A stochastic delay predator-prey model in a polluted environment with impulsive toxicant input is proposed and studied. The thresholds between stability in time average and extinction of each population are obtained. Some recent results are extended and improved greatly. Several simulation figures are introduced to support the conclusions.

## 1. Introduction

Environmental pollution by industries, agriculture, and other human activities is one of the most important socioecological problems in the world today. Due to toxins in the environment, lots of species have gone extinct, and many are on the verge of extinction. Thus, controlling the environmental pollution and the conservation of biodiversity are the major focus areas of all the countries around the world. This motivates scholars to study the effects of toxins on populations and to find out a theoretical persistenceextinction threshold.

Recently, a lot of population models in a polluted environment have been proposed and investigated; here, we may mention, among many others, [1-23]. Particularly, Yang et al. [15] pointed out that in many cases toxicants should be emitted in regular pulses, for example, the use of pesticides and the pollution by heavy metals (see, e.g., [24]). Thus, they proposed the following two-species LotkaVolterra predator-prey system in a polluted environment with impulsive toxicant input:

$$
\begin{aligned}
& \frac{d x_{1}(t)}{d t}=x_{1}(t)\left[r_{10}-r_{11} C_{10}(t)-a_{11} x_{1}(t)-a_{12} x_{2}(t)\right] \\
& \frac{d x_{2}(t)}{d t}=x_{2}(t)\left[-r_{20}-r_{21} C_{20}(t)+a_{21} x_{1}(t)-a_{22} x_{2}(t)\right] \\
& \frac{d C_{10}(t)}{d t}=k_{1} C_{e}(t)-\left(g_{1}+m_{1}\right) C_{10}(t)
\end{aligned}
$$

$$
\begin{align*}
& \frac{d C_{20}(t)}{d t}=k_{2} C_{e}(t)-\left(g_{2}+m_{2}\right) C_{20}(t), \\
& \frac{d C_{e}(t)}{d t}=-h C_{e}(t), \\
& t \neq n \gamma, \quad n \in Z^{+}, \\
& \Delta x_{i}(t)=0, \quad \Delta C_{i 0}(t)=0, \quad \Delta C_{e}(t)=b, \\
& t=n \gamma, \quad n \in Z^{+}, \quad i=1,2, \tag{1}
\end{align*}
$$

where all the parameters are positive constants and $\Delta f(t)=$ $f\left(t^{+}\right)-f(t), Z^{+}=\{1,2, \ldots\} ; x_{1}(t)$ and $x_{2}(t)$ : the size of prey population and the predator population, respectively; $r_{i 0}$ : the intrinsic growth rate of the $i$ th population without toxicant; $r_{i 1}$ : the $i$ th population response to the pollutant present in the organism; $C_{i 0}(t)$ : the concentration of toxicant in the $i$ th organism; $C_{e}(t)$ : the concentration of toxicant in the environment; $k C_{e}(t)$ : the organism's net uptake of toxicant from the environment; $g C_{i 0}(t)+m C_{i 0}(t)$ : the egestion and depuration rates of the toxicant in the $i$ th organism; $h C_{e}(t)$ : the toxicant loss from the environment itself by volatilization and so on; $\gamma$ : the period of the impulsive effect about the exogenous input of toxicant; $b$ : the toxicant input amount at every time.

Yang et al. [15] showed that in the following Lemma holds.

Lemma 1. For system (1), define
$\Delta_{2}=r_{10} a_{21}-r_{20} a_{11}, \quad \bar{\Delta}_{2}:=\frac{a_{21} r_{11} K_{1}}{\gamma}+\frac{a_{11} r_{21} K_{2}}{\gamma}$,

$$
\begin{equation*}
K_{i}=\frac{k_{i} b}{h\left(g_{i}+m_{i}\right)} . \tag{2}
\end{equation*}
$$

(a) If $r_{10}<r_{11} K_{1} / \gamma$, then $\lim _{t \rightarrow+\infty} x_{i}(t)=0, i=1,2$.
(b) If $r_{10}>r_{11} K_{1} / \gamma$ and $\Delta_{2}<\bar{\Delta}_{2}$, then limsup $\sup _{t \rightarrow+\infty}$ $t^{-1} \int_{0}^{t} x_{1}(s) d s>0$ and $x_{2}(t)$ goes to extinction.
(c) If $\Delta_{2}>\bar{\Delta}_{2}$, then $\lim \sup _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} x_{i}(s) d s>0, i=$ $1,2$.

Some interesting and important problems arise naturally.
(Q1) In the real world, the growth of species depends on various environmental factors, such as temperature, humidity and parasites and so forth. Therefore population models should be stochastic rather than deterministic (May [25]). Thus, what happens if model (1) is subject to stochastic noises?
(Q2) In addition, time delays occur in almost every situation. Kuang [26] has pointed out that ignoring time delays means ignoring reality. Therefore, what happens if model (1) takes time delays into account?
(Q3) Can we improve the results given in Lemma 1?
The aim of this paper is to study the above problems. Suppose that stochastic noises mainly affect the growth rates, with $r_{i 0} \rightarrow r_{i 0}+\alpha_{i} \dot{B}_{i}(t)$ (see, e.g., [27-39]), where $\dot{B}_{i}(t)$ is a white noise and $\alpha_{i}^{2}$ is the intensity of the noise. Moreover, taking time delays into account, we obtain the following model:

$$
\begin{align*}
& d x_{1}(t)=x_{1}(t)\left[r_{10}-r_{11} C_{10}(t)-a_{11} x_{1}(t)\right. \\
& \left.\quad-a_{12} x_{2}\left(t-\tau_{1}\right)\right] d t+\alpha_{1} x_{1}(t) d B_{1}(t), \\
& d x_{2}(t)=x_{2}(t)\left[-r_{20}-r_{21} C_{20}(t)-a_{22} x_{2}(t)\right. \\
& \left.\quad+a_{21} x_{1}\left(t-\tau_{2}\right)\right] d t+\alpha_{2} x_{2}(t) d B_{2}(t), \\
& \frac{d C_{10}(t)}{d t}= \\
& k_{1} C_{e}(t)-\left(g_{1}+m_{1}\right) C_{10}(t), \\
& \frac{d C_{20}(t)}{d t}= \\
& k_{2} C_{e}(t)-\left(g_{2}+m_{2}\right) C_{20}(t), \\
& \frac{d C_{e}(t)}{d t}=-h C_{e}(t), \\
& t \neq n \gamma, \quad n \in Z^{+},  \tag{3}\\
& \Delta x_{i}(t)=0, \quad \Delta C_{i 0}(t)=0, \\
& \Delta C_{e}(t)=b, \quad t=n \gamma, n \in Z^{+}, i=1,2,
\end{align*}
$$

