## 1. General experimental details

All reagents, obtained from Acros, Aldrich, Alfa Aesar, Fluka, Fluorochem and Lancaster fine chemicals suppliers, were used directly as supplied or purified by the methods described by Armarego and Chai ${ }^{1}$ except where otherwise noted in the experimental text. All non-aqueous reactions were performed in oven-dried apparatus under argon or nitrogen atmospheres, using distilled anhydrous solvents, at room temperature (rt) unless otherwise indicated. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, acetonitrile and methanol were distilled from calcium hydride and stored under an argon atmosphere. Tetrahydrofuran (THF) was distilled from potassium wire/benzophenone ketyl radical under an argon atmosphere. Diethyl ether ( $\mathrm{Et}_{2} \mathrm{O}$ ) was distilled from sodium wire/benzophenone ketyl radical under an argon atmosphere.

2,6-lutidine, trimethylamine ( $\mathrm{Et}_{3} \mathrm{~N}$ ), diisopropylamine (DIPA) and diisopropylethylamine (DIPEA) were distilled from calcium hydride or calcium chloride and stored under an argon atmosphere. Dimethyl sulfoxide (DMSO) and $N, N^{\prime}$-dimethylformamide (DMF) were distilled from $\mathrm{MgSO}_{4}$ and stored over 4Å molecular sieves (MS). 2,3-Dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) was recrystallised from chloroform and Proton Sponge ${ }^{\circledR}$ recrystallised from EtOH. Oxalyl chloride was distilled. All solvents used in extraction and chromatography were distilled. The use of ammonium chloride $\left(\mathrm{NH}_{4} \mathrm{Cl}\right)$, sodium bicarbonate $\left(\mathrm{NaHCO}_{3}\right)$, sodium thiosulfate $\left(\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}\right)$, brine ( NaCl ) and sodium/potassium ( $\mathrm{Na} / \mathrm{K}$ ) tartrate refers to saturated aqueous solutions unless otherwise stated. $4 \AA \mathrm{MS}$ were activated by heating under high vacuum or in a microwave. $\mathrm{Ba}(\mathrm{OH})_{2}$ was prepared by heating $\mathrm{Ba}(\mathrm{OH})_{2} \cdot 8 \mathrm{H}_{2} \mathrm{O}$ at $150^{\circ} \mathrm{C}$ overnight under high vacuum before being stored in a glove box.

Flash column chromatography was performed according to the method described by Still, Kahn and Mitra, ${ }^{2}$ using a positive solvent pressure, with silica gel obtained from Merck Kieselgel 60 (230-400 mesh).

Reactions were monitored by TLC using pre-coated glass-backed plates (Merck Kieselgel 60 with fluorescent indicator UV254). Spots were visualised by quenching of UV fluorescence and staining with potassium permanganate or phosphomolybdic acid $/ \mathrm{Ce}_{2}\left(\mathrm{SO}_{4}\right)_{3}$, ninhydrin, anisaldehyde or vanillin dips.

NMR spectra were recorded using an internal deuterium lock for the residual protons in $\mathrm{CDCl}_{3}\left(\delta_{\mathrm{H}} 7.26 \mathrm{ppm}\right.$ ) at ambient probe temperatures on the following instruments: Bruker AVANCE BB 500, AVANCE TCI cryoprobe (500 MHz ) or AVANCE DRX $400(400 \mathrm{MHz})$. Proton data are presented in the following way: chemical shift (in ppm on a $\delta$-scale relative to $\delta_{T M S}=0 \mathrm{ppm}$ ), integration, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, quint $=$ quintet, $\mathrm{br}=\mathrm{broad}, \mathrm{app}=\mathrm{apparent})$, coupling constants $(\mathrm{J} / \mathrm{Hz})$ and assignment. Assignments were determined either on the basis of unambiguous chemical shift or coupling patterns, 2D NMR experiments, or by analogy to fully interpreted spectra for structurally related compounds. Protons of OH groups are missing in some spectra due to proton exchange. ${ }^{13} \mathrm{C}$ spectra were recorded by broadband proton spin decoupling, at ambient probe temperatures on the following instruments: Bruker AVANCE BB 500 and AVANCE TCI 500 ( 125.7 MHz ), using an internal deuterium lock for $\mathrm{CDCl}_{3}\left(\delta_{\mathrm{C}} 77.0\right)$. Chemical shifts are given in ppm on a $\delta$-scale relative to $\delta_{\text {TMS }}=0$.

