Abstract

This paper gives growth properties of Green-Sch potentials at infinity in a cone, which generalizes results obtained by Qiao-Deng. The proof is based on the fact that the estimations of Green-Sch potentials with measures are connected with a kind of densities of the measures modified by the measures.

MSC: 35J10; 35J25

Keywords: stationary Schrödinger operator; Green-Sch potential; growth property; cone

1 Introduction and main results

Let $\mathbf{R}$ and $\mathbf{R}_+$ be the set of all real numbers and the set of all positive real numbers, respectively. We denote by $\mathbf{R}^n$ ($n \geq 2$) the n-dimensional Euclidean space. A point in $\mathbf{R}^n$ is denoted by $P = (X, x_n)$, $X = (x_1, x_2, \dots, x_{n-1})$. The Euclidean distance of two points P and Q in $\mathbf{R}^n$ is denoted by $|P - Q|$. Also $|P - O|$ with the origin O of $\mathbf{R}^n$ is simply denoted by $|P|$. The boundary, the closure and the complement of a set $\mathbf{S}$ in $\mathbf{R}^n$ are denoted by $\partial\mathbf{S}$, $\overline{\mathbf{S}}$, and $\mathbf{S}^c$, respectively. For $P \in \mathbf{R}^n$ and $r > 0$, let $B(P, r)$ denote the open ball with center at P and radius r in $\mathbf{R}^n$.

We introduce a system of spherical coordinates (r, Θ), $\Theta = (\theta_1, \theta_2, \dots, \theta_{n-1})$, in $\mathbf{R}^n$ which are related to cartesian coordinates $(x_1, x_2, \dots, x_{n-1}, x_n)$ by

$$x_1 = r\left(\prod_{j=1}^{n-1} \sin\theta_j\right) \quad (n \geq 2), \qquad x_n = r\cos\theta_1,$$

and if $n \geq 3$, then

$$x_{n-m+1} = r\left(\prod_{j=1}^{m-1} \sin\theta_j\right)\cos\theta_m \quad (2 \leq m \leq n-1),$$

where $0 \leq r < +\infty$, $-\frac{1}{2}\pi \leq \theta_{n-1} < \frac{3}{2}\pi$, and if $n \geq 3$, then $0 \leq \theta_j \leq \pi$ ($1 \leq j \leq n-2$).

The unit sphere and the upper half unit sphere in $\mathbf{R}^n$ are denoted by $\mathbf{S}^{n-1}$ and $\mathbf{S}^{n-1}_+$, respectively. For simplicity, a point $(1, \Theta)$ on $\mathbf{S}^{n-1}$ and the set $\{\Theta; (1, \Theta) \in \Omega\}$ for a set Ω, $\Omega \subset \mathbf{S}^{n-1}$, are often identified with Θ and Ω, respectively. For two sets $\Xi \subset \mathbf{R}_+$ and $\Omega \subset \mathbf{S}^{n-1}$, the set $\{(r, \Theta) \in \mathbf{R}^n; r \in \Xi, (1, \Theta) \in \Omega\}$ in $\mathbf{R}^n$ is simply denoted by $\Xi \times \Omega$. In particular, the half space $\mathbf{R}_+ \times \mathbf{S}^{n-1}_+ = \{(X, x_n) \in \mathbf{R}^n; x_n > 0\}$ will be denoted by $\mathbf{T}_n$.

By $C_n(\Omega)$, we denote the set $\mathbf{R}_+ \times \Omega$ in $\mathbf{R}^n$ with the domain Ω on $\mathbf{S}^{n-1}$ ($n \geq 2$). We call it a cone. Then T_n is a special cone obtained by putting $\Omega = \mathbf{S}_+^{n-1}$. We denote the sets $I \times \Omega$ and $I \times \partial\Omega$ with an interval on $\mathbf{R}$ by $C_n(\Omega; I)$ and $S_n(\Omega; I)$. By $S_n(\Omega; r)$ we denote $C_n(\Omega) \cap S_r$. By $S_n(\Omega)$ we denote $S_n(\Omega; (0, +\infty))$, which is $\partial C_n(\Omega) - \{O\}$.

