Background Psoriasis is an inflammatory long-term condition involving comorbidities, unhealthy lifestyle and significant life impact. Patients' understanding of psoriasis is limited and support lacking. The Common-Sense Model of Self-Regulation of Health and Illness emphasizes the role of illness and treatment beliefs on coping and self-management. New 'Pso Well[®]' patient materials informed by the model, addressed psoriasis as a long-term condition, medication management and lifestyle behaviours.

Objectives To investigate whether Pso Well[®] materials (i) broaden understanding of psoriasis without increasing anxiety; (ii) are acceptable; and (iii) comprise features that appear to effect change.

Methods The Revised Illness Perceptions Questionnaire (IPQ-R modified) and the Hospital Anxiety and Depression Scale (HADS) were administered in patients before and after intervention. Numerical rating scales assessed perceptions of change in understanding and anxiety resulting from engagement with the materials. Qualitative interviews explored acceptability and perceived 'active ingredients'.

Results Fifty-five patients completed pre- and postintervention questionnaires (56% female; median age 59 years). Postintervention, a large effect size was indicated in two IPQ-R domains – illness coherence [$t(55) = -3.48$, $P = 0.001$ (two-tailed), $\eta^2 = 0.19$] and personal control [$t(55) = -2.98$, $P = 0.004$ (two-tailed), $\eta^2 = 0.14$] – and a medium effect in one, treatment control [$t(55) = -2.08$, $P = 0.042$ (two-tailed), $\eta^2 = 0.08$]. HADS scores did not change. For numerical rating scales, 80% of participants reported increased understanding of psoriasis and none reported increased anxiety. Interviews with 19 patients indicated the materials were acceptable and usable. Factors reported to broaden understanding and promote engagement with self-management included linking of related disease aspects, personally relevant content and high-quality design.

Conclusions High-quality, theory-based psoriasis materials are acceptable to patients and can improve understanding and sense of control without increasing anxiety.

What's already known about this topic?

- Psoriasis is associated with comorbidities, unhealthy lifestyle and significant life impact.
- Patients' understanding of psoriasis is limited, self-management support is lacking and disengagement from healthcare services is common.

What does this study add?

- The new, theory-informed Pso Well[®] patient materials address psoriasis as a long-term condition; medications management and lifestyle behaviour.
- The Pso Well[®] patient materials can increase understanding of psoriasis, promote feelings of self-worth and encourage a desire to engage in self-management and behaviour change, without increasing anxiety or depression.

What are the clinical implications of this work?

- The Pso Well[®] patient materials could support clinical consultations by helping patients recognize the remitting–relapsing nature of psoriasis.
- This will help to improve understanding of the disease, as well as providing a clearer rationale for treatment adherence and lifestyle behaviour change.

Psoriasis is a complex, long-term inflammatory skin condition affecting at least 2% of the U.K. population.¹ It is associated with high levels of physical and psychological disability,^{2–5} comorbidities^{6–10} and significant life impact.^{11,12} While individuals with psoriasis have additional risk factors for¹³ and higher mortality from¹⁴ cardiovascular disease, recent evidence suggests that psoriasis in the absence of inflammatory arthritis is not an independent risk factor.¹³

Unhealthy lifestyle behaviours^{15–20} and obesity²¹ are more common in individuals with psoriasis, complicating understanding of comorbidities^{13,18} and contributing to risks of psoriasis onset and/or exacerbation,^{16,22–27} although patients and nonspecialist clinicians may be unaware of these associations. Improving lifestyles may improve outcomes,^{27–31} however, complex interactions between physiological and behavioural processes can be compounded by high levels of associated psychological distress. Distress can increase risk behaviour (e.g. smoking) and reduce motivation and capacity to engage in healthy behaviours.³²

Dissatisfaction with psoriasis management,^{33,34} problematic medication adherence³⁵ and disengagement from health services are common among patients.^{34,36} Clinicians express low confidence in managing psoriasis comorbidities, including supporting healthy lifestyle.^{37–40} Patients' understanding of psoriasis is limited,⁴¹ and patient information rarely addresses comorbidity risk or rationale for lifestyle modification. There is little evidence to support the effectiveness of generic education-based interventions in psoriasis for patient self-management.^{42,43} While tailored, disease-specific programmes appear to be more promising,^{44,45} these interventions may be labour intensive and relatively costly, and do not explicitly recognize the central importance of patient

understanding in self-management. Informing patients of additional possible health risks could further increase anxiety. Lack of 'illness coherence', or the mismatch between understanding underlying disease mechanisms and corresponding self-care activities, is a barrier to action, reducing perceived personal control of psoriasis with consequent suboptimal outcomes.³⁴

