# Global, regional, and national disability-adjusted life-years (DALYs) for 359 diseases and injuries and healthy life expectancy (HALE) for 195 countries and territories, 1990-2017: a systematic analysis for the Global Burden of Disease Study 2017 

GBD 2017 DALYs and HALE Collaborators*

#### Abstract

Summary Background How long one lives, how many years of life are spent in good and poor health, and how the population's state of health and leading causes of disability change over time all have implications for policy, planning, and provision of services. We comparatively assessed the patterns and trends of healthy life expectancy (HALE), which quantifies the number of years of life expected to be lived in good health, and the complementary measure of disability-adjusted lifeyears (DALYs), a composite measure of disease burden capturing both premature mortality and prevalence and severity of ill health, for 359 diseases and injuries for 195 countries and territories over the past 28 years.

Methods We used data for age-specific mortality rates, years of life lost (YLLs) due to premature mortality, and years lived with disability (YLDs) from the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) 2017 to calculate HALE and DALYs from 1990 to 2017. We calculated HALE using age-specific mortality rates and YLDs per capita for each location, age, sex, and year. We calculated DALYs for 359 causes as the sum of YLLs and YLDs. We assessed how observed HALE and DALYs differed by country and sex from expected trends based on Sociodemographic Index (SDI). We also analysed HALE by decomposing years of life gained into years spent in good health and in poor health, between 1990 and 2017, and extra years lived by females compared with males.

Findings Globally, from 1990 to 2017, life expectancy at birth increased by $7 \cdot 4$ years ( $95 \%$ uncertainty interval $7 \cdot 1-7 \cdot 8$ ), from $65 \cdot 6$ years ( $65 \cdot 3-65 \cdot 8$ ) in 1990 to $73 \cdot 0$ years $(72 \cdot 7-73 \cdot 3$ ) in 2017. The increase in years of life varied from $5 \cdot 1$ years $(5 \cdot 0-5 \cdot 3)$ in high SDI countries to $12 \cdot 0$ years (11.3-12.8) in low SDI countries. Of the additional years of life expected at birth, $26 \cdot 3 \%(20 \cdot 1-33 \cdot 1)$ were expected to be spent in poor health in high SDI countries compared with $11 \cdot 7 \%$ $(8 \cdot 8-15 \cdot 1)$ in low-middle SDI countries. HALE at birth increased by $6 \cdot 3$ years (5.9-6.7), from $57 \cdot 0$ years ( $54 \cdot 6-59 \cdot 1$ ) in 1990 to $63 \cdot 3$ years $(60 \cdot 5-65 \cdot 7)$ in 2017. The increase varied from $3 \cdot 8$ years $(3 \cdot 4-4 \cdot 1)$ in high SDI countries to 10.5 years (9.8-11.2) in low SDI countries. Even larger variations in HALE than these were observed between countries, ranging from 1.0 year ( $0.4-1 \cdot 7$ ) in Saint Vincent and the Grenadines ( 62.4 years [59.9-64.7] in 1990 to 63.5 years [ $60 \cdot 9-65 \cdot 8$ ] in 2017) to 23.7 years (21.9-25.6) in Eritrea ( $30 \cdot 7$ years [28.9-32.2] in 1990 to $54 \cdot 4$ years [51.5-57.1] in 2017). In most countries, the increase in HALE was smaller than the increase in overall life expectancy, indicating more years lived in poor health. In 180 of 195 countries and territories, females were expected to live longer than males in 2017, with extra years lived varying from 1.4 years $(0 \cdot 6-2 \cdot 3)$ in Algeria to 11.9 years $(10 \cdot 9-12 \cdot 9)$ in Ukraine. Of the extra years gained, the proportion spent in poor health varied largely across countries, with less than $20 \%$ of additional years spent in poor health in Bosnia and Herzegovina, Burundi, and Slovakia, whereas in Bahrain all the extra years were spent in poor health. In 2017, the highest estimate of HALE at birth was in Singapore for both females ( 75.8 years [ $72 \cdot 4-78 \cdot 7$ ]) and males ( 72.6 years [ $69 \cdot 8-75 \cdot 0$ ]) and the lowest estimates were in Central African Republic ( 47.0 years [43.7-50.2] for females and $42 \cdot 8$ years [ $40 \cdot 1-45 \cdot 6$ ] for males). Globally, in 2017, the five leading causes of DALYs were neonatal disorders, ischaemic heart disease, stroke, lower respiratory infections, and chronic obstructive pulmonary disease. Between 1990 and 2017, age-standardised DALY rates decreased by $41 \cdot 3 \%$ (38.8-43.5) for communicable diseases and by $49.8 \%(47 \cdot 9-51 \cdot 6)$ for neonatal disorders. For non-communicable diseases, global DALYs increased by $40 \cdot 1 \%(36 \cdot 8-43 \cdot 0)$, although age-standardised DALY rates decreased by $18 \cdot 1 \%(16 \cdot 0-20 \cdot 2)$.

Interpretation With increasing life expectancy in most countries, the question of whether the additional years of life gained are spent in good health or poor health has been increasingly relevant because of the potential policy implications, such as health-care provisions and extending retirement ages. In some locations, a large proportion of those additional years are spent in poor health. Large inequalities in HALE and disease burden exist across countries in different SDI quintiles and between sexes. The burden of disabling conditions has serious implications for health system planning and health-related expenditures. Despite the progress made in reducing the burden of communicable diseases and neonatal disorders in low SDI countries, the speed of this progress could be increased by scaling up

proven interventions. The global trends among non-communicable diseases indicate that more effort is needed to maximise HALE, such as risk prevention and attention to upstream determinants of health.

## Introduction

Understanding global trends in the health status of populations and changes in the leading causes of disease burden over time is crucial to tracking progress towards the Sustainable Development Goal to ensure healthy lives and promote wellbeing for all at all ages. ${ }^{1}$ Robust assessment of these trends requires objective and comparable measures of population health that can help countries identify priorities and address challenges to achieving this goal. The Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) 2017, the third
annual update in the series, uses all available up-to-date epidemiological data and improved standardised methods to provide a comparative assessment of health loss across 359 diseases and injuries and 73 age and sex groups for 195 countries and territories. The availability of GBD 2017 data for years of life lost (YLLs) because of premature mortality and years lived with disability (YLDs) provides an opportunity to assess trends in population health over the past 28 years by analysing two complementary summary measures: healthy life expectancy (HALE), which quantifies the number of

## Research in context

## Evidence before this study

The Global Burden of Diseases, Injuries, and Risk Factors Study 2016 (GBD 2016) estimated 333 causes of disability-adjusted life-years (DALYs) for 195 countries and territories from 1990 to 2016. GBD 2016 also provided estimates for life expectancy and healthy life expectancy (HALE) at birth and at age 65 years, by sex, for each location over time. GBD 2016 included analysis of the epidemiological transition as a function of the Socio-demographic Index. The WHO Global Health Estimates has also published estimates of HALE and DALYs, although these estimates largely relied on GBD 2016 results.

## Added value of this study

In GBD 2017, we expanded the scope of the study compared with previous iterations to include subnational estimates for five more countries (Ethiopia, Iran, New Zealand, Norway, and Russia) and 19 additional causes. The new causes estimated are invasive non-typhoidal salmonella disease; liver cancer due to non-alcoholic steatohepatitis; cirrhosis due to non-alcoholic steatohepatitis; myelodysplastic, myeloproliferative, and other haemopoietic neoplasms; benign and in-situ intestinal neoplasms; benign and in-situ cervical and uterine neoplasms; other benign and in-situ neoplasms; subarachnoid haemorrhage; non-rheumatic valvular heart disease; non-rheumatic calcific aortic valve disease; non-rheumatic degenerative mitral valve disease; other non-rheumatic valve diseases; gastro-oesophageal reflux disease; type 1 diabetes; type 2 diabetes; chronic kidney disease due to type 1 diabetes; chronic kidney disease due to type 2 diabetes; poisoning by carbon monoxide; and poisoning by other means. In addition to broadening our estimation by cause, location, and time, a substantial amount of new data were added for GBD 2017. For cause-specific non-fatal estimations, we added new data from epidemiological surveillance, disease registries, scientific literature sources, and survey sources. Similarly, for cause-specific fatal estimation, we added new data from verbal
autopsy studies, vital registration, and cancer registries. For age-specific all-cause mortality estimations, we added vital registration data, complete birth history sources, summary birth history sources, and sibling history surveys. These improvements are reflected in the summary measures of population health, DALYs and HALE, reported in this paper. We also provided a more detailed assessment for HALE than in previous GBD papers by examining the following: distinguishing the years of life gained over the past 28 years into years spent in good health and in poor health, by sex, for each location; determining which extra years lived were spent in good health and in poor health for females compared with males for each location; and assessing the male-female difference in HALE and years lived in poor health for the period 1990-2017 across Socio-demographic Index (SDI) quintiles. With increasing longevity, such information has relevance for policy development, health systems planning, and resource allocation.

## Implications of all the available evidence

Over the past 28 years, the world has had tremendous gains in life expectancy; however, in many locations simply gaining years of life has not meant living those years in good health. In some locations, a large proportion of those years are spent in poor health. By distinguishing where, among whom, and how many of these additional years of life gained are spent in good health versus poor health, we have more insight to inform policy, planning, and resource prioritisation for improving health and reducing disparities. Our results showed large disparities in health and disease burden by SDI and sex, suggesting that much could be done to narrow these gaps, such as targeted approaches to reduce risk factors and scale up proven cost-effective interventions to decrease the burden of disease and make additional improvements to HALE more equitable. Our results not only provide the most up-to-date evidence, but also serve as a baseline for evaluating the effectiveness of interventions and programmes over time.
years expected to be lived in good health, and disabilityadjusted life-years (DALYs), which quantifies the health loss due to specific diseases and injuries. HALE provides a snapshot of overall population health and DALYs are useful for quantifying and ranking disease burden due to specific causes. DALYs can be utilised to help decision makers and the public understand the leading causes of health burden and whether improvement occurs over time.
The continuing trend of increasing life expectancy and decreasing mortality because of improvements in living conditions, income per capita, education, and medical practices is well known and understood. ${ }^{2-5}$ Previous GBD papers have reported that increases in HALE have been slower than increases in life expectancy, resulting in more years of poor health, and suggesting an absolute expansion of morbidity. ${ }^{6-9}$ However, details of how many of the additional years of life gained are spent in good health versus poor health across countries and sociodemographic groups have not been well characterised. As people live longer, such information becomes increasingly relevant for policy development, health systems planning, and resource allocation, the effects of which cannot be understated for population health. The estimates herein provide insight into the importance of access to services and appropriate health care, and the potential societal burden of caregiving and excess health-care expenditure for years lived in poor health. ${ }^{10}$

In this study, we present GBD 2017 results for HALE and DALYs by age and sex from 1990 to 2017 for 195 countries and territories. GBD 2017 includes new morbidity and mortality data (epidemiological surveillance data, disease registry data, scientific literature sources, survey sources, verbal autopsy studies, vital registration systems, cancer registries, complete birth history sources, summary birth history sources, and sibling history surveys); refined methods; and new estimations at the subnational level for Ethiopia, Iran, Norway, and Russia, and stratified by ethnicity for New Zealand. Also, the disaggregation of larger cause categories (eg, diabetes) has allowed separate estimation for several additional diseases (eg, type 1 and type 2 diabetes). GBD 2017 provides a complete reanalysis of all available data by country from 1990 to 2017, and thus supersedes all previously published GBD estimations of HALE and DALYs.

## Methods

## Overview

The GBD study comprehensively and systematically quantifies the comparative magnitude of health loss due to diseases and injuries by age, sex, and location over time. We estimated all-cause and cause-specific mortality using the following key principles: identification of all data sources that are available, assessment of the quality of the data and correction for known bias, application of
highly standardised analytical procedures, and assessment of model performance using cross-validation analysis. We used similar principles to identify, enhance comparability, and analyse data to estimate the incidence, prevalence, and YLDs of diseases and injuries. ${ }^{7}$ Using the GBD 2017 results for YLLs and YLDs, we calculated DALYs for 359 diseases and injuries. ${ }^{11,12}$ We used agespecific mortality and YLDs per person to calculate HALE, defined as the average number of years that a person at a given age can expect to live in good health, taking into account mortality and loss of functional health. ${ }^{13}$ Additional details for computing HALE can be found in appendix 1 . We calculated years lived in poor health (ie, years lived with functional health loss) as life expectancy minus HALE. Estimations for GBD 2017 cover the period 1990 to 2017 for 195 countries and territories. We did analyses using Python versions 2.7.12 and 2.7.3, Stata version 13.1, and $R$ version 3.2.2.
For this study, we followed the Guidelines for Accurate and Transparent Health Estimates Reporting (GATHER), ${ }^{14}$ which include recommendations on documentation of data sources, estimation methods, and statistical analysis (appendix 1). Interactive online tools are available to explore GBD 2017 data sources in detail using our online sourcing tool, the Global Health Data Exchange. Data before and after adjustments and the fit of the model to the data for causes of death and nonfatal outcomes can be explored with the available data visualisation tool.