with initial condition

$$
\begin{equation*}
x_{i}(t)=\phi_{i}(t)>0, \quad t \in[-\tau, 0] ; \quad \phi_{i}(0)>0, \quad i=1,2, \tag{4}
\end{equation*}
$$

where $\tau_{i} \geq 0, \tau=\max \left\{\tau_{1}, \tau_{2}\right\}, \phi_{i}(t)$ is continuous on $[-\tau, 0]$. Our main result is the following theorem.

Theorem 2. For system (3), define

$$
\begin{gather*}
\theta_{1}=r_{10}-0.5 \alpha_{1}^{2}, \quad \theta_{2}=r_{20}+0.5 \alpha_{2}^{2}, \quad \Delta=a_{11} a_{22}+a_{12} a_{21}, \\
\widetilde{\Delta}_{1}:=\theta_{1} a_{22}+\theta_{2} a_{12}, \quad \widetilde{\Delta}_{2}:=\theta_{1} a_{21}-\theta_{2} a_{11}, \\
\bar{\Delta}_{1}:=\frac{a_{22} r_{11} K_{1}}{\gamma}-\frac{a_{12} r_{21} K_{2}}{\gamma} . \tag{5}
\end{gather*}
$$

(i) If $\theta_{1}<r_{11} K_{1} / \gamma$, then both $x_{1}$ and $x_{2}$ go to extinction almost surely (a.s.); that is, $\lim _{t \rightarrow+\infty} x_{i}(t)=0$ a.s., $i=$ $1,2$.
(ii) If $\theta_{1}>r_{11} K_{1} / \gamma$ and $\widetilde{\Delta}_{2}<\bar{\Delta}_{2}$, then $x_{2}(t)$ goes to extinction and $x_{1}$ is stable in time average a.s.; that is,

$$
\begin{equation*}
\lim _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} x_{1}(s) d s=\frac{\theta_{1}-r_{11} K_{1} / \gamma}{a_{11}}>0, \text { a.s. } \tag{6}
\end{equation*}
$$

(iii) If $\widetilde{\Delta}_{2}>\bar{\Delta}_{2}$, then both $x_{1}$ and $x_{2}$ are stable in time average a.s.

$$
\begin{align*}
& \lim _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} x_{1}(s) d s=\frac{\widetilde{\Delta}_{1}-\bar{\Delta}_{1}}{\Delta}>0, \text { a.s. }  \tag{7}\\
& \lim _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} x_{2}(s) d s=\frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{\Delta}>0, \text { a.s. }
\end{align*}
$$

Remark 3. By comparing Lemma 1 with our Theorem 2, we can see that on the one hand, if $\alpha_{1}=\alpha_{2}=0$ and $\tau_{1}=\tau_{2}=0$, then $\theta_{i}=r_{i 0}, \widetilde{\Delta}_{i}=\Delta_{i}, i=1,2$, and our stochastic delay system (3) becomes model (1); on the other hand, our results in Theorem 2 improve that in Lemma 1. Lemma 1 shows that the superior limit is positive, while Theorem 2 reveals that the limit exists and gives the explicit form of the limit. The contribution of this paper is therefore clear.

## 2. Proof

For the sake of simplicity, we introduce some notations:

$$
\begin{gather*}
R_{+}^{2}=\left\{a=\left(a_{1}, a_{2}\right) \in R^{2} \mid a_{i}>0, i=1,2\right\}, \\
\langle f(t)\rangle=t^{-1} \int_{0}^{t} f(s) d s ; \\
\langle f(t)\rangle^{*}=\limsup _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} f(s) d s,  \tag{8}\\
\langle f(t)\rangle_{*}=\liminf _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} f(s) d s .
\end{gather*}
$$

Lemma 4. For any given initial value $\phi(t)=\left(\phi_{1}(t), \phi_{2}(t)\right) \in$ $C\left([-\tau, 0], R_{+}^{2}\right)$, there is a unique global positive solution $x(t)=$ $\left(x_{1}(t), x_{2}(t)\right)^{T}$ to the first two equations of system (3) a.s.

Proof. The proof is similar to Hung [29] by defining

$$
\begin{align*}
V(x)= & {\left[x_{1}-1-\ln x_{1}\right]+\frac{a_{11} a_{22}}{a_{21}^{2}}\left[x_{2}-1-\ln x_{2}\right] } \\
& +0.5 a_{11} \int_{t-\tau_{2}}^{t} x_{1}^{2}(s) d s \tag{9}
\end{align*}
$$

and hence is omitted.

To begin with, let us consider the following subsystem of (3):

$$
\begin{gather*}
\frac{d C_{10}(t)}{d t}=k_{1} C_{e}(t)-\left(g_{1}+m_{1}\right) C_{10}(t), \\
\frac{d C_{20}(t)}{d t}=k_{2} C_{e}(t)-\left(g_{2}+m_{2}\right) C_{20}(t), \\
\frac{d C_{e}(t)}{d t}=-h C_{e}(t),  \tag{10}\\
t \neq n \gamma, \quad n \in Z^{+}, \\
\Delta C_{10}(t)=0, \quad \Delta C_{20}(t)=0, \quad \Delta C_{e}(t)=b, \\
t=n \gamma, \quad n \in Z^{+}, \\
0 \leq C_{0}(0) \leq 1, \quad 0 \leq C_{e}(0) \leq 1 .
\end{gather*}
$$