The Common-Sense Model of Self-Regulation of Health and Illness (CS-SRM)⁴⁶ provides an explanation as to how an individual's beliefs about their condition and its treatment influence their emotional and behavioural responses,⁴⁷ including self-care behaviours. The five key beliefs highlighted in the model relate to symptoms attributed to the condition, its cause, chronicity, levels of perceived controllability or curability, and its perceived consequences.⁴⁸ In 2002, the concept of 'illness coherence' was added to the CS-SRM to describe an individual's ability to hold a congruent working model of their symptoms.⁴⁹ Patients' beliefs have been shown to predict health outcomes and are amenable to change in a range of long-term conditions including psoriasis.⁵⁰ Thus, changing patients' understanding of psoriasis and the relevance of health behaviours may help increase motivation to engage in appropriate self-management. However, exposing patients to a revised picture of psoriasis as an incurable condition associated with comorbidities risks creating or compounding distress.

Guided by the Medical Research Council framework for complex healthcare interventions^{51,52} and evidence from the Identification and Management of Psoriasis-Associated Comorbidity (IMPACT) programme,⁵³ we developed and tested new 'Pso Well[®]' patient-focused materials to: (i) improve illness coherence (i.e. broaden patient understanding of psoriasis

as a systemic long-term condition without increasing anxiety); (ii) improve understanding of treatments by linking disease mechanisms with effective self-care options, including behavioural change; and (iii) identify aspects of the intervention that patients perceive as motivating them to change (i.e. mechanisms of action).

Materials and methods

Study design

This was a within-group, before-and-after feasibility and acceptability study to develop, test and evaluate new patient materials for psoriasis, described using TIDieR guidance.⁵⁴

Materials development, design and content

Guiding principles informed the materials' presentation and communication style (Table 1).^{55–58} Materials were designed iteratively, by mapping key concepts against the CS-SRM domains (to increase understanding by relating information to patients' own personal experience of psoriasis rather than simply increasing knowledge about the disease), and refining content and style in consultation with the IMPACT Patient User Group, specialist clinicians and graphic designers (Table S1; see Supporting Information).

The collaborative design and refinement process resulted in 15 paper-based leaflets (see Figure 1 for design and Table 2 for content).

Materials testing

Sampling and recruitment

A community-based sample of primary-care patients from a previous study⁵⁹ was invited to participate (University of Manchester ethics reference 14269).

Study procedure and outcome measures

Informed written consent was obtained by post. Data collected at baseline via postal questionnaire prior to intervention included the following. Firstly, three domains of the Revised Illness Perceptions Questionnaire (IPQ-R).⁴⁹ Both the revised and earlier versions of this instrument have been widely used in the psoriasis population^{50,60–67} and have good evidence for reliability and validity.⁴⁹ The illness coherence domain score was the primary outcome. Secondary outcome measures were the personal control and the treatment control domains. Illness coherence scores and treatment control scores are each calculated by summing the scores of five items, each with a possible score of 1–5 (range 5–25). The personal control score is similarly calculated; however, this domain contains six items (range 6–30).

Secondly, two further items, which were administered to assess other aspects of illness coherence specific to psoriasis. Data from these items were analysed separately from the original IPQ-R illness coherence domain. They were: (i) 'I have a clear picture or understanding of other conditions that are associated with psoriasis (sometimes called comorbidities)'

Table 1 Guiding principles for Pso Well[®] patient materials development

Principles	Techniques	Aim
Broadening understanding (beliefs) about psoriasis and treatment options	Clearly written, accurate information directly addressing key beliefs in CS-SRM	Improve illness coherence
	Use of analogies and metaphors to communicate complex disease and treatment mechanisms	Improve understanding of relapsing–remitting nature of psoriasis
	Directly addressing common emotional responses to psoriasis	Improve understanding of links between treatment options and underlying disease processes
Recommendations for writing effective health communication	Textual and graphical coherence	Promote optimum information processing
	Attention to readability and usability	
	Chunking information into 'bite-size' sections	
Content of personal relevance to people with psoriasis	Pilot testing with target audience	Promote understanding of comorbidities Provide rationale for personally relevant lifestyle behaviour change and medication adherence
	Inclusion of issues and experiences grounded in in-depth qualitative research with patients and clinicians managing psoriasis	
	Advice and suggestions from current best evidence-based self-management approaches	
Positive messages	Use of self-affirmation to build confidence and motivation	Counteract possible increase in anxiety resulting from new understanding of psoriasis as a lifelong, incurable inflammatory condition
	Hopeful tone	
	Modelling functional coping	

CS-SRM, Common-Sense Model of Self-Regulation of Health and Illness.

Fig 1. Pso Well® patient materials design.

and (ii) ‘Having a healthy lifestyle can improve my psoriasis or psoriasis flares’.

