Greater drought intensity and frequency before AD 1200 in the
Northern Great Plains, USA, Nature v.384 552-554.

GEOGRAPHIC REGION: Northern Great Plains, USA and Canada
PERIOD OF RECORD: 11 KYrBP - present

DESCRIPTION:

11,000 year diatom-derived salinity record, interpreted as a
drought intensity and frequency proxy on the Great Plains of North America
Site: Moon Lake, North Dakota, USA
(46 51' 27" N, 98 09' 30" W. ~35 ha, max. depth ~13m).

ABSTRACT:

Estimates of past lake-water salinity from fossil diatom assemblages
were used to infer past climatic conditions at Moon Lake, a climatically
sensitive site in the northern Great Plains. A good correspondence

between diatom-inferred salinity and historical records of mean annual precipitation minus evapotranspiration (P-ET) strongly suggests that the sedimentary record from Moon Lake can be used to reconstruct past climatic conditions. Century-scale analysis of the Holocene diatom record indicates four major hydrological periods: an early Holocene transition from an open freshwater system to a closed saline system by 7300 BP, which corresponds with a transition from spruce forest to deciduous parkland to prairie and indicates a major shift from wet to dry climate; a mid-Holocene period of high salinity from 7300 to 4700 BP, indicating low effective moisture (P-ET); a transitional period of high salinity 4700 to 2200 BP, characterized by poor diatom preservation; and a late Holocene period of variable lower salinity during the past 2,200 years, indicating fluctuations in effective moisture.

DATA:

Moon Lake salinity - Holocene