Lemma 5 (see $[13,15]$ ). System (10) has a unique positive $\gamma$ periodic solution $\left(\widetilde{C}_{10}(t), \widetilde{C}_{20}(t), \widetilde{C}_{e}(t)\right)^{T}$, and for each solution $\left(C_{10}(t), C_{20}(t), C_{e}(t)\right)^{T}$ of $(10), C_{10}(t) \rightarrow \widetilde{C}_{10}(t), C_{20}(t) \rightarrow$ $\widetilde{C}_{20}(t)$, and $C_{e}(t) \rightarrow \widetilde{C}_{e}(t)$ as $t \rightarrow \infty$. Moreover, $C_{i 0}(t)>$ $\widetilde{C}_{i 0}(t)$ and $C_{e}(t)>\widetilde{C}_{e}(t)$ for all $t \geq 0$ if $C_{i 0}(0)>\widetilde{C}_{i 0}(0)$ and $C_{e}(0)>\widetilde{C}_{e}(0), i=1,2$, where

$$
\begin{gathered}
\widetilde{C}_{10}(t)=\widetilde{\mathrm{C}}_{10}(0) e^{-\left(g_{1}+m_{1}\right)(t-n \gamma)} \\
+\frac{k_{1} b\left(e^{-\left(g_{1}+m_{1}\right)(t-n \gamma)}-e^{-h(t-n \gamma)}\right)}{\left(h-g_{1}-m_{1}\right)\left(1-e^{-h \gamma}\right)}, \\
\widetilde{\mathrm{C}}_{20}(t)=\widetilde{\mathrm{C}}_{20}(0) e^{-\left(g_{2}+m_{2}\right)(t-n \gamma)} \\
+\frac{k_{2} b\left(e^{-\left(g_{2}+m_{2}\right)(t-n \gamma)}-e^{-h(t-n \gamma)}\right)}{\left(h-g_{2}-m_{2}\right)\left(1-e^{-h \gamma}\right)}, \\
\widetilde{\mathrm{C}}_{10}(0)=\frac{\widetilde{C}_{e}(t)=\frac{b e^{-h(t-n \gamma)}}{1-e^{-h \gamma}},}{\left(h-g_{1}-m_{1}\right)\left(1-e^{-\left(g_{1}+m_{1}\right) \gamma}\right)\left(1-e^{-h \gamma}\right)}, \\
k_{1} b\left(e^{-\left(g_{1}+m_{1}\right) \gamma}-e^{-h \gamma}\right) \\
\widetilde{C}_{20}(0)=\frac{k_{2} b\left(e^{-\left(g_{2}+m_{2}\right) \gamma}-e^{-h \gamma}\right)}{\left(h-g_{2}-m_{2}\right)\left(1-e^{-\left(g_{2}+m_{2}\right) \gamma}\right)\left(1-e^{-h \gamma}\right)}, \\
\widetilde{C}_{e}(0)=\frac{b}{1-e^{-h \gamma}}
\end{gathered}
$$

for $t \in(n \gamma,(n+1) \gamma]$ and $n \in Z^{+}$. In addition,

$$
\begin{equation*}
\lim _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} \widetilde{C}_{i 0}(s) d s=\frac{k_{i} b}{h\left(g_{i}+m_{i}\right) \gamma}=\frac{K_{i}}{\gamma}, \quad i=1,2 . \tag{12}
\end{equation*}
$$

Lemma 6 (see [34]). Suppose that $x(t) \in C\left[\Omega \times[0,+\infty), R_{+}\right]$.
(I) If there exist $\sigma$ and positive constants $\sigma_{0}, T$ such that

$$
\begin{equation*}
\ln x(t) \leq \sigma t-\sigma_{0} \int_{0}^{t} x(s) d s+\sum_{i=1}^{n} \beta_{i} B_{i}(t) \tag{13}
\end{equation*}
$$

for $t \geq T$, where $B_{i}(t)$ are independent standard Brownian motions and $\beta_{i}$ are constants, $1 \leq i \leq n$, then one has the following: if $\sigma \geq 0$, then $\langle x\rangle^{*} \leq \sigma / \sigma_{0}$ a.s.; if $\sigma<0$, then $\lim _{t \rightarrow+\infty} x(t)=0$ a.s.
(II) If there exist positive constants $\sigma_{0}, T$ and $\sigma$ such that

$$
\begin{equation*}
\ln x(t) \geq \sigma t-\sigma_{0} \int_{0}^{t} x(s) d s+\sum_{i=1}^{n} \beta_{i} B_{i}(t) \tag{14}
\end{equation*}
$$

for $t \geq T$, then $\langle x\rangle_{*} \geq \sigma / \sigma_{0}$ a.s.
Now, let us consider the following auxiliary system:

$$
\begin{align*}
d y_{1}(t)= & y_{1}(t)\left[r_{10}-r_{11} C_{10}(t)-a_{11} y_{1}(t)\right] d t \\
& +\alpha_{1} y_{1}(t) d B_{1}(t), \\
d y_{2}(t)= & y_{2}(t)\left[-r_{20}-r_{21} C_{20}(t)+a_{21} y_{1}\left(t-\tau_{2}\right)\right.  \tag{15}\\
& \left.\quad-a_{22} y_{2}(t)\right] d t+\alpha_{2} y_{2}(t) d B_{2}(t),
\end{align*}
$$

with initial value $\phi(t) \in C\left([-\tau, 0], R_{+}^{2}\right)$.
Lemma 7. If $\theta_{1}=r_{10}-0.5 \alpha_{1}^{2}>r_{11} K_{1} / \gamma$, then the solution $y(t)$ of system (15) obeys

$$
\begin{gather*}
\lim _{t \rightarrow+\infty}\left\langle y_{1}(t)\right\rangle=\frac{\theta_{1}-r_{11} K_{1} / \gamma}{a_{11}} ; \\
\lim _{t \rightarrow+\infty} y_{2}(t)=0 \text { a.s., } \text { if } \widetilde{\Delta}_{2}<\bar{\Delta}_{2} ;  \tag{16}\\
\lim _{t \rightarrow+\infty}\left\langle y_{2}(t)\right\rangle=\frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{a_{11} a_{22}} \text { a.s., if } \widetilde{\Delta}_{2}>\bar{\Delta}_{2} .
\end{gather*}
$$

