (125)
1961	292 (118)	25.5 (1715)	7,446 (203)
1962	310 (126)	27.0 (1816)	8,370 (228)

NEBRASKA SOYBEAN VARIETY TESTS

1989

The 1989 estimated soybean yield for Nebraska was 30 bushels per acre from 2,550,000 harvested acres. The yield was low because of the hot dry summer. The total production of soybeans for the state was 76,500,000 bushels.

The crop was planted ahead of normal. The growing season was slightly behind

normal because of drought. Cool weather in late August and early September slowed maturing down. Along with the cool weather, scattered rains in Southeastern Nebraska slowed maturity. Harvest was behind normal because of the cool weather and drought.

PROCEDURE

Data were obtained from 15 trials at 9 locations (Table A). Publicly-released entries were included at all sites. Privately developed varieties or blends were included in trials at all locations. Privately developed varieties were selected by the seed producer. At many locations, entries were divided into early and late for convenience in handling. A list of entries by brand name is shown in Table B. Names and addresses of entrants are shown in Table C.

Entries usually were planted in four-row plots 15 to 35 feet long. Plots were replicated four times in a randomized complete block design. A planting rate of 8.5 seeds per foot in 30-inch rows (148,100 seeds per acre) was used unless a higher or lower rate was requested by the entrant. Hobbit, Hoyt and Ripley were planted at a 13 seeds per foot rate.

At harvest, two rows 10 to 30 feet long were threshed for yield. Reported yields are corrected to 13% moisture. Plots were rated mature when 95% of the pods had

turned brown. Plant height was measured in inches from the soil surface to the top node of the main stem. Lodging scores were based on a 1 to 5 scale where 1 = all plants erect and 5 = all plants flat. Seeds per pound or grams per 100 seeds data are reported for some locations. Seeds per pound = $453.6 \times 100 \times \text{grams per 100 seeds}$. Protein and oil content were obtained at many locations in 1989. These are reported on a 13% moisture basis and will appear lower than many reported figures. Conversions can be made to 0% by multiplying the protein or oil by 1.15. Estimated Processed Value per Bushel (EPVB) is calculated from the protein and oil content and the January, 1990 Chicago Board of Trade futures prices for soybean oil (\$0.193/lb.) and 44 percent protein soybean meal (\$183.10/ton) on Sept. 1 1989. To obtain EPVA (Estimated Processed Value per Acre) calculate by multiplying the yield (bu/acre) times the EPVB value. The Iowa State University Grain Quality Laboratory did the protein and oil content analyses, our thanks to Iowa State University.

PERFORMANCE

Entries generally are listed in tables in order of decreasing yield. Average performance of varieties included in trials for five years in each area is shown in Table D. These data give an indication of year effects on yield, maturity, lodging,

plant height and seed size. From these data, it is quite apparent that the drought of 1989 had considerable effect on yield and seed size of the non irrigated locations.

Performance of entries cannot be

measured with absolute accuracy because of variations in moisture, soil fertility and other factors. For this reason small yield differences have little significance.

Differences required for significance are shown in each table at the 5% and 25% levels. This means that differences this great would be expected through chance alone in 1 of 20 or 1 of 4 trials, respectively.

Many soybean varieties have similar yield potentials. Early-maturing varieties are

favored in some seasons and later-maturing varieties in others. Period-of-years averages provide a measure of performance over a range of environmental conditions.

This was the ninth year that privately developed entries were included in these trials. Period-of-years data for varieties included for two-, three-, four-, and five-years are reported.

RESULTS AT INDIVIDUAL LOCATIONS

Northeast (Tables 1A and 2A)

Rainfall was generally short during the entire growing season. However, timely rain a few days after planting assured seed emergence and generally uniform stands. The growing season was relatively mild as to temperatures. An early freeze caught many of the late varieties ahead of ripened pod color but most varieties were physiologically mature. The freeze delayed uniform ripening of pods.

East Central (Tables 3A & 4A)

The yields were real good for a dryland plot. Rain two days prior to planting assured good germination but did cause some crusting. Timely rains throughout the growing season and when the pods were filling helped boost the yields. A rain followed by strong winds in the fall caused a considerable amount of lodging.

Southeast (Tables 5A & 6A)

Emergence was not good due to soil crusting after planting. Hot, dry conditions during summer reduced yields. Plant heights were short but had very little lodging. Maturity was slowed because of drought in the summer and rain followed by cool weather in the fall. A light frost also delayed normal maturing of the later varieties.

South Central Irrigated (Tables 7A & 8A)

In Clay County due to dry soil conditions at planting time the ridge was shaved off prior to planting with a Buffalo ridge runner. Yields in Clay County were good due to irrigation.

In Fillmore County, average yields were in near 60 bushels per acre. Here as in Clay County irrigation helped boost yields.

Central Irrigated (Tables 7C & 8C)

Yields were good due to irrigation. There was some variability due to irrigation, yields were adjusted using plant heights and field location.

West Central Irrigated (Table 9A)

In Furnas County extremely dry conditions after planting hurt emergence. Irrigation raised yields in this drought-stricken area. In Perkins County the yields were not good due to drought, a late spring frost, and an early fall frost.

North Central Irrigated (Table 9C)

Shorter than normal season, cool August (especially at night), and an early frost hurt yields.

CULTURAL PRACTICES

Dixon: Previous crop was corn. Herbicides used were Treflan at 0.75 lbs./A soil incorporated, Poast at 0.2 lbs./A applied postemergence for additional grass control.

Dodge: Cropping history: 1987: soybeans 1988: corn. Herbicides used were Lasso 2.5 qts./A and Lexon 8 oz./A. This test was cultivated one time and hand weeded.

Otoe: Cropping history: 1987: soybeans 1988: corn. Herbicide used Sencor 0.6 lbs./A dry flowable. Due to a crust after planting, it was rotary-hoed. This test was cultivated one time and hand weeded.

Clay: Previous crop was corn. Herbicides used were Lasso MT 2 qts./A and Sencor .5 lb.

Fillmore: Cropping history: corn since 1983. Herbicides used were Command and Scepter.

Howard: Cropping history: 1988: soybeans 1987: continuous corn. Pursuit (post emergent) was the herbicide used.

Furnas: Cropping history: 1986: soybeans 1987: corn 1988: corn. Broadcasted Commence 2.66 pts./A preplant.

Perkins: Cropping history: 1988: corn 1987: pinto beans. No herbicide was used it was hand weeded. Soil applied Inoculum 6.5 lbs./A.

Rock: Cropping history: 1988: corn 1987: corn. Herbicides used were Scepter 0.5 pt./A and Treflan 1 qt./A preplanting time. Fertilizer used was 7 lbs. of N, 16 lbs. of P, 5 lbs. of K, and 7 lbs. of S.

AGRICULTURAL RESEARCH AND EXTENSION FOR ALL OF NEBRASKA

The Agricultural Research Division of the Institute of Agriculture and Natural Resources is responsible for studies to broaden our basis of knowledge for agricultural production. Research centers and field laboratories provide applied information for development of Nebraska's largest industry — agriculture.

The Cooperative Extension Service transmits data and provides interpretation to users through Extension Agents and Specialists. Extension Agents may be contacted through 85 local Extension offices for additional information and more specific recommendations.

Nebraska is a large state and has great variation due to topography and the continental type of climate. The elevation ranges from 1,000 feet to near a mile high in the northwest portion of the state, rainfall varies from less than 15 to more than 35 inches per year, and the soil types vary from sands to heavy clays. The research and extension programs thus are broad in subject matter and geography, resulting in the need for various centers, satellite locations, and local offices.
