On hereditary reducibility of 2-monomial matrices over commutative rings

Vitaliy M. Bondarenko, Joseph Gildea, Alexander A. Tylyshchak[1], Natalia V. Yurchenko

Communicated by V. V. Kirichenko

Abstract. A 2-monomial matrix over a commutative ring R is by definition any matrix of the form $M(t,k,n) = \Phi\begin{pmatrix} I_k & 0 \\ 0 & tI_{n-k}\end{pmatrix}$, $0 < k < n$, where t is a non-invertible element of R, Φ the companion matrix to $\lambda^n - 1$ and I_k the identity $k \times k$-matrix. In this paper we introduce the notion of hereditary reducibility (for these matrices) and indicate one general condition of the introduced reducibility.

Introduction

This paper is devoted to one class of monomial matrices over commutative rings which first arose in studying indecomposable representations of finite p-groups over local rings ([1]). They were studied more extensively (in a more generally) in [2]–[6].

Let R be a commutative ring with Jacobson radical $J(R) \neq 0$ and t a non-zero element from $J(R)$. An $n \times n$ matrix over R is called 2-*monomial concerning* t, if it is permutation similar to a matrix of the

2010 Mathematics Subject Classification: *15B33, 15A30.*

Key words and phrases: *commutative ring, Jacobson radical, 2-monomial matrix, hereditary reducible matrix, similarity, linear operator, free module.*

following form:

$$M(t,k,n) := \Phi_n \begin{pmatrix} I_k & 0 \\ 0 & tI_{n-k} \end{pmatrix} = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & t \\ 1 & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 1 & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & t & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & t & 0 \end{pmatrix},$$

where $0 < k < n$, Φ_n is the companion matrix to the polynomial $x^n - 1$ and I_s is the identity $s \times s$ matrix. Such a matrix $M = M(t,k,n)$ is said to be *hereditary reducible* if it similar to a matrix

$$M' = \begin{pmatrix} M(t,k',n') & * \\ 0 & N \end{pmatrix}, \quad n' \neq n,$$

and *hereditary irreducible* if otherwise.

The aim of this paper is to prove the following result.

Theorem 1. *A 2-monomal matrix $M(t,k,n)$ is hereditary reducible if k and n are not coprime.*

In the next section, we indicate a more detailed interpretation of the idea of this statement.

1. Generalization of Theorem 1: formulation and proof

In this section we prove a more general theorem (from which Theorem 1 follows). Instead of R we consider the ring $\mathbb{Z}[\lambda]$ ((of integer polynomials). Let (n,k) denote the greatest common divisor of the natural numbers n and k.

Theorem 2. *Let $n > k$ be positive integers, such that $(n,k) > 1$. Then for any positive divisors $d > 1$ of the number (n,k), the matrix $M(\lambda,k,n) \in M(n,\mathbb{Z}[\lambda])$ similar to a matrix of the following form*

$$\begin{pmatrix} M(\lambda,k',n') & B \\ 0 & A \end{pmatrix} \in M(n,\mathbb{Z}[\lambda]),$$

where $k' = \frac{k}{d}$ and $n' = \frac{n}{d}$.

Through this section $0 < k < n$, $0 < k' < n'$, $0 < n' < n$. Before we prove this result, we need to provide four other important results needed for the proof.

Proposition 1. *Let $n'|n$. Then there exists an $n \times n'$-matrix*

$$S = \begin{pmatrix} \lambda^{s_1} & 0 & \dots & 0 \\ 0 & \lambda^{s_2} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_{n'}} \\ \lambda^{s_{n'+1}} & 0 & \dots & 0 \\ 0 & \lambda^{s_{n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_{2n'}} \\ \dots & \dots & \dots & \dots \\ \lambda^{s_{n-n'+1}} & 0 & \dots & 0 \\ 0 & \lambda^{s_{n-n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_n} \end{pmatrix},$$

where $s_i \geq 0$, $i = 1, \dots, n$, such that $M(\lambda, k, n)S = SM(\lambda, k', n')$ if and only if $\frac{n}{n'} = \frac{k}{k'}$.