Thirdly, the Hospital Anxiety and Depression Scale (HADS), which was used to assess anxiety and depression.⁶⁸ This is a widely used tool that has been used extensively in patients with psoriasis and shown to have good reliability and validity in these populations.^{69–71} It comprises seven items assessing anxiety symptoms and seven assessing depression symptoms. Anxiety and depression scores are produced by summing the scores from a four-point Likert scale (0–3) with a maximum possible value of 21 for each; scores under seven indicate no or normal levels of anxiety or depression.

Fourthly, the Simplified Psoriasis Index, administered to assess current psoriasis severity, historical course of the condition and perceived psychological and social impact.⁷² Baseline Simplified Psoriasis Index scores were used to characterize the sample of participants.

Participants were given 2 weeks to read and reflect upon the materials and were invited to identify information that

was new or made them think differently about psoriasis or its management. Views were recorded on a ‘relevance’ chart according to two categories: ‘highly relevant now’ and ‘relevant in the past’. Once completed and returned, postintervention assessments were collected by post. These included the three domains of the IPQ-R as above; the two additional illness coherence questions; HADS; and two simple numerical rating scales (NRS) to enable participants to indicate changes (positive, negative or none) in (i) understanding and (ii) anxiety, which the participants attributed as resulting directly from interacting with the materials. Figure 2 shows the study process flowchart.

Process evaluation

A subset of participants purposively sampled for age, sex, psoriasis severity and responses to the outcome measures was invited to participate in follow-up interviews based on a flexible topic guide (Table S2; see Supporting Information). This was to evaluate the usability and acceptability of the materials and to identify any perceived influences on understanding psoriasis (i.e. ‘active ingredients’).

Data analyses

Paired-sample t-tests assessed change in illness perceptions and anxiety and depression scores before and after intervention. All quantitative analyses used SPSS version 22 (IBM, Armonk, NY, U.S.A.).

Qualitative data collection and analysis were carried out concurrently.⁷³ Data were managed in NVivo 10 (QSR International, Doncaster, Australia) and explored iteratively for similarities and differences within and across interviews using principles of framework analysis.⁷⁴ Data were labelled in a series of coding steps. The first author (P.A.N.) led and

Table 2 Content of Pso Well® patient materials

Leaflet set	Leaflet title	Content
Introductory (two leaflets)	Psoriasis: new for you	Signposting for patients with a new diagnosis of psoriasis
	Knowing your psoriasis	Signposting for patients with a long-standing diagnosis of psoriasis
Understanding psoriasis as a complex long-term condition (three leaflets)	Changing phases	What is psoriasis?
	Linking mind and body	Associated comorbidities
	Your journey with psoriasis	Cardiovascular risk and mood factors
Medications management (six leaflets)	Treatment overview	Explanation of first-, second- and third-line treatments for psoriasis and relevance for stages of disease
	Topical treatments	
	Emollients	
	Steroid-based topicals	
	Light therapy	
	Systemics and biologics	
Lifestyle management (four leaflets)	Why does my weight matter?	Practical tips for treatment use. Reflective activities to enhance adherence
	Keeping active feeling good	Weight/nutrition
	Smokeless	Physical activity
	Is your glass half full?	Smoking
		Alcohol

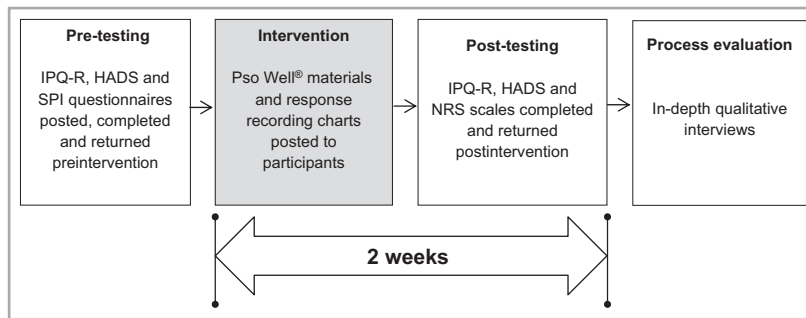

Fig 2. Pso Well® patient materials study process flowchart. IPQ-R, Revised Illness Perceptions Questionnaire; HADS, Hospital Anxiety and Depression Scale; SPI, Simplified Psoriasis Index; NRS, numerical rating scale.

coordinated the coding process to generate a draft conceptual framework (key themes). A series of analysis meetings between authors P.A.N., K.K. and L.C. took place regularly during coding. Data were considered from the perspectives of dermatology, health psychology and health service research, to identify whether and how exposure to the materials had prompted any change in participants' understanding or coherence in relation to psoriasis. The second author (K.K.) applied the draft conceptual framework to a subset of data, and the final list of key themes was agreed. Data collection was concluded when key themes were fully developed.⁷³

Results

Participants

Of the 127 invited, 58 participants completed the 'relevance' chart and 55 completed the pre- and postintervention questionnaires. Of the 24 invited for interview, 19 accepted. The sampling frame for the interviews was the total number of participants ($n = 55$) who completed the postintervention assessments. Individuals were selected based on maximizing heterogeneity on the following four attributes: age, sex, psoriasis severity and responses to the item, 'Since reading the leaflets, my understanding of psoriasis has changed'.

