#### Abstract

Mobile Television is highly considered to be the next breakthrough application in wireless technology. Recently mobile marketing has become an important method of communication with the recent advances in mobile phone technology. The primary objective of the study was to find solutions that could possibly increase the number of mobile TV subscribers in South Africa so as to increase mobile TV usefulness as a marketing tool for products and services. The design of the study was a quantitative design. This research involved distributing a questionnaire at The University of The Witwatersrand to a sample group of 380 students between the ages of 18 to 25. The data collected was analysed using Statistical Analysis Software (SAS) Enterprise Guide 5. The results of the empirical study indicated that size of screens being too small was a major concern for mobile TV viewers and would make viewers less likely consider viewing mobile TV.

Keywords: Mobile television, technology, communication

#### 1. Introduction

Mobile television has evolved into a marketing vehicle due to recent technological advances in mobile devices (Varnali & Toker, 2009). Mobile TV can be defined as television content which can be viewed on mobile devices through the use of wireless networks (Shim, Ahn & Shim, 2006). There are various standards for Mobile TV networks, including T-DMB (Terrestrial-Digital Multimedia Broadcasting), ISDB-T (Integrated Services Digital Broad-casting-Terrestrial) and DVB-H (Digital Video Broadcasting- Handheld) (Hsu & Hefeeda, 2009). This research paper explored the (DVB-H) which is the abbreviation for Digital Video Broadcasting-Handheld and (DMB) which stands for Digital Multimedia Broadcasting and has been used to a greater extent Europe and Asia (Cullen, 2005).

According to (Cullen, 2005) mobile TV is a service that will be the next milestone for the wireless industry. The mobile industry in Africa is on the rise, leading the way is South Africa which boasts a 6% stake of all of Africa's mobile usage (BBC News Africa, 2011). DStv Mobile, a division of Multichoice had been pioneering the way for mobile TV in South Africa and had introduced mobile TV for smartphones on the 23<sup>rd</sup> of November 2010 for a monthly subscription fee of R36. Another mobile TV device Multichoice introduced was the DStv Drifta, launched in 2011 it sales for R449 and has a subscription fee of R49 per month. The Drifta is a mobile TV device that receives a DVB-H signal which it then turns into a wireless fidelity (Wi-Fi) signal which then enables wireless devices such as laptops, tablets and smartphones to receive television signals.

The Drifta needs to be within range of the DVB-H coverage area for it to work. The Drifta can also be connected through a Universal Serial Bus (USB) of a laptop or personal computer (Multichoice.com, 2013). On the 7<sup>th</sup> of September 2012, the DStv Walka which is the company's latest mobile TV device was released and was being sold for R499 (Multichoice.com, 2013). The future for mobile TV in South Africa seems to be bright when one looks at the penetration figures of television which is viewed by 76% of all South African households and 58% of all them already subscribe to pay

TV and generate an estimated US\$ 1.9 billion (Engineering News, 2013). The research involved quantitative techniques. A comprehensive research questionnaire was developed and distributed to respondents to determine the impact that Mobile TV had in South Africa. MultiChoice's DStv Mobile has utilized both broadcast and streaming technology to provide mobile TV, that is Digital Video Broadcasting (DVB-H) and Third Generation (3G) streaming respectively (Multichoice.com, 2013).

### 1.1 Problem Statement

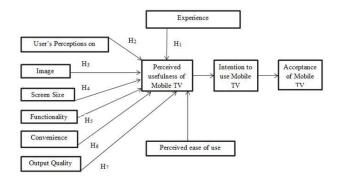

Knoche, McCarthy & Sasse (2005) conducted a study to find out complaints customers had about mobile TV. According to their findings, users were not comfortable operating handheld televisions as they had to be operated 15 cm away from the viewer's eyes, which respondents considered to be too close for enjoyment. Knoche et al., (2005) also found that people had discomfort with the smallness of the screens fearing eye strain age, poor coordination between audio and sound which would possibly prevent them from indulging further in mobile TV. The desired viewing distance for maximum pleasure and comfort is considered to be 89 cm (Knoche et al, 2005). Often mobile users want the largest screens possible for viewing but still want their phones to remain small which makes it fairly difficult to determine the most appropriate sizes for handheld devices (Knoche et al, 2005).