Proof. By Lemma 5,

$$
\begin{align*}
\lim _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} C_{i 0}(s) d s & =\lim _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} \widetilde{C}_{i 0}(s) d s \\
& =\frac{K_{i}}{\gamma}, \quad i=1,2 . \tag{17}
\end{align*}
$$

Then, for all $\varepsilon>0$, there exists $T>0$ such that

$$
\begin{equation*}
\frac{K_{i}}{\gamma}-\varepsilon \leq\left\langle C_{i 0}(t)\right\rangle \leq \frac{K_{i}}{\gamma}+\varepsilon, \quad t>T, i=1,2 . \tag{18}
\end{equation*}
$$

An application of Itô's formula to (15) yields

$$
\begin{align*}
& \ln y_{1}(t)-\ln y_{1}(0) \\
& =\theta_{1} t-r_{11} \int_{0}^{t} C_{10}(s) d s-a_{11} \int_{0}^{t} y_{1}(s) d s+\alpha_{1} B_{1}(t) \\
& \begin{aligned}
\ln y_{2}(t) & -\ln y_{2}(0) \\
= & -\theta_{2} t-r_{21} \int_{0}^{t} C_{20}(s) d s \\
& +a_{21} \int_{0}^{t} y_{1}\left(s-\tau_{2}\right) d s-a_{22} \int_{0}^{t} y_{2}(s) d s+\alpha_{2} B_{2}(t) \\
= & -\theta_{2} t-r_{21} \int_{0}^{t} C_{20}(s) d s+a_{21} \int_{0}^{t} y_{1}(s) d s \\
& -a_{21}\left[\int_{t-\tau_{2}}^{t} y_{1}(s) d s-\int_{-\tau_{2}}^{0} y_{1}(s) d s\right] \\
& -a_{22} \int_{0}^{t} y_{2}(s) d s+\alpha_{2} B_{2}(t) .
\end{aligned}
\end{align*}
$$

That is to say, we have shown that

$$
\begin{gather*}
t^{-1} \ln \frac{y_{1}(t)}{y_{1}(0)}=\theta_{1}-r_{11}\left\langle C_{10}(t)\right\rangle-a_{11}\left\langle y_{1}(t)\right\rangle+t^{-1} \alpha_{1} B_{1}(t)  \tag{20}\\
t^{-1} \ln \frac{y_{2}(t)}{y_{2}(0)}+t^{-1} a_{21}\left[\int_{t-\tau_{2}}^{t} y_{1}(s) d s-\int_{-\tau_{2}}^{0} y_{1}(s) d s\right] \\
=-\theta_{2}-r_{21}\left\langle C_{20}(t)\right\rangle+a_{21}\left\langle y_{1}(t)\right\rangle  \tag{21}\\
\quad-a_{22}\left\langle y_{2}(t)\right\rangle+t^{-1} \alpha_{2} B_{2}(t)
\end{gather*}
$$

When (18) is used in (20), we can see that for $t>T$,

$$
\begin{align*}
t^{-1} \ln \frac{y_{1}(t)}{y_{1}(0)} \leq & \theta_{1}-\frac{r_{11} K_{1}}{\gamma}+r_{11} \varepsilon  \tag{22}\\
& -a_{11}\left\langle y_{1}(t)\right\rangle+t^{-1} \alpha_{1} B_{1}(t), \\
t^{-1} \ln \frac{y_{1}(t)}{y_{1}(0)} \geq & \theta_{1}-\frac{r_{11} K_{1}}{\gamma}-r_{11} \varepsilon  \tag{23}\\
& -a_{11}\left\langle y_{1}(t)\right\rangle+t^{-1} \alpha_{1} B_{1}(t) .
\end{align*}
$$

Let $\varepsilon$ be sufficiently small such that $\theta_{1}-r_{11} K_{1} / \gamma-r_{11} \varepsilon>0$. Making use of (I) and (II) in Lemma 6 to (22) and (23), respectively, we have

$$
\begin{align*}
& \left\langle y_{1}(t)\right\rangle^{*} \leq \frac{\theta_{1}-r_{11} K_{1} / \gamma+r_{11} \varepsilon}{a_{11}} \\
& \left\langle y_{1}(t)\right\rangle_{*} \geq \frac{\theta_{1}-r_{11} K_{1} / \gamma-r_{11} \varepsilon}{a_{11}} \tag{24}
\end{align*}
$$

It then follows from the arbitrariness of $\varepsilon$ that

$$
\begin{equation*}
\lim _{t \rightarrow+\infty}\left\langle y_{1}(t)\right\rangle=\frac{\theta_{1}-r_{11} K_{1} / \gamma}{a_{11}} \tag{25}
\end{equation*}
$$

Substituting (17) and (25) into (20) and noting that $\lim _{t \rightarrow+\infty}$ $t^{-1} B_{1}(t)=0$, one can derive that

$$
\begin{equation*}
\lim _{t \rightarrow+\infty} t^{-1} \ln y_{1}(t)=0, \text { a.s. } \tag{26}
\end{equation*}
$$

Employing (20) and (21) in the expression $a_{21} \ln \left(y_{1}(t) /\right.$ $\left.y_{1}(0)\right)+a_{11} \ln \left(y_{2}(t) / y_{2}(0)\right)$ yields

$$
\begin{align*}
a_{11} t^{-1} \ln & \frac{y_{2}(t)}{y_{2}(0)}+a_{21} t^{-1} \ln \frac{y_{1}(t)}{y_{1}(0)} \\
= & \widetilde{\Delta}_{2}-r_{11} a_{21}\left\langle C_{10}(t)\right\rangle-r_{21} a_{11}\left\langle C_{20}(t)\right\rangle \\
& -a_{11} a_{22}\left\langle y_{2}(t)\right\rangle  \tag{27}\\
& -t^{-1} a_{11} a_{21}\left[\int_{t-\tau_{2}}^{t} y_{1}(s) d s-\int_{-\tau_{2}}^{0} y_{1}(s) d s\right] \\
& +t^{-1}\left[a_{21} \alpha_{1} B_{1}(t)+a_{11} \alpha_{2} B_{2}(t)\right] .
\end{align*}
$$