Let $C_n(\Omega)$ be an arbitrary domain in $\mathbf{R}^n$ and $\mathscr{A}_a$ denote the class of nonnegative radial potentials $a(P)$, *i.e.* $0 \leq a(P) = a(r)$, $P = (r, \Theta) \in C_n(\Omega)$, such that $a \in L^b_{\mathrm{loc}}(C_n(\Omega))$ with some $b > n/2$ if $n \geq 4$ and with $b = 2$ if $n = 2$ or $n = 3$.

If $a \in \mathscr{A}_a$, then the stationary Schrödinger operator

$$Sch_a = -\Delta + a(P)I = 0,$$

where Δ is the Laplace operator and I is the identical operator, can be extended in the usual way from the space $C_0^\infty(C_n(\Omega))$ to an essentially self-adjoint operator on $L^2(C_n(\Omega))$ (see [1, Ch. 13]). We will denote it Sch_a as well. This last one has a Green-Sch function $G^a_\Omega(P, Q)$. Here $G^a_\Omega(P, Q)$ is positive on $C_n(\Omega)$ and its inner normal derivative $\partial G^a_\Omega(P, Q)/\partial n_Q \geq 0$, where $\partial/\partial n_Q$ denotes the differentiation at Q along the inward normal into $C_n(\Omega)$. We denote this derivative by $PI^a_\Omega(P, Q)$, which is called the Poisson-Sch kernel with respect to $C_n(\Omega)$.

We shall say that a set $E \subset C_n(\Omega)$ has a covering $\{r_j, R_j\}$ if there exists a sequence of balls $\{B_j\}$ with centers in $C_n(\Omega)$ such that $E \subset \bigcup_{j=0}^\infty B_j$, where r_j is the radius of B_j and R_j is the distance from the origin to the center of B_j.

For positive functions h_1 and h_2, we say that $h_1 \lesssim h_2$ if $h_1 \leq M h_2$ for some constant $M > 0$. If $h_1 \lesssim h_2$ and $h_2 \lesssim h_1$, we say that $h_1 \approx h_2$.

Let Ω be a domain on $\mathbf{S}^{n-1}$ with smooth boundary. Consider the Dirichlet problem

$$(\Lambda_n + \lambda)\varphi = 0 \quad \text{on } \Omega,$$

$$\varphi = 0 \quad \text{on } \partial\Omega,$$

where Λ_n is the spherical part of the Laplace opera Δ_n

$$\Delta_n = \frac{n-1}{r}\frac{\partial}{\partial r} + \frac{\partial^2}{\partial r^2} + \frac{\Lambda_n}{r^2}.$$

We denote the least positive eigenvalue of this boundary value problem by λ and the normalized positive eigenfunction corresponding to λ by $\varphi(\Theta)$, $\int_\Omega \varphi^2(\Theta)\, dS_1 = 1$. In order to ensure the existence of λ and a smooth $\varphi(\Theta)$. We put a rather strong assumption on Ω: if $n \geq 3$, then Ω is a $C^{2,\alpha}$-domain ($0 < \alpha < 1$) on $\mathbf{S}^{n-1}$ surrounded by a finite number of mutually disjoint closed hypersurfaces (*e.g.* see [2, pp.88-89] for the definition of $C^{2,\alpha}$-domain).

For any $(1, \Theta) \in \Omega$, we have (see [3, pp.7-8])

$$\varphi(\Theta) \approx \mathrm{dist}\big((1, \Theta), \partial C_n(\Omega)\big),$$

which yields

$$\delta(P) \approx r\varphi(\Theta), \tag{1.1}$$

where $P = (r, \Theta) \in C_n(\Omega)$ and $\delta(P) = \mathrm{dist}(P, \partial C_n(\Omega))$.

Solutions of an ordinary differential equation

$$-Q''(r) - \frac{n-1}{r}Q'(r) + \left(\frac{\lambda}{r^2} + a(r)\right)Q(r) = 0, \quad 0 < r < \infty. \tag{1.2}$$

It is well known (see, for example, [4]) that if the potential $a \in \mathscr{A}_a$, then (1.2) has a fundamental system of positive solutions $\{V, W\}$ such that V is nondecreasing with (see [5–8])

$$0 \le V(0+) \le V(r) \quad \text{as } r \to +\infty,$$

and W is monotonically decreasing with

$$+\infty = W(0+) > W(r) \searrow 0 \quad \text{as } r \to +\infty.$$

We will also consider the class $\mathscr{B}_a$, consisting of the potentials $a \in \mathscr{A}_a$ such that there exists the finite limit $\lim_{r\to\infty} r^2 a(r) = k \in [0, \infty)$, and moreover, $r^{-1}|r^2 a(r) - k| \in L(1, \infty)$. If $a \in \mathscr{B}_a$, then the (sub)superfunctions are continuous (see [9]).