In order to obtain meaningful feedback on the materials from the interviews we purposively sampled people who reported their understanding of psoriasis to have changed a lot after reading the leaflets (e.g. participant 3, female, aged 42 years and participant 5, male, aged 69 years) and those who reported no change in understanding (e.g. participant 6, male, aged 44 years and participant 12, female, aged 67 years). The ranges of scores recorded for individuals in the interview sample on other variables reflected those of the larger sample used in the quantitative analysis. The qualitative subsample also included those with both positive views (e.g. participant 1, female, aged 65 years and participant 2, male, aged 62 years) and negative views (e.g. participant 9, female, aged 59 years and participant 11, female, aged 59 years) about the relevance of the content of the patient support materials.

Figure 3 shows the final study sample (with dropouts at each stage) and Table 3 presents the sample demographics for

the quantitative (outcome measures) and qualitative (process evaluation) data.

Quantitative study (outcome measures)

Revised Illness Perceptions Questionnaire

Postintervention, a statistically significant difference between the means was found in the primary outcome 'illness coherence' [from 16.0 to 17.5; $t(55) = -3.48$, $P = 0.001$ (two-tailed)], indicating a large effect size ($\eta^2 = 0.19$). Notably, both the personal control and treatment control domains also improved postintervention, with a large [$t(55) = -2.98$, $P = 0.004$ (two-tailed), $\eta^2 = 0.14$] and moderate [$t(55) = -2.08$, $P = 0.042$ (two-tailed), $\eta^2 = 0.08$] effect size, respectively (Table 4). Data for all domains are reported in Table S3 (see Supporting Information).

The materials resulted in changes in understanding of specific aspects of psoriasis: 31 of 54 (57%) participants reported not having a clear understanding of comorbidities preintervention, reducing to 19 (35%) postintervention; and 31 of 53 (58%) of the sample did not know about the relevance of lifestyle behaviours preintervention, reducing to 19 (36%) postintervention (the similarity in reported frequencies is coincidental).

Hospital Anxiety and Depression Scale

There were no clinically or statistically significant increases in HADS anxiety or depression scores after exposure to the materials, implying that improvements in understanding of the nature of psoriasis occurred without a corresponding increase in either anxiety or depression (Table 4). Cronbach's α scores for the IPQ-R and the HADS domains range from 0.91 to 0.72, indicating high levels of internal reliability for these scores (Table 4).

Numerical rating scale scores

Overall 80% of participants reported that their understanding of psoriasis increased postintervention; none reported that their anxiety increased after reading the leaflets and 16% reported reduced anxiety (Table 5).

Fig 3. Final study sample with dropouts.

Table 3 Sample characteristics

Characteristics	Participants: quantitative outcomes study	Participants: qualitative process evaluation study
Female, n (%)	55 (56)	19 (63)
Current age (years), median (range)	59 (31–79)	59 (31–69)
Age at diagnosis (years), median (range)	29 (7–65)	40 (7–62)
Years with psoriasis, median (range)	28 (2–67)	19 (3–49)
Psoriasis severity (SPI severity subscale)	48 mild, 5 moderate, 2 severe	16 mild, 1 moderate, 2 severe

SPI, Simplified Psoriasis Index.

Leaflet relevance

The majority of participants indicated that the content of the leaflets was highly relevant. Notably, many indicated that it would have had relevance earlier in the course of their disease (Table 6).

Process evaluation (qualitative study)

Analysis generated three themes explaining participants' perspectives on the Pso Well® materials and what influenced their understanding of psoriasis: (i) 'Seeing the bigger picture: psoriasis as more than a skin condition'; (ii) 'Personalizing

Table 4 Revised Illness Perceptions Questionnaire (IPQ-R) domain and Hospital Anxiety and Depression Scale (HADS) changes pre- and postintervention

IPQ-R domain	Cronbach α	Mean change ^a	η^2	Effect size	P-value
Illness coherence (primary target)	0.91	-1.49	0.19	Large	≤ 0.001
Personal control	0.91	-1.42	0.14	Large	≤ 0.01
Treatment control	0.72	-0.79	0.08	Medium	≤ 0.05

HADS	Cronbach α	Mean change ^a	SD	t	P-value
Anxiety	0.88	-0.25	2.34	-0.76	0.45
Depression	0.84	-0.26	2.63	0.73	0.47

^aPre- vs. postintervention.

