

MULTIPLIERS AND OPERATORS ON THE TEMPERED ULTRADISTRIBUTION SPACES OF ROUMIEU TYPE FOR THE DISTRIBUTIONAL HANKEL-TYPE TRANSFORMATION SPACES

P. K. BANERJI AND S. K. AL-OMARI

Received 4 May 2006; Accepted 4 May 2006

The tempered ultradistribution space of Roumieu type for the space $H_{\mu,\nu}$ is defined, which is a subspace of the Hausdörff locally convex topological linear space. Further, results are obtained for the multipliers and operators on the tempered ultradistribution spaces for the distributional Hankel-type transformation spaces.

1. Introduction

During the course of time researchers have defined ultradistributions as the duals of various types of ultradifferentiable functions of Roumieu type and of Buerling type, Roumieu type ultradifferentiable functions have been considered in the present paper. Three types of spaces of rapidly decreasing ultradifferentiable functions of Roumieu type have been defined, which can be considered as subspaces of the Hausdörff locally convex topological linear space $H_{\mu,\nu}$ (cf. [3]), as the set of all infinitely differentiable complex-valued functions $\varphi(x)$ on an interval $I(0, \infty)$ with the norm

$$\Gamma_{i,j}^{\mu,\nu}(\varphi) = \sup_{x \in I} |x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)| < \infty, \quad (1.1)$$

where i, j are a pair of nonnegative integers and μ, ν are real numbers which will be an auxiliary to obtain duals of Roumieu-type tempered ultradistributions.

The a_i s and b_j s, wherever they appear ($i, j = 0, 1, 2, \dots$), are to be considered as sequences of positive real numbers on which the constraints imposed are (cf. [2, page 66])

$$\begin{aligned} a_i^2 &\leq a_{i-1} a_{i+1} \quad \forall i \in \mathbb{N}, \\ b_j^2 &\leq b_{j-1} b_{j+1} \quad \forall j \in \mathbb{N}. \end{aligned} \quad (1.2)$$

$S_1, S_1 > 0$ and $T_1, T_1 > 1$ are constants such that

$$\begin{aligned} a_i &\leq ST^i \min_{0 \leq k \leq i} a_k a_{i-k}, \quad i \in \mathbb{N}_0, \\ b_j &\leq S_1 T_1^j \min_{0 \leq k \leq j} b_k b_{j-k}, \quad j \in \mathbb{N}_0. \end{aligned} \quad (1.3)$$

2 Tempered ultradistribution space of Roumieu type

As a consequence of (1.2), we have (cf. [1])

$$\begin{aligned} a_i a_k &\leq a_0 a_{i+k}, \quad i, k \in \mathbb{N}_0, \\ b_j b_k &\leq b_0 b_{j+k}, \quad j, k \in \mathbb{N}_0. \end{aligned} \quad (1.4)$$

Definition 1.1. (I) $H_{\mu, a_i, A}^v$ is the space of all those functions, defined on interval I , and are infinitely smooth, for which

$$|x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)| \leq C_j^{\mu, \nu} (A + \alpha)^i a_i, \quad i, j \in \mathbb{N}_0, \quad (1.5)$$

where A and $C_j^{\mu, \nu}$ are constants depending on φ and α is an arbitrary positive constant.

(II) Define $\varphi \in H_{\mu}^{v, b_j, B}$ whenever φ is smooth and the inequality

$$|x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)| \leq C_j^{\mu, \nu} (B + \beta)^j b_j \quad (1.6)$$

is true for all $i, j \in \mathbb{N}_0$.

(III) For φ being a smooth function, $\varphi(x) \in H_{\mu, a_i, A}^{v, b_j, B}$, which satisfies the inequality

$$|x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)| \leq C^{\mu, \nu} (A + \alpha)^i (B + \beta)^j a_i b_j, \quad (1.7)$$

where $i, j \in \mathbb{N}_0$ (arbitrary constants) and $\alpha, \beta > 0$, A, B , and $C^{\mu, \nu}$ are positive constants depending on φ .