In the rest of paper, we assume that $a \in \mathscr{B}_a$ and we shall suppress this assumption for simplicity.

Denote

$$\iota_k^{\pm} = \frac{2 - n \pm \sqrt{(n-2)^2 + 4(k+\lambda)}}{2},$$

then the solutions to (1.2) have the asymptotic (see [10])

$$V(r) \approx r^{\iota_k^+}, \qquad W(r) \approx r^{\iota_k^-} \quad \text{as } r \to \infty. \tag{1.3}$$

We denote the Green-Sch potential with a positive measure ν on $C_n(\Omega)$ by

$$G_\Omega^a \nu(P) = \int_{C_n(\Omega)} G_\Omega^a(P, Q)\, d\nu(Q).$$

Let ν be any positive measure $C_n(\Omega)$ such that $G_\Omega^a \nu(P) \not\equiv +\infty$ (resp. $G_\Omega^0 \nu(P) \not\equiv +\infty$) for $P \in C_n(\Omega)$. The positive measure ν' (rep. ν'') on $\mathbf{R}^n$ is defined by

$$d\nu'(Q) = \begin{cases} W(t)\varphi(\Phi)\, d\nu(Q), & Q = (t, \Phi) \in C_n(\Omega; (1, +\infty)), \\ 0, & Q \in \mathbf{R}^n - C_n(\Omega; (1, +\infty)). \end{cases}$$

$$\left(d\nu'(Q) = \begin{cases} t^{\iota_0^-}\varphi(\Phi)\, d\nu(Q), & Q = (t, \Phi) \in C_n(\Omega; (1, +\infty)), \\ 0, & Q \in \mathbf{R}^n - C_n(\Omega; (1, +\infty)). \end{cases} \right)$$

Let $\epsilon > 0$, $0 \le \alpha < n$, and λ be any positive measure on $\mathbf{R}^n$ having finite total mass. For each $P = (r, \Theta) \in \mathbf{R}^n - \{O\}$, the maximal function $M(P; \lambda, \alpha)$ is defined by (see [11])

$$M(P; \lambda, \alpha) = \sup_{0<\rho<\frac{r}{2}} \lambda\big(B(P, \rho)\big) V(\rho) W(\rho) \rho^{\alpha-2}.$$

The set

$$\{P=(r,\Theta)\in\mathbf{R}^n-\{O\};M(P;\lambda,\alpha)V^{-1}(r)W^{-1}(r)r^{2-\alpha}>\epsilon\}$$

is denoted by $E(\epsilon;\lambda,\alpha)$.

Remark 1 If $\lambda(\{P\})>0$ ($P\neq O$), then $M(P;\lambda,\alpha)=+\infty$ for any positive number β. So we can find $\{P\in\mathbf{R}^n-\{O\};\lambda(\{P\})>0\}\subset E(\epsilon;\lambda,\alpha)$.

About the growth properties of Green potentials at infinity in a cone, Qiao-Deng (see [12, Theorem 1]) has proved the following result.

Theorem A *Let ν be a positive measure on $C_n(\Omega)$ such that $G^0_\Omega\nu(P)\not\equiv+\infty$ for any $P=(r,\Theta)\in C_n(\Omega)$. Then there exists a covering $\{r_j,R_j\}$ of $F(\epsilon;\nu'',\alpha)$ ($\subset C_n(\Omega)$) satisfying*

$$\sum_{j=0}^{\infty}\left(\frac{r_j}{R_j}\right)^{n-\alpha}<\infty,$$

such that

$$\lim_{r\to\infty,P\in C_n(\Omega)-F(\epsilon;\nu'',\alpha)}r^{-\iota_0^+}\varphi^{\alpha-1}(\Theta)G^0_\Omega\nu(P)=0,$$

where

$$H(P;\nu'',\alpha)=\sup_{0<\rho<\frac{r}{2}}\frac{\nu''(B(P,\rho))}{\rho^{n-\alpha}}$$

and

$$F(\epsilon;\nu'',\alpha)=\{P=(r,\Theta)\in\mathbf{R}^n-\{O\};H(P;\nu'',\alpha)r^{n-\alpha}>\epsilon\}.$$

Now we state our first result.