Table 5 Self-reported changes in understanding and anxiety after reading Pso Well[®] materials

	Increased, n (%)	Neutral, n (%)	Decreased, n (%)
Understanding	44 (80)	11 (20)	0
Anxiety	0	46 (84)	9 (16)

psoriasis: developing illness coherence' and (iii) 'Managing psoriasis differently: making changes'. All themes and sub-themes are presented alongside illustrative data extracts (Table 7).

Theme 1: seeing the bigger picture: psoriasis as more than a skin condition

Newly discovered aspects of psoriasis Discovering hitherto unknown or unexplained aspects of psoriasis through exposure to the materials was a commonly reported experience. The leaflets enabled participants to build up a wider picture of psoriasis as a complex long-term condition affecting more than the skin. Many were unaware of comorbidities, links with lifestyle behaviours, treatments available and the need for treatment review. Some learned about the mechanisms involved in psoriasis for the first time, for example the relapsing–remitting nature, its systemic basis, the plaque formation process and inflammatory links.

Enablers of learning Features enabling participants to assimilate information, link aspects of psoriasis together and gain a sense of reassurance rather than distress included plain-language style, colour coding to aid navigation, 'chunking' of information and the positive tone of language used.

Unintended consequences of exposure to Pso Well[®] materials There were some unintended consequences of exposure to the new materials, highlighting that acquiring new information about psoriasis was not always a positive or even neutral process.

Some participants expressed disappointment in health services for failing to provide similar information; others blamed themselves for not actively seeking information. Participants expressed regret about not having access to the materials earlier in life, believing that this could have improved how they managed psoriasis.

Almost every participant interviewed learned something new from the materials, enabling them to link disease aspects together in a new way. Learning that psoriasis was a complex long-term condition appeared to be offset by the positive, hopeful tone of the materials, but some disappointment was expressed that information had not been made available earlier.

Theme 2: personalizing psoriasis – developing illness coherence

Making personal sense of psoriasis Participants reported that the materials helped 'make sense' of psoriasis. Sense making involved finding a 'reference point', linking disease aspects to self, understanding how psoriasis affects individuals personally and ways to manage it. A new awareness of the bidirectional links between psoriasis, mood and lifestyle behaviours and where these were personally relevant became apparent for some.

Enablers of engagement with the materials Several factors enabled participants to engage with the materials. These included personally relevant or resonant content that confirmed or validated previously unarticulated feelings and thoughts (particularly

Table 7 Themes and subthemes

Theme 1: Seeing the bigger picture: psoriasis as more than a skin condition	
Sub-theme	Data extract
Newly discovered aspects of psoriasis	
Learning about co-morbidities	It was something I didn't know. . . I thought that perhaps [psoriatic arthritis] applied to me. . . I didn't realise that psoriasis and arthritis could be combined (P1 female 65)
Learning about lifestyle behaviour links	A lot of the information was new to me. . . [leaflets] gave me a lot to think about. . . I didn't realise smoking and alcohol could affect [psoriasis] (P3 female 42)
Learning about treatments	I didn't even know there were things for psoriasis other than the ointment I'm using – I thought everybody used that! I wasn't aware there were other types of treatment. . . light therapy and that (P5 male 69)
Learning about disease/treatment mechanisms	Nobody had ever explained why you get. . . plaques. . . it's your skin cells speeded up and you've got a build-up of what you can physically see (P17 female 32)
Enablers of learning	
Plain language style	The [materials] were at the right level without patronising people – it was just at the right level for me and just going in (P4 female 57)
Ease of navigation	[Leaflets] were uniform, so they'd all look nice and you'd choose your colour. . . and could go straight to it (P9 female 59)
Chunking of information	It's little bits at a time, little bits of information. . . bite-sized, that's it (P7 female 45)
Positive/hopeful tone	It just puts the two things together [psoriasis and heart health]. The way it's written isn't threatening at all, it just makes it plain that there could be a link (P2 male 62)
Unintended consequences	
Disappointment in health services	It was a bit disappointing really that my doctor had never said there are new things (P5 male 69)
Self-blaming	Having the leaflets, it made me angry with myself for not looking things up. . . I was a bit angry with myself and annoyed (P8 female 31)
Regret that information not made available earlier	When I saw all of [materials] I thought – all right, so this is the kind of information you can get access to! If we had this back then it would've been brilliant. . . I wouldn't have felt so alone with [psoriasis] (P6 male 44)
Theme 2: Personalising psoriasis: developing illness coherence	
Sub-theme	Data extract
Making personal sense of psoriasis	
Finding a 'reference point'	I had no reference points or anything to know what should be happening or how bad [psoriasis] could get, so by having the leaflets – they said – if this doesn't work you can try this (P8 female 31)
Linking disease aspects to self	I recognised the sort of things that were me. . . a greater knowledge from reading all the different things and relating certain aspects to myself. . . I do understand [psoriasis] more now than I did (P4 female 57)
New awareness of bi-directional links	I hadn't put the links together in my mind. I realised being withdrawn had made my psoriasis worse but hadn't. . . linked that one relates to the other. By having the leaflets I was able to understand all the little things that can affect it, things I hadn't thought about (P8 female 31)
Enablers of engagement with materials	
Personally relevant/resonant content (acknowledging emotional impact)	I thought. . . yes that's how it is. . . there it is on the page. . . it's not just a skin condition, it's the whole range of emotions that come with it as well (P6 male 44)
Perceived trustworthiness of the materials	The source of the information is the thing. You get all sorts of stuff on the internet, put up by all sorts of people, bloggers of every description. . . if you can go to a trusted source. . . the NHS is very much in that category (P18 male 61)
Perceived 'high quality' of materials content and design	[Leaflets] were quite professional. . . and. . . attractive, like you want to read them – they're not just your boring leaflets in waiting rooms in the NHS. . . you want to pick them up (P17 female 32)