Proof. Let $l_1 = \dots = l_k = 0$, $l_{k+1} = \dots = l_n = 1$, $r_1 = \dots = r_{k'} = 0$ and $r_{k'+1} = \dots = r_{n'} = 1$ such that

$$M(\lambda, k, n) = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & \lambda^{l_n} \\ \lambda^{l_1} & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \lambda^{l_k} & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & \lambda^{l_{k+1}} & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & \lambda^{l_{n-1}} & 0 \end{pmatrix}$$

and

$$M(\lambda, k', n') = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & \lambda^{r_{n'}} \\ \lambda^{r_1} & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \lambda^{r_{k'}} & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & \lambda^{r_{k'+1}} & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & \lambda^{r_{n'-1}} & 0 \end{pmatrix}.$$

We denote by (i, j) the scalar equality

$$(M(\lambda, k, n)S)_{ij} = (SM(\lambda, k', n'))_{ij}.$$

Obviously, in each of matrices $M(\lambda,k,n)S$ and $SM(\lambda,k',n')$ there are exactly n non-zero element, which are in the i,j positions (i-th row, j-th column), where $i \equiv j+1 \pmod{n'}$. Let $\delta_{n'}(i) = (i-1) \mod n' + 1$ or, equivalently, $\delta_{n'}(i) \equiv i \pmod{n'}$, $1 \le \delta_{n'}(i) \le n'$. Thus $M(\lambda,k,n)S = SM(\lambda,k',n')$ if and only if scalar equalities

$$\begin{cases} (i+1,\delta_{n'}(i)): & \lambda^{l_i}\lambda^{s_i} = \lambda^{s_{i+1}}\lambda^{r_{\delta_{n'}(i)}} \quad (i=1,\ldots,n-1), \\ (1,n'): & \lambda^{l_n}\lambda^{s_n} = \lambda^{s_1}\lambda^{r_{n'}}; \end{cases}$$

hold. Obviously, these equalities are equivalent to the equalities

$$\begin{cases} (i+1,\delta_{n'}(i)): & l_i + s_i = s_{i+1} + r_{\delta_{n'}(i)} \quad (i=1,\ldots,n-1), \\ (1,n'): & l_n + s_n = s_1 + r_{n'}. \end{cases} \tag{1}$$

Assume that for some $s_i \ge 0$, $i=1,\ldots,n$ $M(\lambda,k,n)S = SM(\lambda,k',n')$. Then (1) holds. Summing the equations (1), we obtain

$$\sum_{i=1}^{n-1} l_i + \sum_{i=1}^{n-1} s_i + l_n + s_n = \sum_{i=1}^{n-1} s_{i+1} + \sum_{i=1}^{n-1} r_{\delta_{n'}(i)} + s_1 + r_{n'}.$$

But since $\delta_{n'}(n) = n'$ we have that

$$\sum_{i=1}^{n} l_i + \sum_{i=1}^{n} s_i = \sum_{i=1}^{n} s_i + \sum_{i=1}^{n} r_{\delta_{n'}(i)},$$

or $\sum_{i=1}^{n} l_i = \sum_{i=1}^{n} r_{\delta_{n'}(i)}$. This is equivalent to $\sum_{i=1}^{n} l_i = \frac{n}{n'}\sum_{i=1}^{n'} r_i$ or $k = \frac{n}{n'}k'$ and $\frac{n}{n'} = \frac{k}{k'}$.

Now, assume that $\frac{n}{n'} = \frac{k}{k'}$ and we want to prove that for some $s_i \ge 0$, $i=1,\ldots,n$ $M(\lambda,k,n)S = SM(\lambda,k',n')$. It remains to prove that the equations in (1) hold for non negative integers s_i. We will prove it for arbitrary integers s_i since that addition of any number to s_i will also be a solution. Let $s_1 = 0$, $s_{i+1} = l_i + s_i - r_{\delta_{n'}(i)}$ $(i=1,\ldots,n-1)$. It follows immediately that all, accept last equation in (1) holds and $s_n = \sum_{i=1}^{n-1} l_i - \sum_{i=1}^{n-1} r_{\delta_{n'}(i)}$. If we replace s_n by $\sum_{i=1}^{n-1} l_i - \sum_{i=1}^{n-1} r_{\delta_{n'}(i)}$ and s_1 by 0 in the last equation in (1), we obtain the following equation:

$$l_n + \sum_{i=1}^{n-1} l_i - \sum_{i=1}^{n-1} r_{\delta_{n'}(i)} = r_{n'} \text{ or } l_n + \sum_{i=1}^{n-1} l_i = \sum_{i=1}^{n-1} r_{\delta_{n'}(i)} + r_{n'}.$$

