By taking a counterexample, we prove that the multistep iteration process is faster than the Mann and Ishikawa iteration processes for Zamfirescu operators.

1. Introduction

Let C be a nonempty convex subset of a normed space E , and let $T : C \rightarrow C$ be a mapping.

(a) For arbitrary $x_0 \in C$, the sequence $\{x_n\}$ defined by

$$x_{n+1} = (1 - b_n)x_n + b_nTx_n, \quad n \geq 0, \quad (M_n)$$

where $\{b_n\}$ is a sequence in $[0, 1]$, is known as the Mann iteration process [1].

(b) For arbitrary $x_0 \in C$, the sequence $\{x_n\}$ defined by

$$\begin{aligned} x_{n+1} &= (1 - b_n)x_n + b_nTy_n, \\ y_n &= (1 - b'_n)x_n + b'_nTx_n, \quad n \geq 0, \end{aligned} \quad (I_n)$$

where $\{b_n\}$ and $\{b'_n\}$ are sequences in $[0, 1]$, is known as the Ishikawa iteration process [2].

(c) For arbitrary $x_0 \in C$, the sequence $\{x_n\}$ defined by

$$\begin{aligned} x_{n+1} &= (1 - b_n)x_n + b_nTy_n^1, \\ y_n^i &= (1 - b_n^i)x_n + b_n^iT_n y_n^{i+1}, \\ y_n^{p-1} &= (1 - b_n^{p-1})x_n + b_n^{p-1}T^m x_n, \quad n \geq 0, \end{aligned} \quad (RS_n)$$

where $\{b_n\}$ and $\{b_n^i\}$, $i = 1, 2, \dots, p-2$ ($p \geq 2$), are sequences in $[0, 1]$ and denoted by (RS_n) , is known as the multistep iteration process [3].

Definition 1 (see [4]). Suppose that $\{a_n\}$ and $\{b_n\}$ are two real convergent sequences with limits a and b , respectively. Then, $\{a_n\}$ is said to converge faster than $\{b_n\}$ if

$$\lim_{n \rightarrow \infty} \left| \frac{a_n - a}{b_n - b} \right| = 0. \quad (1)$$

Definition 2 (see [4]). Let $\{u_n\}$ and $\{v_n\}$ be two fixed-point iteration procedures which, both, converge to the same fixed point p , say, with error estimates,

$$\|u_n - p\| \leq a_n, \quad \|v_n - p\| \leq b_n, \quad n \geq 0, \quad (2)$$

where $\lim a_n = 0 = \lim b_n$. If $\{a_n\}$ converges faster than $\{b_n\}$, then $\{u_n\}$ is said to converge faster than $\{v_n\}$.

Theorem 3 (see [5]). Let (X, d) be a complete metric space, and let $T : X \rightarrow X$ be a mapping for which there exist real numbers a, b , and c satisfying $a \in (0, 1)$ and $b, c \in (0, 1/2)$ such that, for each pair $x, y \in X$, at least one of the following is true:

$$(z1) \quad d(Tx, Ty) \leq ad(x, y),$$

$$(z2) \ d(Tx, Ty) \leq b[d(x, Tx) + d(y, Ty)],$$

$$(z3) \ d(Tx, Ty) \leq c[d(x, Ty) + d(y, Tx)].$$

Then, T has a unique fixed point p , and the Picard iteration $\{x_n\}$ defined by

$$x_{n+1} = Tx_n, \quad n \geq 0, \tag{3}$$

converges to p for any $x_0 \in X$.

Remark 4. An operator T , which satisfies the contraction conditions (z1)–(z3) of Theorem 3, will be called a *Zamfirescu operator* [4, 6, 7].

In [6, 7], Berinde introduced a new class of operators on a normed space E satisfying

$$\|Tx - Ty\| \leq \delta \|x - y\| + L \|Tx - x\|, \tag{4}$$

for any $x, y \in E$, $0 \leq \delta < 1$, and $L \geq 0$.

He proved that this class is wider than the class of Zamfirescu operators.

The following results are proved in [6, 7].