(continued)

Table 7 (continued)

Theme 2: Personalising psoriasis: developing illness coherence	
Sub-theme	Data extract
Changing emotions and cognitions (feelings and thoughts)	
Reduced feelings of self-blame/increased confidence	It's not my fault is one of the biggest things. By knowing all these things affect [psoriasis], it's not something I've done. . .that's made this happen. . .by having the leaflets. . . I felt more confident to go and sit and have breakfast in a coffee shop (P8 female 31)
Increased feelings of self-esteem (being valued)	To be given something like [materials]. . .made me as a psoriasis sufferer feel valued, because so often dermatology – psoriasis – is the bottom of the pile. . .so this. . .the way it was presented. . .actually made me feel for once, somebody was trying to make me feel valued about it (P19 female 67)
Bringing previously 'unconscious' thoughts to the fore	I kind of made a personal link and I thought – hey – when I get stressed there are times when my psoriasis starts getting worse. So maybe I'd better watch that. Maybe I can do something about it (P17 female 32)
Self-questioning about managing psoriasis differently	When I saw the leaflets. . .it did make me question things more, especially the use of lotions and things, that made me re-think my journey with my doctor over the years, how I've let things lapse and not ask for further consultations. Those leaflets made me think, well actually, I should be more proactive (P3 female 42)
Theme 3: Managing psoriasis differently: making changes?	
Sub-theme	Data extract
Materials as 'stand-alone' tool	
Consulting in a different way	That leaflet was good in that it made me go back and think about [medication] and I got on a different topical lotion – changed it for the first time in as long as I can remember (P3 female 42)
Using medications differently	I make sure I look after [skin] properly and put the creams on the right way. . .I take more care. . .it's reading [materials] and trying to do things differently than I was before. . .sometimes I used to just ignore [psoriasis] (P1 female 65)
Taking action to address lifestyle behaviour	It [re-joining Weight Watchers] was after that [reading leaflets]. . .because I felt better. Somebody understood me, understood my condition, understood how I feel (P7 female 45)
Perceived change mechanisms	
Tracking psoriasis with body diagram	Looking at [body diagram] from 5 months ago I'd have said [psoriasis] didn't do that [fluctuate]. I'm shocked looking now. . . when I completed the leaflets I felt I was in a good place, but my psoriasis is much better months along the line than it was (P3 female 42)
Identifying concerns and priorities with activities/charts	Seeing it written down made me realise that there were phases [to psoriasis] because – yes it's controlled. . .but. . .something would trigger it off again. It. . .made me realise what was bothering me (P4 female 57)
Identifying goals and strategies with activities/charts	You need a strategy. . .you need a plan. . .and I started to. . .write down what I need to do and then – right. . .the next stage is this (P1 female 65)
Increasing intention/motivation to make changes through engagement with activities	The activities was something I was able to use to help me. . .being able to put that tick. . .gave you a boost – like – yeah, you're doing what you need to do, you're going to get there (P8 female 31)
Materials as a 'shared' management tool	
Materials as a useful to 'share' with doctor	It would open up a conversation, if [GP] was to say – we've got these leaflets – where are you? It might make you feel. . .there's somebody caring and trying to improve the situation (P5 male 69)
'Shared' tool as an incentive to change	The doctor could actually use [leaflet] and say – look – what we're going to do is I need you to keep a diary, to keep noting and. . .I want you to fill this in. Then the person is going to use the leaflet rather than. . .stick it in my drawer when I get home (P17 female 32)
Materials as a support for clinicians' practice	I imagine [materials] would help GPs massively because I wonder how much GPs actually update their information about [skin] conditions. . .invaluable information here that you could use with the doctor (P3 female 42)