## Cause and location hierarchies

In GBD 2017, as in previous GBDs, causes of mortality and morbidity are structured using a four-level classification hierarchy to produce results that are mutually exclusive and collectively exhaustive. GBD 2017 estimates 359 causes of DALYs, 77 of which are a source of disability but not a cause of death (eg, attention-deficit hyperactivity disorder, headache disorders, low back pain, and neck pain), and five of which are causes of death but not sources of morbidity (sudden infant death syndrome, aortic aneurysm, late maternal deaths, indirect maternal deaths, and maternal deaths aggravated by HIV/AIDS). In the GBD hierarchy, the number of mutually exclusive and collectively exhaustive fatal and non-fatal causes in each level for which GBD estimates is three at Level 1, 22 at Level 2, 169 at Level 3, and 293 at Level 4. The full GBD cause hierarchy, including corresponding International Classification of Diseases (ICD)-9 and ICD-10 codes and detailed cause-specific methods, is in GBD 2017 publications on cause-specific mortality ${ }^{11}$ and non-fatal health outcomes ${ }^{12}$ in the corresponding appendices.
GBD 2017 includes 195 countries and territories that are grouped into 21 regions on the basis of epidemiological similarities and geographical proximity. ${ }^{15}$ For the purposes of statistical analyses, we further grouped regions into seven super-regions (central Europe, eastern

See Online for appendix 1

For the online data
visualisation tool see https://vizhub.healthdata.org

Europe, and central Asia; high income; Latin America and Caribbean; north Africa and Middle East; south Asia; southeast Asia, east Asia and Oceania; and sub-Saharan Africa). Each year, GBD includes subnational analyses for a few new countries and continues to provide subnational estimates for countries that were added in previous cycles. Subnational estimation in GBD 2017 includes five new countries (Ethiopia, Iran, New Zealand, Norway, and Russia) and countries previously estimated at subnational levels (GBD 2013: China, Mexico, and the UK [regional level]; GBD 2015: Brazil, India, Japan, Kenya, South Africa, Sweden, and the USA; and GBD 2016: Indonesia and the UK [local government authority level]). All analyses are at the first level of administrative organisation within each country except for New Zealand (by Māori ethnicity), Sweden (by Stockholm and nonStockholm), and the UK (by local government authorites). All subnational estimates for these countries were incorporated into model development and evaluation as part of GBD 2017. To meet data use requirements, we present all subnational estimates excluding those pending publication (Brazil, India, Japan, Kenya, Mexico, Sweden, the UK, and the USA); these results are presented in appendix tables and figures (appendix 2). Subnational estimates for countries with populations larger than 200 million people (as measured according to our most recent year of published estimates) that have not yet been published elsewhere are presented wherever estimates are illustrated with maps but are not included in data tables.

## Estimation of mortality and non-fatal health loss

We estimated age-specific mortality using data from vital registration systems, sample registration systems, household surveys, censuses, and demographic surveillance sites. ${ }^{13}$ We estimated cause-specific mortality and YLLs using the GBD cause of death database, composed of vital registration and verbal autopsy data, survey and census data for injuries and maternal mortality, surveillance data for maternal and child mortality, cancer registries, and police records for interpersonal violence and road injuries. ${ }^{11}$ The quality and comparability of the cause of death data were evaluated and improved through several steps, including adjustment of data from vital registration systems for incompleteness, conversion of causes found in the original data to the GBD 2017 cause list, and redistribution of deaths assigned to ICD codes that cannot be underlying causes of death. Detailed methods for each step are available in the appendix of the GBD 2017 causes of death paper. ${ }^{11}$ We estimated cause-specific mortality using standardised modelling processes, most commonly the Cause of Death Ensemble model (CODEm), which uses a covariate selection algorithm to generate several plausible combinations of covariates that are then run through four model classes-namely, mixed effects linear models and spatiotemporal

Gaussian process regression models for cause fractions and death rates. For a given cause, we categorised covariates into three groups on the basis of the following criteria: evidence of proximal or causal association (Level 1), strong evidence for an association but without adequate evidence of a causal link (Level 2), and covariates that are distal in the causal pathway and therefore might be mediated by other factors in Levels 1 or 2 (Level 3). ${ }^{16}$ The programme then selects an ensemble of models that performs best on out-ofsample predictive validity tests for each cause of death. Ensemble models have been shown to produce smaller errors in estimated cause-specific mortality and more accurate trends than single-component models. ${ }^{16}$ Additional detail, including model specifications and data availability for each cause-specific model, can be found in the appendices of the GBD 2017 causes of death ${ }^{11}$ and mortality ${ }^{13}$ publications. We calculated YLLs from the sum of each death multiplied by the standard life expectancy at each age. The standard life expectancy was taken from the lowest observed risk of death for each 5 -year age group in all populations greater than 5 million people. For consistency across all fatal and non-fatal estimates in GBD 2017, we calculated our own population and fertility estimates. ${ }^{17}$ We then used the GBD world population age standard to calculate agestandardised rates for cause-specific deaths and YLLs. The GBD world population age standard and the standard life expectancies are available in the appendix of the GBD 2017 mortality publication. ${ }^{13}$
Changes we have implemented since GBD 2016 for cause-specific mortality include the addition of important sources of new mortality data (detailed at the beginning of this section) and the expansion of the GBD location hierarchy, refinements in the calculation of Sociodemographic Index (SDI), and disaggregation of specific causes into subgroupings to provide additional detail. We estimated the following specific causes separately for the first time: invasive non-typhoidal salmonella disease; liver cancer due to non-alcoholic steatohepatitis (NASH); cirrhosis due to non-alcoholic steatohepatitis; myelodysplastic, myeloproliferative, and other haemopoietic neoplasms; benign and in-situ intestinal neoplasms; benign and in-situ cervical and uterine neoplasms; other benign and in-situ neoplasms; subarachnoid haemorrhage; non-rheumatic valvular heart disease; non-rheumatic calcific aortic valve disease; nonrheumatic degenerative mitral valve disease; other nonrheumatic valve diseases; gastro-oesophageal reflux disease; type 1 diabetes; type 2 diabetes; chronic kidney disease due to type 1 diabetes; chronic kidney disease due to type 2 diabetes; poisoning by carbon monoxide; and poisoning by other means. Specific data sources are available in the appendices of the GBD 2017 non-fatal diseases and injuries ${ }^{12}$ and causes of death ${ }^{11}$ publications. Additional information on data sources used can be found in our online source tool.

For estimation of non-fatal health loss, we most commonly used the Bayesian meta-regression tool DisMod-MR 2.1, which synthesises variable data sources to produce internally consistent estimates of incidence, prevalence, remission, and excess mortality. ${ }^{18}$ If DisModMR 2.1 did not capture the complexity of the disease, or if incidence and prevalence needed to be calculated from other data, we used custom models; detailed methods for each cause are in the appendices of the GBD 2017 nonfatal diseases and injuries publication. ${ }^{12}$
We estimated each non-fatal sequela separately and assessed the occurrence of comorbidity for each age group, sex, location, and year separately using a microsimulation framework. ${ }^{12}$ Disability estimated for comorbid conditions was distributed to each contributing cause during the comorbidity estimation process. Although the distribution of sequelae and the severity and cumulative disability per case of a condition might be different by age, sex, location, and year, previous studies have found that disability weights do not substantially vary between locations, income per capita, or levels of educational attainment. ${ }^{19,20}$ Additional details, including model specifications, data availability, data adjustments to enhance comparability for each causespecific model, and the development of disability weights by cause and their use in the estimation of non-fatal health loss, are available in the appendices of the GBD 2017 non-fatal diseases and injuries publication. ${ }^{12}$

## Estimation of DALYs, HALE, and corresponding uncertainty

To calculate HALE, we used the following inputs from GBD 2017: age-specific mortality rates; estimates of the prevalence of sequelae by age, sex, location, and year; and disability weights for all unique health states. We used the method originally developed by Sullivan ${ }^{21}$ to estimate HALE (appendix 1). We calculated DALYs as the sum of YLLs ${ }^{11}$ and YLDs $^{12}$ for each location, year, age group, and cause, by sex.
We calculated $95 \%$ uncertainty intervals (UIs) on the basis of 1000 draws from the posterior distribution of each step in the estimation process using the $2 \cdot 5$ th and $97 \cdot 5$ th percentiles of the ordered 1000 values. We attributed the uncertainty associated with estimation of
mortality and YLLs to multiple sources, including sample size variability in data sources, adjustment and standardisation methods applied to data, and model specifications. We attributed the uncertainty associated with estimation of YLDs to sampling error of data inputs, adjustment and standardisation methods applied to data, the uncertainty in coefficients from model fit, and the uncertainty of severity distributions and disability weights.

## Estimation of SDI and expected DALYs and HALE on the basis of SDI

The SDI is the geometric mean of three rescaled components: total fertility rate under age 25 years (ie, the number of births expected per woman aged 10-24 years), lag-distributed income per capita, and average educational attainment in populations aged 15 years or older. The methods we used to calculate the SDI are in appendix 1. SDI scores were scaled from 0 (lowest income, fewest years of schooling, and highest fertility) to 1 (highest income, most years of schooling, and lowest fertility). We estimated the association between SDI and cause-specific mortality using a generalised additive model with a Loess smoother on SDI; we then used this association to calculate expected YLLs. Expected YLDs were calculated on the basis of the relationship between SDI and YLD rates. We then calculated expected DALYs as the sum of expected YLLs and YLDs, and expected HALE using expected YLDs and expected life tables. All results are available both in appendix 2 and through our online visualisation tool.

## Role of the funding source

The funder of the study had no role in study design, data collection, data analysis, data interpretation, or writing of the report. All authors had full access to all the data in the study and had final responsibility for the decision to submit for publication.

## Results

## Levels and trends in life expectancy and HALE at birth

Globally, life expectancy at birth for both sexes combined increased by $7 \cdot 4$ years ( $95 \%$ UI $7 \cdot 1-7 \cdot 8$ ), rising from $65 \cdot 6$ years $(65 \cdot 3-65 \cdot 8)$ in 1990 to $73 \cdot 0$ years $(72 \cdot 7-73 \cdot 3)$ in 2017 (appendix 2). The increase in life expectancy at

Table 1: Life expectancy and HALE at birth for 21 GBD regions and 195 countries and territories, by sex in 1990 and 2017

Figure 1: Trends of HALE at birth and years in poor health from birth by SDI quintile and sex, 1990-2017
HALE=healthy life expectancy. SDI=Socio-demographic Index
birth was $7 \cdot 3$ years ( $6 \cdot 9-7 \cdot 7$ ) for males (from $63 \cdot 2$ years [62.9-63.4] in 1990 to $70 \cdot 5$ years [70.1-70.8] in 2017) and 7.5 years (7.2-7.9) for females (from 68.0 years [67.8-68.3] in 1990 to $75 \cdot 6$ years [ $75 \cdot 3-75 \cdot 9$ ] in 2017; table 1). During the same period, global HALE at birth for both sexes combined increased by $6 \cdot 3$ years ( $5 \cdot 9-6 \cdot 7$ ), from 57.0 years ( $54 \cdot 6-59 \cdot 1$ ) in 1990 to 63.3 years (60.5-65.7) in 2017 (appendix 2). The increase in HALE at birth was 6.2 years $(5 \cdot 8-6 \cdot 7)$ for males (from $55 \cdot 6$ years [ $53 \cdot 5-57.5$ ] in 1990 to 61.8 years [ $59.4-64 \cdot 0$ ] in 2017) and 6.4 years ( $6 \cdot 0-6 \cdot 8$ ) for females (from $58 \cdot 4$ years [55.7-60.8] in 1990 to $64 \cdot 8$ years [61.7-67.4] in 2017; table 1). The number of years lived in poor health from birth increased globally by $1 \cdot 1$ years ( $95 \%$ UI $0 \cdot 9-1 \cdot 4)$, in the low SDI countries by 1.5 years ( $1.2-1 \cdot 9$ ), and in the high SDI countries by 1.3 years ( $1 \cdot 0-1 \cdot 7$; appendix 2).
The increases from 1990 to 2017 in life expectancy and HALE varied across SDI quintiles and countries, with the greatest increases in life expectancy and HALE seen in the low SDI quintile and the smallest increases seen in the high SDI quintile. The increase in life expectancy varied from $5 \cdot 1$ years $(5 \cdot 0-5 \cdot 3)$ in high SDI countries to $12 \cdot 0$ years ( $11 \cdot 3-12 \cdot 8$ ) in low SDI countries. HALE increased for both sexes in low SDI countries by $10 \cdot 5$ years ( $95 \%$ UI $9 \cdot 8-11 \cdot 2$; by $10 \cdot 1$ years [ $9 \cdot 3-10 \cdot 9$ ] for males and by $10 \cdot 9$ years [ $10 \cdot 1-11 \cdot 7$ ] for females), and in high SDI countries by 3.8 years ( $3 \cdot 4-4 \cdot 1$; by 4.4 years [4.0-4.8] for males and by $3 \cdot 2$ years [2.9-3.5] for females; table 1, figure 1; appendix 2). Increases in HALE in the middle SDI quintiles for both sexes follow a gradient, with increases of $6 \cdot 8$ years $(6 \cdot 3-7 \cdot 4)$ for
low-middle SDI, $5 \cdot 7$ years $(5 \cdot 3-6 \cdot 2)$ for middle SDI, and $5 \cdot 5$ years $(5 \cdot 1-5 \cdot 8)$ for high-middle SDI (figure 1; appendix 2).
Increases in HALE at birth between 1990 and 2017 were smaller than increases in life expectancy over the same period in all SDI quintiles, resulting in an increase in years lived in poor health. Of the additional years of life expected at birth, $26 \cdot 3 \%(20 \cdot 1-33 \cdot 1)$ were spent in poor health in high SDI countries compared with $11.7 \%$ ( $8 \cdot 8-15 \cdot 1$ ) in low-middle SDI countries (figure 2 ). The largest increase in years lived in poor health was for females in low SDI quintile countries, by 1.6 years $(1 \cdot 2-2 \cdot 1)$, and the smallest increase was for males in middle SDI quintile countries, by 0.8 years ( $0 \cdot 6-1 \cdot 0$; figure 1). Although males and females in all SDI quintiles had increases in HALE at birth, the increase was disparate between the sexes. In 1990, high SDI quintile countries had the largest gap in HALE between males and females, at $4 \cdot 1$ years ( $3 \cdot 4-4 \cdot 8$; figure 3 ); this gap decreased to $2 \cdot 9$ years $(2 \cdot 3-3 \cdot 5)$ by 2017. In 2017, the high-middle SDI quintile countries had the largest gap in HALE between males and females ( $3 \cdot 8$ years [3.1-4.5]); this gap had increased from 1990 to peak in 1995 at 4.8 years $(4.5-5 \cdot 2)$ and then decreased gradually thereafter. Low SDI quintile countries had the smallest gap in HALE between males and females in 2017 (figure 3). The difference in HALE at birth between the sexes during the period 1990-2017 increased in countries in the low SDI, low-middle SDI, and middle SDI quintiles. South Asia was the only region where males had higher HALE at birth than females did in 1990, and this trend lasted until 2000, after which point females