Signals are assigned according to the numbering scheme for patellazole B (Figure SI-1), unless otherwise indicated. Signals for non-patellazole related compounds are denoted by a prime, e.g. H-1'. Optical rotations were recorded on a Perkin Elmer 241 polarimeter at the sodium D-line ( 589 nm ) using a 10 cm path length cell and are reported as follows: $[a]_{D}^{20}$ concentration ( $c$ in $\mathrm{g} / 100 \mathrm{~mL}$ ) and solvent.

High and low resolution mass spectra were recorded by the EPSRC Mass Spectrometry facility (Swansea, UK), using chemical ionisation (CI), electron impact (EI) or electron spray ionisation (ESI) techniques. The parent ion $[\mathrm{M}]^{+},[\mathrm{M}+\mathrm{H}]^{+},[\mathrm{M}-\mathrm{H}]^{+},\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$or $[\mathrm{M}+\mathrm{Na}]^{+}$is quoted. HPLC analysis was carried out on an Agilent 1200 series running in normal phase under UV detection using a ZORBAX RX-SIL ( $150 \mathrm{~mm} \times 4.6 \mathrm{~mm}$ ID) as the analytical column. Chiral analysis was carried out using a DAICEL CHIRALPAK-IA, IB, IC ( $250 \mathrm{~mm} \times 4.6 \mathrm{~mm}$ ID). Fourier transform IR spectra were recorded on a Perkin-Elmer Spectrum One FT-IR spectrometer with the sample being prepared as a thin film on a universal ATR sampling accessory. Wavelengths of maximum absorbance ( $v_{\text {max }}$ ) are quoted in $\mathrm{cm}^{-1}$.

Gas chromatography (GC) analysis was performed using a 6890N Network GC system (Agilent Technologies Inc., Palo Alto, CA, USA), equipped with a Varian CP7502, CHIRASIL DEX CB ( $25.0 \mathrm{~m} \times 250 \mu \mathrm{~m} \times 0.25 \mu \mathrm{~L}$ nominal) capilliary column. The GC analyses were carried out in split mode (ratio 50:1) using helium as a carrier gas at a flow rate of $134 \mathrm{~mL} \mathrm{~min}^{-1} 25.00 \mathrm{psi}$. The injection port temperature was $250^{\circ} \mathrm{C}$, using $\mathrm{H}_{2}$ flow at $40.00 \mathrm{~mL} \mathrm{~min}^{-1}$, air at $450 \mathrm{~mL} \mathrm{~min}^{-1}$ and helium makeup flow at $45.0 \mathrm{~mL} \mathrm{~min}^{-1}$.

## Diester 17

To a stirred solution of 3-methylglutaric acid ( $19.0 \mathrm{~g}, 13.0 \mathrm{mmol}, 1.0$ equiv.) in $\mathrm{MeOH}(250 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added acetyl chloride ( $37.1 \mathrm{~mL}, 52.0 \mathrm{mmol}, 4.0$ equiv.) dropwise. The reaction mixture was heated to reflux for 3 h . The solvent was removed in vacuo and the residue redissolved in $\mathrm{NaHCO}_{3}(100 \mathrm{~mL})$ to neutralise. Once gas evolution had ceased, the product was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 80 \mathrm{~mL})$. Combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to give diester 17 as a yellow oil ( $20.2 \mathrm{~g}, 89 \%$ ), which was used without further purification.
$\mathbf{R}_{\mathrm{f}} 0.61$ (2:1 PE/EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta_{H} 3.68\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right.$ ), 2.52-2.42 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-5$ ), $2.40(2 \mathrm{H}, \mathrm{dd}, \mathrm{J}$ $=15.0,6.0 \mathrm{~Hz}, \mathrm{H}-4 \mathrm{a}, \mathrm{H}-6 \mathrm{a}), 2.25(2 \mathrm{H}, \mathrm{dd}, \mathrm{J}=15.0,7.3, \mathrm{~Hz}, \mathrm{H}-4 \mathrm{~b}, \mathrm{H}-6 \mathrm{~b}), 1.03$ ( $3 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.5 \mathrm{~Hz}, \mathrm{Me}-5$ ); HRMS (ES+): calc. for $\mathrm{C}_{8} \mathrm{H}_{15} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+} 175.0965$, found 175.0962.