Theorem 1 *Let ν be a positive measure on $C_n(\Omega)$ such that*

$$G^a_\Omega\nu(P)\not\equiv+\infty\quad\big(P=(r,\Theta)\in C_n(\Omega)\big).\tag{1.4}$$

Then there exists a covering $\{r_j,R_j\}$ of $E(\epsilon;\nu',\alpha)$ ($\subset C_n(\Omega)$) satisfying

$$\sum_{j=0}^{\infty}\left(\frac{r_j}{R_j}\right)^{2-\alpha}\frac{V(R_j)W(R_j)}{V(r_j)W(r_j)}<\infty,\tag{1.5}$$

such that

$$\lim_{r\to\infty,P\in C_n(\Omega)-E(\epsilon;\nu',\alpha)}V^{-1}(r)\varphi^{\alpha-1}(\Theta)G^a_\Omega\nu(P)=0.\tag{1.6}$$

Remark 2 By comparison the condition (1.4) is fairly briefer and easily applied. Moreover, $E(\epsilon;\nu',1)$ is a set of 1-finite view in the sense of [13, 14] (see [13, Definition 2.1] for the definition of 1-finite view). In the case $a = 0$, Theorem 1 (1.6) is just the result of Theorem A.

Corollary 1 *Let ν be a positive measure on $C_n(\Omega)$ such that* (1.4) *holds. Then for a sufficiently large L and a sufficiently small ϵ we have*

$$\bigl\{P\in C_n\bigl(\Omega;(L,+\infty)\bigr); G_\Omega^a\nu(P)\geq V(r)\varphi^{1-\alpha}(\Theta)\bigr\}\subset E\bigl(\epsilon;\mu',\alpha\bigr).$$

2 Some lemmas

Lemma 1 (see [15, 16])

$$G_\Omega^a(P,Q)\approx V(t)W(r)\varphi(\Theta)\varphi(\Phi) \tag{2.1}$$

$$\bigl(\textit{resp. } G_\Omega^a(P,Q)\approx V(r)W(t)\varphi(\Theta)\varphi(\Phi)\bigr), \tag{2.2}$$

for any $P=(r,\Theta)\in C_n(\Omega)$ and any $Q=(t,\Phi)\in C_n(\Omega)$ satisfying $0<\frac{t}{r}\leq\frac{4}{5}$ (resp. $0<\frac{r}{t}\leq\frac{4}{5}$);
Further, for any $P=(r,\Theta)\in C_n(\Omega)$ and any $Q=(t,\Phi)\in C_n(\Omega;(\frac{4}{5}r,\frac{5}{4}r))$, we have

$$G_\Omega^0(P,Q)\lesssim\frac{\varphi(\Theta)\varphi(\Phi)}{t^{n-2}}+\Pi_\Omega(P,Q), \tag{2.3}$$

where

$$\Pi_\Omega(P,Q)=\min\left\{\frac{1}{|P-Q|^{n-2}},\frac{rt\varphi(\Theta)\varphi(\Phi)}{|P-Q|^n}\right\}.$$

Lemma 2 *Let ν be a positive measure on $C_n(\Omega)$ such that there is a sequence of points $P_i=(r_i,\Theta_i)\in C_n(\Omega)$, $r_i\to+\infty$ $(i\to+\infty)$ satisfying $G_\Omega^a\nu(P_i)<+\infty$ $(i=1,2,\ldots;Q\in C_n(\Omega))$. Then, for a positive number l,*

$$\int_{C_n(\Omega;(l,+\infty))}W(t)\varphi(\Phi)\,d\nu(Q)<+\infty \tag{2.4}$$

and

$$\lim_{R\to+\infty}\frac{W(R)}{V(R)}\int_{C_n(\Omega;(0,R))}V(t)\varphi(\Phi)\,d\nu(Q)=0. \tag{2.5}$$