The purpose of this research was to explore the perceptions and attitudes towards causes of low adoption levels of mobile TV in South Africa. This study intended to find ways of using mobile TV as a marketing tool for products and services in South Africa. The primary objective of the study was to find solutions that could possibly increase the number of mobile TV subscribers in South Africa so as to increase mobile TV usefulness as a marketing tool for products and services.

# 1.2 Proposed Theoretical Model and Hypotheses

In-order to determine the perceptions that consumers in South Africa had towards mobile TV being used as a marketing tool by marketers a modified Technology Acceptance Model was used as a basis for this study. This model contains the following independent variables; experience, user's perceptions on mobile TV, image, screen size, functionality, convenience, and output quality. The dependent variable was the acceptance of mobile TV. The hypotheses were dependent on consumer's acceptance of mobile TV. For purposes of the study the researchers used a modified hypothesized Technology Acceptance model that was adopted from Venkatesh & Davis (2000).

Figure 1: Modified Hypothesized Technology Acceptance Model

Adopted from Venkatesh & Davis (2000)

# 1.3 Hypotheses

Hypothesis 1: Mobile TV experience is positively related to adoption.

Hypothesis 2: The user's perception of mobile TV has a positive relationship with the mobile TV acceptance. Hypothesis 3: The image associated with owning or using mobile TV is positively related to mobile TV acceptance. Hypothesis 4: The size of the screen has a positive relationship with the adoption of mobile TV Hypothesis 5: Mobile TV functionality is positively related to the acceptance of mobile TV. Hypothesis 6: Mobile TV convenience is positively related to acceptance. Hypothesis 7: Output quality is positively related to adoption of mobile TV.

# 2. Research Design and Methodology

The following section outlines the research design and the methodology used for this study.

### 2.1 Research Design

Research design helps to map out procedures for gathering information that is required to and solve given problems (Malhotra & Birks, 2007). The research design establishes the foundation for the entire research project (Malhotra & Birks, 2007). The design of the study was quantitative, non-experimental and correlation design. Five point likert -scales were used to collect data from respondents in order to determine their preferences and attitudes towards mobile television. To collect data from respondents for this study a self-administered research questionnaire was distributed to participants by the researchers.

# 2.2 Sample Size Determination

According to (Lenth, 2001) sample size determination is crucial in planning a statistical study as well as challenging. The sample size was determined using the Raosoft sample size calculator. Raosoft is statistical software that is used to calculate sample size. Raosoft takes into the following factors; account the margin of error, the confidence level, the population size and the response distribution. The researchers chose the default settings on Raosoft which had a margin of error at 5%, confidence level at 95% sample size at 30 000 and a response distribution of 50%. The calculated sample size was 380 respondents.

# 3. Results

The first linear regression analysis tested the relationship between the effect of mobile TV experience and the acceptance of mobile TV by consumers. Below are the null and alternate hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H1: Mobile TV experience is positively related to adoption.

Analysis of Variance						
Source	DF	Sum of squares	Mean Squares	F Value	Pr>F	
Model	1	0.59912	0.59912	1.03	0.3105	
Error	247	143.27655	0.58007			
Corrected total	248	143.87566				
		Coeff Var	Root MSE	Dependent Mean	R-Square	
		22.60893	0.76162	3.36867	0.0042	
		Parameter I	Estimates			
Variable	DF	Parameter Estimate	Standard Error	t Value	Pr >  t	
Intercept	1	3.11638	0.25290	12.32	<.0001	
Average Experience	1	0.07760	0.07635	1.02	0.3105	

**Table 1:** Linear regression analysis test for the experience obtained from mobile TV usage

The P-value for the experience variable is 0.3105; this is significant at the 0.05 significance level. Therefore the researchers failed to reject the null hypothesis that states which states that the perceived experience obtained from mobile TV is not significantly related to acceptance and rejects the alternative hypothesis which states that the perceived experience obtained from mobile TV is positively related to acceptance. This means that viewers' perceive the experience obtained from mobile TV to be of no significance implying that viewers are less likely to accept mobile TV. This ultimately meant that viewers could not see the value of mobile TV and hence are less motivated to view mobile TV.