Figure 2: Years of life gained at birth by sex and functional health status for five SDI quintiles, 21 GBD regions, and 28 countries with the largest and smallest proportions of years spent in poor health between 1990 and 2017
GBD=Global Burden of Diseases, Injuries, and Risk Factors Study. SDI=Socio-demographic Index.

Figure 3: Difference in HALE at birth between males and females by SDI quintile, 1990-2017
HALE=healthy life expectancy. SDI=Socio-demographic Index.

|  | Life expectancy at age 65 years |  |  |  | HALE at age 65 years |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Females |  | Males |  | Females |  | Males |  |
|  | 1990 | 2017 | 1990 | 2017 | 1990 | 2017 | 1990 | 2017 |
| Global | $16 \cdot 2$ (16.1-16.2) | 18.7 (18.6-18.8) | 13.6 (13.5-13.6) | 15.9 (15.8-16.0) | 11.9 (10.8-12.9) | 13.7(12.4-14.9) | $10 \cdot 3$ (9.4-11.0) | 12.0 (10.9-12.9) |
| Low SDI | $12 \cdot 2$ (12.0-12.5) | 14.7 (14.5-15.0) | $11 \cdot 4$ (11.1-11.6) | 13.7 (13.4-13.9) | $8 \cdot 6$ (7.7-9.5) | 10.5 (9.5-11.5) | $8 \cdot 3$ (7.5-9.1) | 10.0 (9.1-10.9) |
| Low-middle SDI | 13.8 (13.6-14.0) | $15 \cdot 8$ (15.6-16.1) | 12.6 (12.4-12.8) | $14 \cdot 1$ (13.9-14.3) | 9.9 (8.9-10.7) | $11 \cdot 4$ (10.3-12.5) | $9 \cdot 3$ (8.4-10.1) | $10 \cdot 5$ (9.5-11.4) |
| Middle SDI | $15 \cdot 4$ (15.3-15.6) | 18.2 (18.0-18.4) | $13 \cdot 8$ (13.7-13.9) | $15 \cdot 4$ (15.2-15.6) | 11.5 (10.5-12.4) | $13 \cdot 5$ (12.3-14.6) | $10 \cdot 6$ (9.8-11.4) | 11.8 (10.8-12.7) |
| High-middle SDI | 15.8 (15.6-15.9) | 18.5 (18.3-18.8) | $13 \cdot 2$ (13.0-13.3) | 15.6 (15.4-15.9) | $11 \cdot 6$ (10.5-12.5) | $13 \cdot 7$ (12.4-14.8) | $10 \cdot 0$ (9.2-10.8) | 11.8 (10.8-12.8) |
| High SDI | 18.7 (18.6-18.7) | $21 \cdot 9(21 \cdot 8-22 \cdot 0)$ | 14.9 (14.9-14.9) | 18.6 (18.5-18.7) | $13 \cdot 9$ (12.7-15.1) | 16.2 (14.6-17.6) | $11 \cdot 3$ (10.3-12.1) | 13.8 (12.6-15.0) |
| Central Europe, eastern Europe, and central Asia | $15 \cdot 9$ (15.9-15.9) | 18 (17.9-18.1) | $12 \cdot 5$ (12.5-12.5) | 14.0 (14.0-14.1) | 11.4 (10.2-12.5) | $12 \cdot 9$ (11.6-14.1) | 9.0 (8.1-9.9) | $10 \cdot 1$ (9.1-11.1) |
| Central Asia | 16.4 (16.3-16.5) | 16.5 (16.2-16.8) | $13 \cdot 2$ (13.1-13.2) | 12.8 (12.5-13.0) | 12.0 (10.8-13.1) | $12 \cdot 2$ (10.9-13.2) | 9.8 (8.9-10.6) | 9.5 (8.6-10.4) |
| Armenia | $15 \cdot 7$ (15.4-15.9) | $17 \cdot 3$ (17.0-17.6) | $13 \cdot 2$ (12.9-13.4) | 14.6 (14.4-14.9) | 11.4 (10.3-12.5) | 12.7 (11.4-13.9) | 9.7 (8.7-10.6) | $10 \cdot 8$ (9.8-11.8) |
| Azerbaijan | $16 \cdot 9$ (16.6-17.3) | $16 \cdot 4(15 \cdot 8-17.1)$ | $13 \cdot 6$ (13.2-13.9) | $11 \cdot 9$ (11.4-12.4) | $12 \cdot 5$ (11.4-13.6) | 12.1 (10.9-13.4) | $10 \cdot 2$ (9.1-11.1) | $8 \cdot 9$ (8.0-9.8) |
| Georgia | 16.2 (15.9-16.5) | 16.7 (16.5-17.0) | $13 \cdot 2$ (12.9-13.6) | $13 \cdot 1$ (12.9-13.3) | $12 \cdot 1$ (11.0-13.2) | $12 \cdot 3$ (11.1-13.4) | 10.0 (9.0-10.8) | 8 (8.8-10.6) |
| Kazakhstan | 16.5 (16.4-16.5) | 17.0 (16.6-17.4) | $12 \cdot 3$ (12.2-12.3) | $13 \cdot 2$ (12.9-13.6) | 11.8 (10.6-12.9) | $12 \cdot 4$ (11.2-13.5) | 8.9 (8.0-9.7) | 9.7 (8.7-10.6) |
| Kyrgyzstan | 16.0 (15.6-16.4) | 17.0 (16.8-17.3) | $12 \cdot 5$ (12.1-12.8) | 13.7 (13.5-13.9) | 11.7 (10.5-12.8) | 12.6 (11.4-13.7) | 9.2 (8.3-10.1) | $10 \cdot 3$ (9.4-11.2) |
| Mongolia | $13 \cdot 1$ (12.8-13.4) | 16.1 (15.4-16.9) | $11 \cdot 1$ (10.8-11.4) | $12 \cdot 1$ (11.5-12.8) | 9.8 (8.9-10.7) | 12.0 (10.7-13.1) | $8 \cdot 4(7 \cdot 6-9 \cdot 1)$ | 9.0 (8.1-9.9) |
| Tajikistan | 16.9 (16.6-17.1) | $17 \cdot 1$ (16.3-17.9) | 14.4 (14.3-14.6) | $13 \cdot 9$ (13.2-14.6) | $12 \cdot 4(11 \cdot 2-13 \cdot 5)$ | 12.7 (11.4-13.8) | 10.8 (9.7-11.7) | $10 \cdot 5$ (9.4-11.6) |
| Turkmenistan | $15 \cdot 4$ (15.4-15.5) | $16 \cdot 4(15 \cdot 7-17 \cdot 1)$ | 12.7 (12.6-12.7) | $13 \cdot 3$ (12.8-13.9) | 11.5 (10.4-12.5) | $12 \cdot 3$ (11.0-13.4) | 9.6 (8.7-10.3) | 10.1 (9.1-11.0) |
| Uzbekistan | 17.0 (16.9-17.0) | 15.8 (14.8-16.9) | 14.2 (14.1-14.2) | 12.0 (11.2-12.8) | $12 \cdot 5$ (11.3-13.6) | 11.7 (10.4-13.0) | 10.7 (9.7-11.5) | $9 \cdot 1$ (8.1-10.1) |
| Central Europe | $15 \cdot 9$ (15.8-15.9) | 19.0 (18.8-19.2) | $12 \cdot 6$ (12.6-12.6) | $15 \cdot 3$ (15.2-15.5) | $11 \cdot 2$ (10.0-12.3) | $13 \cdot 5$ (12.1-14.8) | $8 \cdot 9$ (8.0-9.8) | $10 \cdot 8$ (9.6-11.9) |
| Albania | $19 \cdot 3$ (19.2-19.5) | 20.6 (18.9-22.4) | 13.7 (13.6-13.8) | 15.6 (14.4-17.1) | 14.1 (12.7-15.4) | $15 \cdot 1$ (13.4-17.0) | $10 \cdot 0$ (9.1-10.9) | $11 \cdot 4(10 \cdot 0-13 \cdot 0)$ |
| Bosnia and Herzegovina | 16.4 (16.3-16.6) | 17.4 (16.9-17.9) | 13.6 (13.6-13.7) | $15 \cdot 1$ (14.6-15.5) | 11.8 (10.6-12.9) | $12 \cdot 4$ (11.1-13.6) | 9.8 (8.8-10.7) | 10.6 (9.4-11.7) |
| Bulgaria | 16.0 (15.9-16.1) | 18.0 (17.5-18.5) | 12.8 (12.7-12.8) | $14 \cdot 2$ (13.8-14.7) | 11.6 (10.4-12.6) | 13.0 (11.7-14.3) | 9.2 (8.3-10.1) | $10 \cdot 2$ (9.1-11.2) |
| Croatia | $15 \cdot 9$ (15.8-16.0) | $19 \cdot 3$ (18.8-19.8) | $12 \cdot 6$ (12.6-12.7) | $15 \cdot 7$ (15.3-16.2) | $11 \cdot 4$ (10.1-12.5) | 13.7 (12.2-15.1) | 9.0 (8.0-9.8) | $11 \cdot 1$ (9.8-12.2) |
| Czech Republic | $15 \cdot 3$ (15.2-15.4) | 19.8 (19.3-20.3) | 11.6 (11.5-11.6) | 16.3 (15.9-16.8) | $10 \cdot 6$ (9.3-11.7) | $13 \cdot 9$ (12.2-15.3) | $8 \cdot 1$ (7.2-8.9) | $11 \cdot 2$ (9.9-12.5) |
| Hungary | $15 \cdot 5$ (15.4-15.5) | 19.1 (18.6-19.5) | $12 \cdot 1$ (12.1-12.1) | 15.0 (14.6-15.5) | 10.5 (9.3-11.7) | $13 \cdot 4$ (11.9-14.8) | $8 \cdot 4$ (7.4-9.2) | $10 \cdot 5$ (9.3-11.6) |
| Macedonia | $16 \cdot 3$ (16.2-16.5) | 18.8 (18.5-19.2) | 13.6 (13.5-13.7) | 14.8 (14.3-15.2) | 11.7 (10.5-12.8) | $13 \cdot 6$ (12.2-14.9) | 9.8 (8.8-10.7) | $10 \cdot 6$ (9.4-11.6) |
| Montenegro | $17 \cdot 6$ (17.4-17.7) | 17.4 (16.8-18.0) | 14.5 (14.4-14.7) | 14.8 (14.0-15.5) | 12.7 (11.5-14.0) | $12 \cdot 5$ (11.2-13.8) | 10.5 (9.4-11.5) | $10 \cdot 6$ (9.4-11.7) |
| Poland | $16 \cdot 3$ (16.3-16.4) | 20.2 (19.7-20.7) | $12 \cdot 6$ (12.6-12.6) | 16.0 (15.5-16.4) | 11.6 (10.3-12.7) | $14 \cdot 4$ (12.8-15.8) | 9.0 (8.0-9.8) | 11.2 (10-12.5) |
| Romania | $15 \cdot 2(15 \cdot 2-15 \cdot 2)$ | 18.2 (17.8-18.7) | $13 \cdot 1$ (13.0-13.1) | 14.7 (14.3-15.1) | 10.8 (9.7-11.9) | $13 \cdot 1$ (11.7-14.4) | 9.2 (8.2-10.2) | $10 \cdot 4$ (9.3-11.5) |
| Serbia | $15 \cdot 9$ (15.8-16.0) | 16.5 (16.0-17.0) | $12 \cdot 4$ (12.4-12.5) | 14.6 (14.2-15.0) | $11 \cdot 4$ (10.2-12.4) | 11.8 (10.5-12.9) | $8 \cdot 9$ (8.0-9.7) | $10 \cdot 4$ (9.3-11.5) |
| Slovakia | 15.8 (15.7-15.9) | 19.0 (18.5-19.5) | $12 \cdot 2$ (12.2-12.3) | $15 \cdot 4$ (14.9-15.8) | 11.2 (10.0-12.3) | $13 \cdot 5$ (12.0-14.8) | $8 \cdot 6$ (7.6-9.5) | 10.7 (9.4-11.8) |
| Slovenia | $17 \cdot 2$ (17.0-17.3) | $21 \cdot 6$ (21.0-22.2) | $13 \cdot 4$ (13.3-13.5) | 17.5 (17.0-18.0) | 12.0 (10.6-13.2) | $15 \cdot 1$ (13.3-16.7) | $9 \cdot 3$ (8.2-10.3) | $12 \cdot 1$ (10.6-13.5) |
| Eastern Europe | 15.9 (15.9-15.9) | $17.7(17.5-17.8)$ | $12 \cdot 3$ (12.2-12.3) | $13 \cdot 4$ (13.2-13.5) | 11.4 (10.2-12.4) | 12.7 (11.3-13.8) | 9.0 (8.1-9.8) | $9 \cdot 8$ (8.8-10.6) |
| Belarus | 16.7 (16.6-16.8) | 17.9 (17.5-18.4) | $13 \cdot 2$ (13.2-13.2) | 13.0 (12.7-13.4) | 12.1 (10.9-13.2) | 13.0 (11.7-14.2) | 9.7 (8.7-10.6) | 9.6 (8.6-10.5) |
| Estonia | 15.8 (15.7-16.0) | $20 \cdot 4$ (19.4-21.4) | $12 \cdot 1$ (12.0-12.2) | 15.9 (15.0-16.9) | $11 \cdot 5$ (10.4-12.5) | 14.9 (13.3-16.5) | 8.8 (7.9-9.6) | $11 \cdot 6$ (10.3-12.9) |
| Latvia | $15 \cdot 9$ (15.8-16.0) | 19.0 (18.0-20.0) | $12 \cdot 3$ (12.2-12.3) | 14.2 (13.4-15.1) | $11 \cdot 4$ (10.2-12.5) | $13 \cdot 7(12 \cdot 2-15 \cdot 1)$ | $8 \cdot 9$ (8.0-9.7) | $10 \cdot 3$ (9.1-11.4) |
| Lithuania | 16.9 (16.8-17.0) | 19.3 (18.8-19.8) | $13 \cdot 4$ (13.3-13.4) | $14 \cdot 3$ (13.8-14.7) | $12 \cdot 2$ (11.0-13.3) | $13 \cdot 8$ (12.3-15.2) | 9.8 (8.8-10.6) | $10 \cdot 2$ (9.1-11.3) |
| Moldova | $14 \cdot 9$ (14.8-14.9) | 17.9 (17.6-18.2) | 12.6 (12.6-12.7) | $13 \cdot 6$ (13.4-13.8) | 10.8 (9.7-11.7) | $13 \cdot 1$ (11.9-14.3) | $9 \cdot 3$ (8.3-10.1) | $10 \cdot 1$ (9.1-11.0) |
| Russia | $15 \cdot 9$ (15.9-15.9) | 17.7 (17.7-17.8) | 12.0 (12.0-12.0) | 13.6 (13.6-13.7) | $11 \cdot 3$ (10.2-12.4) | $12 \cdot 6$ (11.3-13.8) | $8 \cdot 8$ (7.9-9.6) | 9.9 (8.9-10.8) |
| Ukraine | 15.8 (15.7-15.9) | 17.2 (16.7-17.6) | 12.5 (12.4-12.6) | 12.5 (12.2-12.9) | $11 \cdot 3$ (10.1-12.3) | $12 \cdot 5$ (11.2-13.6) | 9.2 (8.3-10.0) | 9.2 (8.3-10.1) |
| High income | 18.8 (18.8-18.8) | 21.9 (21.8-22.0) | 15.0 (15.0-15.0) | 18.6 (18.5-18.7) | $14 \cdot 1$ (12.8-15.2) | 16.3 (14.7-17.6) | 11.4(10.4-12.3) | 13.9 (12.6-15.0) |
| Australasia | 18.9 (18.8-18.9) | $22 \cdot 2$ (21.4-22.9) | $15 \cdot 1$ (15.0-15.1) | 19.4 (18.7-20.2) | 14.0 (12.7-15.2) | $16 \cdot 3$ (14.6-17.8) | $11 \cdot 3$ (10.2-12.2) | $14 \cdot 3$ (12.8-15.7) |
| Australia | 19.0 (18.9-19.1) | $22 \cdot 3$ (21.4-23.2) | $15 \cdot 1$ (15.1-15.2) | $19 \cdot 4$ (18.6-20.3) | $14 \cdot 2$ (12.8-15.3) | 16.4 (14.7-17.9) | $11 \cdot 3$ (10.3-12.2) | 14.4 (12.8-15.7) |
| New Zealand | 18.2 (18.1-18.3) | $21 \cdot 7$ (21.2-22.1) | 14.8 (14.6-14.9) | 19.2 (18.8-19.7) | $13 \cdot 4$ (12.0-14.6) | $15 \cdot 5$ (13.8-17.0) | 11.0 (9.9-11.9) | $13 \cdot 9$ (12.4-15.2) |
| High-income Asia Pacific | 19.7 (19.7-19.8) | $24 \cdot 1(24 \cdot 0-24 \cdot 3)$ | 15.8 (15.8-15.9) | 19.5 (19.4-19.7) | $15 \cdot 1$ (13.8-16.2) | 18.2 (16.6-19.7) | $12 \cdot 3$ (11.3-13.1) | 14.9 (13.6-16.0) |
| Brunei | 13.8 (13.4-14.2) | 17.8 (17.2-18.4) | $12 \cdot 5$ (12.1-12.8) | $15 \cdot 3$ (14.4-16.2) | $10 \cdot 3$ (9.3-11.2) | $13 \cdot 5$ (12.2-14.6) | 9.4 (8.5-10.2) | $11 \cdot 6$ (10.5-12.8) |
| Japan | $20 \cdot 3$ (20.3-20.3) | $24 \cdot 4$ (24.2-24.6) | $16 \cdot 4$ (16.4-16.4) | 19.7 (19.5-19.9) | $15 \cdot 6$ (14.2-16.7) | 18.5 (16.8-19.9) | 12.8 (11.8-13.6) | $15 \cdot 1$ (13.8-16.2) |
| Singapore | 18.1 (18.0-18.3) | 24.6 (24.1-25.0) | 14.7 (14.6-14.8) | 20.2 (19.7-20.7) | 13.8 (12.6-14.9) | 18.8 (17.1-20.2) | $11 \cdot 4$ (10.5-12.2) | $15 \cdot 7$ (14.4-16.9) |
| South Korea | 16.6 (16.6-16.7) | $22 \cdot 6$ (22.2-23.1) | $12 \cdot 4$ (12.4-12.4) | 18.5 (18.0-19.0) | $12 \cdot 5$ (11.3-13.5) | 17.0 (15.4-18.5) | 9.4 (8.5-10.1) | 13.9 (12.6-15.0) |