Theorem 5 (see [7]). *Let C be a nonempty closed convex subset of a normed space E . Let $T : C \rightarrow C$ be an operator satisfying (4). Let $\{x_n\}$ be defined through the iterative process (M_n) and $x_0 \in C$. If $F(T) \neq \emptyset$ and $\sum_{n=0}^{\infty} b_n = \infty$, then $\{x_n\}$ converges strongly to the unique fixed point of T .*

Theorem 6 (see [6]). *Let C be a nonempty closed convex subset of an arbitrary Banach space E , and let $T : C \rightarrow C$ be an operator satisfying (4). Let $\{x_n\}$ be defined through the iterative process (I_n) and $x_0 \in C$, where $\{b_n\}$ and $\{b'_n\}$ are sequences of positive numbers in $[0, 1]$ with $\{b_n\}$ satisfying $\sum_{n=0}^{\infty} b_n = \infty$. Then, $\{x_n\}$ converges strongly to the fixed point of T .*

The following result can be found in [8].

Theorem 7. *Let C be a closed convex subset of an arbitrary Banach space E . Let the Mann and Ishikawa iteration processes with real sequences $\{b_n\}$ and $\{b'_n\}$ satisfy $0 \leq b_n, b'_n \leq 1$, and $\sum_{n=0}^{\infty} b_n = \infty$. Then, (M_n) and (I_n) converge strongly to the unique fixed point of T . Let $T : C \rightarrow C$ be a Zamfirescu operator, and, moreover, the Mann iteration process converges faster than the Ishikawa iteration process to the fixed point of T .*

In [4], Berinde proved the following result.

Theorem 8. *Let C be a closed convex subset of an arbitrary Banach space E , and let $T : C \rightarrow C$ be a Zamfirescu operator. Let $\{y_n\}$ be defined by (M_n) and $y_0 \in C$ with a sequence $\{b_n\}$ in $[0, 1]$ satisfying $\sum_{n=0}^{\infty} b_n = \infty$. Then, $\{y_n\}$ converges strongly to the fixed point of T , and, moreover, the Picard iteration $\{x_n\}$ converges faster than the Mann iteration.*

Remark 9. In [9], Qing and Rhoades by taking a counterexample showed that the Mann iteration process converges more slowly than the Ishikawa iteration process for Zamfirescu operators.

In this paper, we establish a general theorem to approximate fixed points of quasi-contractive operators in a Banach space through the multistep iteration process. Our result generalizes and improves upon, among others, the corresponding results of Babu and Vara Prasad [8] and Berinde [4, 6, 7].

We also prove that the Mann iteration process and the Ishikawa iteration process converge more slowly than the multistep iteration process for Zamfirescu operators.

2. Main Results

We now prove our main results.

Theorem 10. *Let C be a nonempty closed convex subset of an arbitrary Banach space E , and let $T : C \rightarrow C$ be an operator satisfying (4). Let $\{x_n\}$ be defined through the iterative process (RS_n) and $x_0 \in C$, where $\{b_n\}$ and $\{b'_n\}$, $i = 1, 2, \dots, p-2$ ($p \geq 2$), are sequences in $[0, 1]$ with $\sum_{n=0}^{\infty} b_n = \infty$. If $F(T) \neq \emptyset$, then $F(T)$ is a singleton, and the sequence $\{x_n\}$ converges strongly to the fixed point of T .*

Proof. Assume that $F(T) \neq \emptyset$ and $w \in F(T)$. Then, using (RS_n) , we have

$$\begin{aligned} \|x_{n+1} - w\| &= \|(1 - b_n)x_n + b_nTy_n^1 - w\| \\ &= \|(1 - b_n)(x_n - w) + b_n(Ty_n^1 - w)\| \\ &\leq (1 - b_n)\|x_n - w\| + b_n\|Ty_n^1 - w\|. \end{aligned} \tag{5}$$

Now, for $x = w$ and $y = y_n^1$, (4) gives

$$\|Ty_n^1 - w\| \leq \delta \|y_n^1 - w\|. \tag{6}$$

By substituting (6) in (5), we obtain

$$\|x_{n+1} - w\| \leq (1 - b_n)\|x_n - w\| + \delta b_n\|y_n^1 - w\|. \tag{7}$$

In a similar fashion, again by using (RS_n) , we can get

$$\|y_n^i - w\| \leq (1 - b'_n)\|x_n - w\| + \delta b'_n\|y_n^{i+1} - w\|, \tag{8}$$