The norms on the spaces $H_{\mu, a_i, A}^v$, $H_{\mu}^{v, b_j, B}$, and $H_{\mu, a_i, A}^{v, b_j, B}$ are defined as

$$\begin{aligned} \mathfrak{G}_{j, \alpha}^{\mu, \nu}(\varphi) &= \sup_{\substack{x \in (0, \infty) \\ i \in \mathbb{N}_0}} \frac{|x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)|}{(A + \alpha)^i a_i}, \\ \mathfrak{G}_{i, \beta}^{\mu, \nu}(\varphi) &= \sup_{\substack{x \in (0, \infty) \\ i \in \mathbb{N}_0}} \frac{|x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)|}{(B + \beta)^j b_j}, \end{aligned} \quad (1.8)$$

where $i, j = 0, 1, 2, 3, \dots$ and $\alpha, \beta = 1, 1/2, 1/3, \dots$, and

$$\mathfrak{G}_{\alpha, \beta}^{\mu, \nu}(\varphi) = \sup_{\substack{x \in (0, \infty) \\ i, j \in \mathbb{N}_0}} \frac{|x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)|}{(A + \alpha)^i (B + \beta)^j a_i b_j}, \quad (1.9)$$

for the conditions already mentioned.

The duals of the spaces, defined earlier, are denoted by $H'_{\mu, a_i, A}{}^v$, $H'_{\mu}{}^{v, b_j, B}$, and $H'_{\mu, a_i, A}{}^{v, b_j, B}$, respectively, which, indeed, are Roumieu-type ultradifferentiable functions. Whereas the duals are the tempered ultradistributions of Roumieu type.

The spaces $H_{\mu, a_i, A}^v$, $H_{\mu}^{v, b_j, B}$, and $H_{\mu, a_i, A}^{v, b_j, B}$ being the subspaces of the space $H_{\mu, \nu}$, indeed, $H'_{\mu, \nu}$ will be a subspace of their duals.

2. Multipliers for ultradifferentiable functions

This section deals with results, which justify certain mapping to be linear on the three spaces defined earlier. The following definition will make sense in the analysis of the results.

Definition 2.1. Denote by \mathcal{E}_{a_i, A_0} , \mathcal{E}^{b_j, B_0} , and $\mathcal{E}_{a_i, A_0}^{b_j, B_0}$ the set of all complex-valued infinitely differentiable functions (C^∞ -functions) $\theta(x)$ on the interval $(0, \infty)$, which satisfy the following:

$$\begin{aligned} |(x^{-1}D)^i \theta(x)| &\leq CA_0^i a_i (1+x^r), \\ |(x^{-1}D)^j \theta(x)| &\leq CB_0^j b_j (1+x^r), \\ |(x^{-1}D)^j \theta(x)| &\leq EA_0^j B_0^j a_j b_j (1+x^r), \end{aligned} \tag{2.1}$$

where C, D, E are positive constants and $r > 0$ is an arbitrary integer.

THEOREM 2.2. Let $\varphi \in H_{\mu, a_i, A}^\nu, H_\mu^{\nu, b_j, B}$, and $H_{\mu, a_i, A}^{\nu, b_j, B}$, respectively. Then

$$\begin{aligned} \mathfrak{D}_{j, 1/n}^{\mu, \nu}(\varphi) &\leq \mathfrak{D}_{j, 1/(n+1)}^{\mu, \nu}(\varphi), & \mathfrak{D}_{i, 1/n}^{\mu, \nu}(\varphi) &\leq \mathfrak{D}_{i, 1/(n+1)}^{\mu, \nu}(\varphi), \\ \mathfrak{D}_{1/n}^{\mu, \nu}(\varphi) &\leq \mathfrak{D}_{1/(n+1), 1/(n+1)}^{\mu, \nu}(\varphi), & \text{respectively.} \end{aligned} \tag{2.2}$$

Proofs of the above inequalities are straightforward consequences of (1.8) and (1.9), respectively. The details are thus avoided.