Acid 17a

A solution of $\mathrm{NaOH}(1.0 \mathrm{M}$ aq., $57.1 \mathrm{~mL}, 57.1 \mathrm{mmol}, 1.0$ equiv.) was added dropwise over 54 h , at such a rate as to maintain a pH between 6.5 and 8.0. After the addition was completed, the light brown suspension was filtered through Celite ${ }^{\circledR}$ and the residue rinsed with $\mathrm{H}_{2} \mathrm{O}(150 \mathrm{~mL})$. The pH of the combined filtrates was adjusted to 3 with $\mathrm{HCl}(3 \mathrm{M}$ aq.) and the mixture extracted with $\mathrm{Et}_{2} \mathrm{O}(8 \times 250 \mathrm{~mL})$. Combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo to give the enantioenriched acid ( $8.92 \mathrm{~g}, 55.3 \mathrm{mmol}, 97 \%$ ) as a colourless liquid.

Enantioenriched acid was dissolved in acetone ( 180 mL ) and cinchonidine ( $16.8 \mathrm{~g} 57.1 \mathrm{mmol}, 1.0$ equiv.) added. The white suspension was heated to $40^{\circ} \mathrm{C}$ and stirred rapidly. $\mathrm{H}_{2} \mathrm{O}(23 \mathrm{~mL})$ was added dropwise until a pale-
yellow solution formed. The solution was cooled to rt and then left to stand at $-5^{\circ} \mathrm{C}$ for 16 h to give off-white, needle like crystals. The solid was collected by filtration, washed with ice-cold acetone ( 35 mL ) and dried in vacuo. The mother liquor was recooled to $-10^{\circ} \mathrm{C}$, left to stand for 16 h , filtered and the solids washed (acetone, 20 mL ) and collected, to isolate a second crop of the crystals. Combined collected solids were dissolved in HCl $(2 \mathrm{M}, 120 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(5 \times 150 \mathrm{~mL})$. The organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo to give acid 17a as a colourless oil ( $5.53 \mathrm{~g}, 34.3 \mathrm{mmol}, 62 \%, 96 \% \mathrm{ee}$ ).
$\mathbf{R}_{\mathrm{f}} 0.24$ (1:1 PE/EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta_{\mathrm{H}} 3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OC} \underline{H}_{3}\right)$, 2.53-2.42 ( $3 \mathrm{H}, \mathrm{m}, \mathrm{H}-4 \mathrm{a}, \mathrm{H}-5, \mathrm{H}-6 \mathrm{a}$ ), 2.352.27 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-4 \mathrm{~b}, \mathrm{H}-6 \mathrm{~b}$ ), 1.08 ( $3 \mathrm{H}, \mathrm{d}, J=6.5 \mathrm{~Hz}, \mathrm{Me}-5$ ); HRMS (ES+): calc. for $\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{O}[\mathrm{M}-\mathrm{H}]^{-} 159.0663$, found 159.0665. $\mathbf{R}_{\mathbf{T}}$ (GC, CHIRASIL DEX CB, $134 \mathrm{~mL} \mathrm{~min}^{-1}, 25.00 \mathrm{psi}$, total run time 240 min ) 165.6 min (major), 172.0 $\min$ (minor).