In view of (25), we get

$$
\begin{align*}
\lim _{t \rightarrow+\infty} & t^{-1} \int_{t-\tau_{2}}^{t} y_{1}(s) d s \\
& =\lim _{t \rightarrow+\infty} t^{-1}\left(\int_{0}^{t} y_{1}(s) d s-\int_{0}^{t-\tau_{2}} y_{1}(s) d s\right)=0, \text { a.s. } \tag{28}
\end{align*}
$$

By (17), (26), (27), and (28), for all $\varepsilon>0$, there exists $T>0$ such that, for $t \geq T$,

$$
\begin{align*}
a_{11} t^{-1} \ln \frac{y_{2}(t)}{y_{2}(0)} \leq & \widetilde{\Delta}_{2}-\bar{\Delta}_{2}+\varepsilon-a_{11} a_{22}\left\langle y_{2}(t)\right\rangle  \tag{29}\\
& +t^{-1}\left[a_{21} \sigma_{1} B_{1}(t)+a_{11} \sigma_{2} B_{2}(t)\right] \\
a_{11} t^{-1} \ln \frac{y_{2}(t)}{y_{2}(0)} \geq & \widetilde{\Delta}_{2}-\bar{\Delta}_{2}-\varepsilon-a_{11} a_{22}\left\langle y_{2}(t)\right\rangle  \tag{30}\\
& +t^{-1}\left[a_{21} \sigma_{1} B_{1}(t)+a_{11} \sigma_{2} B_{2}(t)\right]
\end{align*}
$$

If $\widetilde{\Delta}_{2}<\bar{\Delta}_{2}$, then we can choose $\varepsilon$ sufficiently small such that $\widetilde{\Delta}_{2}-\bar{\Delta}_{2}+\varepsilon<0$. Then, by (29) and (I) in Lemma 6, we obtain $\lim _{t \rightarrow+\infty} y_{2}(t)=0$ a.s. If $\widetilde{\Delta}_{2}>\bar{\Delta}_{2}$, then we can choose $\varepsilon$ sufficiently small such that $\widetilde{\Delta}_{2}-\bar{\Delta}_{2}-\varepsilon>0$. An application of (I) and (II) in Lemma 6 to (29) and (30), respectively, makes one observe that

$$
\begin{equation*}
\frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}-\varepsilon}{a_{11} a_{22}} \leq\left\langle y_{2}(t)\right\rangle_{*} \leq\left\langle y_{2}(t)\right\rangle^{*} \leq \frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}+\varepsilon}{a_{11} a_{22}}, \text { a.s. } \tag{31}
\end{equation*}
$$

Therefore, using the arbitrariness of $\varepsilon$ results in

$$
\begin{equation*}
\lim _{t \rightarrow+\infty}\left\langle y_{2}(t)\right\rangle=\frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{a_{11} a_{22}} \text { a.s. } \tag{32}
\end{equation*}
$$

This completes the proof.
We are now in the position to prove our main results.

Proof of Theorem 2. Applying Itô's formula to (3) leads to

$$
\begin{align*}
\ln x_{1}(t) & -\ln x_{1}(0) \\
= & \theta_{1} t-r_{11} \int_{0}^{t} C_{10}(s) d s-a_{11} \int_{0}^{t} x_{1}(s) d s \\
& -a_{12} \int_{0}^{t} x_{2}\left(s-\tau_{1}\right) d s+\alpha_{1} B_{1}(t) \\
= & \theta_{1} t-r_{11} \int_{0}^{t} C_{10}(s) d s-a_{12} \int_{0}^{t} x_{2}(s) d s  \tag{33}\\
& +a_{12}\left[\int_{t-\tau_{1}}^{t} x_{2}(s) d s-\int_{-\tau_{1}}^{0} x_{2}(s) d s\right] \\
& -a_{11} \int_{0}^{t} x_{1}(s) d s+\alpha_{1} B_{1}(t) \\
\ln x_{2}(t) & -\ln x_{2}(0) \\
= & -\theta_{2} t-r_{21} \int_{0}^{t} C_{20}(s) d s+a_{21} \int_{0}^{t} x_{1}(s) d s \\
& -a_{21}\left[\int_{t-\tau_{2}}^{t} x_{1}(s) d s-\int_{-\tau_{2}}^{0} x_{1}(s) d s\right]  \tag{34}\\
& -a_{22} \int_{0}^{t} x_{2}(s) d s+\alpha_{2} B_{2}(t) .
\end{align*}
$$

(i) It follows from (17) and (33) that

$$
\begin{align*}
& t^{-1} \ln x_{1}(t)-t^{-1} \ln x_{1}(0) \\
& \quad \leq \theta_{1}-r_{11}\left\langle C_{10}(t)\right\rangle-a_{11}\left\langle x_{1}(t)\right\rangle+\frac{\alpha_{1} B_{1}(t)}{t}  \tag{35}\\
& \quad \leq \theta_{1}-\frac{r_{11} K_{1}}{\lambda}+\varepsilon-a_{11}\left\langle x_{1}(t)\right\rangle+\frac{\alpha_{1} B_{1}(t)}{t}
\end{align*}
$$

for sufficiently large $t$. Since $\theta_{1}-r_{11} K_{1} / \lambda<0$, then we can choose $\varepsilon$ sufficiently small such that $\theta_{1}-r_{11} K_{1} / \lambda+\varepsilon<0$. Then, by (I) in Lemma 6,

$$
\begin{equation*}
\lim _{t \rightarrow+\infty} x_{1}(t)=0 \text {, a.s. } \tag{36}
\end{equation*}
$$

When (36) is used in (34), one can see that

$$
\begin{equation*}
t^{-1} \ln x_{2}(t)-\ln x_{2}(0) \leq-\theta_{2}+\varepsilon-a_{22}\left\langle x_{2}(t)\right\rangle+\frac{\alpha_{2} B_{2}(t)}{t} \tag{37}
\end{equation*}
$$

for sufficiently large $t$, where $\varepsilon>0$ obeys $-\theta_{2}+\varepsilon<0$. In view of Lemma 6 again, $\lim _{t \rightarrow+\infty} x_{2}(t)=0$, a.s.
(ii) By the stochastic comparison theorem [40], one can observe that

$$
\begin{equation*}
x_{1}(t) \leq y_{1}(t), \quad x_{2}(t) \leq y_{2}(t) \tag{38}
\end{equation*}
$$