Data in parentheses are $95 \%$ uncertainty intervals. Super-regions, regions, and countries are listed alphabetically. GBD=Global Burden of Diseases, Injuries, and Risk Factors Study. HALE=healthy life expectancy. SDI=Socio-demographic Index.

Table 2: Life expectancy and HALE at age 65 years for 21 GBD regions and 195 countries and territories, by sex, in 1990 and 2017
had higher HALE at birth (appendix 2). In all other regions, females had higher HALE at birth than males did in all study years. Eastern Europe had the biggest difference in HALE at birth between females and males throughout the period 1990-2017, with a difference of 7.7 years $(6 \cdot 8-8 \cdot 4)$ in 2017 . North Africa and the Middle East had the smallest difference in HALE at birth between females and males in 1990, and south Asia had the lowest difference in 2017 (appendix 2).
At the country level, countries that had the largest increases in HALE at birth for both sexes combined between 1990 and 2017 were Eritrea ( 23.7 years [95\% UI 21.9-25.6], Ethiopia ( $18 \cdot 5$ years [17•2-19.9], and Uganda ( $16 \cdot 3$ years [ $13 \cdot 5-19 \cdot 0]$ ). The smallest increases were seen in Saint Vincent and the Grenadines ( 1.0 years [ $0.4-1 \cdot 7$ ]), South Africa ( 1.1 years [0.3-1•8]), and Uzbekistan ( $1 \cdot 4$ years [0.4-2.4]). Decreases in HALE at birth for both sexes combined occurred in Lesotho ( $5 \cdot 0$ years [3.1-6.8]), Swaziland (eSwatini; $2 \cdot 3$ years [0.4-4.3]), and Guam ( $1 \cdot 2$ years [ $0 \cdot 5-1 \cdot 9]$ ). In 2017, the highest HALE at birth was estimated to be in Singapore for both females ( $75 \cdot 8$ years [ $72 \cdot 4-78 \cdot 7$ ]) and males ( $72 \cdot 6$ years [ $69 \cdot 8-75 \cdot 0$ ]; table 1). The lowest HALE at birth in 2017 for both males and females was estimated to be in the Central African Republic, at $47 \cdot 0$ years $(43 \cdot 7-50 \cdot 2)$ for females and $42 \cdot 8$ years $(40 \cdot 1-45 \cdot 6)$ for males. The largest differences in HALE at birth in 2017 between males and females were in Ukraine $[8.7$ years ( $7 \cdot 5-9 \cdot 8$ ), Lithuania ( $7 \cdot 8$ years [6.6-8.9]), and Russia ( $7 \cdot 4$ years [6.6-8.1]).

## Trends in HALE for males and females at age 65 years

Globally, HALE at age 65 years for females was 11.9 years ( $95 \%$ UI $10 \cdot 8-12 \cdot 9$ ) in 1990 and $13 \cdot 7$ years ( $12 \cdot 4-14 \cdot 9$ ) in 2017, an increase of 1.8 years ( $1 \cdot 6-2 \cdot 0$; table 2 ). For males, HALE at age 65 years increased by 1.7 years $(1 \cdot 5-1 \cdot 9)$, from $10 \cdot 3$ years $(9 \cdot 4-11 \cdot 1)$ to $12 \cdot 0$ years (10•9-12•9). At the SDI level, both males and females in the high SDI quintile had the largest increases in HALE at age 65 , increasing from $13 \cdot 9$ years $(12 \cdot 7-15 \cdot 1)$ in 1990 to $16 \cdot 2$ years ( $14 \cdot 6-17 \cdot 6$ ) in 2017 for females, and increasing from 11.3 years (10.3-12.1) in 1990 to $13 \cdot 8$ years ( $12 \cdot 6-15 \cdot 0$ ) in 2017 for males. The countries with the largest increases in HALE for females at age 65 years from 1990 to 2017 were the Maldives (by 7.0 years [6.3-7.8]), Singapore (by 4.9 years [4.4-5.5]), and Ethiopia (by $4 \cdot 6$ years [ $4 \cdot 0-5 \cdot 3]$ ). For males, the largest increases were in Iraq (by 4.7 years [3.8-5.6]), the Maldives (by $4 \cdot 5$ years [4.0-5.1]), and South Korea (by 4.5 years $[4 \cdot 0-5 \cdot 0]$ ). In 2017, the largest difference between HALE at age 65 years between females and males was in Bermuda (17.7 years [16.2-19.2] for females, and $13 \cdot 4$ years [12.4-14.5] for males).