## Alkene 22

A solution of iodide 21 ( $400 \mathrm{mg}, 0.69 \mathrm{mmol}, 1.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(7 \mathrm{~mL})$ was cooled to $-78{ }^{\circ} \mathrm{C}$ and $t$-BuLi ( 1.7 M in pentane, $1.6 \mathrm{~mL}, 2.78 \mathrm{mmol}, 4.0$ equiv.) added in a single portion. The reaction mixture was stirred for 3 min before the addition of B-Methoxy-9-BBN ( 1 M in hexanes, $4.27 \mathrm{~mL}, 4.27 \mathrm{mmol}, 6.0$ equiv.). After a further 5 min , the THF ( 7 mL ) was added and the resulting solution slowly warmed to $r$ t and stirred for a further $h . \mathrm{K}_{3} \mathrm{PO}_{4}(3 \mathrm{M}$, $0.7 \mathrm{~mL}, 2.01 \mathrm{mmol}, 3.0$ equiv.), $\mathrm{Pd}(\mathrm{dppf}) \mathrm{Cl}_{2}(51 \mathrm{mg}, 0.069 \mathrm{mmol}, 0.1$ equiv.) and $\mathrm{DMF}(7 \mathrm{~mL})$ were then added, followed by 2-bromopropene ( $0.18 \mathrm{~mL}, 2.07 \mathrm{mmol}, 3.0$ equiv.) The resulting solution was stirred for 16 h before being quenched with $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$. The layers were separated and the aqueous layer extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 15$ mL ). Combined organic layers were washed with brine ( 10 mL ), dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The crude material was purified by flash column chromatography (1:0 $\rightarrow 20: 1 \mathrm{PE} / \mathrm{EtOAc})$ to give alkene $\mathbf{2 2}$ as pale-yellow oil ( $231 \mathrm{mg}, 67 \%$, inconsequential mix of diastereomers) in an inseparable $3: 1$ mixture with the alkane arising from protonation of the lithiated intermediate.

The reaction mixture was then concentrated in vacuo and pentane ( 10 mL ) added. The precipitate formed was filtered through Celite ${ }^{\circledR}$ and the filtrate concentrated in vacuo. The crude silyl enol ether was then redissolved in $t-\mathrm{BuOH} / \mathrm{H}_{2} \mathrm{O} / \mathrm{THF}\left(1: 1: 1,20 \mathrm{~mL}\right.$ ) and $\mathrm{OsO}_{4}\left(4 \mathrm{wt} \%\right.$ in $\mathrm{H}_{2} \mathrm{O}, 1.4 \mathrm{~mL}, 0.22$ mmol, 0.05 equiv.) and NMO ( $50 \mathrm{wt} \%$ in $\mathrm{H}_{2} \mathrm{O}, 2.13 \mathrm{~mL}, 9.10 \mathrm{mmol}, 2.2$ equiv.) added. ## Aldol adduct 25

To a solution of allylic alcohol $\mathbf{1 4 b}$ ( 1.7 g , $8.58 \mathrm{mmol}, 1.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(40 \mathrm{~mL})$ was added $\mathrm{MnO}_{2}(7.47 \mathrm{~g}, 85.8$ $\mathrm{mmol}, 10$ equiv.) and stirred for 16 h . The reaction mixture was then filtered through Celite ${ }^{\circledR}$, which was washed with $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$. The filtrate was concentrated carefully in vacuo and the aldehyde (14) dried over $4 \AA \AA \mathrm{MS}$ before being used directly in the following reaction, without further purification.