This equation is equivalent to $\sum_{i=1}^{n} l_i = \sum_{i=1}^{n} r_{\delta_{n'}(i)}$. and $\sum_{i=1}^{n} l_i = \frac{n}{n'}\sum_{i=1}^{n'} r_i$ which in turn is equivalent to $k = \frac{n}{n'}k'$ or $\frac{n}{n'} = \frac{k}{k'}$. The proof is complete. □

Using a similar argument applied in the previous proof, we can state the following result:

Proposition 2. *Let* $n'|n$, $l_i \geq 0$ $(i = 1, \ldots, n)$ $\sum_{i=1}^{n} l_i = k$,

$$M = \begin{pmatrix} 0 & \ldots & 0 & 0 & \ldots & 0 & \lambda^{l_n} \\ \lambda^{l_1} & \ldots & 0 & 0 & \ldots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \ldots & \lambda^{l_k} & 0 & \ldots & 0 & 0 \\ 0 & \ldots & 0 & \lambda^{l_{k+1}} & \ldots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \ldots & 0 & 0 & \ldots & \lambda^{l_{n-1}} & 0 \end{pmatrix}.$$

Then there exists an $n \times n'$*-matrix*

$$S = \begin{pmatrix} \lambda^{s_1} & 0 & \ldots & 0 \\ 0 & \lambda^{s_2} & \ldots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \ldots & \lambda^{s_{n'}} \\ \lambda^{s_{n'+1}} & 0 & \ldots & 0 \\ 0 & \lambda^{s_{n'+2}} & \ldots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \ldots & \lambda^{s_{2n'}} \\ \ldots & \ldots & \ldots & \ldots \\ \lambda^{s_{n-n'+1}} & 0 & \ldots & 0 \\ 0 & \lambda^{s_{n-n'+2}} & \ldots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \ldots & \lambda^{s_n} \end{pmatrix},$$

where $s_i \geq 0$, $i = 1, \ldots, n$, *such that* $MS = SM(\lambda, k', n')$ *if and only if* $\frac{n}{n'} = \frac{k}{k'}$.

Next, we provide a result regarding the the similarity of $M(\lambda, k, n)$ and a certain matrix.

Proposition 3. *Let* $n'|n$, $\frac{n}{n'} = \frac{k}{k'}$. *Than* $k' < k$ *and* $M(\lambda, k, n)$ *is similar* *(over $\mathbb{Z}[\lambda]$) to a matrix of the form*

$$M = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & \lambda^{l_n} \\ \lambda^{l_1} & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \lambda^{l_{k'}} & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & \lambda^{l_{k'+1}} & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & \lambda^{l_{n-1}} & 0 \end{pmatrix},$$

where $l_1 = \dots = l_{k'} = 0$, $l_{k'+1} = \dots = l_{k'+n-k} = 1$, $l_{k'+n-k+1} = \dots = l_n = 0$.

Proof. Clearly $k' < k$ as $\frac{k}{k'} = \frac{n}{n'} > 1$. Now, rearrange the rows and columns of the matrix $M(\lambda, k, n)$ in the order $k-k'+1, k-k'+2, \dots n, 1, 2, \dots, k-k'$ and denote the new matrix by M:

$$M = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & \lambda^{l_n} \\ \lambda^{l_1} & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \lambda^{l_{k'}} & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & \lambda^{l_{k'+1}} & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & \lambda^{l_{n-1}} & 0 \end{pmatrix}$$

where $l_1 = \dots = l_{k'} = 0$, $l_{k'+1} = \dots = l_{k'+n-k} = 1$, $l_{k'+n-k+1} = \dots = l_n = 0$. □

The next result connects the previous two results.