#### 3.1 Linear regression for the Perceptions construct

The second linear regression analysis tested the relationship between the viewer's perceptions of mobile TV and the viewer's acceptance of mobile TV. Below are the null and alternate hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H2: The user's perception of mobile TV has a positive relationship with the mobile TV acceptance.

Table 2: Linear regression analysis test for user's perceptions towards mobile TV

		Analysis of \	/ariance		
Source	DF	Sum of Squares	Mean Squares	F Value	Pr>F
Model	1	34.06731	34.06731	70.97	<.0001
Error	378	181.44795	0.48002		
Corrected total	379	215.51526			
		CoeffVar	Root MSE	Dependent Mean	R-Square
		20.77960	0.69284	3.33421	0.1581
		Parameter Es	stimates		•
Variable	DF	Parameter Estimate	Standard Error	tValue	Pr >  t
Intercept	1	1.73662	0.19294	9.00	<.0001
Average Perceptions	1	0.49101	0.05828	8.42	<.0001

The p-value for the perceptions construct is <.0001. This is less than the level of significance ( $\alpha$ ) 0.05 hence the null hypothesis is rejected which states viewers perceptions of mobile TV are not significantly related to the acceptance of mobile TV in favour of the alternative hypothesis which states that viewers' perceptions of mobile TV are positively related to mobile TV acceptance. This implied is that if respondents have positive perceptions towards mobile TV they would in turn accept mobile TV. Television viewers were more willing to view mobile TV if they had positive perceptions about mobile TV.

### 3.2 Linear regression for the Image construct

The third linear regression analysis tested the relationship between the image associated with owning or using mobile TV and viewers acceptance mobile TV.Below are the null and alternative hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H3: The image associated with owning or using mobile TV is positively related to mobile TV acceptance.

Table 3: Linear regression analysis test for the Image associated with mobile TV

		Analysis	of Variance		
Source	DF	Sum of Squares	Mean Squares	F Value	Pr>F
Model	1	6.32920	6.32920	11.44	0.0008
Error	378	209.18607	0.55340		
Corrected total	379	215.51526			
		CoeffVar	Root MSE	Dependent Mean	R-Square
		22.31143	0.74391	3.33421	0.0294
		Paramete	r Estimates		
Variable	DF	Parameter Estimate	Standard Error	tValue	Pr >  t
Intercept	1	2.86946	0.14263	20.12	<.0001
Average Image	1	0.16407	0.04852	3.38	0.0008

The P- value for the image variable was 0.0008 this is significant at the 0.05 significance level therefore the null

hypothesis is rejected which states that the perceived image associated with mobile TV is not significantly related to the acceptance of mobile TV in favour of the alternative hypothesis which states that the image associated with mobile TV is positively related to the acceptance of mobile TV. This means that if viewer's associate mobile TV ownership or mobile TV use with an improved image they would be more willing to accept mobile TV.

# 3.3 Linear regression for the Screen size construct

The fourth linear regression analysis tested the relationship between the mobile TV screen size and the acceptance mobile TV. Below are the null and alternate hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H4: The size of the screen has a positive relationship with the adoption of mobile TV

		Analysis of \	/ariance		
Source	DF	Sum of Squares	Mean Squares	F Value	Pr>F
Model	1	0.34045	0.34045	0.60	0.4398
Error	378	215.17482	0.56925		
Corrected total	379	215.51526			
		CoeffVar	Root MSE	Dependent Mean	R-Square
		22.62855	0.75448		0.0016
		Parameter Es	stimates		
Variable	DF	Parameter Estimate	Standard Error	tValue	Pr >  t
Intercept	1	3.44867	0.15299	22.54	<.0001
Average Screen size	1	-0.04107	0.05311	-0.77	0.4398

**Table 4:** Linear regression analysis test for Screen size associated with mobile TV

The P value for the image variable is 0.4398, this is insignificant at the 0.05 significance level hence the researchers failed to reject the null hypothesis which states that mobile TV screen size is not significantly related to the acceptance of mobile TV. This means is that the screen sizes of mobile TV makes no difference in the viewer's mind as to whether the viewer would accept mobile TV or not. This would probably imply that for the various mobile TV screen sizes that are available consumers perceive them to be equal in terms of the amount of material they could show.