THEOREM 2.3. Let $\theta \in \mathcal{E}_{a_i, A_0}$ and $\varphi \in H_{\mu, a_i, A}^\nu$. Then

$$\mathfrak{D}_{j, \alpha}^{\mu, \nu}(\theta\varphi) \leq 2CA_0^j a_j \sum_{k=0}^j \binom{j}{k} \mathfrak{D}_{j-k, \alpha}^{\mu, \nu}(\varphi), \tag{2.3}$$

that is, the mapping $\varphi \rightarrow \theta\varphi$ is a continuous linear mapping on $H_{\mu, a_i, A}^\nu$ into itself.

Proof. By virtue of Leibniz theorem and employing (1.5) and Definition 2.1, we obtain

$$\begin{aligned} &|x^i (x^{-1}D)^j x^{-\mu-\nu-1}(\theta\varphi)(x)| \\ &= \left| \sum_{k=0}^j \binom{j}{k} \frac{(x^{-1}D)^k \theta(x)}{(1+x^r)} x^i (1+x^r) (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x) \right| \\ &\leq \sum_{k=0}^j \binom{j}{k} CA_0^j a_j \{ |x^i (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x)| \\ &\quad + |x^{i+r} (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x)| \}. \end{aligned} \tag{2.4}$$

4 Tempered ultradistribution space of Roumieu type

By multiplying by $1/(A + \alpha)^i a_i$ and considering the supremum over all integers $i > 0$, for all $x \in (0, \infty)$, the above relation is expressed as

$$\begin{aligned} & \sup_{\substack{i \in \mathbb{N}_0 \\ x \in (0, \infty)}} \frac{|x^i (x^{-1}D)^j x^{-\mu-\nu-1}(\theta\varphi)(x)|}{(A + \alpha)^i a_i} \\ & \leq \sum_{k=0}^j \binom{j}{k} CA_0^j a_j \left[\sup_{\substack{i \in \mathbb{N}_0 \\ x \in (0, \infty)}} \frac{|x^i (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x)|}{(A + \alpha)^i a_i} \right. \\ & \quad \left. + \sup_{\substack{i \in \mathbb{N}_0 \\ x \in (0, \infty)}} \frac{|x^{i+\nu} (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x)|}{(A + \alpha)^i a_i} \right], \end{aligned} \quad (2.5)$$

that is,

$$\mathfrak{G}_{j,\alpha}^{\mu,\nu}(\theta\varphi) \leq CA_0^j a_j \sum_{k=0}^j \binom{j}{k} \vartheta(j-k, \alpha^{\mu,\nu}(\varphi) +) \mathfrak{G}_{j-k,\alpha}^{\mu,\nu}(\varphi), \quad (2.6)$$

that is,

$$\mathfrak{G}_{j,\alpha}^{\mu,\nu}(\theta\varphi) \leq 2CA_0^j a_j \sum_{k=0}^j \binom{j}{k} \mathfrak{G}_{j-k,\alpha}^{\mu,\nu}(\varphi). \quad (2.7)$$

This completes the proof of the theorem. \square

THEOREM 2.4. *If \mathcal{E}^{b_j, B_0} and b_j satisfy the relation (1.4), then for all $\varphi \in H_\mu^{v, b_j, B}$, the map $\varphi \rightarrow \theta\varphi$ is a continuous linear map on the space $H_\mu^{v, b_j, B}$ into itself, that is,*

$$\mathfrak{G}_{j,\alpha}^{\mu,\nu}(\theta\varphi) \leq 2Db_0 B_0^j b_j \sum_{k=0}^j \binom{j}{k} \mathfrak{G}_{j-k,\beta}^{\mu,\nu}(\varphi). \quad (2.8)$$