Note that $\theta_{1}>r_{11} K_{1} / \gamma$ and $\widetilde{\Delta}_{2}<\bar{\Delta}_{2}$; it then follows from Lemma 7 that $\lim _{t \rightarrow+\infty} y_{2}(t)=0$, a.s. Making use of (38)
gives $\lim _{t \rightarrow+\infty} x_{2}(t)=0$, a.s. Thus, for all $\varepsilon>0$, there exists $T>0$ such that, for $t \geq T$,

$$
\begin{equation*}
\frac{\varepsilon}{2} \leq a_{12} x_{2}(t) \leq \frac{\varepsilon}{2} \tag{39}
\end{equation*}
$$

Substituting the above inequalities into (33) and then using (18), we obtain

$$
\begin{align*}
t^{-1} \ln x_{1}(t) \leq & t^{-1} \ln x_{1}(0)+\theta_{1}-r_{11}\left\langle C_{10}(t)\right\rangle \\
& -a_{11}\left\langle x_{1}(t)\right\rangle+\frac{\varepsilon}{2}+\frac{\alpha_{1} B_{1}(t)}{t} \\
\leq & \theta_{1}-\frac{r_{11} K_{1}}{\gamma}+2 \varepsilon-a_{11}\left\langle x_{1}(t)\right\rangle+\frac{\alpha_{1} B_{1}(t)}{t},  \tag{40}\\
t^{-1} \ln x_{1}(t) \geq & t^{-1} \ln x_{1}(0)+\theta_{1}-r_{11}\left\langle C_{10}(t)\right\rangle \\
& -a_{11}\left\langle x_{1}(t)\right\rangle-\frac{\varepsilon}{2}+\frac{\alpha_{1} B_{1}(t)}{t} \\
\geq & \theta_{1}-\frac{r_{11} K_{1}}{\gamma}-2 \varepsilon-a_{11}\left\langle x_{1}(t)\right\rangle+\frac{\alpha_{1} B_{1}(t)}{t} . \tag{41}
\end{align*}
$$

Let $\varepsilon$ be sufficiently small such that $\theta_{1}-r_{11} K_{1} / \gamma-\varepsilon>0$, and then, applying (I) and (II) in Lemma 6 to (40) and (41), respectively, one can see that

$$
\begin{align*}
\frac{\theta_{1}-r_{11} K_{1} / \gamma-2 \varepsilon}{a_{11}} & \leq\left\langle x_{1}(t)\right\rangle_{*} \leq\left\langle x_{1}(t)\right\rangle^{*} \\
& \leq \frac{\theta_{1}-r_{11} K_{1} / \gamma+2 \varepsilon}{a_{11}} \text { a.s. } \tag{42}
\end{align*}
$$

An application of the arbitrariness of $\varepsilon$ gives

$$
\begin{equation*}
\lim _{t \rightarrow+\infty}\left\langle x_{1}(t)\right\rangle=\frac{\theta_{1}-r_{11} K_{1} / \gamma}{a_{11}}, \text { a.s. } \tag{43}
\end{equation*}
$$

(iii) Clearly, $\widetilde{\Delta}_{2}>\bar{\Delta}_{2}$ implies $\theta_{1}>r_{11} K_{1} / \gamma$, and then, by Lemma 7,

$$
\begin{equation*}
\lim _{t \rightarrow+\infty}\left\langle y_{2}(t)\right\rangle=\frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{a_{11} a_{22}} \tag{44}
\end{equation*}
$$

Thus, similar to the proof of (28), we get

$$
\begin{equation*}
\lim _{t \rightarrow+\infty} t^{-1} \int_{t-\tau_{1}}^{t} y_{2}(s) d s=0 \text { a.s. } \tag{45}
\end{equation*}
$$

Therefore, by (26), (28), and (38), we can observe that

$$
\begin{gather*}
\limsup _{t \rightarrow+\infty} t^{-1} \ln x_{1}(t) \leq \lim _{t \rightarrow+\infty} t^{-1} \ln y_{1}(t)=0  \tag{46}\\
\lim _{t \rightarrow+\infty} t^{-1} \int_{t-\tau_{2}}^{t} x_{1}(s) d s=0 \\
\lim _{t \rightarrow+\infty} t^{-1} \int_{t-\tau_{1}}^{t} x_{2}(s) d s=0, \text { a.s. } \tag{47}
\end{gather*}
$$

Employing (33) and (34) in the expression $a_{21} \ln \left(x_{1}(t) /\right.$ $\left.x_{1}(0)\right)+a_{11} \ln \left(x_{2}(t) / x_{2}(0)\right)$ yields

$$
\begin{align*}
t^{-1} a_{21} \ln & \frac{x_{1}(t)}{x_{1}(0)}+t^{-1} a_{11} \ln \frac{x_{2}(t)}{x_{2}(0)} \\
= & a_{12} a_{21} t^{-1}\left[\int_{t-\tau_{1}}^{t} x_{2}(s) d s-\int_{-\tau_{1}}^{0} x_{2}(s) d s\right] \\
& -a_{11} a_{21} t^{-1}\left[\int_{t-\tau_{2}}^{t} x_{1}(s) d s-\int_{-\tau_{2}}^{0} x_{1}(s) d s\right]  \tag{48}\\
& +\widetilde{\Delta}_{2}-a_{21} r_{11}\left\langle C_{10}(t)\right\rangle-a_{11} r_{21}\left\langle C_{20}(t)\right\rangle \\
& -\Delta\left\langle x_{2}(t)\right\rangle+t^{-1} a_{21} \alpha_{1} B_{1}(t)+t^{-1} a_{11} \alpha_{2} B_{2}(t)
\end{align*}
$$