# 3.4 Linear regression for the Functionality construct

The fifth linear regression analysis tested the relationship between mobile TV functionality and the acceptance of mobile TV. Below are the null and alternate hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H5: Mobile TV functionality is positively related to the acceptance of mobile TV.

Table 5: Linear r	egression analy	sis test for	Functionality	associated with mobile TV
	cyrcssion unury	313 1031 101	i unononunty	

		Analysis of V	ariance		
Source	DF	Sum of Squares	Mean Squares	F Value	Pr>F
Model	1	5.19843	5.19843	9.34	0.0024
Error	378	210.31683	0.55639		
Corrected total	379	215.51526			
		CoeffVar	Root MSE	Dependent Mean	R-Square
		22.37165	0.74592	3.33421	0.0241
		Parameter Es	timates	•	•
Variable	DF	Parameter Estimate	Standard Error	tValue	Pr >  t
Intercept	1	2.76732	0.18937	14.61	<.0001
Average Functionality	1	0.18916	0.06189	3.06	0.0024

ISSN 2039-2117 (online)	Mediterranean Journal of Social Sciences	Vol 5 No 25
ISSN 2039-9340 (print)	MCSER Publishing, Rome-Italy	November 2014

The P value for the functionality variable is 0.0024 this is significant at the 5% significance level hence the null hypothesis is rejected which states that that Mobile TV functionality is not significantly related to the acceptance of mobile TV in favour of the alternative hypothesis which states that mobile TV functionality has a positive relationship with the acceptance of mobile TV. What this means is that mobile TV functions have a positive relationship with the acceptance of mobile TV. This means that if viewers perceive mobile TV functions to be easy to understand and use, they would be more willing to accept mobile TV.

# 3.5 Linear regression for the Convenience construct

The linear regression analysis is testing the relationship between mobile TV convenience and the acceptance of mobile TV. Below are the null and alternate hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H6: Mobile TV functionality is positively related to the acceptance of mobile TV.

Below is the table illustrating the linear regression analysis for the convenience construct.

		Analysis of V	ariance		
Source	DF	Sum of Squares	Mean Squares	F Value	Pr>F
Model	1	40.76228	40.76228	88.17	<.0001
Error	378	174.75298	0.46231		
Corrected total	379	215.51526			
		Coeff Var	Root MSE	Dependent Mean	R-Square
		20.39264	0.67993	3.33421	0.1891
		Parameter Es	timates		
Variable	DF	Parameter Estimate	Standard Error	t Value	Pr >  t
Intercept	1	2.15814	0.13001	16.60	<.0001
Average Convenience	1	0.40806	0.04346	9.39	<.0001

**Table 6:** Linear regression analysis test for Convenience associated with mobile TV

The P value for the convenience variable is 0.0024 this is significant at the 5% significance level hence the null hypothesis is rejected which states that mobile TV convenience is not significantly related to the acceptance of mobile TV in favour of the alternative hypothesis which states that mobile TV convenience is positively related to acceptance of mobile TV. This means that if viewers perceive mobile TV to be convenient they would be willing to accept mobile TV.

#### 3.6 Linear regression for the Output quality construct

The linear regression analysis tested the relationship between mobile TV output quality and the acceptance of mobile TV. Below are the null and alternate hypotheses. The significance level that was used for the linear regression analysis was ( $\alpha$ ) 0.005.

H7: Output quality is positively related to adoption of mobile TV.