## Decomposition of years of life gained at birth and at age 65 years

Although life expectancy at birth increased for both males and females globally during the period 1990-2017,
the proportion of additional years spent in poor health was $15 \cdot 3 \%(95 \%$ UI $11 \cdot 8-19 \cdot 2)$ of the additional $7 \cdot 5$ years $(7 \cdot 2-7 \cdot 9)$ for females and $14 \cdot 9 \%(11 \cdot 3-19 \cdot 0)$ of the additional $7 \cdot 3$ years $(6 \cdot 9-7 \cdot 7)$ for males, with substantial variations across SDI quintiles, regions, and countries (figure 2). The proportion of additional years spent in poor health varied from $11 \cdot 1 \%(8 \cdot 3-14 \cdot 3)$ of the additional $8 \cdot 2$ years ( $7 \cdot 5-8 \cdot 8$ ) among females in lowmiddle SDI countries, to $27 \cdot 3 \%(20 \cdot 8-34 \cdot 4)$ of the additional 4.4 years $(4 \cdot 2-4 \cdot 6)$ among females in high SDI countries. From 1990 to 2017, life expectancy at birth increased the most for both males and females in eastern sub-Saharan Africa compared with other regions (table 1), but of the additional years gained, $11 \cdot 1 \%(8 \cdot 3-14 \cdot 3)$ of $13 \cdot 8$ years $(12 \cdot 8-14 \cdot 8)$ for males and $13 \cdot 1 \%(10 \cdot 0-16 \cdot 7)$ of 14.6 years $(13 \cdot 7-15 \cdot 5)$ for females were spent in poor health. At the country level, 179 countries gained additional years of life from 1990 to 2017, and 16 did not (appendix 2). The most additional years of life were gained by males in Eritrea (28.6 years [25.7-31.4]), Ethiopia ( $21 \cdot 1$ years [19.5-22•8]), and Equatorial Guinea ( $18 \cdot 6$ years [ $15 \cdot 1-21 \cdot 8]$ ). Of these years gained, the proportion spent in poor health was $11 \cdot 3 \%(8 \cdot 0-14 \cdot 9)$ for Eritrea, $12 \cdot 1 \% ~(9 \cdot 2-15 \cdot 6)$ for Ethiopia, and $13 \cdot 7 \%$ (9.4-18.7) for Equatorial Guinea. Females gained the most additional years of life in Eritrea ( 22.4 years [19.7-25.4]), Ethiopia (21.5 years [20.0-23.2]), and Rwanda ( $19 \cdot 5$ years [17•1-22•1]). Of these years gained, the proportion spent in poor health was $10 \cdot 4 \%(7 \cdot 1-14 \cdot 6)$ for Eritrea, $13 \cdot 6 \%(10 \cdot 2-17 \cdot 4)$ for Ethiopia, and $16 \cdot 1 \%$ (11.8-21.1) for Rwanda. Males spent over a third of the years of life gained in poor health in Belize ( $45.9 \%$ [5.5-155.6]), Ukraine (39.3\% [14.1-128.7]), the Federated States of Micronesia (34.2\% [7.0-55.9]), and the USA ( $33 \cdot 6 \%$ [25.1-42.2]). Similarly, females spent over a third of their years of life gained in poor health in the USA (47.9\% [35.2-61.6]), Northern Mariana Islands ( $40 \cdot 7 \%$ [25.9-70.7]), and the UK ( $34 \cdot 3 \%$ [25•8-43.6]; appendix 2).
Globally, between 1990 and 2017, life expectancy for females at age 65 years increased by $2 \cdot 5$ years ( $95 \%$ UI $2 \cdot 4-2 \cdot 6)$ and they spent $27 \cdot 6 \%(21 \cdot 2-35 \cdot 0)$ of those years in poor health (appendix 2). Similarly, males at age 65 years gained $2 \cdot 4$ years $(2 \cdot 2-2 \cdot 5)$ of life and spent $26 \cdot 6 \%(20 \cdot 1-34 \cdot 0)$ of those years in poor health. Between 1990 and 2017, at the SDI quintile level, females in the high SDI quintile spent the largest proportion of years gained in poor health (29.9\% [22.9-37.5] of 3.2 years [3.1-3.4] gained), and females in the low-middle SDI quintile spent the smallest proportion of years gained in poor health ( $23 \cdot 8 \%$ [17.1-31.6] of $2 \cdot 0$ years $[1 \cdot 7-2 \cdot 3]$ gained; appendix 2 ). Similarly, males in the high SDI quintile spent the largest proportion of additional years in poor health in the same period ( $30 \cdot 0 \%$ [22.9-37.8] of $3 \cdot 7$ years [3.6-3.8] gained), and males in the low-middle SDI quintile spent the smallest proportion of additional years in poor health (23.7\%

Figure 4: Extra years of life expected at birth in females compared with males by functional health status for five SDI quintiles, 21 GBD regions, and 28 countries with the largest and smallest percentages of years spent in poor health, 2017
GBD=Global Burden of Diseases, Injuries, and Risk Factors Study. SDI=Socio-demographic Index.
[17.2-30.9] of 1.5 years [1.2-1.8] gained). At the country level, life expectancy between 1990 and 2017 for females at age 65 years increased the most in the Maldives ( $9 \cdot 3$ years [ $8 \cdot 6-9 \cdot 9$ ]), Singapore ( $6 \cdot 4$ years [5.9-6.8]), and Iraq ( $6 \cdot 2$ years $[5 \cdot 0-7 \cdot 4]$ ), with the proportion of years spent in poor health being $24.4 \%(18 \cdot 2-31 \cdot 3)$ for those in the Maldives, $23 \cdot 2 \%(17 \cdot 4-29 \cdot 7)$ for those in Singapore, and $28 \cdot 5 \%(21 \cdot 3-36 \cdot 3)$ for those in Iraq (appendix 2). For males at age 65 years, life expectancy increased the most for Iraq ( $6 \cdot 8$ years [5.6-7.9]), South Korea ( $6 \cdot 1$ years [ $5 \cdot 6-6 \cdot 6]$ ), and the Maldives ( $5 \cdot 9$ years [5.3-6.4]), with the proportion of those years spent in poor health being $30 \cdot 3 \%(22 \cdot 9-38 \cdot 2)$ for Iraq, $26 \cdot 1 \%$ (19.6-33.1) for South Korea, and $22 \cdot 5 \%(16 \cdot 6-29 \cdot 4)$ for the Maldives (appendix 2).

## Decomposition of extra years lived by females compared with males in 2017

In 2017, females had longer life expectancy than males in 180 of 195 countries (appendix 2). Of these countries, the largest differences (>10 years) between female and male life expectancy at birth were in Ukraine $(76.5$ years [ $95 \%$ UI $75 \cdot 8-77 \cdot 2$ ] for females and 64.7 years [63.9-65.4] for males), Lithuania ( $80 \cdot 2$ years [79.4-81•0]
for females and $69 \cdot 6$ years [68.7-70.5] for males), Russia ( $77 \cdot 2$ years [77.1-77.4] for females and 66.8 years [66.6-66.9] for males), and Swaziland (eSwatini; $65 \cdot 1$ years [62.1-68.4] for females and 54.9 years [52.6-57.6] for males). For the other 15 countries, life expectancy was not significantly different between the sexes.
Globally, in 2017, females lived an additional $5 \cdot 1$ years ( $95 \%$ UI $4 \cdot 9-5 \cdot 3$ ) compared with males, and of those extra years $57.5 \%(46 \cdot 2-67 \cdot 4)$ were spent in good health and $42.5 \%(32 \cdot 6-53 \cdot 8)$ in poor health (figure 4). The proportion of additional years spent in poor health varied a lot across SDI quintiles, regions, and countries. Compared with all other SDI quintiles, females in the high-middle SDI quintile lived the most extra years of life compared with males, living longer than males by $6 \cdot 1$ years; however, $37 \cdot 8 \%(29 \cdot 1-47 \cdot 6)$ of those extra years were lived in poor health. At the regional level, the proportion of extra years lived in poor health among females in 2017 ranged from $21 \cdot 9 \%(16 \cdot 2-28 \cdot 4)$ in central Europe to $92 \cdot 2 \%(87 \cdot 2-96 \cdot 2$ ) in south Asia (figure 4). Extra years lived by females varied from $11 \cdot 9$ years (10.9-12.9) in Ukraine to 1.4 years $(0 \cdot 6-2 \cdot 3)$ in Algeria (appendix 2). Of the extra years lived, the proportion

DALY counts are quoted to three significant figures and percentage changes and rates to one decimal place. DALY=disability-adjusted life-year. G6PD=glucose-6-phosphate dehydrogenase. H influenzae=Haemophilus influenzae. NASH=non-alcoholic steatohepatitis. *Percentage changes that are statistically significant. ¥Incidence estimates for stroke represent first-ever stroke only.

Table 3: Global all-age DALYs and age-standardised DALY rates in 2017 with percentage changes between 2007 and 2017 for all causes, by sex
spent in poor health varied largely at the country level, with less than $20 \%$ of the additional years spent in poor health for females in Bosnia and Herzegovina, Burundi, and Slovakia, whereas females lived all extra years in poor health in Bahrain ( $1 \cdot 6$ years [ $0 \cdot 2-3 \cdot 1$ ]; appendix 2 ).
Globally, at age 65 years, women lived an additional 2.7 years ( $95 \%$ UI $2 \cdot 6-2 \cdot 9$ ) compared with men, but $63 \cdot 9 \%(55 \cdot 2-72 \cdot 2)$ of those years were spent in good health and $36 \cdot 1 \%(27 \cdot 8-44 \cdot 8)$ in poor health (appendix 2 ). Compared with other SDI quintiles, the difference in life expectancy was greatest between females and males in the high SDI quintile, with females living 3.3 years $(3 \cdot 1-3 \cdot 5)$ longer than males, but $28 \cdot 4 \%(21 \cdot 3-36 \cdot 1)$ of those years were spent in poor health. In the low SDI quintile, females are estimated to live the largest proportion of extra years in poor health compared with other SDI quintiles ( $58 \cdot 0 \%$ [43.8-74.6] of 1.1 years [ $0 \cdot 7-1 \cdot 4]$ ). For females aged 65 years in Iran and India, of the extra years lived compared with males, more than $60 \%$ of extra years were spent in poor health, $70 \cdot 1 \%$ (53.5-88.2) for those in Iran and 63.4\% (49.0-79.6) for those in India (appendix 2).

## Global levels and trends for DALYs

The global level of all-age all-cause DALYs in 2017 was $2 \cdot 50$ billion ( $95 \%$ UI $2 \cdot 29-2 \cdot 74$ ). The estimated DALY counts and age-standardised rate of DALYs, and changes in these metrics between 2007 and 2017, are in table 3. The largest contribution to global DALYs was from noncommunicable diseases, which, combined, accounted for $62 \cdot 0 \%(60 \cdot 3-63.8)$ of total DALYs, whereas communicable, maternal, neonatal, and nutritional (CMNN) causes accounted for $27.9 \%$ (26.4-29.4), and injuries $10 \cdot 1 \%(9 \cdot 7-10 \cdot 5)$ of total DALYs.
For non-communicable diseases, global DALYs increased by $40 \cdot 1 \%$ ( $95 \%$ UI 36•8-43.0), although
age-standardised DALY rates decreased by $18.1 \%$ (16•0-20 2). Between 2007 and 2017, 12 causes at Level 2 of the GBD cause hierarchy (diabetes and kidney diseases, sense organ diseases, neurological disorders, neoplasms, musculoskeletal disorders, substance use disorders, cardiovascular diseases, chronic respiratory diseases, skin and subcutaneous diseases, mental disorders, digestive diseases, and self-harm and interpersonal violence) had significant increases in DALY counts. The greatest number of DALYs among Level 3 non-communicable disease causes in 2017 were estimated for ischaemic heart disease (170 million [167-174]), stroke (132 million [126-137]), and chronic obstructive pulmonary disease ( 81.6 million [76.0-86.8]) which, combined, accounted for $15.4 \%$ (14.2-16.4) of all-cause DALYs (table 3). By contrast with the overall decrease in DALYs during 2007-17 for many causes, total all-age DALYs from noncommunicable diseases increased from 1.11 billion ( $1.00-1.23$ ) in 1990 to 1.34 billion ( $1.19-1.51$ ) in 2007, and continued to increase to 1.55 billion (1.38-1.75) in 2017 (appendix 2): a change of $20 \cdot 7 \%(18 \cdot 4-22 \cdot 8)$ from 1990 to 2007, and $16 \cdot 0 \%(15 \cdot 1-16 \cdot 9)$ from 2007 to 2017. At Level 4 between 1990 and 2007, the largest significant increases in total DALYs were estimated for HIV/AIDS and multidrug-resistant tuberculosis co-infection without extensive drug resistance (5329.0\% [3143.5-8492.9]), multidrug-resistant tuberculosis without extensive drug resistance ( $700 \cdot 6 \%$ [335.0-1,431.6]), and HIV/AIDS resulting in other diseases (454.3\% [389.5-529.2]; appendix 2. From 2007 to 2017, the largest significant increases in DALYs were for liver cancer due to NASH ( $37 \cdot 4 \%$ [ $32 \cdot 8-42 \cdot 9]$ ), chronic kidney disease due to type 2 diabetes ( $34 \cdot 3 \%$ [30.9-37.2]), and diabetes type 2 ( $34 \cdot 0 \%$ [30.3-38.1]). Relative to changes in the population, the age-standardised DALY rate for non-communicable diseases decreased by $13 \cdot 2 \% \quad(11 \cdot 7-14 \cdot 7)$, from

(Figure 5 continues on next page)

Figure 5: DALYs by Level 2 causes by age and sex, for global (A), high SDI (B), high-middle SDI (C), middle SDI (D), low-middle SDI (E), and low SDI (F), 2017
Scales in each panel are different. The early neonatal period is 0-6 days, the late neonatal period is 7-27 days, and the post neonatal period is $28-364$ days. DALYs=disability-adjusted life-years. GBD=Global Burden of Diseases, Injuries, and Risk Factors Study. SDI=Socio-demographic Index.