(continued)

Table 7 (continued)

Theme 3: Managing psoriasis differently: making changes?	
Sub-theme	Data extract
Resistance to using the materials	
Psoriasis experienced as mild/not bothersome	I don't think I was so keen on the [activities]...because it's saying how much is [psoriasis] affecting you at the moment and it wasn't affecting me...my psoriasis isn't normally that bad (P9 female 59)
Feeling 'bombarded' with lifestyle behaviour change messages in general	I'm not sure anything in the [weight] leaflet would help...it's on the telly all the time, there's stop smoking things all over...all these years I've been trying to lose weight by doing what the doctors and everyone have said...and I think I was probably feeling like strangling them. (P9 female 59)
Perceiving messages as rigid/rule-based	For me personally it smacks a bit of work...you went on various courses and it would be 'let's have a target here' and... 'we need to write an action plan!'...oh crikey here we go again (P13 female 64)

having the emotional impact of psoriasis acknowledged), the perceived trustworthiness of the materials, and their high-quality content and design.

Changes to emotions and cognitions (feelings and thoughts) Participants reported that engagement with the materials promoted an improved personalized understanding of psoriasis (illness coherence). This encouraged an increased sense of personal control and/or prompted new ways of thinking about self-management. Participants stated they: (i) felt less inclined to self-blame for having psoriasis; (ii) experienced increased self-confidence and self-esteem (as a result of 'warranting' high-quality, attractive health-focused materials); (iii) became aware of new concepts (e.g. psoriasis and links with mood; the concept of 'goal-setting'); and (iv) began to self-question about how to manage psoriasis differently (e.g. medication use, consulting behaviour and lifestyle behaviours).

Participants identified factors that promoted engagement with the materials: the trusted source and high quality, conveying a message that people with psoriasis were valued.

Theme 3: managing psoriasis differently: making changes?

Differing reasons were given for the materials' potential to influence behavioural change. Some participants used them immediately as a 'stand-alone' self-management tool; some viewed them as a 'shared' management tool for use in conjunction with a health professional; and, more rarely, some participants were resistant to using the materials at all.

Pso Well® materials as a 'stand-alone' self-management tool Some participants (who generally perceived their psoriasis as bothersome) used the materials as a 'stand-alone' tool to change psoriasis management. Behavioural changes reported were: consulting differently, seeking referral to secondary care, using medications as recommended, taking steps to address low mood, and acting to make lifestyle behavioural changes. Thus, some participants were able to use the materials of their own volition without support from a third party.

Perceived mechanisms promoting intention or motivation for change Participants who had been able to use the materials to make changes identified the 'activity' sections as useful facilitators of change. The activities (charts and exercises) enabled participants to track flares and identify concerns, priorities and goals, and to find strategies to achieve goals and increase intention to make changes.

Pso Well® materials as a 'shared' management tool Some also viewed the materials as a beneficial self-management tool, for use in partnership with health professionals such as general practitioners or specialist clinicians. This was particularly, but not exclusively, where individuals valued further explanation of the rationale for change (e.g. the mechanisms and evidence to support lifestyle behaviour links) or individualized support to identify goals and plans. The materials were viewed as useful for prompting meaningful discussions between patients and professionals, facilitating 'shared' monitoring and increasing the incentive for medication adherence and lifestyle changes. Participants believed that using the materials together with a clinician could enhance their credibility further, encouraging sustained patient engagement. The materials were also viewed as useful support for professionals in clinical practice.

Resistance to using the materials as a self-management tool There were some reports of resistance to using the materials, from participants who saw no need to change their self-care routine if psoriasis was well controlled or mild. However, particularly in relation to lifestyle behaviour change, others appeared to react to an initial perception of the 'top-line' messages, which could be experienced as threatening (similarly to commonly heard 'fear-based' or rule-bound health messages). If participants were already feeling negative about lifestyle changes, initial reading appeared to compound this response, acting as a barrier to further reading or deeper engagement with the materials.

In summary, the Pso Well® materials were used independently by some participants as tools for self-management, while others saw benefit in sharing them to monitor and manage psoriasis in partnership with a clinician. Others had

difficulty conceiving of their use, particularly in relation to lifestyle behaviour change, and appeared 'defensive' and unwilling to receive such health messages in general.