Proof Take a positive number l satisfying $P_1=(r_1,\Theta_1)\in C_n(\Omega)$, $r_1\leq\frac{4}{5}l$. Then from (2.2), we have

$$V(r_1)\varphi(\Theta_1)\int_{S_n(\Omega;(l,+\infty))}W(t)\varphi(\Phi)\,d\mu(Q)\lesssim\int_{S_n(\Omega)}G_\Omega^a(P,Q)\,d\mu(Q)<+\infty,$$

which gives (2.4). For any positive number ϵ, from (2.4), we can take a number R_ϵ such that

$$\int_{S_n(\Omega;(R_\epsilon,+\infty))}W(t)\varphi(\Phi)\,d\mu(Q)<\frac{\epsilon}{2}.$$

If we take a point $P_i = (r_i, \Theta_i) \in C_n(\Omega)$, $r_i \geq \frac{5}{4}R_\epsilon$, then we have from (2.1)

$$W(r_i)\varphi(\Theta_i)\int_{S_n(\Omega;(0,R_\epsilon])} V(t)\varphi(\Phi)\,d\mu(Q) \lesssim \int_{S_n(\Omega)} G_\Omega^a(P,Q)\,d\mu(Q) < +\infty.$$

If R ($R > R_\epsilon$) is sufficiently large, then

$$\begin{aligned}
&\frac{W(R)}{V(R)}\int_{S_n(\Omega;(0,R))} V(t)\varphi(\Phi)\,d\mu(Q) \\
&\quad\lesssim \frac{W(R)}{V(R)}\int_{S_n(\Omega;(0,R_\epsilon])} V(t)\varphi(\Phi)\,d\mu(Q) + \int_{S_n(\Omega;(R_\epsilon,R))} W(t)\varphi(\Phi)\,d\mu(Q) \\
&\quad\lesssim \frac{W(R)}{V(R)}\int_{S_n(\Omega;(0,R_\epsilon])} V(t)\varphi(\Phi)\,d\mu(Q) + \int_{S_n(\Omega;(R_\epsilon,+\infty))} W(t)\varphi(\Phi)\,d\mu(Q) \\
&\quad\lesssim \epsilon,
\end{aligned}$$

which gives (2.5). □

Lemma 3 *Let λ be any positive measure on $\mathbf{R}^n$ having finite total mass. Then $E(\epsilon;\lambda,\alpha)$ has a covering $\{r_j, R_j\}$ ($j = 1, 2, \ldots$) satisfying*

$$\sum_{j=1}^{\infty}\left(\frac{r_j}{R_j}\right)^{2-\alpha}\frac{V(R_j)W(R_j)}{V(r_j)W(r_j)} < \infty.$$

Proof Set

$$E_j(\epsilon;\lambda,\beta) = \left\{P = (r,\Theta) \in E(\epsilon;\lambda,\beta) : 2^j \leq r < 2^{j+1}\right\} \quad (j = 2, 3, 4, \ldots).$$

If $P = (r,\Theta) \in E_j(\epsilon;\lambda,\beta)$, then there exists a positive number $\rho(P)$ such that

$$\left(\frac{\rho(P)}{r}\right)^{2-\alpha}\frac{V(r)W(R)}{V(\rho(P))W(\rho(P))} \approx \left(\frac{\rho(P)}{r}\right)^{n-\alpha} \leq \frac{\lambda(B(P,\rho(P)))}{\epsilon}.$$

Since $E_j(\epsilon;\lambda,\beta)$ can be covered by the union of a family of balls $\{B(P_{j,i},\rho_{j,i}) : P_{j,i} \in E_k(\epsilon;\lambda,\beta)\}$ ($\rho_{j,i} = \rho(P_{j,i})$). By the Vitali lemma (see [17]), there exists $\Lambda_j \subset E_j(\epsilon;\lambda,\beta)$, which is at most countable, such that $\{B(P_{j,i},\rho_{j,i}) : P_{j,i} \in \Lambda_j\}$ are disjoint and $E_j(\epsilon;\lambda,\beta) \subset \bigcup_{P_{j,i}\in\Lambda_j} B(P_{j,i}, 5\rho_{j,i})$.