		Analysis of Va	riance		
Source	DF	Sum of Squares	Mean Squares	F Value	Pr>F
Model	1	30.87520	30.87520	63.21	<.0001
Error	378	184.64007	0.48847		
Corrected total	379	215.51526			
		CoeffVar	Root MSE	Dependent Mean	R-Square
		20.96158	0.69890	3.33421	0.1433
		Parameter Est	imates		
Variable	DF	Parameter Estimate	Standard Error	tValue	Pr >  t
Intercept	1	2.08169	0.16157	12.88	<.0001
Average Output quality	1	0.43770	0.05505	7.95	<.0001

**Table 7:** Linear regression analysis test for Output quality associated with mobile TV

The P value for the output quality variable is<.0001 this is significant at the 5% significance level hence the null hypothesis is rejected which states that Mobile TV output quality is not significantly related to the acceptance of mobile TV in favour of the alternative hypothesis which states mobile TV output quality is positively related to acceptance. What this means is that if viewers perceive mobile TV output quality to be favourable they would be more willing to accept mobile TV.

# 4. Findings

This research comprised of seven main findings which encompassed the perceptions that television viewers in South Africa had about mobile TV being used as a marketing tool for products and services. This study was based on a modified technology acceptance model. This model was used to explain and predict user acceptance of new technology (Venkatesh & Davis, 2000). This modified technology acceptance model had eight constructs which were tested and these included: experience, user's perceptions, image, screen size, functionality, convenience, output quality and acceptance of mobile TV. The study also looked at how viewers perceived the relationship that existed or potentially existed between each construct and acceptance.

# 4.1 Perceived Experience of Mobile TV

The first finding of the study was that the perceived experience obtained from mobile TV was not significantly related to acceptance. What this means is that respondents perceived the experience obtained from mobile TV to be of no significance implying that they were less likely to accept mobile TV. This ultimately meant that viewers could not see the value of mobile TV and hence were less motivated to view mobile TV. This meant that viewers were not willing to substitute traditional TV for mobile TV.

# 4.2 Perceptions about Mobile TV

The second finding of this study was that viewers' perceptions about mobile TV were positively related to mobile TV acceptance. What this implied was that if respondents have positive perceptions towards mobile TV they would in turn accept mobile TV. Television viewers were more willing to view mobile TV if they had positive perceptions about mobile TV. This finding was supported by a study conducted by (Ali, 2007). Ali (2007) established that television viewers were not prepared to replace their traditional television sets with mobile TV as they considered mobile TV to be merely a convenient tool for television viewing but not a device they would be willing to entirely substitute for traditional television.

# 4.1 Perceived image of Mobile TV

The third finding of this study was that the perceived image associated with mobile TV was positively related to the acceptance of mobile TV. This meant that if respondents associated mobile TV ownership or use with an improved image they would be more willing to accept mobile TV. Viewers were more likely to watch mobile TV if they believed it would

ISSN 2039-2117 (online)	Mediterranean Journal of Social Sciences	Vol 5 No 25
ISSN 2039-9340 (print)	MCSER Publishing, Rome-Italy	November 2014

raise their image in society. Hazel Kwon, Kyounghee, and Bum Soo Chon (2009) also believe that mobile T.V adoption is heavily influenced by the social image that the consumers are looking to portray of themselves which suggests that these devices should be customized well in order to suit the relevant image and personalities of the potential users.

Screen size of Mobile TV

The fourth finding of this study was that that mobile TV screen size was not significantly related to the acceptance of mobile TV. What this means is that the screen sizes of mobile TV made no difference in the viewer's mind as to whether the viewer would accept mobile TV or not. This probably implied that for the various mobile TV screen sizes that are available consumers perceived them to be equal in terms of the amount of material they could show and therefore no mobile TV screen size would influence the viewer to accept mobile TV. This finding was supported by Marcus, Roibas, & Sala (2010) who pointed that mobile TV screens where too small and not suited for showing television content.

#### 4.3 Perceived Functionality of Mobile TV

The fifth finding of this study was that that mobile TV functionality had a positive relationship with the acceptance of mobile TV. This means is that if viewers perceive mobile TV functions to be easy to understand and use, they would be more willing to accept mobile TV. Carlsson & Walden (2007) support this finding as their study also established that mobile TV services should be simple to understand and easy to use.