When (18), (46) and (47), are used in (48), one can obtain

$$
\begin{align*}
t^{-1} a_{11} \ln \frac{x_{2}(t)}{x_{2}(0)} \geq & \widetilde{\Delta}_{2}-\bar{\Delta}_{2}-\varepsilon-\Delta\left\langle x_{2}(t)\right\rangle  \tag{49}\\
& +t^{-1} a_{21} \alpha_{1} B_{1}(t)+t^{-1} a_{11} \alpha_{2} B_{2}(t)
\end{align*}
$$

for sufficiently large $t$, where $\varepsilon>0$ obeys $\widetilde{\Delta}_{2}-\bar{\Delta}_{2}-\varepsilon>0$. It then follows from (II) in Lemma 6 that

$$
\begin{equation*}
\left\langle x_{2}(t)\right\rangle_{*} \geq \frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}-\varepsilon}{\Delta} \tag{50}
\end{equation*}
$$

By virtue of the arbitrariness of $\varepsilon$, we can see that

$$
\begin{equation*}
\left\langle x_{2}(t)\right\rangle_{*} \geq \frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{\Delta} \tag{51}
\end{equation*}
$$

Consequently, for every $0<\varepsilon<a_{12}\left(\widetilde{\Delta}_{2}-\bar{\Delta}_{2}\right) / \Delta$, there is $T>0$ such that

$$
\begin{equation*}
a_{12}\left\langle x_{2}(t)\right\rangle \geq a_{12}\left\langle x_{2}\right\rangle_{*}-\varepsilon \geq \frac{a_{12}\left(\widetilde{\Delta}_{2}-\bar{\Delta}_{2}\right)}{\Delta}-\varepsilon, \quad t>T \tag{52}
\end{equation*}
$$

Substituting the above inequality into (33) and then using (18) and (47), one can see that

$$
\begin{align*}
t^{-1} \ln \frac{x_{1}(t)}{x_{1}(0)} \leq & \theta_{1}-\frac{a_{12}\left(\widetilde{\Delta}_{2}-\bar{\Delta}_{2}\right)}{\Delta}+3 \varepsilon \\
& -a_{11} t^{-1} \int_{0}^{t} x_{1}(s) d s+t^{-1} \alpha_{1} B_{1}(t) \\
= & \frac{a_{11}\left(\widetilde{\Delta}_{1}-\bar{\Delta}_{1}\right)}{\Delta}+3 \varepsilon-a_{11} t^{-1} \int_{0}^{t} x_{1}(s) d s \\
& +t^{-1} \alpha_{1} B_{1}(t) \tag{53}
\end{align*}
$$

for sufficiently large $t$. Since $\widetilde{\Delta}_{1}-\bar{\Delta}_{1}>0$, and then, by Lemma 6 and the arbitrariness of $\varepsilon$, one can observe that

$$
\begin{equation*}
\left\langle x_{1}(t)\right\rangle^{*} \leq \frac{\widetilde{\Delta}_{1}-\bar{\Delta}_{1}}{\Delta} \tag{54}
\end{equation*}
$$

When this inequality, (18) and (47), are used in (34), we can see that

$$
\begin{align*}
t^{-1} \ln \frac{x_{2}(t)}{x_{2}(0)} \leq & -\theta_{2}+a_{21} \frac{\widetilde{\Delta}_{1}-\bar{\Delta}_{1}}{\Delta}+3 \varepsilon \\
& -a_{22} t^{-1} \int_{0}^{t} x_{2}(s) d s+t^{-1} \alpha_{2} B_{2}(t) \\
= & \frac{a_{22}\left(\widetilde{\Delta}_{2}-\bar{\Delta}_{2}\right)}{\Delta}+3 \varepsilon-a_{22} t^{-1} \int_{0}^{t} x_{2}(s) d s \\
& +t^{-1} \alpha_{2} B_{2}(t) \tag{55}
\end{align*}
$$

for sufficiently large $t$. Then, it follows from Lemma 6 and the arbitrariness of $\varepsilon$ that

$$
\begin{equation*}
\left\langle x_{2}(t)\right\rangle^{*} \leq \frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{\Delta} . \tag{56}
\end{equation*}
$$

Substituting the above inequality and (18) into (33), we get

$$
\begin{align*}
t^{-1} \ln \frac{x_{1}(t)}{x_{1}(0)} \geq & \theta_{1}-a_{12} \frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{\Delta}-3 \varepsilon \\
& -a_{11} t^{-1} \int_{0}^{t} x_{1}(s) d s+t^{-1} \alpha_{1} B_{1}(t) \\
= & \frac{a_{11}\left(\widetilde{\Delta}_{1}-\bar{\Delta}_{1}\right)}{\Delta}-3 \varepsilon-a_{11} t^{-1} \int_{0}^{t} x_{1}(s) d s \\
& +t^{-1} \alpha_{1} B_{1}(t) \tag{57}
\end{align*}
$$

for sufficiently large $t$. By (II) in Lemma 6 and the arbitrariness of $\varepsilon$ again, we obtain

$$
\begin{equation*}
\left\langle x_{1}(t)\right\rangle_{*} \geq \frac{\widetilde{\Delta}_{1}-\bar{\Delta}_{1}}{\Delta} \tag{58}
\end{equation*}
$$

Then, the required assertion follows from (51), (54), (56), and (58).

## 3. Numerical Simulations

Let us use the famous Milstein method (see, e.g., [41]) to illustrate the analytical results.

To begin with, we choose $r_{10}=0.85, r_{20}=0.05, r_{11}=$ $r_{21}=1, a_{11}=0.4, a_{12}=0.4, a_{21}=0.3, a_{22}=0.3, \tau_{1}=3, \tau_{2}=$ $8, \alpha_{2}^{2}=0.1, k_{i}=g_{i}=m_{i}=0.1, i=1,2, h=0.5, b=0.6$, and $\gamma=12$. Then,

$$
\begin{gather*}
K_{i}=\frac{k_{i} b}{h\left(g_{i}+m_{i}\right)}=0.6, \\
\Delta_{2}=r_{10} a_{21}-r_{20} a_{11}=0.235>\bar{\Delta}_{2}  \tag{59}\\
=\frac{a_{21} r_{11} K_{1}}{\gamma}+\frac{a_{11} r_{21} K_{2}}{\gamma}=0.035 .
\end{gather*}
$$

FIGURE 1: Solutions of system (3) for $r_{10}=0.85, r_{20}=0.05, r_{11}=r_{21}=1, a_{11}=0.4, a_{12}=0.4, a_{21}=0.3, a_{22}=0.3, \tau_{1}=3, \tau_{2}=8, \alpha_{2}^{2}=0.1$, $k_{i}=g_{i}=m_{i}=0.1, i=1,2, h=0.5, b=0.6, \gamma=12, x_{1}(0)=0.9, x_{2}(0)=0.5, C_{0}(0)=C_{e}(0)=0.1$, and step size $\Delta t=0.001$. (a) is with $\alpha_{1}^{2} / 2=0.82$; (b) is with $\alpha_{1}^{2} / 2=0.65$; (c) is with $\alpha_{1}^{2} / 2=0.2$.