So

$$\bigcup_{j=2}^{\infty} E_j(\epsilon;\lambda,\beta) \subset \bigcup_{j=2}^{\infty}\bigcup_{P_{j,i}\in\Lambda_j} B(P_{j,i}, 5\rho_{j,i}).$$

On the other hand, note that

$$\bigcup_{P_{j,i}\in\Lambda_j} B(P_{j,i},\rho_{j,i}) \subset \left\{P = (r,\Theta) : 2^{j-1} \leq r < 2^{j+2}\right\},$$

so that

$$\sum_{P_{j,i}\in\Lambda_j}\left(\frac{5\rho_{j,i}}{|P_{j,i}|}\right)^{2-\alpha}\frac{V(|P_{j,i}|)W(|P_{j,i}|)}{V(\rho_{j,i})W(\rho_{j,i})}\approx\sum_{P_{j,i}\in\Lambda_j}\left(\frac{5\rho_{j,i}}{|P_{j,i}|}\right)^{n-\alpha}\le 5^{n-\alpha}\sum_{P_{j,i}\in\Lambda_j}\frac{\lambda(B(P_{j,i},\rho_{j,i}))}{\epsilon}$$
$$\le\frac{5^{n-\alpha}}{\epsilon}\lambda\bigl(C_n\bigl(\Omega;\bigl[2^{j-1},2^{j+2}\bigr)\bigr)\bigr).$$

Hence we obtain

$$\sum_{j=1}^{\infty}\sum_{P_{j,i}\in\Lambda_j}\left(\frac{\rho_{j,i}}{|P_{j,i}|}\right)^{2-\alpha}\frac{V(|P_{j,i}|)W(|P_{j,i}|)}{V(\rho_{j,i})W(\rho_{j,i})}\approx\sum_{j=1}^{\infty}\sum_{P_{j,i}\in\Lambda_j}\left(\frac{\rho_{j,i}}{|P_{j,i}|}\right)^{n-\alpha}$$
$$\le\sum_{j=1}^{\infty}\frac{\lambda(C_n(\Omega;[2^{j-1},2^{j+2})))}{\epsilon}$$
$$\le\frac{3\lambda(\mathbf{R}^n)}{\epsilon}.$$

Since $E(\epsilon;\lambda,\beta)\cap\{P=(r,\Theta)\in\mathbf{R}^n;r\ge 4\}=\bigcup_{j=2}^{\infty}E_j(\epsilon;\lambda,\beta)$. Then $E(\epsilon;\lambda,\beta)$ is finally covered by a sequence of balls $\{B(P_{j,i},\rho_{j,i}),B(P_1,6)\}$ $(j=2,3,\ldots;i=1,2,\ldots)$ satisfying

$$\sum_{j,i}\left(\frac{\rho_{j,i}}{|P_{j,i}|}\right)^{2-\alpha}\frac{V(|P_{j,i}|)W(|P_{j,i}|)}{V(\rho_{j,i})W(\rho_{j,i})}\approx\sum_{j,i}\left(\frac{\rho_{j,i}}{|P_{j,i}|}\right)^{n-\alpha}\le\frac{3\lambda(\mathbf{R}^n)}{\epsilon}+6^{n-\alpha}<+\infty,$$

where $B(P_1,6)$ $(P_1=(1,0,\ldots,0)\in\mathbf{R}^n)$ is the ball which covers $\{P=(r,\Theta)\in\mathbf{R}^n;r<4\}$. □

3 Proof of Theorem 1

For any point $P=(r,\Theta)\in C_n(\Omega;(R,+\infty))-E(\epsilon;\nu',\alpha)$, where R $(\le\frac{4}{5}r)$ is a sufficiently large number and ϵ is a sufficiently small positive number.

Write

$$G_\Omega^a\nu(P)=G_\Omega^a\nu(1)(P)+G_\Omega^a\nu(2)(P)+G_\Omega^a\nu(3)(P),$$

where

$$G_\Omega^a\nu(1)(P)=\int_{C_n(\Omega;(0,\frac{4}{5}r])}G_\Omega^a(P,Q)\,d\nu(Q),$$
$$G_\Omega^a\nu(2)(P)=\int_{C_n(\Omega;(\frac{4}{5}r,\frac{5}{4}r))}G_\Omega^a(P,Q)\,d\nu(Q),$$

and

$$G_\Omega^a\nu(3)(P)=\int_{C_n(\Omega;[\frac{5}{4}r,\infty))}G_\Omega^a(P,Q)\,d\nu(Q).$$

