A. College of Science, Ahmedabad, Gujarat 380001, India, and ${ }^{\mathbf{d} R e s e a r c h ~ C e n t r e ~ f o r ~}$ Crystalline Materials, School of Science and Technology, Sunway University, 47500 Bandar Sunway, Selangor Darul Ehsan, Malaysia. *Correspondence e-mail: edwardt@sunway.edu.my

The title compound, $\mathrm{C}_{16} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{3}$, is constructed about a central oxopyridazinyl ring (r.m.s. deviation = 0.0047 A ), which is connected to an ethylacetate group at the N atom closest to the carbonyl group, and benzyl and methyl groups second furthest and furthest from the carbonyl group, respectively. An approximately orthogonal relationship exists between the oxopyridazinyl ring and the best plane through the ethylacetate group [dihedral angle $=77.48$ (3) ${ }^{\circ}$ ]; the latter lies to one side of the central plane [the $\mathrm{N}_{\mathrm{r}}-\mathrm{N}_{\mathrm{r}}-\mathrm{C}_{\mathrm{m}}-\mathrm{C}_{\mathrm{c}}(\mathrm{r}=$ ring, $\mathrm{m}=$ methylene, c $=$ carbonyl) torsion angle being $\left.104.34(9)^{\circ}\right]$. In the crystal, both H atoms of the N -bound methylene group form methylene- $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ (ring carbonyl) or N (pyridazinyl) interactions, resulting in the formation of a supramolecular tape along the $a$-axis direction. The tapes are assembled into a three-dimensional architecture by methyl- and phenyl- $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ (ring carbonyl) and phenyl- $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ (ester carbonyl) interactions. The analysis of the calculated Hirshfeld surface indicates the dominance of $\mathrm{H} \cdots \mathrm{H}$ contacts to the overall surface (i.e. $52.2 \%$ ). Reflecting other identified points of contact between molecules noted above, $\mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}(23.3 \%), \mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}(14.7 \%)$ and $\mathrm{N} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{N}(6.6 \%)$ contacts also make significant contributions to the surface.

## 1. Chemical context

Pyridazin- $3(2 \mathrm{H})$-ones are pyridazine derivatives, being constructed about a six-membered ring which contains two adjacent nitrogen atoms, at positions one and two, and with a carbonyl group at position three. The interest in these nitro-gen-rich heterocyclic derivatives arises from the fact that they exhibit a number of promising pharmacological and biological activities. These include anti-oxidant (Khokra et al., 2016), anti-bacterial and anti-fungal (Abiha et al. 2018), anti-cancer (Kamble et al. 2017), analgesic and anti-inflammatory (Ibrahim et al. 2017), anti-depressant (Boukharsa et al. 2016) and anti-ulcer activities (Yamada et al., 1981). In addition, a number of pyridazinone derivatives have been reported to have potential as agrochemicals, for example as insecticides (Nauen \& Bretschneider, 2002), acaricides (Igarashi \& Sakamoto, 1994) and herbicides (Azaari et al., 2016). Given the interest in this class of compound and the paucity in structural data (see Database survey), the crystal and molecular structures of the the title pyridazin-3(2H)-one derivative, (I), has
been undertaken along with an analysis of the calculated Hirshfeld surface in order to gain further insight into the molecular packing.