(Figure 6 continues on next page)
24017.4 DALYs (21861.4-26509.6) per 100000 in 1990 to $20852 \cdot 2$ DALYs ( $18710 \cdot 2-23388 \cdot 5$ ) per 100000 in 2007, and decreased by a further $5 \cdot 6 \% ~(4 \cdot 8-6 \cdot 6)$ to $19676 \cdot 5$ DALYs (17509•8-22177.9) per 100000 in 2017. From 1990 to 2017, the greatest significant decreases in age-standardised DALY rates were for visceral leishmaniasis (97.8\% [97•0-99•2]), maternal haemorrhage ( $78.7 \%$ [73.4-83.0]), and ascariasis (70.8\% [66.0-75.3]). Significant increases in age-standardised DALY rates from 1990 to 2017 were observed for 17 Level 4 non-communicable diseases, with other benign and insitu neoplasms ( $35 \cdot 1 \%$ [7.8-81•7]), type 2 diabetes (28.2\% [24.1-32.3]), and opioid use disorders ( $24 \cdot 8 \%$ [20.1-31•0]) having the most pronounced changes.
Among CMNNs, at Level 3 of the GBD cause hierarchy the greatest contributors to global DALYs in 2017 were neonatal disorders ( 186 million [95\% UI 175-197] DALYs), lower respiratory infections ( 106 million [100-112] DALYs), and diarrhoeal diseases ( 81.0 million [70.1-97.2] DALYs). Globally, total DALYs from all CMNNs decreased from 1.19 billion (1.14-1.23) in 1990 to 0.946 billion ( $0.910-0.987$ ) in 2007, to 0.696 billion ( $0.660-0.740$ ) in 2017, a decrease of $41 \cdot 3 \%(38 \cdot 8-43 \cdot 5)$ from 1990 to 2017. In
parallel, the age-standardised DALY rate for all CMNN causes decreased by 49•8\% (47•9-51.6) from 1990 to 2017. For 2007-17, the largest decreases were for visceral leishmaniasis (by 63.9\% [40.0-84.5]), HIV/AIDS and drug-susceptible tuberculosis co-infection (by $54.9 \%$ [51.0-57.9]), and maternal haemorrhage (52.4\% [44.3-59.5]; table 3). Significant decreases of more than $50 \%$ in age-standardised DALY rates between 2007-17 were estimated for five Level 4 CMNN causes, specifically, visceral leishmaniasis ( $66 \cdot 2 \%$ [44•3-86•0]), HIV/AIDS and drug-susceptible tuberculosis co-infection (59.8\% [56-3-62•5]), HIV/AIDS and multidrug-resistant tuberculosis without extensive drug resistance co-infection ( $56 \cdot 6 \%$ [40.1-69•1]), maternal haemorrhage (56.4\% [49.1-62•8]), and HIV/AIDS resulting in other diseases (53.7\% [51•1-56•1]). Against this general decreasing trend, seven CMNN causes at Level 4 were estimated to have significant increases in age-standardised DALY rate between 1990 and 2017, specifically, HIV/AIDS and multidrug-resistant tuberculosis without extensive drug resistance co-infection (1805.0\% [1016•3-3049•2]), HIV/AIDS resulting in other diseases ( $103 \cdot 1 \%$ [76.3-134.9]), and cutaneous and mucocutaneous leishmaniasis (40.5\% [7•0-106.0]).

Figure 6: Leading 30 Level 3 causes of global DALYs for 1990, 2007, and 2017 with percentage change in number of DALYs and age-standardised DALY rates by sex
Solid lines indicate increases and dashed lines indicate decreases in rank between periods. Significant changes are shown in bold. COPD=chronic obstructive pulmonary disease. DALYs=disability-adjusted life-years.

In 2017, the top five leading causes of DALYs were communicable diseases (lower respiratory infections, malaria, diarrhoeal diseases, HIV/AIDS, and tuberculosis) and neonatal disorders (table 3). For low-middle SDI countries, both communicable and non-communicable diseases ranked highly as leading causes of DALYs, and the top five causes were neonatal disorders, lower respiratory infections, ischaemic heart disease, diarrhoeal diseases, and stroke (figure 5). In high SDI countries, non-communicable diseases (ischaemic heart disease, low back pain, stroke, lung cancer, and chronic obstructive pulmonary disease) were the leading causes of DALYs (figure 5). Younger age groups contributed more to total DALY counts in low SDI countries than did older age groups, and mostly from communicable diseases. In low SDI countries in 2017, 136 million ( $95 \%$ UI 130-143) DALYs were estimated for neonatal age groups to be from communicable diseases, with a further 18.9 million (17.2-21.0) from non-communicable diseases, and $2 \cdot 95$ million (2.60-3.26) from injuries. For low and
low-middle SDI countries, the burden is more equal across age groups than in other SDI quintiles. The burden from DALYs in high-middle and high SDI countries occurs mostly from age 15 years and consists largely of non-communicable diseases (figure 5).

Leading causes of DALYs and changes during 1990-2017 Globally in 2017, the leading causes of DALYs were predominantly CMNN and non-communicable causes for both men and women (figure 6). Of the top 30 causes of DALYs for men, four were injuries: road injuries (49.8 million [95\% UI 47.3-52•1] DALYs), self-harm ( 22.9 million [20.9-24.0] DALYs), falls ( $21 \cdot 0$ million [17.6-24.9] DALYs), and interpersonal violence ( 19.8 million [17.8-21.0] DALYs; table 3). By contrast, two of the top 30 causes of DALYs for women were injuries: road injuries ( $18 \cdot 0$ million [16.6-19.4] DALYs) and falls ( $15 \cdot 0$ million [12•3-18•0] DALYs). Our results showed disparities in disease burden between males and females. Females are more likely than males to have a higher
burden from disabling conditions such as most musculoskeletal disorders except for gout, iron-deficiency anaemia, and major depressive disorder. Iron-deficiency aneaemia is common especially at reproductive ages for females, and for boys and girls (aged $5-14$ years) equally (appendix 2 ). Males are more likely than females to be affected by fatal conditions including different types of cancer, injuries, and ischaemic heart disease. Globally, the all-age DALY count of HIV/AIDS for females increased sharply from 1990 to 2007, rising from 36th to third leading cause of DALYs with an increase of $610 \cdot 7 \%$ (548.5-680.6), then decreased from 2007 to 2017 by $53 \cdot 9 \%$ (51.6-53.9), dropping to 12 th leading cause of DALYs (figure 6). Similarly, the global age-standardised DALY rate for females increased from 1990 to 2007 by $483 \cdot 0 \%$ $(431 \cdot 4-540 \cdot 5)$, and then decreased from 2007 to 2017 by $58.8 \%$ ( $56 \cdot 8-60 \cdot 6$; appendix 2). Males had similar patterns in all-age DALY counts and age-standardised DALY rates for HIV/AIDS during the same period. The allage DALY count of HIV/AIDS for males increased by $297 \cdot 3$ (259•8-338.4) from 1990 to 2007, rising from the 25th leading cause of DALYs to seventh (figure 6; appendix 2). By 2017, all-age DALYs from HIV/AIDS for males dropped to 13th leading cause of DALYs, a decrease of $44 \cdot 8 \%(42 \cdot 8-46 \cdot 6)$ between 2007 and 2017. Similarly, the age-standardised DALY rate of HIV/AIDS for males increased sharply from 1990 to 2007, with an increase of $212.9 \%$ ( $182 \cdot 8-246.4$ ), and then decreasing by $51 \cdot 1 \%$ (49.0-52.6) in 2017. The global all-age DALY count of malaria for females increased from 1990 to 2007 by $28 \cdot 6 \%$ (11.7-51.2), rising from the tenth leading cause of DALYs to the seventh leading cause of DALYs. Malaria agestandardised DALY rates for females also increased, with an increase of $23 \cdot 2 \%(7 \cdot 4-44 \cdot 2)$ between 1990 and 2007, and then decreased from 2007 to 2017 by $40 \cdot 2 \%$ (30•7-49•2). DALYs from malaria for males also increased from 1990 to 2007, increasing by $30 \cdot 5 \%(12 \cdot 9-55 \cdot 7)$ from the 11th to the tenth leading cause of DALYs. Similarly, the age-standardised DALY rate for malaria in males increased between 1990 and 2007 by $23 \cdot 6 \%(7 \cdot 0-46 \cdot 0)$, and then decreased by $37 \cdot 7 \%(27 \cdot 6-46 \cdot 8)$ in 2017.
The leading 30 causes of DALYs for men and women varied between SDI quintiles (appendix 2). In the low SDI quintile countries, males and females had similar CMNN causes as the leading causes of DALYs in 2017, with the greatest total DALYs for both sexes being from neonatal disorders, lower respiratory infections, diarrhoeal diseases, and malaria for both sexes, and thereafter for females the fifth leading cause was congenital defects and for males was ischaemic heart disease. In the low SDI quintile, males had more injury sources of DALYs than females, whereas CMNN causes of DALYs were more common among the leading DALY causes for females than males. An epidemiological shift in sources of DALYs was evident in the leading causes for both men and women at middle to high SDI levels, which were dominated by non-communicable disease causes. In high

SDI quintiles, two CMNN causes of DALYs were in the leading 30 causes for both men and women, lower respiratory infections and neonatal disorders, and the agestandardised DALYs rate for these causes decreased between 1990 and 2017, by $36 \cdot 2 \% ~(95 \%$ UI 33.9-38-6) for lower respiratory infections and $30 \cdot 1 \%(25 \cdot 1-36 \cdot 7)$ for neonatal disorders for men, and by $37 \cdot 8 \%$ (35.8-39.9) for lower respiratory infections and $27 \cdot 5 \%$ (22.3-34.1) for neonatal disorders for women (appendix 2).

## YLLs and YLDs composition by age, sex, and SDI

Globally in 2017, males had 1.34 billion ( $95 \%$ UI 1.24-1.46) DALYs and females had 1.16 billion (1.04-1.29) DALYs. For males, $29.4 \%$ (23.8-34.9) of DALYs were from YLDs and $70 \cdot 6 \%(65 \cdot 1-76 \cdot 2)$ were from YLLs. For females, $39 \cdot 4 \%(33 \cdot 0-45 \cdot 6)$ of DALYs were from YLDs and $60 \cdot 6 \%(54 \cdot 4-67 \cdot 0)$ were from YLLs. A greater proportion of DALYs were from YLDs for females than for males, particularly for those older than 65 years (figure 7). Globally, among females YLDs were the larger fraction of DALYs for many age groups, whereas for males this was only the case for those aged 10-14 years. Across SDI quintiles, the composition of DALYs varied. Females aged 1-69 years in the high SDI quintile had more DALYs from YLDs than from YLLs, whereas in the low SDI quintile all age groups except those aged 10-29 years had more DALYs from YLLs than from YLDs. In all quintiles, women older than 65 years had more DALYs from YLDs than men older than 65 years did.

## Observed and expected values of HALE and DALYs based on SDI level

Maps of observed minus expected HALE can highlight which countries have worse or better HALE than expected based on SDI quintile, as shown in figure 8. The three countries with the greatest difference between expected HALE at birth and observed HALE at birth for males, with observed HALE much lower than expected on the basis of their SDI value, were Lesotho, with a difference of 13.4 years, Swaziland (eSwatini), with a difference of 11.7 years, and Central African Republic, with a differences of 7.9 years. For females, the countries with the greatest differences were Lesotho, with a difference of $10 \cdot 0$ years, Congo (Brazzaville), with a difference of 9.3 years, and Swaziland (eSwatini), with a difference of 8.1 years. The three countries that had the greatest difference between observed and expected HALE at birth for

Figure 7: Contribution of YLLs and YLDs to DALYs by age and sex for global (A), high SDI (B), high-middle SDI (C), middle SDI (D), low-middle SDI (E), and low SDI (F), 2017 The early neonatal period is 0-6 days, the late neonatal period is 7-27 days, and the post neonatal period is 28-364 days. DALYs=disability-adjusted life-years. SDI=Socio-demographic Index. YLDs=years lived with disability. YYLs=years of life lost.

Global Health Metrics

males, where HALE was much better than expected, were Niger, Nicaragua, and the Maldives, with differences of 11.9 years for Niger, 9.5 years for Nicaragua, and 9.2 years for the Maldives. For females, these countries were Niger, Nicaragua, and Ethiopia, with differences between observed and expected HALE at birth of 11.5 years for Niger, 8.3 years for Nicaragua, and 8.2 years for the Maldives. We saw a similar trend in countries having differences in observed and expected HALE at age 65 years for both males and females (appendix 2). The greatest differences in observed and expected HALE at age 65 years for males, where HALE was worse than expected, were seen in Lesotho ( 3.1 years), Swaziland (eSwatini; 2.8 years), and Papua New Guinea ( $2 \cdot 3$ years), and for females were seen in Congo (Brazzaville; $2 \cdot 7$ years), Papua New Guinea ( $2 \cdot 6$ years), and Marshall Islands ( $2 \cdot 2$ years). HALE at age 65 years was better than expected on the basis of SDI level for males in Peru (by 5.0 years), Colombia (by 5.0 years), and Nicaragua (by 4.9 years), and for females in Colombia (by 4.5 years), Peru (by 4.3 years), and Nicaragua (by 3.7 years).

Higher ratios of observed to expected age-standardised DALY rates indicate more DALYs experienced than expected on the basis of SDI (appendix 2). Males had the highest ratio of observed to expected age-standardised DALY rates in Lesotho (1.94), Swaziland (eSwatini; 1•86), and Central African Republic (1-60). Females had the highest ratio of observed to expected age-standardised DALY rates in Congo (Brazzaville; 1•67), Lesotho (1.62), and Equatorial Guinea (1.57). Alternatively, males in the Maldives, Niger, and Nicaragua experience DALYs at a much lower rate than expected, with observed to expected ratios of 0.54 in the Maldives, 0.56 in Niger, and 0.57 in Nicaragua. Females had low ratios of observed to expected age-standardised DALY rates in Niger, Nicaragua, and Ethiopia, with ratios of 0.57 in Niger, 0.58 in Nicaragua, and 0.62 in Ethiopia.