From (2.1) and (2.2) we obtain the following growth estimates:

$$G_\Omega^a\nu(1)(P)\lesssim\epsilon V(r)\varphi(\Theta),\tag{3.1}$$
$$G_\Omega^a\nu(3)(P)\lesssim\epsilon V(r)\varphi(\Theta).\tag{3.2}$$

By (2.3) and (3.1), we have

$$G_\Omega^a \nu(2)(P) \le G_\Omega^a \nu(21)(P) + G_\Omega^a \nu(22)(P),$$

where

$$G_\Omega^a \nu(21)(P) = \varphi(\Theta) \int_{C_n(\Omega;(\frac{4}{5}r,\frac{5}{4}r))} V(t)\, d\nu'(Q)$$

and

$$G_\Omega^a \nu(22)(P) = \int_{C_n(\Omega;(\frac{4}{5}r,\frac{5}{4}r))} \Pi_\Omega(P,Q)\, d\nu(Q).$$

Then by Lemma 2, we immediately get

$$G_\Omega^a \nu(21)(P) \lesssim \epsilon V(r)\varphi(\Theta). \tag{3.3}$$

To estimate $G_\Omega^a \nu(22)(P)$, take a sufficiently small positive number c independent of P such that

$$\Lambda(P) = \left\{(t,\Phi) \in C_n\left(\Omega; \left(\frac{4}{5}r, \frac{5}{4}r\right)\right); \left|(1,\Phi) - (1,\Theta)\right| < c\right\} \subset B\left(P, \frac{r}{2}\right) \tag{3.4}$$

and divide $C_n(\Omega;(\frac{4}{5}r,\frac{5}{4}r))$ into two sets $\Lambda(P)$ and $\Lambda(P)$, where

$$\Lambda(P) = C_n\left(\Omega; \left(\frac{4}{5}r, \frac{5}{4}r\right)\right) - \Lambda(P).$$

Write

$$G_\Omega^a \nu(22)(P) = G_\Omega^a \nu(221)(P) + G_\Omega^a \nu(222)(P),$$

where

$$G_\Omega^a \nu(221)(P) = \int_{\Lambda(P)} \Pi_\Omega(P,Q)\, d\nu(Q)$$

and

$$G_\Omega^a \nu(222)(P) = \int_{\Lambda(P)} \Pi_\Omega(P,Q)\, d\nu(Q).$$

There exists a positive c' such that $|P - Q| \ge c'r$ for any $Q \in \Lambda(P)$, and hence

$$\begin{aligned} G_\Omega^a \nu(222)(P) &\lesssim \int_{C_n(\Omega;(\frac{4}{5}r,\frac{5}{4}r))} \frac{rt\varphi(\Theta)\varphi(\Phi)}{|P-Q|^n}\, d\nu(Q) \\ &\lesssim V(r)\varphi(\Theta) \int_{C_n(\Omega;(\frac{4}{5}r,\infty))} d\nu'(Q) \\ &\lesssim \epsilon V(r)\varphi(\Theta) \end{aligned} \tag{3.5}$$

from Lemma 2.

Now we estimate $G^{a}_{\Omega}\nu(221)(P)$. Set

$$I_i(P) = \{Q \in \Lambda(P); 2^{i-1}\delta(P) \leq |P-Q| < 2^{i}\delta(P)\},$$

where $i = 0, \pm1, \pm2, \ldots$.

Since $P = (r,\Theta) \notin E(\epsilon;\nu',\alpha)$ and hence $\nu'(\{P\}) = 0$ from Remark 1, we can divide $G^{a}_{\Omega}\nu(221)(P)$ into

$$G^{a}_{\Omega}\nu(221)(P) = G^{A}_{\Omega}\nu(2211)(P) + G^{a}_{\Omega}\nu(2212)(P),$$

where

$$G^{A}_{\Omega}\nu(2211)(P) = \sum_{i=-\infty}^{-1}\int_{I_i(P)}\Pi_{\Omega}(P,Q)\,d\nu(Q)$$

and

$$G^{a}_{\Omega}\nu(2212)(P) = \sum_{i=0}^{\infty}\int_{I_i(P)}\Pi_{\Omega}(P,Q)\,d\nu(Q).$$