Proof. Employing Definition 2.1 to (2.8) and multiplying it by $1/(B + \beta)^j b_j$, we have

$$\begin{aligned} & \frac{|x^i (x^{-1}D)^j x^{-\mu-\nu-1}(\theta\varphi)(x)|}{(B + \beta)^j b_j} \\ & \leq \sum_{k=0}^j \binom{j}{k} DB_0^j b_j (|x^i (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x)| \\ & \quad + |x^{i+\nu} (x^{-1}D)^{j-k} x^{-\mu-\nu-1} \varphi(x)|) \frac{1}{(B + \beta)^j b_j}. \end{aligned} \quad (2.9)$$

Now by virtue of (1.4), $1/b_j \leq b_0/b_k b_{j-k}$. Owing to $j - k > 0$, $x^i \leq x^{i+r}$ for all $i, r > 0$,

from (2.9) we have

$$\begin{aligned} & \frac{|x^i(x^{-1}D)^j x^{-\mu-\nu-1}(\theta\varphi)(x)|}{(B+\beta)^j b_j} \\ & \leq \sum_{k=0}^j \binom{j}{k} DB_0^j \frac{b_j b_0}{b_k (B+\beta)^k} \left(\frac{|x^i(x^{-1}D)^{j-k} x^{-\mu-\nu-1}\varphi(x)|}{(B+\beta)^{j-k} b_{j-k}} \right. \\ & \quad \left. + \frac{|x^{i+r}(x^{-1}D)^{j-k} x^{-\mu-\nu-1}\varphi(x)|}{(B+\beta)^{j-k} b_{j-k}} \right) \end{aligned} \quad (2.10)$$

for all integers $j > 0$, and for all $x \in (0, \infty)$, we consider the supremum to obtain

$$\mathfrak{G}_{i,\beta}^{\mu,\nu}(\theta\varphi) \leq 2Db_0B_0^j b_j \sum_{k=0}^j \binom{j}{k} \mathfrak{G}_{i+r,\beta}^{\mu,\nu}(\varphi). \quad (2.11)$$

The theorem is thus completely proved. \square

THEOREM 2.5. *If $\theta \in \mathcal{E}_{a_i, A_0}^{b_j, B_0}$, $\varphi \in H_{\mu, a_i, A}^{\nu, b_j, B}$, and b_j satisfy (1.4), then*

$$\mathfrak{G}_{i,\beta}^{\mu,\nu}(\theta\varphi) \leq C \sum_{k=0}^j \frac{\binom{j}{k}}{b_k} \mathfrak{G}_{\alpha,\beta}^{\mu,\nu}(\varphi), \quad (2.12)$$

that is, the mapping $\varphi \rightarrow \theta\varphi$ is a continuous linear mapping on $H_{\mu, a_i, A}^{\nu, b_j, B}$ into itself, where $C = EA_0^j B_0^j a_i b_j b_0$.

Proof. By virtue of (2.8) and Definition 1.1, we are led to

$$\begin{aligned} & |x^i(x^{-1}D)^j x^{-\mu-\nu-1}(\theta\varphi)(x)| \\ & \leq \sum_{k=0}^j \binom{j}{k} EA_0^j B_0^j a_j b_j |(x^i + x^{i+r})(x^{-1}D)^{j-k} x^{-\mu-\nu-1}\varphi(x)|. \end{aligned} \quad (2.13)$$

Now multiplying this relation by $1/(A+\alpha)^i(B+\beta)^j a_i b_j$, we conclude, indeed, that $1/(B+\beta)^k \leq 1$, that is,

$$\begin{aligned} & \frac{|x^i(x^{-1}D)^j x^{-\mu-\nu-1}(\theta\varphi)(x)|}{(A+\alpha)^i(B+\beta)^j a_i b_j} \\ & \leq \sum_{k=0}^j \binom{j}{k} EA_0^j B_0^j a_j b_j \frac{b_{j-k}}{b_j} \left| \frac{(x^i + x^{i+r})(x^{-1}D)^{j-k} x^{-\mu-\nu-1}\varphi(x)}{(A+\alpha)^i(B+\beta)^{j-k} a_i b_{j-k}} \right|. \end{aligned} \quad (2.14)$$