where $i = 1, 2, \dots, p-2$ ($p \geq 2$) and

$$\|y_n^{p-1} - w\| \leq (1 - (1 - \delta)b_n^{p-1})\|x_n - w\|. \tag{9}$$

It can be easily seen that, for $i = 1, 2, \dots, p-2$ ($p \geq 2$), we have

$$\|y_n^1 - w\| \leq (1 - b_n^1)\|x_n - w\| + \delta b_n^1\|y_n^2 - w\|,$$

⋮

$$\|y_n^{p-3} - w\| \leq (1 - b_n^{p-3})\|x_n - w\| + \delta b_n^{p-3}\|y_n^{p-2} - w\|,$$

$$\|y_n^{p-2} - w\| \leq (1 - b_n^{p-2})\|x_n - w\| + \delta b_n^{p-2}\|y_n^{p-1} - w\|. \tag{10}$$

Substituting (9) in (10) gives us

$$\|y_n^{p-2} - w\| \leq (1 - (1 - \delta) b_n^{p-2} (1 + \delta b_n^{p-1})) \|x_n - w\|. \quad (11)$$

It may be noted that, for $\delta \in [0, 1)$ and $\{\eta_n\} \in [0, 1]$, the following inequality is always true:

$$1 \leq 1 + \delta \eta_n \leq 1 + \delta. \quad (12)$$

From (11) and (12), we get

$$\|y_n^{p-2} - w\| \leq (1 - (1 - \delta) b_n^{p-2}) \|x_n - w\|. \quad (13)$$

By repeating the same procedure, finally from (7) and (10), we yield

$$\|x_{n+1} - w\| \leq [1 - (1 - \delta) b_n] \|x_n - w\|. \quad (14)$$

By (14), we inductively obtain

$$\|x_{n+1} - w\| \leq \prod_{k=0}^n [1 - (1 - \delta) b_k] \|x_0 - w\|, \quad n \geq 0. \quad (15)$$

Using the fact that $0 \leq \delta < 1$, $0 \leq b_n \leq 1$, and $\sum_{n=0}^{\infty} b_n = \infty$, it results that

$$\lim_{n \rightarrow \infty} \prod_{k=0}^n [1 - (1 - \delta) b_k] = 0, \quad (16)$$

which, by (15), implies that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - w\| = 0. \quad (17)$$

Consequently, $x_n \rightarrow w \in F$, and this completes the proof. \square

Now, by a counterexample, we prove that the multistep iteration process is faster than the Mann and Ishikawa iteration processes for Zamfirescu operators.

Example 11. Suppose that $T : [0, 1] \rightarrow [0, 1]$ is defined by $Tx = (1/2)x$; $b_n = 0 = b_n^{p-1} = b_n^i$, $i = 1, 2, \dots, p - 1$ ($p \geq 2$), and $n = 1, 2, \dots, 15$; $b_n = 4/\sqrt{n} = b_n^{p-1} = b_n^i$, $i = 1, 2, \dots, p - 1$ ($p \geq 2$), and $n \geq 16$. It is clear that T is a Zamfirescu operator with a unique fixed point 0 and that all of the conditions of Theorem 10 are satisfied. Also, $M_n = x_0 = I_n = RS_n$, $n = 1, 2, \dots, 15$. Suppose that $x_0 \neq 0$. For the Mann and Ishikawa iteration processes, we have

$$\begin{aligned} M_n &= (1 - b_n) x_n + b_n T x_n \\ &= \left(1 - \frac{4}{\sqrt{n}}\right) x_n + \frac{4}{\sqrt{n}} \frac{1}{2} x_n \\ &= \left(1 - \frac{2}{\sqrt{n}}\right) x_n \\ &= \dots = \prod_{i=16}^n \left(1 - \frac{2}{\sqrt{i}}\right) x_0, \end{aligned}$$

$$I_n = (1 - b_n) x_n + b_n T \left((1 - b_n') x_n + b_n' T x_n \right)$$

$$= \left(1 - \frac{4}{\sqrt{n}}\right) x_n + \frac{4}{\sqrt{n}} \frac{1}{2} \left(1 - \frac{2}{\sqrt{n}}\right) x_n$$

$$= \left(1 - \frac{2}{\sqrt{n}} - \frac{4}{n}\right) x_n$$

$$= \dots = \prod_{i=16}^n \left(1 - \frac{2}{\sqrt{i}} - \frac{4}{i}\right) x_0,$$