## 2. Structural commentary

The molecular structure of (I), Fig. 1, comprises a central oxopyridazinyl ring connected to an ethylacetate group at the N 1 atom, a methyl group at the C 2 position and a benzyl residue at the C 3 atom. The oxopyridazinyl ring is almost planar, having an r.m.s. deviation of $0.0047 \AA$ for the ring atoms, with the maximum deviation from the ring being 0.0072 (6) $\AA$ for the C 3 atom; the O 1 atom lies 0.0260 (13) $\AA$ out of the plane in the same direction as the C3 atom. The ethyl acetate group is close to planar with the r.m.s. deviation for the $\mathrm{O} 2, \mathrm{O} 3, \mathrm{C} 12-\mathrm{C} 16$ atoms being $0.0476 \AA$ [the maximum deviation from the least-squares plane is 0.0711 (7) $\AA$ for the O3 atom]. The dihedral angle between the two mentioned planes is $77.48(3)^{\circ}$, indicating an approximately orthogonal relationship. The ethyl acetate group lies to one side of the central plane, as seen in the value of the $\mathrm{N} 2-\mathrm{N} 1-\mathrm{C} 13-\mathrm{C} 14$ torsion angle of $104.34(9)^{\circ}$. The benzyl ring forms a dihedral angle of $76.94(3)^{\circ}$ with the central ring, also indicating an approximately orthogonal relationship but, in this case, the benzyl ring is bisected by the pseudo mirror plane passing through the oxopyridazinyl ring. Consistent with this, the pendant groups form a dihedral angle of 69.74 (3) ${ }^{\circ}$. Within the ester group, it is the carboxylate-O3 atom that is directed away from the oxopyridazinyl ring so that the carbonyl-O1 and O2 atoms are proximate, at least to a first approximation.

Symmetry codes: (i) $-x+2,-y+1,-z+1$; (ii) $-x+1,-y+1,-z+1$.

## 3. Supramolecular features

The molecular packing of (I) reveals a prominent role for the N1-bound methylene group as each hydrogen atom of this residue participates in a methylene- $\mathrm{C} 13-\mathrm{H} \cdots \mathrm{O}$ (ring carbonyl) or N2(pyridazinyl) interaction, Table 1, leading to ten-membered $\{\cdots \mathrm{OCNCH}\}_{2}$ and eight-membered $\{\cdots \mathrm{NNCH}\}_{2}$ synthons, respectively. The result is the formation of a supramolecular tape orientated along the $a$-axis direction, Fig. 2(a). Globally, the tapes assemble into layers in the $a b$ plane and these stack along the $c$-axis direction as shown in

Figure 2
Supramolecular association in the crystal of (I): (a) a view of the supramolecular tape along the $a$-axis direction sustained by methylene$\mathrm{C} 13-\mathrm{H} \cdots \mathrm{O} 1$ (ring carbonyl) or $\mathrm{N} 2($ pyridazinyl) interactions shown as orange and blue dashed lines, respectively, and (b) a view of the unit-cell contents shown in projection down the $a$ axis.

Figure 3
Two views of the Hirshfeld surface for (I) mapped over $d_{\text {norm }}$ in the range -0.085 to +1.271 arbitrary units.

Fig. 2(b). Weak interactions contributing to the formation of the layers include methyl-C16-H..OO1(ring carbonyl) contacts (Table 2). Between layers are weak contacts of the type phenyl-C8, $\mathrm{C} 9-\mathrm{H} \cdots \mathrm{O}$ (ester carbonyl), phenyl$\mathrm{C} 10 \cdots \mathrm{O}$ (ring carbonyl) and $\pi-\pi$ between the oxopyridazinyl and phenyl ring [inter-centroid separation $=3.9573$ (7) $\AA$ A, angle of inclination $=15.00(4)^{\circ}$ for symmetry operation $\frac{3}{2}-x$, $\left.\frac{1}{2}+y, \frac{1}{2}-z\right]$. These interactions are discussed further in the section Hirshfeld surface analysis.

## 4. Hirshfeld surface analysis

The Hirshfeld surfaces calculated for (I) were performed in accord with recent studies (Tan et al., 2019) in order to provide complementary information on the influence of short interatomic contacts on the molecular packing. On the Hirshfeld surfaces mapped over $d_{\text {norm }}$ in Fig. $3(a)$, the $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ contact involving the methylene-H13A and pyridazinyl-N2 atoms are represented as bright-red spots on the surface. The diminutive red spots appearing near the methylene- $\mathrm{H} 13 B$ and carbonyl-

Figure 4
Two views of the Hirshfeld surface mapped over the electrostatic potential in the range -0.076 to +0.039 atomic units. The red and blue regions represent negative and positive electrostatic potentials, respectively.