Proposition 4. *Let $n'|n$, $k' < k$.*

$$M = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & \lambda^{l_n} \\ \lambda^{l_1} & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \lambda^{l_{k'}} & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & \lambda^{l_{k'+1}} & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & \lambda^{l_{n-1}} & 0 \end{pmatrix},$$

where $l_1 = \dots = l_{k'} = 0$, $l_{k'+1} = \dots = l_{k'+n-k} = 1$, $l_{k'+n-k+1} = \dots = l_n = 0$. *Then there exists an* $n \times n'$*-matrix*

$$S = \begin{pmatrix} 1 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & 1 \\ 1 & 0 & \dots & 0 \\ 0 & \lambda^{s_{n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_{2n'}} \\ \dots & \dots & \dots & \dots \\ \lambda^{s_{n-n'+1}} & 0 & \dots & 0 \\ 0 & \lambda^{s_{n-n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_n} \end{pmatrix},$$

where $s_i \geq 0$, $(i = n'+1, \dots, n)$, *such that* $MS = SM(\lambda, k', n')$ *if and only if* $\frac{n}{n'} = \frac{k}{k'}$.

Proof. Clearly if $MS = SM(\lambda, k', n')$, then $\frac{n}{n'} = \frac{k}{k'}$ by Proposition 2. Assume that $\frac{n}{n'} = \frac{k}{k'}$. Let $r_1 = \dots = r_{k'} = 0$, $r_{k'+1} = \dots = r_{n'} = 1$ such that

$$M(\lambda, k', n') = \begin{pmatrix} 0 & \dots & 0 & 0 & \dots & 0 & \lambda^{r_{n'}} \\ \lambda^{r_1} & \dots & 0 & 0 & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \lambda^{r_{k'}} & 0 & \dots & 0 & 0 \\ 0 & \dots & 0 & \lambda^{r_{k'+1}} & \dots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & 0 & 0 & \dots & \lambda^{r_{n'-1}} & 0 \end{pmatrix}.$$

We will prove that $M(\lambda, k, n)S = SM(\lambda, k', n')$ for some $s_i \geq 0$ $(i = n'+2, \dots, n)$.

It remains to prove that (1) holds, where $s_1 = \dots = s_{k'} = s_{k'+1} = 0$. Let

$$s_1 = 0, \quad s_{i+1} = l_i + s_i - r_{\delta_{n'}(i)} \quad (i = 1, \dots, n-1). \tag{2}$$

Using a similar argument to the one used in (1) all equations hold except the last one. Furthermore, if $\frac{n-k}{n'-k'} = \frac{n}{n'} = \frac{k}{k'} > 1$ it follows $n' - k' < n - k$,

$$l_1 = \dots = l_{k'} = 0 = r_1 = \dots = r_{k'}$$

and

$$l_{k'+1} = \cdots = l_{n'} = 1 = r_{k'+1} = \cdots = r_{n'}.$$

Therefore $l_i = r_i$ $(i = 1, \ldots, n')$ and $s_{i+1} = s_i$ $(i = 1, \ldots, n')$ by (2). We can also see that $s_1 = \cdots = s_{n'} = s_{n'+1} = 0$.

It remains to prove that $s_i \geq 0$ $(i = n' + 2, \ldots, n)$. Let $s_{n+1} = s_1$. It follows from (2) end last equation from (1), that $s_{n+1} = l_n + s_n - r_{\delta_{n'}(n)}$, which is equivalent to $s_1 = s_{n+1} = 0$ and

$$s_{i+1} = \sum_{j=1}^{i} l_j - \sum_{j=1}^{i} r_{\delta_{n'}(j)} \quad (i = 1, \ldots, n). \tag{3}$$

Let us consider $s(i) = s_i$, as function of an integer i $(1 \leq i \leq n+1)$. Then $s(i) = 0$ if $1 \leq i \leq n' + 1$. Thus, $s(i)$ is a constant for $1 \leq i \leq n' + 1$. If $n' + 1 \leq i < i + 1 \leq k' + n - k + 1$, then it follows from (3) that $s(i + 1) - s(i) = l_i - r_{\delta_{n'}(i)} = 1 - r_{\delta_{n'}(i)} \geq 0$. Therefore $s(i)$ either increases or remains constant for each step and $s(i) \geq s(n' + 1) = 0$. If $k' + n - k + 1 \leq i < i + 1 \leq n + 1$, then it follows from (3) that $s(i + 1) - s(i) = l_i - r_{\delta_{n'}(i)} = 0 - r_{\delta_{n'}(i)} \leq 0$. Consequently $s(i)$ either decreases or remains constant for each step and $s(i) \geq s(n + 1) = 0$. Therefore, $s_i = s(i) \geq 0$ $(i = n' + 2, \ldots, n)$. □

Finally, we are in a position to prove our main result.