## Discussion <br> Main findings

Globally, HALE at birth increased by $6 \cdot 3$ years (95\% UI $5 \cdot 9-6.7$ ) and the number of years lived in poor health from birth increased by 1.1 years ( $0 \cdot 9-1 \cdot 4$ ) during the period 1990-2017, with substantial variation across sociodemographic quintiles and countries. People in low SDI countries gained an additional $10 \cdot 5$ years $(9 \cdot 8-11 \cdot 2)$ of life in good health and 1.5 years (1.2-1.9) in poor health from birth, whereas people in high SDI countries gained

## Figure 8: Difference in years between observed and expected HALE at birth

on the basis of SDI for females and males, 2017
ATG=Antigua and Barbuda. FSM=Federated States of Micronesia. HALE=healthy life expectancy. IsI=|slands. LCA=Saint Lucia. SDI=Socio-demographic Index. TTO=Trinidad and Tobago. TLS=Timor-Leste. VCT=Saint Vincent and the Grenadines.
an additional 3.8 years (3.4-4.1) in good health and 1.3 years ( $1 \cdot 0-1 \cdot 7$ ) in poor health from birth. Women are expected to live longer than men (both at birth and at age 65 years) in most countries, but the number of extra years lived and the proportions of extra years spent in poor health vary greatly across countries. In 2017, the global leading causes of DALYs were neonatal disorders, ischaemic heart disease, stroke, lower respiratory infections, and chronic obstructive pulmonary disease. Communicable diseases and neonatal disorders were the leading causes of DALYs in low SDI countries in 2017. Non-communicable diseases were the leading causes of DALYs in the remaining SDI quintiles in the same year.

## Sex disparities in health

Sex differences in HALE exist across SDI quintiles, with the smallest difference seen in low SDI countries. Although societal factors, biological factors, and men's risk behaviours probably contribute to their shorter HALE, ${ }^{22,23}$ the smaller male-female gap in HALE in low SDI countries might be explained by the increased risk of mortality in both sexes due to the high occurrence of infectious diseases. Additionally, women are affected by pregnancy-related conditions, and maternal disorders were a leading cause of DALYs in low SDI countries in 2017. In several high SDI countries, the difference between male and female HALE has decreased over time, which could partly be attributable to the decreasing gap between the sexes in the prevalence of specific risk factors-eg, smoking and alcohol use. ${ }^{24,25}$
Our results show increased life expectancy and more years lived in poor health for women than men in most countries. This finding could be attributable to sex differences in the patterns of disease burden. For example, women are more likely than men to have a higher burden from disabling conditions (eg, most musculoskeletal disorders except for gout, iron-deficiency anaemia, and major depressive disorder), whereas men are more likely than women to be affected by fatal conditions including different types of cancer (eg, liver cancer, lung cancer, leukaemia, colorectal cancer, and pancreatic cancer), injuries, and ischaemic heart disease. Various explanations have been suggested for the sex difference in disease risk, including social norms (eg, heavy drinking is socially acceptable for men in Russian tradition), health-related beliefs and behaviours, and biological factors (eg, sex hormones). ${ }^{22,26}$
In 2017, the widest difference between male and female HALE at birth was observed in the eastern European region ( $7 \cdot 7$ years [ $95 \%$ UI $6 \cdot 8-8.4]$ ), where the agestandardised DALY rate from all causes among men was also 1.7 times higher than among women. A large proportion of DALYs in men in these countries was attributable to alcohol use and smoking, which led to high incidence and prevalence of cardiovascular disease and other leading causes of DALYs. ${ }^{27}$ Interventions aiming to reduce these risk factors could help decrease
the difference. Ukraine and Lithuania had the biggest sex difference in HALE at birth globally ( $8 \cdot 7$ years [7.5-9.8] for Ukraine and $7 \cdot 8$ years [6.6-8.9] for Lithuania) in 2017. Age-standardised DALY rates due to cardiovascular diseases and alcohol use disorders were two times higher in both these countries for men than for women, whereas self-harm and drug use disorders were four or more times higher.

## Longevity and functional health status

With increasing life expectancy in almost all locations worldwide, the question of whether the years of life gained are spent in good health or poor health is increasingly relevant because of the associated policy implications, ranging from health-care provisions to extending retirement ages.
In the context of improving longevity, the age of retirement versus extending working life has been much debated. Some key questions need to be considered in this debate, including whether the increase in life expectancy is accompanied by an equivalent increase in years in good health, and whether the common causes of early retirement, ${ }^{28,29}$ such as mental disorders and musculoskeletal disorders, have improved over time. Our results showed that the additional years of life were accompanied by poor health to some extent, but varied widely across countries, and the burden from musculoskeletal disorders and mental disorders has not improved over time. A lack of progress in reducing the burden of these causes and other conditions associated with ageing, such as sense organ disorders and Alzheimer's disease, might restrict the ability of older workers to contribute to the workforce. ${ }^{30}$
Globally, 12 Level 2 causes have had significant increases in DALY counts since 2007. Causes with the largest increases in DALY counts include musculoskeletal disorders, sense organ diseases, neurological disorders, diabetes and kidney diseases, and neoplasms. The large and increasing number of people living with these diseases necessitates careful planning by governments and health-care providers to ensure adequate funding and staff for treatment and rehabilitation services. Some of these diseases are expensive to manage. ${ }^{31}$ Despite the large amount of spending on health in some countries, such as India and Nigeria, the spending is inefficient because most of it is through out-of-pocket expenditures (ie, direct payments by individuals to health-care providers); additional health services could be provided if the money was consolidated. ${ }^{32}$

## Cross-national variation in health gains

Our results showed that substantial variations in health gains exist even between countries within the same SDI quintile. For example, between 1990 and 2017, the increase in HALE at birth among females in Singapore was more than six times greater than the increase among females in the USA ( $7 \cdot 3$ years [ $95 \%$ UI $6 \cdot 6-7 \cdot 9$ ] vs
$1 \cdot 1$ years $[0 \cdot 8-1 \cdot 4]$ ), and the females in Singapore spent a smaller proportion of the extra years in poor health ( $17 \cdot 7 \%$ [12•7-23•1] vs $33 \cdot 6 \%$ [25•1-42•2]). The comparatively small increase in HALE in the USA is probably due to inequalities in access to health care. ${ }^{33}$ The burden attributable to drug use disorders has also been increasing in the USA, with the age-standardised DALY rates due to drug use disorders almost three times higher in 2017 compared with 1990. This trend coincides with a sharp increase between 2015 and 2016 in the use of and deaths from synthetic opioids such as fentanyl, suggesting the need to improve harm-reduction efforts in the USA. ${ }^{34,35}$
Over the past 28 years, several countries in sub-Saharan Africa have had substantial increases in HALE. But at the same time, some countries in this region, especially those with major HIV epidemics, had a stagnation or reduction in HALE. Although HIV control efforts have resulted in a decrease in HIV-related mortality and an increase in life expectancy and HALE in the past decade, countries such as Lesotho and Swaziland (eSwatini) still have yet to catch up with the level of HALE in 1990.
In addition to examining improvements in health, we compared the observed HALE and disease burden with those expected based on development status to discern which countries are lagging behind and identify priority areas that need to be addressed to further improve HALE. In 2017, several countries, most of them from southern sub-Saharan Africa and eastern Europe, had higher disease burden and lower HALE than expected on the basis of their sociodemographic development. Our study also identified countries that outperformed expectations based on their development status (eg, in Niger and the Maldives, males had more than 9 years higher HALE at birth than expected based on the countries' SDI). The approaches used in these countries to accelerate improvements in health (eg, the child survival programme in Niger ${ }^{36}$ ) could inform successful programmatic strategies for countries with poor performance with similar levels of development.

## Disease burden related to undernutrition and obesity

Although child and maternal undernutrition is the main risk factor for the leading causes of disease burden in low SDI countries (eg, lower respiratory infections, diarrhoea, and neonatal disorders), obesity remains a key driver of the leading causes of burden in high-middle and high SDI countries (eg, ischaemic heart disease, ischaemic stroke, diabetes, low back and neck pain). ${ }^{27}$ With changing diets and lifestyle over time, obesity-related diseases are emerging, especially in low-middle and middle SDI countries where diseases related to both undernutrition and obesity contribute substantially to the total burden of disease. Evidence suggests that the disease burden associated with undernutrition and obesity can potentially be reduced. ${ }^{37}$ For example, nutritional counselling, food supplementation, and conditional cash-transfer programmes have
been shown to substantially reduce stunting and associated burdens of disease in settings with food insecurity. ${ }^{37}$ Randomised controlled trials have shown that a lifestyle intervention with a small amount of weight loss (5-7\%) decreases the incidence of type 2 diabetes by $58 \%$ during a 3 -year follow-up and by $34 \%$ during a 10 -year follow-up. ${ }^{38-40}$ However, weight maintenance after weight loss is challenging and requires continuing support to help maintain diet, physical activity, and behavioural changes. ${ }^{41}$ For countries with a dual burden of malnutrition, an integrated approach addressing both undernutrition and obesity to simultaneously reduce the burden associated with both risk factors has been recommended. ${ }^{42,43}$

Dietary iron deficiency was the fifth leading cause of DALYs among women of reproductive age and the top leading cause of DALYs among children of both sexes at ages 5-14 years in 2017. Age-standardised DALY rates due to dietary iron deficiency were similar between boys and girls aged $5-14$ years, but for adult women the rates were almost double those for men. Despite its high burden, iron deficiency remains commonly underdiagnosed and undertreated. ${ }^{44}$ Iron deficiency is not only a problem in low SDI countries, but also in high SDI countries, and reduction of iron deficiency among children and women of reproductive age, for example, is one of the objectives of the US Public Health Service's Healthy People 2020 initiative. ${ }^{45}$ Various options are available to treat iron deficiency, ranging from iron supplementation to biofortification of crops. ${ }^{46,47}$ Although iron supplementation has been shown to be efficacious, challenges exist in terms of distribution, cost and compliance, and inability to tolerate it because of potential adverse gastrointestinal effects. ${ }^{46}$ Food fortification is highly cost-effective but can be a challenge in rural populations with little access to marketed fortified food. ${ }^{47}$ Biofortification of crops is considered to be a sustainable strategy to prevent iron deficiency, especially in settings with few resources; this strategy has been shown to improve iron status in iron-deficient individuals, but the longer-term effects on functional outcomes has yet to be determined. ${ }^{48}$

## Communicable diseases with increasing trends

A global shift has occurred from communicable to noncommunicable causes of disease burden with sociodemographic development. However, a few key exceptions exist among communicable diseases. In most tropical and subtropical countries, the burden of dengue has been increasing over time, in terms of both DALY counts and age-standardised DALY rates, with the highest number of DALYs occurring in south Asia. A dengue vaccine has been licensed for use in people aged 9-45 years living in several endemic settings, ${ }^{49}$ however, the vaccine efficacy varies from $76 \%$ in seropositive individuals to only $39 \%$ in seronegative individuals. ${ }^{50}$ In the absence of specific treatment for dengue, prevention and control measures are crucial. Top-down vector-control efforts
have restricted effectiveness and sustainability, and innovative community-based vector-control strategies are being developed. ${ }^{51}$
All-age DALY counts and age-standardised DALY rates due to HIV/AIDS have been decreasing since 2007, but for adolescents (aged 15-19 years) age-specific DALY rates continued to increase after 2007. The HIV/AIDS YLL and YLD trends among adolescents also differ from the all-age trends. The all-age YLL rate increased after 1990, peaked around 2005, and then declined steadily afterwards ${ }^{11}$ as antiretroviral treatment became more widely available. Among adolescents, the YLL rate continued to increase after 2005, reaching a plateau since 2013. The all-age YLD rate due to HIV/AIDS has decreased slightly since 2007, but the adolescent YLDs rate has continued to increase. ${ }^{12}$ DALYs from HIV/AIDS are concentrated in sub-Saharan Africa. Adolescents have low rates of HIV testing and poor access to antiretroviral treatment, which might partly explain some of the increases in HIV/AIDS DALYs in this age group. ${ }^{52}$

## Causes with sharp decreases in DALYs

Since 1990, we have seen exceptional progress in many countries in reducing the burden from communicable diseases, especially vaccine-preventable diseases such as tetanus and measles. Much of this burden came from premature mortality, which has sharply decreased in the past 28 years. However, despite these interventions, DALYs due to these causes remain unnecessarily high in several low, low-middle, and middle SDI countries. Immunisation efforts have been helpful, but progress in immunisation coverage has slowed in the past decade; about 20 million children younger than 1 year, most of them in sub-Saharan Africa and south Asia, did not receive the measles vaccine and the three recommended doses of the diphtheria, tetanus, and pertussis vaccine in 2016. ${ }^{53}$ Conflict, inadequate investment in national immunisation programmes, and vaccine stock outages were among the reasons for the stalled progress in immunisation coverage. ${ }^{53}$