O1 atoms indicate the weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contact, Fig. 3(a) and (b). The intense blue and red regions corresponding to positive and negative electrostatic potentials on the Hirshfeld surfaces mapped over electrostatic potential in Fig. 4 also represent the donors and acceptors of the above intermolecular interactions, respectively. The influence of the short interatomic $\mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}, \mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ and $\mathrm{C} \cdots \mathrm{C}$ contacts, as summarized in Table 2, are viewed as the faint-red spots on the $d_{\text {norm }}$-mapped Hirshfeld surfaces in Fig. 3. The environment of short interatomic $\mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}, \mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ and C..C contacts about the reference molecule within $d_{\text {norm }}$ mapped Hirshfeld surface illustrating weak intermolecular interactions are shown in the views of Fig. 5.

The overall two-dimensional fingerprint plot, Fig. 6(a), and those delineated into $\mathrm{H} \cdots \mathrm{H}, \mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}, \mathrm{N} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ and $\mathrm{C} \cdots \mathrm{C}$ contacts (McKinnon et al., 2007) are

Figure 5
Two views of Hirshfeld surface mapped over $d_{\text {norm }}$ in the range -0.085 to +1.271 arbitrary units showing significant short inter atomic $\mathrm{O} \cdots \mathrm{H} /$ $\mathrm{H} \cdots \mathrm{O}, \mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ and $\mathrm{C} \cdots \mathrm{C}$ contacts by sky-blue, yellow and black dotted lines, respectively.

Table 2
Summary of short interatomic contacts ( $\AA$ ) in (I).

| Contact | Distance | Symmetry operation |
| :--- | :--- | :--- |
| H5C $\cdots \mathrm{H} 16 C$ | 2.29 | $2-x, 1-y, 1-z$ |
| O1 $\cdots \mathrm{H} 10$ | 2.58 | $\frac{1}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z$ |
| O1 $\cdots \mathrm{H} 16 B$ | 2.55 | $1-x, 2-y, 1-z$ |
| O2 $\cdots \mathrm{H} 8$ | 2.63 | $\frac{3}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z$ |
| O2 $\cdots \mathrm{H} 9$ | 2.63 | $x,-1+y, z$ |
| C2 $\cdots \mathrm{H} 1 B 5$ | 2.71 | $\frac{1}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z$ |
| C $9 \cdots \mathrm{H} 11$ | 2.73 | $\frac{1}{2}-x,-\frac{1}{2}+y, \frac{1}{2}-z$ |
| C10 $\cdots \mathrm{H} 5 B$ | $3.3683(14)$ |  |
| C2 2 C 9 |  |  |

illustrated in Fig. 6(b)-(f); the percentage contribution from different interatomic contacts to the Hirshfeld surfaces of (I) are summarized in Table 3. In the fingerprint plot delineated into $\mathrm{H} \cdots \mathrm{H}$ contacts shown in Fig. $6(b)$, having the greatest contribution, i.e. $52.2 \%$, to the Hirshfeld surface, a pair of beak-shaped tips at $d_{\mathrm{e}}+d_{\mathrm{i}} \sim 2.3 \AA$ reflect the short interatomic contact between the methyl-H5C and H16C atoms, Table 2. The fingerprint plot delineated into $\mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}$ contacts in Fig. 6(c) demonstrates two pairs of adjoining short tips at $d_{\mathrm{e}}+d_{\mathrm{i}} \sim 2.5$ and $2.6 \AA$, together with the green aligned points in the central region, which are indicative of weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts present in the crystal. The pair of long spikes at $d_{\mathrm{e}}+d_{\mathrm{i}}$ $\sim 2.5 \AA$ in the fingerprint plot delineated into $\mathrm{N} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{N}$ contacts of Fig. $6(d)$, are the result of a potential $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ interaction involving the methylene- $\mathrm{C} 13-\mathrm{H} 13 A$ and pyrida-zinyl-N2 atoms. The short interatomic $\mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ contacts as summarized in Table 2 are represented by a pair of forcepslike and parabolic tips a $d_{\mathrm{e}}+d_{\mathrm{i}} \sim 2.7$ and $2.8 \AA$, respectively in Fig. $6(e)$. The presence of a weak $\pi-\pi$ contact between the oxopyridazinyl and phenyl rings is reflected in the thick arrowlike tip at $d_{\mathrm{e}}+d_{\mathrm{i}} \sim 3.4 \AA$ in the fingerprint plot delineated into C $\cdots$ C contacts of Fig. $6(f)$, specifically the short interatomic $\mathrm{C} 2 \cdots \mathrm{C} 9$ contact, Table 2, and the small but notable, i.e. $2.3 \%$, contribution from $\mathrm{C} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{C}$ contacts to the Hirshfeld surface.