$$RS_n = (1 - b_n) x_n + b_n T y_n^1,$$

$$y_n^i = (1 - b_n^i) x_n + b_n^i T y_n^{i+1},$$

$$y_n^{p-1} = (1 - b_n^{p-1}) x_n + b_n^{p-1} T x_n, \quad n \geq 0,$$

(18)

where $i = 1, 2, \dots, p - 2$ ($p \geq 2$) implies that

$$RS_n = \left(1 - \sum_{j=1}^p \left(\frac{2}{\sqrt{n}}\right)^j\right) x_n$$

(19)

$$= \dots = \prod_{i=16}^n \left(1 - \sum_{j=1}^p \left(\frac{2}{\sqrt{i}}\right)^j\right) x_0.$$

Now, consider

$$\left| \frac{RS_n - 0}{M_n - 0} \right| = \left| \frac{\prod_{i=16}^n \left(1 - \sum_{j=1}^p (2/\sqrt{i})^j\right) x_0}{\prod_{i=16}^n \left(1 - (2/\sqrt{i})\right) x_0} \right|$$

$$= \left| \frac{\prod_{i=16}^n \left(1 - \sum_{j=1}^p (2/\sqrt{i})^j\right)}{\prod_{i=16}^n \left(1 - (2/\sqrt{i})\right)} \right|$$

(20)

$$= \left| \prod_{i=16}^n \left(1 - \frac{\sum_{k=2}^p (2/\sqrt{i})^k}{1 - (2/\sqrt{i})}\right) \right|$$

$$= \left| \prod_{i=16}^n \left(1 - \frac{\sum_{k=2}^p (2/\sqrt{i})^k \sqrt{i}}{\sqrt{i} - 2}\right) \right|.$$

It is easy to see that

$$0 \leq \lim_{n \rightarrow \infty} \prod_{i=16}^n \left(1 - \frac{\sum_{k=2}^p (2/\sqrt{i})^k \sqrt{i}}{\sqrt{i} - 2}\right)$$

$$\leq \lim_{n \rightarrow \infty} \prod_{i=16}^n \left(1 - \frac{1}{i}\right)$$

(21)

$$= \lim_{n \rightarrow \infty} \frac{15}{n}$$

$$= 0.$$

Hence,

$$\lim_{n \rightarrow \infty} \left| \frac{RS_n - 0}{M_n - 0} \right| = 0.$$

(22)

Thus, the Mann iteration process converges more slowly than the multistep iteration process to the fixed point 0 of T .

Similarly,

$$\begin{aligned} \left| \frac{RS_n - 0}{I_n - 0} \right| &= \left| \frac{\prod_{i=16}^n \left(1 - \sum_{j=1}^p (2/\sqrt{i})^j \right) x_0}{\prod_{i=16}^n \left(1 - (2/\sqrt{i}) - (4/i) \right) x_0} \right| \\ &= \left| \frac{\prod_{i=16}^n \left(1 - \sum_{j=1}^p (2/\sqrt{i})^j \right)}{\prod_{i=16}^n \left(1 - (2/\sqrt{i}) - (4/i) \right)} \right| \tag{23} \\ &= \left| \prod_{i=16}^n \left(1 - \frac{\sum_{k=3}^p (2/\sqrt{i})^k}{1 - (2/\sqrt{i}) - (4/i)} \right) \right| \\ &= \left| \prod_{i=16}^n \left(1 - \frac{\sum_{k=3}^p (2/\sqrt{i})^k i \sqrt{i}}{i \sqrt{i} - 2i - 4\sqrt{i}} \right) \right|, \end{aligned}$$

with

$$\begin{aligned} 0 &\leq \lim_{n \rightarrow \infty} \prod_{i=16}^n \left(1 - \frac{\sum_{k=3}^p (2/\sqrt{i})^k i \sqrt{i}}{i \sqrt{i} - 2i - 4\sqrt{i}} \right) \\ &\leq \lim_{n \rightarrow \infty} \prod_{i=16}^n \left(1 - \frac{1}{i} \right) \tag{24} \\ &= \lim_{n \rightarrow \infty} \frac{15}{n} \\ &= 0, \end{aligned}$$

implies that

$$\lim_{n \rightarrow \infty} \left| \frac{RS_n - 0}{I_n - 0} \right| = 0. \tag{25}$$

Thus, the Ishikawa iteration process converges more slowly than the multistep iteration process to the fixed point 0 of T .

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