To a solution of $\mathrm{Cy}_{2} \mathrm{BCl}\left(1.01 \mathrm{~mL}, 5.48 \mathrm{mmol}, 1.5\right.$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(8 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{Et}_{3} \mathrm{~N}(0.86 \mathrm{~mL}, 6.21$ $\mathrm{mmol}, 1.7$ equiv.) and stirred for 10 min before the addition of a solution of ketone $\mathbf{1 2}(1.25 \mathrm{~g}, 3.65 \mathrm{mmol}, 1.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(8 \mathrm{~mL})$. The reaction mixture was stirred for a further 75 min before cooling to $-78^{\circ} \mathrm{C}$. A solution of aldehyde $\mathbf{1 4}\left(2.5 \mathrm{~g}, 14.6 \mathrm{mmol}, 3.5\right.$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(8 \mathrm{~mL})$ was then added via cannula and the reaction mixture allowed to stir at this temperature for 5 h before quenching with $\mathrm{MeOH}(4 \mathrm{~mL}), \mathrm{pH} 7$ buffer ( 4 mL ) and $\mathrm{H}_{2} \mathrm{O}_{2}(30$ $\mathrm{wt} \% \mathrm{aq}, 2.5 \mathrm{~mL}$ ) and warming to rt , stirring for a further 30 min . The layers were then separated and the aqueous layer extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 8 \mathrm{~mL})$. Combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The crude material was purified by flash column chromatography (9:1 PE/EtOAc) to give aldol adduct $\mathbf{2 5}$ as a pale-yellow oil ( $1.61 \mathrm{~g}, 82 \%,>20: 1 \mathrm{dr}$ ).

## Confirmation of C15 stereochemistry: Acetonide Ac-26

To a solution of silyl ether ent-26 ( $10 \mathrm{mg}, 0.018 \mathrm{mmol}, 1.0$ equiv.) in THF ( 0.5 mL ) was added TBAF ( $1.0 \mathrm{M}, 27$ $\mu \mathrm{L}, 0.027 \mathrm{mmol}, 1.5$ equiv.) and stirred for 3 h . [^0]Analysis of a series of 1D NOEs was carried out to determine the acetonide stereochemistry (Figure SI-2). We hypothesised that in the anti-acetonide case (desired diastereomer), $\mathrm{H}-15$ and $\mathrm{H}-16$ would exhibit asymmetric NOEs with respect to the two geminal methyl groups. A strong NOE was observed between $\mathrm{H}-15$ and $\mathrm{Me}-\mathrm{I}^{\prime}$ (combined with a weak NOE to Me-2'), whereas the opposite was true for $\mathrm{H}-16$. In the syn-acetonide case (undesired diastereomer), it was expected that both protons should observe similarly strong NOEs to one methyl group and correspondingly weak ones to the other. Thus, the observed asymmetric NOE correlations to the acetonide Me protons is diagnostic for our stereochemical assignment. To corroborate our observations, a conformational search and optimisation of the lowest energy conformers with density functional theory (DFT) (B3LYP/LACVP**) was conducted for Ac-26. ${ }^{\dagger}$ The optimised structure obtained Figure SI-3 (coordinates shown in Table SI-1) confirmed the NOEs observed.

[^0]:    * Exploratory studies on the C13-C19 fragment commenced with the enantiomeric series from (S)-Roche ester due to the greater availability of $(S)$-Roche ester in our laboratory.

[^1]:    ${ }^{\dagger}$ Structure optimisation was conducted as follows: A conformational search was carried out in MacroModel ${ }^{13}$ using a hybrid of Monte Carlo multiple-minimum (MCMM) ${ }^{14}$ / low-mode sampling ${ }^{15}$ with the Merck Molecular Force Field (MMFF), ${ }^{16}$ interfaced with Maestro 9.3. ${ }^{17}$ The searches were carried out with a sufficient number of steps to find all conformers within $10 \mathrm{~kJ} \mathrm{~mol}^{-1}$ of the global minimum. Calculations were carried out in gas phase. All conformers within $10 \mathrm{~kJ} \mathrm{~mol}^{-1}$ of the global minimum were then further subjected to quantum mechanical calculations. Single point energies were evaluated at the B3LYP ${ }^{18,19} /$ LACVP** level of theory, implemented with Jaguar 7.9