Figure 6
(a) The full two-dimensional fingerprint plot for (I) and $(b)-(f)$ those delineated into $\mathrm{H} \cdots \mathrm{H}, \mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}, \mathrm{N} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{N}, \mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ and C $\cdots$ C, contacts, respectively.

Table 3
Percentage contributions of interatomic contacts to the Hirshfeld surface for (I).

| Contact | Percentage contribution |
| :--- | :--- |
| $\mathrm{H} \cdots \mathrm{H}$ | 52.2 |
| $\mathrm{O} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{O}$ | 23.3 |
| $\mathrm{C} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{C}$ | 14.7 |
| $\mathrm{~N} \cdots \mathrm{H} / \mathrm{H} \cdots \mathrm{N}$ | 6.6 |
| $\mathrm{C} \cdots \mathrm{C}$ | 2.9 |
| $\mathrm{C} \cdots \mathrm{N} / \mathrm{N} \cdots \mathrm{C}$ | 0.3 |

## 5. Database survey

The most closely related structure to (I) in the crystallographic literature is compound (II) whereby the benzyl group of (I) is substituted by a (5-chloro-1-benzofuran-2-yl)methyl) group (Aydin et al., 2007). The structure of (II) presents the same features as for (I) but, with the ester-carbonyl atom directed away from the ring carbonyl group as highlighted in the overlay diagram of Fig. 7.

## 6. Synthesis and crystallization

A mixture of 3-benzylidene-4-oxopentanoic acid ( 0.05 mol ) and hydrazine hydrate ( 0.1 mol ) in ethanol ( 100 ml ) was refluxed for 2 h . The precipitate formed was filtered off and recrystallized from acetone to obtain the 5-benzyl-6-methyl-pyridazin- $3(2 \mathrm{H})$-one precursor. To this pyridazine ( 0.05 mol ) was added potassium carbonate $(0.1 \mathrm{mmol})$, tetrabutylammonium bromide ( 0.01 mmol ) and 2-ethyl bromoacetate $(0.1 \mathrm{~mol})$ in dimethylformamide $(20 \mathrm{ml})$. The mixture was stirred for 24 h at room temperature. At the end of the reaction, the solution was filtered and the solvent evaporated under reduced pressure. The residue was washed with water and methylenechloride. The solvent was removed and colourless blocks of (I) were obtained by recrystallization of the product from its acetone solution.

Figure 7
Overlay diagram of (I) (red image) and literature analogue (II) (blue). The molecules have been aligned so the $\mathrm{NO}_{2}$ atoms of the central ring are coincident.

## 7. Refinement details

Crystal data, data collection and structure refinement details are summarized in Table 4. The carbon-bound H atoms were placed in calculated positions ( $\mathrm{C}-\mathrm{H}=0.95-0.99 \AA$ ) and included in the refinement in the riding model approximation, with $U_{\text {iso }}(\mathrm{H})$ set to $1.2-1.5 U_{\text {eq }}(\mathrm{C})$.

## Special details

Experimental. The diffraction data were obtained from 3 sets of 400 frames, each of width $0.5^{\circ}$ in $\omega$, colllected at $\varphi=$ $0.00,90.00$ and $180.00^{\circ}$ and 2 sets of 800 frames, each of width $0.45^{\circ}$ in $\varphi$, collected at $\omega=-30.00$ and $210.00^{\circ}$. The scan time was $15 \mathrm{sec} /$ frame.
Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\hat{A}^{2}$ )