6 Tempered ultradistribution space of Roumieu type

Further, employing (1.4) and as usual taking the supremum over all $x \in (0, \infty)$, $i, j \in \mathbb{N}_0$, we have

$$\mathfrak{G}_{i,\beta}^{\mu,\nu}(\theta\varphi) \leq C \sum_{k=0}^j \frac{\binom{j}{k}}{b_k} \mathfrak{G}_{\alpha,\beta}^{\mu,\nu}(\varphi), \quad (2.15)$$

where C has the usual meaning. Thus, the theorem is completely proved. \square

3. Operators for the duals of tempered ultradistribution

In this section, a lemma is proved to establish the isomorphism between the spaces which are infinitely smooth and defined on $(0, \infty)$, described in Section 1 and further, a mapping is proved to be an isomorphism between duals of these spaces.

LEMMA 3.1. *For k being a nonnegative integer, the mapping $\varphi \rightarrow x^k \varphi$ is an isomorphism from the spaces $H_{\mu,a_i,A}^\nu$, $H_\mu^{\nu,b_j,B}$, and $H_{\mu,a_i,A}^{\nu,b_j,B}$ onto $H_{\mu,a_i,A}^{\nu+k}$, $H_\mu^{\nu+k,b_j,B}$, and $H_{\mu,a_i,A}^{\nu,b_j,B}$, respectively.*

Proof. Let $\varphi \in H_{\mu,a_i,A}^\nu$, $H_\mu^{\nu,b_j,B}$, and $H_{\mu,a_i,A}^{\nu,b_j,B}$, respectively.

In the case $\varphi \in H_{\mu,a_i,A}^\nu$, we write

$$|x^i (x^{-1}D)^j x^{-\mu-(\nu+k)-1} (x^k \varphi(x))| = |x^i (x^{-1}D)^j x^{-\mu-\nu-1} \varphi(x)|. \quad (3.1)$$

Now multiplying (3.1) by $1/(A + \alpha)^i a_i$ and taking supremum over all $x \in (0, \infty)$, for $j \in \mathbb{N}_0$, we obtain

$$\mathfrak{G}_{j,\alpha}^{\mu,\nu+k}(x^k \varphi) = \mathfrak{G}_{j,\alpha}^{\mu,\nu}(\varphi). \quad (3.2)$$

Now, when $\varphi \in H_\mu^{\nu,b_j,B}$, we multiply (3.1) by $1/(B + \beta)^j b_j$, and following the above lines of the proof, we arrive at

$$\mathfrak{G}_{i,\beta}^{\mu,\nu+k}(x^k \varphi) = \mathfrak{G}_{i,\beta}^{\mu,\nu}(\varphi). \quad (3.3)$$

Finally, for the case $\varphi \in H_{\mu,a_i,A}^{\nu,b_j,B}$, similarly, we conclude to write

$$\mathfrak{G}_{\alpha,\beta}^{\mu,\nu+k}(x^k \varphi) = \mathfrak{G}_{\alpha,\beta}^{\mu,\nu}(\varphi). \quad (3.4)$$

The lemma is completely proved. \square

As an obvious consequence of Lemma 3.1 and the result (cf. [4, Theorem 1.10-2, page 29]), for $k \geq 0$, it is shown that the mapping $f \rightarrow x^k f$ is an isomorphism from the duals $H_{\mu,a_i,A}^{\nu+k}$, $H_\mu^{\nu+k,b_j,B}$, and $H_{\mu,a_i,A}^{\nu+k,b_j,B}$, respectively, onto $H_{\mu,a_i,A}^\nu$, $H_\mu^{\nu,b_j,B}$, and $H_{\mu,a_i,A}^{\nu,b_j,B}$, respectively.