Proof of Theorem 2. Recall that $0 < k < n$, $\frac{k}{k'} = \frac{n}{n'} = d > 1$ and $0 < n' < n$, $0 < k' < k$. By Propositin 3, $M(\lambda, k, n)$ is similar (over $\mathbb{Z}[\lambda]$) to a matrix of the form

$$M = \begin{pmatrix} 0 & \ldots & 0 & 0 & \ldots & 0 & \lambda^{l_n} \\ \lambda^{l_1} & \ldots & 0 & 0 & \ldots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \ldots & \lambda^{l_{k'}} & 0 & \ldots & 0 & 0 \\ 0 & \ldots & 0 & \lambda^{l_{k'+1}} & \ldots & 0 & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \ldots & 0 & 0 & \ldots & \lambda^{l_{n-1}} & 0 \end{pmatrix}$$

where $l_1 = \cdots = l_{k'} = 0$, $l_{k'+1} = \cdots = l_{k'+n-k} = 1$, $l_{k'+n-k+1} = \cdots = l_n = 0$.

By Proposition 4 there exists an $n \times n'$-matrix

$$S = \begin{pmatrix} 1 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & 1 \\ 1 & 0 & \dots & 0 \\ 0 & \lambda^{s_{n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_{2n'}} \\ \multicolumn{4}{c}{\dotfill} \\ \lambda^{s_{n-n'+1}} & 0 & \dots & 0 \\ 0 & \lambda^{s_{n-n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_n} \end{pmatrix} = \begin{pmatrix} I_{n'} \\ S' \end{pmatrix},$$

where

$$S' = \begin{pmatrix} 1 & 0 & \dots & 0 \\ 0 & \lambda^{s_{n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_{2n'}} \\ \multicolumn{4}{c}{\dotfill} \\ \lambda^{s_{n-n'+1}} & 0 & \dots & 0 \\ 0 & \lambda^{s_{n-n'+2}} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \lambda^{s_n} \end{pmatrix},$$

$I_{n'}$ is the identity $n' \times n'$ matrix, $s_i \geq 0$ $((i = n'+1, \dots, n))$ such that $MS = SM(\lambda, k', n')$. Now,

$$C^{-1}MC = \begin{pmatrix} I_{n'} & 0 \\ S' & I_{n-n'} \end{pmatrix}^{-1} M \begin{pmatrix} I_{n'} & 0 \\ S' & I_{n-n'} \end{pmatrix} =$$

$$\begin{pmatrix} I_{n'} & 0 \\ -S' & I_{n-n'} \end{pmatrix} M \begin{pmatrix} I_{n'} & 0 \\ S' & I_{n-n'} \end{pmatrix}.$$

If we omit the last $n - n'$ columns of the last matrix, we obtain

$$\begin{pmatrix} I_{n'} & 0 \\ -S' & I_{n-n'} \end{pmatrix} M \begin{pmatrix} I_{n'} \\ S' \end{pmatrix} = \begin{pmatrix} I_{n'} & 0 \\ -S' & I_{n-n'} \end{pmatrix} \begin{pmatrix} I_{n'} \\ S' \end{pmatrix} M(\lambda, k', n') =$$

$$\begin{pmatrix} I_{n'} \\ 0 \end{pmatrix} M(\lambda, k', n') = \begin{pmatrix} M(\lambda, k', n') \\ 0 \end{pmatrix}.$$

In conclusion, we note that matrix M and the matrix $M(\lambda, k, n)$ arre similar (over $\mathbb{Z}[\lambda]$) to a matrix of the form

$$\begin{pmatrix} M(\lambda, k', n') & B \\ 0 & A \end{pmatrix} \in M(n, \mathbb{Z}[\lambda]),$$

as claimed.

Note that Theorem 1 folows from the last theorem and the existence of the homomorphism of rings $f : \mathbb{Z}[\lambda] \to R$ where $f(1) = 1$ and $f(\lambda) = t$.