Discussion

The findings from the Pso Well® patient materials study indicate that carefully designed, high-quality, theory-based resources are acceptable to patients with psoriasis and can improve their understanding, coherence and sense of control, without a corresponding increase in anxiety. Furthermore, the materials appeared to have effects on beliefs about psoriasis, as well as emotional responses, of some participants, increasing their motivation or intention to change self-management behaviour.

This study is the first to develop, test and evaluate an intervention for psoriasis that targets patients' understanding of disease and treatment. This was a gap identified from a previous IMPACT programme of work,^{34,37–39} and represents a new way of thinking about health communication in the psoriasis field. The authors recognized the possibility that a new or deeper understanding of the lifelong, relapsing–remitting nature of the condition might increase distress and that learning of the risks of comorbidities may be potentially anxiety provoking. In fact, understanding, motivation and intention all increased with no corresponding change in anxiety or depression. Several features of the Pso Well® materials appeared to facilitate this.

Firstly, the high-quality, accurate content directly targeted illness beliefs, for example linking disease mechanisms with treatment options including the relevance of behaviour change for self-management and helping patients recognize the relapsing–relapsing nature of psoriasis. Notably, materials to improve understanding of disease also appeared to provide patients with a clearer rationale for treatments and vice versa.

Secondly, design values such as attention to readability and usability appeared to aid information processing. Writing for a basic reading ability while avoiding oversimplification, which may deter those with greater literacy levels, is recommended in health communication but challenging to accomplish.⁷⁵ The Pso Well® leaflets appeared to achieve this balance. Additionally, their high-quality 'look and feel' conveyed that psoriasis (a condition that often involves appearance-related concerns) warrants attractive, engaging materials and that their target audience is valued. This contrasts markedly with the lack of design values in many health communication resources identified in our previous work.⁷⁶

Thirdly, personally resonant and relevant information addressed emotional effects directly, acknowledging emotional impact and the rationale for self-management using advice based on best evidence and improving understanding rather than simply increasing knowledge as many educational interventions do.

Finally, the positive, hopeful tone (emphasizing that people could take steps to help control their psoriasis and minimize the impact the condition had on their lives, even if comorbidities did arise in the future) appeared to reassure and

encourage participants to engage with the materials, offsetting potentially threatening health messages about psoriasis as a more complex disease. The associated unintended consequences of exposure to the materials identified by the process evaluation highlight that information-giving is not a neutral process and that attention to tone, language and message framing are crucial components in health communication.

This apparently simple intervention took the form of high-quality paper leaflets; however, the content had undergone extensive development and testing. Participants' accounts suggest that our use of written communication, including phrasing, use of metaphor and context, was important for clarifying or reinforcing messages that may have been superficially familiar but not previously understood in ways that could be of use in planning self-care. Additionally, the study suggests that changing understanding may be a precursor to behaviour change. A trial of a face-to-face intervention to modify patients' illness and treatment beliefs based on the same theoretical model as this study resulted in behavioural changes (increases in walking) that were maintained for at least 2 years.⁷⁷ It is promising that a lower-cost intervention may have at least some of the same outcomes.

The positive results must be interpreted with some caution due to the lack of a separate control group; however, restricting participants' exposure to the intervention to a 2-week period makes it unlikely that any confounding factor promoted the change in understanding within the time frame. Precise measures of responsiveness for the IPQ-R domains and HADS are not readily available for this population, and this is a potential limitation of using these measures to assess the effects of exposure to these materials. We also recognize that this self-selected sample may not be representative of the wider psoriasis population in that they may be more 'engaged' with health messages. However, the strong study design, which, following the Medical Research Council guidelines,⁵² measured the effects of the intervention and evaluated the intervention process to identify perceived mechanisms of action, can usefully inform future research. Patients in this study perceived that the materials could be a useful tool for 'shared' management of psoriasis in partnership with clinicians. A parallel skills-based Pso Well® intervention demonstrated positive effects on clinicians' knowledge and skills in managing psoriasis.⁷⁸ It is possible that there would be additional synergistic effects of these materials if used by patients in collaboration with healthcare professionals who have undertaken the training.

In conclusion, the new Pso Well® materials are acceptable to patients and can improve understanding, coherence and sense of control in relation to psoriasis, without a corresponding increase in anxiety.

Acknowledgments

We are grateful to the study participants for testing the Pso Well® materials and to members of the IMPACT Research User Group and clinicians who helped refine them. Thanks are due to Spoken Image (www.spoken-image.com) for design

expertise. Access to the intervention materials can be arranged through the study principal investigator Dr Lis Cordingley (e-mail: lis.cordingley@manchester.ac.uk).