## Comparisons with GBD 2016

We have made substantial improvements in the estimation of mortality and life expectancy in GBD 2017 across our publications, including an independent estimation of population, a comprehensive update on fertility, adding a substantial amount of new data (from censuses, Demographic Surveillance Sites, and other sources), improvements to the GBD model life-table system, and enhancements to the modelling framework. ${ }^{13}$ We made changes to the GBD cause hierarchy, which can restrict comparisons to estimates from previous GBD iterations. For example, we have combined maternal and neonatal conditions at Level 2 of the cause hierarchy in GBD 2017 and reported these causes separately at Level 3 (rather than Level 2). Because of these changes, neonatal
disorders now appear for the first time as the first leading cause of DALYs in both 1990 and 2017.
Estimates of DALYs due to congenital birth defects were higher in GBD 2017 than in GBD 2016 for two reasons. ${ }^{9}$ First, all data sources that captured only a small subset of congenital causes (eg, only congenital heart disease and neural tube defects) were excluded for GBD 2017, leading to increased mortality estimates. Second, for GBD 2017 we implemented an algorithm to empirically identify data sources for registration of birth defects and for administrations (ie, hospital and claims) that had systematic under-reporting by age, sex, and defect. This change led to exclusion of several sources and, in many cases, higher prevalence estimates. The estimated DALYs due to malaria were lower in GBD 2017 than in GBD 2016 because of newly included Plasmodium parasite rate survey data and updates to insecticidetreated bednet coverage, which decreased incidence estimates, particularly in Nigeria. The decrease in incidence was in agreement with additional verbal autopsy data for Nigeria, which resulted in a decrease in estimated YLLs and DALYs.
The global age-standardised DALY rate for drug use disorders in GBD 2017 was higher for the most recent decade than in GBD 2016, because of a better fit to the most recent years of cause of death data in the USA and the use of more appropriate covariates, including the prevalence of injecting drug use and an estimate of consumption (measured by import and domestic manufacture of scheduled substances, including opioids, expressed as daily doses per 1000 people per day). Estimates of DALYs due to acute hepatitis overall are very similar to GBD 2016, but our assessments of the relative contribution of different viruses changed. We used clinical administrative data sources to calculate location-specific and age-specific case-fatality ratios for acute hepatitis infection, pairing these ratios with incidence estimates of each virus. Previously all locations were assumed to have identical case-fatality ratios. This resulted in higher estimates of DALYs for acute hepatitis A, and lower DALY estimates for acute hepatitis B, C, and E. Finally, estimated DALYs due to HIV/AIDS among children younger than 5 years have increased in the GBD 2017 study because of methodological improvements. In countries with highquality vital registration data, incidence among children was adjusted to produce mortality estimates that better align with recorded HIV/AIDS deaths. Additionally, we produced the paediatric estimates of HIV/AIDS mortality using the CD4 progression and CD4-specific mortality rates developed by UNAIDS. ${ }^{54}$

## Limitations

This study has several limitations. First, the GBD 2017 YLL and YLD analyses had limitations as described in the GBD 2017 cause of death, ${ }^{11}$ disease and injury, ${ }^{12}$ and mortality papers. ${ }^{13}$ Second, we assumed that uncertainty is independent between YLLs and YLDs because little
empirical evidence exists to establish this correlation; however, this assumption could result in an underestimation of the total uncertainty for DALYs. Third, HALE and DALY estimates are influenced by the availability of data for YLL and YLD estimations. Because of time lags in the reporting of health data by countries and their subsequent incorporation into the GBD estimation, recent changes in health states might not have been captured in our estimates. The scarcity of data for a particular location is reflected by wider uncertainty intervals. Fourth, although we have included several sources of uncertainty in our estimations, we have not been able to incorporate uncertainty into the covariates used by cause of death and non-fatal models. Fifth, SDI utility might be restricted in countries with high income inequality. The applicability of SDI could be enhanced in the future by taking into account social heterogeneity within countries. Finally, time trends for specific causes, such as cancer, might be influenced by changes in diagnostic technology, whereas in previous years underreporting might have occurred when diagnostic tests were done infrequently.

## Conclusion

Understanding trends in the health status of the global population and changes in the leading causes of disease burden over time is needed to accurately inform policies and set priorities for action. Updating the GBD study on a regular basis provides an opportunity to assess the latest evidence and monitor these trends with time to understand where interventions are having an effect and how much they have affected the disease burden. Our results showed that, globally, enormous improvements in health have occurred over the past 28 years. Nevertheless, large inequalities in HALE, years lived in poor health, and disease burden exist across SDI quintiles and countries, and between sexes. Despite the progress made in reducing the total burden of disease, hundreds of millions of DALYs could still be averted and disparities could be minimised through targeted interventions ranging from the prevention of risk factors and extended vaccine coverage, to universal access to essential health services.

## Contributors

Please see appendix 1 for more detailed information about individual authors' contributions to the research, divided into the following categories: managing the estimation process; writing the first draft of the manuscript; providing data or critical feedback on data sources; developing methods or computational machinery; applying analytical methods to produce estimates; providing critical feedback on methods or results; drafting the work or revising it critically for important intellectual content; extracting, cleaning, or cataloguing data; designing or coding figures and tables; and managing the overall research enterprise.

## Declaration of interests

Carl Abelardo Antonio reports personal fees from Johnson \& Johnson (Philippines). Cyrus Cooper reports personal fees from Alliance for Better Bone Health, Amgen, Eli Lilly, GlaxoSmithKline (GSK), Medtronic, Merck, Novartis, Pfizer, Roche, Servier, Takeda, and UCB. Louisa Degenhardt reports grants from Indivior, Mundipharma, and Seqirus. Seana Gall reports grants from the National Health and Medical Research Council and the National Heart Foundation of Australia. Panniyammakal Jeemon reports a Clinical and Public Health Intermediate Fellowship from the Wellcome Trust-DBT India Alliance (2015-20). Jacek Jóźwiak reports a grant from Valeant; personal fees from Valeant, ALAB Laboratoria, and Amgen; and non-financial support from Microlife and Servier. Nicholas Kassebaum reports personal fees and other support from Vifor Pharmaceuticals. Srinivasa Vittal Katikireddi reports grants from UK NHS Research Scotland (SCAF/15/02), UK Medical Research Council (MC_UU_12017/13 and MC_UU_12017/15), and the Scottish

Government Chief Scientist Office (SPHSU13 and SPHSU15). Jeffrey Lazarus reports personal fees from Janssen and Cepheid, and grants and personal fees from AbbVie, Gilead Sciences, and MSD. Stefan Lorkowski reports personal fees from Amgen, Berlin-Chemie, MSD Sharp \& Dohme, Novo Nordisk, Sanofi-Aventis, Synlab, and Unilever; and non-financial support from Preventicus. Winfried März reports grants and personal fees from Siemens Diagnostics, Aegerion Pharmaceuticals, Amgen, AstraZeneca, Danone Research, Pfizer, BASF, Numares AG, and Berline-Chemie; personal fees from Hoffmann LaRoche, MSD, Sanofi, and Synageva; grants from Abbott Diagnostics; and other from Synlab Holding Deutschland GmbH. Walter Mendoza is currently a Program Analyst for Population and Development at the Peru Country Office of the United Nations Population Fund-UNFPA, which does not necessarily endorse this study. Ted Miller reports an evaluation contract from $A B$ InBev Foundation. Maarten Postma reports grants from Mundipharma, Bayer, BMS, AstraZeneca, Arteg, and AscA; grants and personal fees from Sigma Tau, MSD, GSK, Pfizer, Boehringer Ingelheim, Novavax, Ingress Health, AbbVie, and Sanofi; personal fees from Quintiles, Astellas, Mapi, OptumInsight, Novartis, Swedish Orphan, Innoval, Janssen, Intercept, and Pharmerit; and stock ownership in Ingress Health and Pharmacoeconomics Advice Groningen. Kazem Rahimi reports grants from National Institute for Health Research Biomedical Research Centres, the Economic and Social Research Council, and Oxford Martin School. Kenji Shibuya reports grants from the Ministry of Health, Labour, and Welfare, Japan, and from the Ministry of Education, Culture, Sports, Science, and Technology, Japan. Mark Shrime reports grants from Mercy Ships and Damon Runyon Cancer Research Foundation. Jasvinder Singh reports consulting for Horizon, Fidia, UBM , Medscape, WebMD, the National Institutes of Health, and the American College of Rheumatology; they serve as the principal investigator for an investigator-initiated study funded by Horizon pharmaceuticals through a grant to Dinora, a 501c3 entity; they are on the steering committee of OMERACT. Jeffrey Stanaway reports a grant from Merck. Cassandra Szoeke reports a grant from the National Medical Health Research Council, Lundbeck, Alzheimer's Association, and the Royal Australasian College of Practicioners; and she holds patent PCT/AU2008/001556. Muthiah Vaduganathan receives research support from the US National Institute of Health National Heart, Lung, and Blood Institute and serves as a consultant for Bayer AG and Baxter Healthcare. Denis Xavier reports grants from Cadila Pharmaceuticals, Boehringer Ingelheim, Sanofi Aventis, Pfizer, and Bristol-Myers Squibb.

## Data sharing

To download the data used in these analyses, please visit the Global Health Data Exchange at http://ghdx.healthdata.org/gbd-2017.

## Acknowledgments

Research reported in this publication was supported by the Bill \& Melinda Gates Foundation, the University of Melbourne, Public Health England, the Norwegian Institute of Public Health, St. Jude Children's Research Hospital, the National Institute on Ageing of the National Institutes of Health (award P30AG047845), and the National Institute of Mental Health of the National Institutes of Health (award R01MH110163). The content is solely the responsibility of the authors and does not necessarily represent the official views of the funders. We thank the Russia Longitudinal Monitoring Survey, done by the National Research University Higher School of Economics and ZAO Demoscope together with the Carolina Population Center, University of North Carolina at Chapel Hill and the Institute of Sociology RAS, for making these data available. Health Behaviour in School-aged Children (HBSC) is an international study carried out in collaboration with WHO/EURO. The International Coordinator of the 1997/98, 2001/02, 2005/06, and 2009/10 surveys was Candace Currie and the databank managers were Bente Wold for the 1997-98 survey and Oddrun Samdal for the following surveys. A list of principal investigators in each country can be found on the HBSC website. The Health and Retirement Study is sponsored by the National Institute on Aging (grant number NIA U01AG009740) and is done by the University of Michigan. This research uses data from Add Health, a programme project designed by J Richard Udry, Peter S Bearman, and Kathleen Mullan Harris, and funded by grant P01-HD31921 from the Eunice Kennedy Shriver

National Institute of Child Health and Human Development, with cooperative funding from 17 other agencies. Special acknowledgment is due to Ronald R Rindfuss and Barbara Entwisle for assistance in the original Add Health. People interested in obtaining data files from Add Health should contact Add Health, Carolina Population Center, 123 W. Franklin Street, Chapel Hill, NC 27516-2524 (addhealth@unc.edu). No direct support was received from grant P01-HD31921 for this analysis. Data for this research were provided by MEASURE Evaluation, funded by the United States Agency for International Development (USAID). Views expressed do not necessarily reflect those of USAID, the US Government, or MEASURE Evaluation. This research used data from the National Health Survey 2003. We are grateful to the Ministry of Health of Chile, the survey copyright owner, for allowing us to have the database. All results of the study are those of the authors and in no way committed to the Ministry. This work was supported by the National Heart, Lung and Blood Institute's Framingham Heart Study (Contract No. N01-HC-25195). Collection of these data was made possible by the USAID under the terms of cooperative agreement (GPO-A-00-08-000_D3-00). The Palestinian Central Bureau of Statistics granted the researchers access to relevant data in accordance with license number SLN2014-3-170, after subjecting data to processing, aiming to preserve the confidentiality of individual data in accordance with the General Statistics Law, 2000. The researchers are solely responsible for the conclusions and inferences drawn upon available data. This paper uses data from SHARE Waves 1, 2, 3 (SHARELIFE), 4, 5 and 6 (DOIs: 10.6103/SHARE.w1.611, 10.6103/SHARE.w2.611, 10.6103/SHARE.w3.611, 10.6103/SHARE.w4.611, 10.6103/SHARE. w5.611, 10.6103/SHARE.w6.611), see Börsch-Supan et al (2013) for methodological details. The SHARE data collection has been primarily funded by the European Commission through FP5 (QLK6-CT-2001-00360), FP6 (SHARE-I3: RII-CT-2006-062193, COMPARE: CIT5-CT-2005-028857, SHARELIFE: CIT4-CT-2006-028812), and FP7 (SHARE-PREP: ${ }^{\circ} 211909$, SHARE-LEAP: ${ }^{\circ}{ }^{\circ} 227822$, SHARE M4: $\mathrm{N}^{\circ} 261982$ ). Additional funding from the German Ministry of Education and Research, the Max Planck Society for the Advancement of Science, the US National Institute on Aging (U01_AG09740-13S2,
P01_AG005842, P01_AG08291, P30_AG12815, R21_AG025169, Y1-AG-4553-01, IAG_BSR06-11, OGHA_04-064, HHSN271201300071C), and from various national funding sources is gratefully acknowledged. This study was realised using data collected by the Swiss Household Panel, which is based at the Swiss Centre of Expertise in the Social Sciences FORS. The project is financed by the Swiss National Science Foundation. Data reported here were supplied by the United S Renal Data System. The interpretation and reporting of these data are the responsibility of the authors and in no way should be seen as an official policy or interpretation of the US Government.
