Abstract

The collection of the National Museum of Natural History, Smithsonian Institution, Washington, D.C., is second only to that of The Natural History Museum (formerly British Museum of Natural History), London, in the number of type specimens of the superfamily Gelechioidea (Lepidoptera). The Smithsonian houses 1,375 gelechioid types: 1,249 holotypes, 48 lectotypes, 1 neotype, 69 species represented by one or more syntypes, and 8 species represented by one or more “pseudotypes” (i.e., specimens identified as “type” by an accompanying label that are unlikely to be the type). Three former curators are responsible for the vast majority of the type specimens: August Busck, J. F. Gates Clarke, and Ronald W. Hodges. We present a list of the species for which a type is deposited in the USNM, organized alphabetically. For each species we provide an abbreviated reference to the original description and label data. This list represents the second contribution to a larger effort to make available information on the Lepidoptera type holdings of the USNM.

Key words: Lepidoptera, Gelechioidea, type specimens, catalogue, USNM

Introduction

The type collection of Gelechioidea in the National Museum of Natural History, Smithsonian Institution (USNM) is second in number of types only to that of The Natural History Museum, London, England, and represents a significant resource for researchers interested in the taxonomy, phylogeny, biology, biodiversity, and conservation of gelechioid moths (Lepidoptera: Gelechioidea) worldwide. The strengths of the collection, reflecting primarily the field work of former curators rather than donations or accessions from abroad, lie in the faunas of North and South America and Oceania. The foundation of the type collection is represented by the large number of species (about 430) described by August Busck, the foremost North American lepidopterist of his time, who was employed by the U.S. Department of Agriculture (USDA) and located at the USNM from about 1900 to 1940 (Heinrich & Loftin 1944). J. F. G. (Jack) Clarke, whose work spans the period from about 1935–1985, was employed by USDA early in his career and later by the Smithsonian Institution. Clarke was as comfortable in the field as he was in the museum, and his field work took him to many exotic places near and far. His monographic treatments of various gelechioid taxa, especially Oecophoridae, added substantially to the USNM gelechioid type holdings. From about 1962–1997, Ronald W. Hodges was USDA's microlepidopterist at the USNM, and the thrust of his systematic research focused on Gelechioidea, primarily the North American fauna, epitomized by several volumes in the series *The Moths of America North of Mexico* (1974, 1978, 1986, 1999). Details on the history of the Lepidoptera collection can be found in Flint et al. (1976).

Faunal treatments of the Philippine Islands (Diakonoff 1968), Rapa Island (Clarke 1971), Micronesia (Clarke 1976), Marquesas Archipelago (Clarke 1986), Palaeartic and Oriental Lecithoceridae (Park 1995, 1999, 2001; Park and Wu 2001, 2003; Wu and Park 1998, 1999; Wu 1998), and Elachistidae (Kaila 1995, 1996, 1997, 1999) resulted in the deposition of many gelechioid types in the USNM.

Recent curatorial efforts resulted in the organization of the type specimens of Gelechioidea into a single collection. The specimens are arranged alphabetically by species (or subspecies) in individual unit trays and stored in 29 insect drawers in the 5th Floor, East Wing of the Natural History Building. The purpose of this work is to list the type specimens as part of a larger effort to make available information regarding the type holdings of USNM Lepidoptera to workers worldwide. This is the second major group, following the Tortricidae (Brown & Lewis 2000), for which a comprehensive type catalog has been compiled for the USNM Lepidoptera types. Consistent with the collection, this list is arranged alphabetically by species, followed by author, year of publication, and genus (or genus and species for subspecies) in parentheses in which the taxon was originally described. References are spelled out in full. The sex, kind of type (e.g., holotype, lectotype, syntype), and label data also are included. We use the term "pseudotype" when the specimen is labeled as the type but there is convincing evidence to the contrary. Following