# 4.4 Perceived Convenience of Mobile TV

The sixth finding of this study was that mobile TV convenience is positively related to the acceptance of mobile TV. This means that if viewers perceive mobile TV to be convenient they would therefore be more likely to accept mobile TV.

# 4.5 Perceived Output Quality of mobile TV

The seventh finding of this study was that mobile TV output quality is positively related to acceptance. What this meant was that if viewers perceived mobile TV output quality to be favourable they would be more willing to accept mobile TV.

# 5. Recommendations and Marketing implications

There is therefore need for marketers to demonstrate the benefits associated with the adoption of Mobile T.V through marketing campaigns in order to convince consumers to perceive mobile TV as an informative media platform. Marketers should also convince viewers that mobile TV has the potential to revolutionize the way viewers enjoy entertainment. Another implication for marketing managers is that if marketing managers decide to use mobile TV devices and services as marketing tools they have to first of all take screen size into consideration as results of the empirical study revealed that size of screens being too small was a major concern for mobile TV viewers and would make viewers less likely to consider viewing mobile TV. This finding was supported by study by Knoche et al, (2005) who stated that viewers complained about the discomfort of viewing television content on mobile TV. A solution to this problem was suggested by Knoche et al, (2005), who proposed that increasing the number of pixels in images would possibly increase the perceived quality of mobile TV. Pixels are dots per inch that assemble a picture (Knoche et al, 2005). This implied that marketing managers should provide mobile TV images in marketing campaigns that contain a high number of pixels in order to assure high picture guality thereby reducing the discomfort associated with viewing mobile TV. The researchers would recommend South African marketing managers to conduct a research on mobile TV perceptions within a South African context on a larger scale than as of this study. This would possibly overcome the limitations of this research such as a restricted sample size, low funding and limited time. If marketers have a substantial budget appropriated to investigating the perceptions of South African viewers towards mobile TV they would be able to successfully implement marketing strategies that would enable them to raise the awareness and penetration levels of mobile TV in South Africa. Investing a substantial amount of resources such as time, money and labour in researching on mobile TV consumption in South Africa would enable marketers to know how, when and why they should introduce mobile TV to a particular target market? Marketers would also save money in the actually implementation of mobile TV as a marketing tool for products and services if thorough research on consumer perceptions is conducted.

#### 6. Limitations of the Study and Future Research

In conducting this study there were many limitations that included small sample size, time and financial constraints. Due to the fact that only students who attend at the University of The Witwatersrand were selected for the study it meant that the study left other viewers of mobile TV who did not attend at The University of the Witwatersrand thereby under representing the number of possible mobile TV users that could have been used for the study. This also meant that the perceptions of those mobile TV viewers who could not be reached were not included in the research and therefore this compromised the full extent of what the study could have achieved. Future research should therefore consider making use of different population samples in order to ensure that the study truly represents the perceptions and attitudes that the South African population has on mobile television. Future researchers may also consider evaluating the type of programs that are best suited for Mobile T.V in order to make them more accessible on these media channels as this will go a long way in helping to alter the attitudes that most consumers have of Mobile T.V.

#### 7. Conclusion

The contribution of this study was to find ways of increasing the penetration levels of mobile TV in South Africa as well as using prospects' and consumers' perceptions of mobile TV to find ways of implementing mobile TV as a marketing tool for products and services in South Africa. Marketers and managers could possibly make the initiative of raising mobile TV awareness levels in South Africa through taking the findings of this research into consideration. Based on the results of the findings of this study the researchers were able to draw a conclusion on the perceptions that South African television viewers have about mobile TV. Based on the findings that pertained to experience of mobile TV the researchers found that viewers were not inclined towards accepting mobile TV as they considered the mobile TV experience to be of no value. The objective of this study was to find if mobile TV could be used as a marketing tool in South Africa and based on the findings of this research mobile TV marketing is not a viable business idea unless if consumer's perceptions towards mobile TV become more positive and further developments are undertaken by mobile TV service providers to improve mobile TV devices and mobile TV services then mobile TV could become a plausible marketing communications tool.