By (c) in Lemma 1, the solution of model (1) obeys $\limsup _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} x_{1}(s) d s>0, \quad \limsup _{t \rightarrow+\infty} t^{-1} \int_{0}^{t} x_{2}(s) d s>0$.

However, when the white noises are taken into account, the properties of the system may be changed greatly. In Figure 1, we let the coefficients be same with the above. The only difference between conditions of Figures 1(a), 1(b), and 1(c)
is that the value of $\alpha_{1}^{2}$ is different. In Figure 1(a), we choose $\alpha_{1}^{2} / 2=0.82$. Therefore,

$$
\begin{equation*}
\theta_{1}=r_{10}-\frac{\alpha_{1}^{2}}{2}=0.03<\frac{r_{11} K_{1}}{\gamma}=0.05 \tag{61}
\end{equation*}
$$

Then, by (i) in Theorem 2, both $x_{1}$ and $x_{2}$ are extinctive. Figure 1(a) confirms these. In Figure 1(b), we choose $\alpha_{1}^{2} / 2=$ 0.65. That is to say $\theta_{1}=0.2>r_{11} K_{1} / \gamma=0.05$ and $\widetilde{\Delta}_{2}=0.02<\bar{\Delta}_{2}=0.035$. It then follows from (ii) in

Figure 2: Solutions of system (3) for $r_{10}=0.85, r_{20}=0.05, r_{11}=$ $r_{21}=1, a_{11}=0.4, a_{12}=0.4, a_{21}=0.3, a_{22}=0.3, \tau_{1}=3, \tau_{2}=8$, $\alpha_{1}^{2}=0.4, \alpha_{2}^{2}=0.1, k_{i}=g_{i}=m_{i}=0.1, i=1,2, h=0.5, b=0.6$, $\gamma=0.8, x_{1}(0)=0.9, x_{2}(0)=0.5, C_{0}(0)=C_{e}(0)=0.1$, and step size $\Delta t=0.001$.

Theorem 2 that $x_{2}$ is extinctive and $x_{1}$ is stable in time average:

$$
\begin{equation*}
\lim _{t \rightarrow+\infty}\left\langle x_{1}(t)\right\rangle=\frac{\theta_{1}-r_{11} K_{1} / \gamma}{a_{11}}=0.375 \tag{62}
\end{equation*}
$$

See Figure 1(b). In Figure 1(c), we choose $\alpha_{1}^{2} / 2=0.2$. Then, $\widetilde{\Delta}_{2}=0.155>\bar{\Delta}_{2}=0.035$. In view of (iii) in Theorem 2, we can obtain that both $x_{1}$ and $x_{2}$ are stable in time average:

$$
\begin{align*}
& \lim _{t \rightarrow+\infty}\left\langle x_{1}(t)\right\rangle=\frac{\widetilde{\Delta}_{1}-\bar{\Delta}_{1}}{\Delta}=\frac{0.24}{0.24}=1 \\
& \lim _{t \rightarrow+\infty}\left\langle x_{2}(t)\right\rangle=\frac{\widetilde{\Delta}_{2}-\bar{\Delta}_{2}}{\Delta}=\frac{0.12}{0.24}=0.5 \tag{63}
\end{align*}
$$

Figure 1(c) confirms these.
In Figure 2, we choose $r_{10}=0.85, r_{20}=0.05, r_{11}=$ $r_{21}=1, a_{11}=0.4, a_{12}=0.4, a_{21}=0.3, a_{22}=0.3, \tau_{1}=3$, $\tau_{2}=8, \alpha_{1}^{2}=0.4, \alpha_{2}^{2}=0.1, k_{i}=g_{i}=m_{i}=0.1, i=1,2$, $h=0.5$, and $b=0.6$. The only difference between conditions of Figures $1(c)$ and 2 is that the value of $\gamma$ is different. In Figure 2, we choose $\gamma=0.8$. Then, $\theta_{1}=0.65<r_{11} K_{1} / \gamma=$ 0.75 . It follows from (i) in Theorem 2 that both $x_{1}$ and $x_{2}$ are extinctive. Figure 2 confirms these. By comparing Figure 1(c) with Figure 2, one can see that the impulsive period $\gamma$ plays a key role in determining the stability in time average and the extinction of the species.

## 4. Conclusions and Future Directions

This paper is concerned with stochastic delay predator-prey model in a polluted environment with impulsive toxicant
input. For each species, the threshold between stability in time average and extinction is established. Some recent results are improved and extended. Our Theorem 2 reveals some interesting and important results.
(A) Firstly, time delay is harmless for stability in time average and extinction of the stochastic system (3).
(B) The white noise $\alpha_{1} d B_{1}(t)$ and $\alpha_{2} d B_{2}(t)$ can change the properties of the system greatly.
(C) The impulsive period $\gamma$ plays an important role in determining the stability in time average and the extinction of the species.

Some interesting questions deserve further investigations. One may consider some more realistic but more complex systems, for example, stochastic delay model with Markov switching (see, e.g., [30, 32, 39]). It is also interesting to investigate what happens if $a_{i j}$ is stochastic.

## Acknowledgments

The author thanks the editor and reviewer for these valuable and important comments. This research is supported by NSFC of China (nos. 11301207, 11171081, 11301112 and 11171056), Natural Science Foundation of Jiangsu Province (No. BK20130411) and Natural Science Research Project of Ordinary Universities in Jiangsu Province (no. 13KJB110002).