Since $\delta(Q) + |P-Q| \geq \delta(P)$, we have

$$tf_{\Omega}(\Phi) \gtrsim \delta(Q) \gtrsim 2^{-1}\delta(P)$$

for any $Q = (t,\Phi) \in I_i(p)$ $(i = -1,-2,\ldots)$. Then by (1.1)

$$\begin{aligned}\int_{I_i(P)}\Pi_{\Omega}(P,Q)\,d\nu(Q) &\lesssim \int_{I_i(P)}\frac{1}{|P-Q|^{n-2}W(t)\varphi(\Phi)}\,d\nu'(Q)\\ &\lesssim \frac{r^{2-\alpha}}{W(r)}\varphi^{1-\alpha}(\Theta)\frac{\nu'(B(P,2^{i}\delta(P)))}{\{2^{i}\delta(P)\}^{n-\alpha}}\\ &\lesssim \frac{r^{2-\alpha}}{W(r)}\varphi^{1-\alpha}(\Theta)M\bigl(P;\nu',\alpha\bigr) \quad (i = -1,-2,\ldots).\end{aligned}$$

Since $P = (r,\Theta) \notin E(\epsilon;\nu',\alpha)$, we obtain

$$G^{a}_{\Omega}\nu(2211)(P) \lesssim \epsilon V(r)\varphi^{1-\alpha}(\Theta). \tag{3.6}$$

By (3.4), we can take a positive integer $i(P)$ satisfying

$$2^{i(P)-1}\delta(P) \leq \frac{r}{2} < 2^{i(P)}\delta(P)$$

and $I_i(P) = \varnothing$ $(i = i(P)+1, i(P)+2,\ldots)$.

Since $rf_{\Omega}(\Theta) \lesssim \delta(P)$ $(P = (r,\Theta) \in C_n(\Omega))$, we have

$$\begin{aligned}\int_{I_i(P)}\Pi_{\Omega}(P,Q)\,d\nu'(Q) &\lesssim r\varphi(\Theta)\int_{I_i(P)}\frac{t}{|P-Q|^{n}W(t)}\,d\nu'(Q)\\ &\lesssim \frac{r^{2-\alpha}}{W(r)}\varphi^{1-\alpha}(\Theta)\frac{\nu'(I_i(P))}{\{2^{i}\delta(P)\}^{n-\alpha}} \quad \bigl(i = 0,1,2,\ldots,i(P)\bigr).\end{aligned}$$

Since $P = (r,\Theta) \notin E(\epsilon;\nu',\alpha)$, we have

$$\begin{aligned}\frac{\nu'(I_i(P))}{\{2^i\delta(P)\}^{n-\alpha}} &\lesssim \nu'\bigl(B\bigl(P,2^i\delta(P)\bigr)\bigr)V\bigl(2^i\delta(P)\bigr)W\bigl(2^i\delta(P)\bigr)\bigl\{2^i\delta(P)\bigr\}^{\alpha-2}\\ &\lesssim M\bigl(P;\nu',\alpha\bigr)\\ &\le \epsilon V(r)W(r)r^{\alpha-2} \quad \bigl(i=0,1,2,\ldots,i(P)-1\bigr)\end{aligned}$$

and

$$\frac{\nu'(I_i(P))}{\{2^i\delta(P)\}^{n-\alpha}} \lesssim \nu'\bigl(\Lambda(P)\bigr)V\left(\frac{r}{2}\right)W\left(\frac{r}{2}\right)\left(\frac{r}{2}\right)^{\alpha-2} \le \epsilon V(r)W(r)r^{\alpha-2}.$$

Hence we obtain

$$G^a_\Omega \nu(2212)(P) \lesssim \epsilon V(r)\varphi^{1-\alpha}(\Theta). \tag{3.7}$$

Combining (3.1)-(3.3) and (3.5)-(3.7), we finally obtain the result that if R is sufficiently large and ϵ is a sufficiently small, then $G^a_\Omega \nu(P) = o(V(r)\varphi^{1-\alpha}(\Theta))$ as $r \to \infty$, where $P = (r,\Theta) \in C_n(\Omega;(R,+\infty)) - E(\epsilon;\nu',\alpha)$. Finally, there exists an additional finite ball B_0 covering $C_n(\Omega;(0,R])$, which together with Lemma 3, gives the conclusion of Theorem 1.
