Dear editor

We read the article “Orthostatic blood pressure in people with mild cognitive impairment predicts conversion to dementia” by Hayakawa et al¹ with interest. It is well-known that many individuals with mild cognitive impairment (MCI) progress to dementia.² However, we do not exactly know which risk factors increase this risk and to what extent. Hypertension is a risk factor for Alzheimer’s disease and vascular dementia. However, the findings of this study make us consider hypotension as a new risk factor for dementia. Furthermore, a recently published 6-year prospective general population cohort study suggested that not only orthostatic hypotension (OH), but also symptoms of OH seemed to be risk factors for cognitive decline.³ Notably, in the study by Elmstahl et al³, hypertension and diabetes mellitus (DM) were more common in subjects with dementia. We would like to make some comments on this well-designed study.

The prevalence of DM is rather high in elderly individuals, and diabetic autonomic neuropathy may cause significant autonomic dysfunction. Furthermore, reactive hypoglycemic attacks and glucose variability may also increase the risk of Alzheimer’s disease in subjects with DM.⁴⁻⁶ Glucose variability and hypoglycemic attacks precipitated by insulin resistance may also affect conversion of MCI to dementia.⁷ Accurate diagnosis of DM is especially important in older adults who may not experience typical symptoms of hyperglycemia and may even have normal fasting blood glucose levels. Thus, the diagnosis of DM may be easily overlooked in elderly subjects.⁸ However, in the study by Hayakawa et al¹, a detailed assessment for the presence or absence of DM is not reported and the rate of DM in the study population seems to be lower than anticipated. We suggest that for an accurate diagnosis of DM, checking fasting glucose, postprandial glucose, and HbA_{1c} levels is essential.⁸ In conclusion, undiagnosed DM, glucose variability, and postprandial hypoglycemia might have contributed significantly to OH and to conversion of MCI to dementia in this study.

Publish your work in this journal

Clinical Interventions in Aging is an international, peer-reviewed journal focusing on evidence-based reports on the value or lack thereof of treatments intended to prevent or delay the onset of maladaptive correlates of aging in human beings. This journal is indexed on PubMed Central, MedLine,

CAS, Scopus and the Elsevier Bibliographic databases. The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