the specimen data are the USNM type number and/or genitalia slide number, where applicable. For some species, remarks are provided on specimen condition or on ambiguities associated with the type(s). Current subfamily and/or family placement (Hodges 1998) for each taxon is provided in brackets at the end of each citation. We have attempted to provide the maximum collection data, relying on both the text of the original description and information on specimen labels. For example, country, state, county, province, etc. frequently are not present on the specimen labels; this information is provided where retrievable accurately. Abbreviations and symbols in the list include the following: CNC = Canadian National Collection, Ottawa, Ontario, Canada; BMNH = The Natural History Museum (formerly British Museum (Natural History)), London, United Kingdom; MCZ = Museum of Comparative Zoology, Harvard University, Cambridge, Massachusetts, USA; r.f. = reared from; em. = emerged; mi = mile(s); no. = number; ' = feet (elevation). Where the collecting data can have more than one interpretation, they are presented in quotes. For example, "Aug. 8/15" could be interpreted as "8 August 1915" or 8–15 August [no year].

At present (2004), the USNM gelechioid type collection includes 1,249 holotypes, 48 lectotypes, 1 neotype, 69 species represented by one or more syntypes, and 8 species represented by one or more pseudotypes. The following list includes all types putatively deposited in the USNM, regardless of whether we could locate them. In cases where we were unable to find the type, we annotate the species' entry with "Specimen not found." The fate of these specimens is uncertain, but they may be on loan, lost, or merely residing undiscovered in the main collection. The annotation "USNM Genitalia Slide No...." indicates that the slide is part of the "curated" USNM slide collection. Other references to slides (e.g., J. F. G. Clarke Slide No...) indicate the slide has not been located, although it is likely to be present in the USNM "pro-tem" slide collection. The genitalia of the type can be assumed to be undissected unless information to the contrary is provided (i.e., genitalia slide number or "abdomen lacking" annotation). In most cases where both the fore- and hindwings are missing from a specimen, it is likely that a wing slide has been made; however, we only present the slide number for those species with which we have associated the wing slide.

USNM Type No. 7816, USNM Genitalia Slide No. 547. In conflict with the data on the holotype, the original description states that the type “was taken at Kaslo, British Columbia, Canada, by Dr. Dyar.” The holotype bears the same USNM type number referred to in the original description. Consequently, Busck may have erred on the locality. Hodges (1974) does not mention the discrepancy. [Elachistidae: Depressariinae]

Acknowledgments

We thank Harriet Bramble and Bernard Landry for assistance in organizing the type collection; assistance of the latter was supported by a Smithsonian Collection Improvement Grant to J. Brown. The following provided helpful reviews of the manuscript: Klaus Sattler, The Natural History Museum, London, England; Jean-François Landry, Agriculture Canada, Ottawa, Ontario, Canada; Gary Miller, USDA, Systematic Entomology Laboratory, Beltsville, Maryland; and David Smith, USDA, Systematic Entomology Laboratory, National Museum of Natural History, Washington, D.C.

About the authors

John W. Brown is a Research Entomologist with the Systematic Entomology Laboratory, USDA, and is stationed at the U.S. National Museum of Natural History, Washington, DC. Although his research focuses primarily on Tortricidae, he is responsible for maintenance and enhancement of the Gelechioidea collection at the National Museum.

David Adamski is a Support Scientist with the Systematic Entomology Laboratory and a Research Associate of the U.S. National Museum of Natural History. He has been with USDA for nearly 15 years in various capacities. His research focuses primarily on the systematics of Blastobasinae.

Ronald W. Hodges is widely recognized as the leading authority on Gelechioidea. Although he retired from a long and productive career with the USDA Systematic Entomology Laboratory in 1997, he has remained extremely active in the field. He is the Executive Director of the Wedge Entomological Foundation which publishes the monographic series "The Moths of North America" (a.k.a. the "Moths of America North of Mexico").

Stephen M. Bahr, II is an undergraduate student at Texas A&M University. He was a intern in the Entomology Department at the U.S. National Museum during the summer of 2003, during which time he made a significant contribution to the catalog by locating type specimens in the main collection and by tracking down references of original descriptions.
