This paper investigates the stabilization problem for impulsive switched systems with time delays. First, exponential stability criteria of the delayed impulsive switched systems are established by use of the Lyapunov-Krasovskii functional method. Based on these results, sufficient conditions for the existence of a guaranteed cost control are also given. Subject to these sufficient conditions, the closed-loop impulsive switched system under the guaranteed cost control law will be exponentially stable with a guaranteed cost value.

## 1. Introduction

During the evolution process of a variety of disciplines such as engineering, economics, and biology, there often exists an impressive characteristic that the system state changes rapidly due to state jumping and the coexistence of continuous dynamics and discrete events. These jumping effects and switching phenomena can be modeled as an impulsive switched system. The system stability problem is one of main problems for such impulsive switched systems.

Recently, there are many results on stability analysis of impulsive switched systems. For instance, the robust stabilization problem for a class of impulsive switched systems under the LQ guaranteed cost control is studied in [1]. In addition, sufficient conditions for the existence of a guaranteed cost control law are given as well. In [2], sufficient conditions, independent of time delays and impulsive switching intervals, are derived by using a Lyapunov-Krasovskii's technique, ensuring asymptotical stability of impulsive switched systems with time invariant delays. Moreover, stability criteria problems for uncertain impulsive switched systems with input delay are studied by using the receding horizon method in [3]. Appropriate switching controllers are designed and linear matrix inequality conditions are derived to guarantee

the closed-loop uncertain impulsive switched systems under a designed delayed controller. Other relevant references can be found in [4–9].

On the other hand, time delay has become a common phenomenon frequently occurred in science and engineering. Stability of time delay systems has received increasing attention among the applied mathematics and control community; for example, see [10–12] and the references therein. Most of these results are derived by use of either the Razumikhin method or the Lyapunov-Krasovskii method.

Since both impulses and time delays are ubiquitous in the real world, it is necessary to analyze their stability performance of dynamical systems involving impulses, time delays, and switchings. There already existed some effective results for the stability analysis of either impulsive switched systems or time delay systems mentioned above. However, there are few results on impulsive switched systems with time delays. This motivates our research in this paper. Our aim is to apply a set of improved Lyapunov functions to analyze the exponential stability performance of the impulsive switched systems with time delays, to derive sufficient conditions to ensure the exponential stability, and to design guaranteed cost controllers based on the linear matrix inequality approach. The designed guaranteed cost controller can ensure not only

exponential stability of the closed-loop system but also the guaranteed cost performance.

The remaining sections of the paper proceed as follows. Section 2 provides necessary propositions and definitions. In Section 3, sufficient conditions for ensuring the closed-loop system exponentially stable are presented, and the designed guaranteed cost controller for impulsive switched systems with time delays are presented. Finally, conclusion remarks are presented in Section 4.

## 2. Problem Statement

Consider the following impulsive switched system with time delay:

$$\dot{x}(t) = \widehat{A}_{i_k} x(t) + \widehat{B}_{i_k} x(t-h(t)) + C_{i_k} u(t) \quad t \neq t_k, \quad (1a)$$

$$\Delta x(t) = D_k x(t) \quad t = t_k, \quad (1b)$$

$$x(t) = \varphi(t) \quad -1 \leq t \leq 0, \quad (1c)$$

$$\widehat{A}_{i_k} = A_{i_k} + \Delta A_{i_k}, \quad \widehat{B}_{i_k} = B_{i_k} + \Delta B_{i_k}, \quad (1d)$$

where  $x(t) \in R^n$  is the state,  $u(t) \in R^p$  is the control input,  $n, p \in N$ .  $A_{i_k}, B_{i_k}, C_{i_k}$ , and  $D_k$  are constant real matrices with appropriate dimensions. The delay function  $h(t)$  satisfies the condition

$$0 \leq h_1 \leq h(t) \leq h_2. \quad (2)$$

$\Delta x(t) = x(t^+) - x(t^-)$ ,  $x(t^+) = \lim_{v \rightarrow 0^+} x(t+v)$ ,  $\lim_{v \rightarrow 0^+} x(t-v) = x(t^-) = x(t_k)$ , where  $i_k \in \{1, 2, 3, \dots, m\}$ ,  $k \in N$ ,  $m \in N$ .  $t_k$  is an impulsive switching point,  $t_0 < t_1 < t_2 < \dots < t_k < \dots < t_\infty$ .  $\Delta A_{i_k}(\cdot)$  and  $\Delta B_{i_k}(\cdot)$  are unknown real norm-bounded matrix valued functions, representing time-varying parameter uncertainties. The admissible uncertainties are assumed to be of the form

$$\begin{bmatrix} \Delta A_{i_k}(t) & \Delta B_{i_k}(t) \end{bmatrix} = E_{i_k} \Psi_{i_k}(t) \begin{bmatrix} H_{i_k} & J_{i_k} \end{bmatrix}. \quad (3)$$

$E_{i_k}, H_{i_k}, J_{i_k}$  are known real constant matrices,  $\Psi_{i_k}(t)$  is an unknown real time-varying matrix satisfying  $\Psi_{i_k}^T(t) \Psi_{i_k}(t) < I$ , and  $I$  is the identity matrix with appropriate dimension.

Consider the following cost function:

$$J = \sum_{k=0}^{\infty} \int_{t_k}^{t_{k+1}} \left[ x^T(t) R_{i_k} x(t) + u^T(t) Q_{i_k} u(t) \right] dt, \quad (4)$$

where  $R_{i_k} > 0$  and  $Q_{i_k} > 0$  are positive definite symmetric matrices.

*Definition 1.* Suppose that there exist a control law  $u(t) = F_{i_k} x(t)$  and a positive constant  $J^*$  such that, for all admissible uncertainties, the closed-loop system ((1a), (1b), (1c), and (1d)) is exponentially stable and the cost function (4) satisfies  $J \leq J^*$ , and then  $u(t)$  is the exponential guaranteed cost control law for the impulsive switched system with time delay. Here,  $J^*$  is the guaranteed cost value.

In addition, the following lemmas are necessary to proceed.

**Lemma 2** (see [13, Proposition 2.2]). *Let  $A, D, E$ , and  $F$  be real matrices of appropriate dimensions with  $\|F\| \leq 1$ . Then, for any matrix  $P = P^T > 0$  and scalar  $\varepsilon > 0$ ,*

$$\begin{aligned} & \varepsilon I - EPE^T > 0, \\ & (A + DFE)P(A + DFE)^T \\ & \leq APA^T + APE^T(\varepsilon I - EPE^T)^{-1}EPA^T + \varepsilon DD^T. \end{aligned} \quad (5)$$

**Lemma 3** (Schur complement lemma (see [14])). *Given constant matrices  $X, Y$ , and  $Z$  with appropriate dimensions satisfying  $X = X^T$  and  $Y = Y^T > 0$ . then  $X + Z^T Y^{-1} Z < 0$  if and only if*

$$\begin{pmatrix} X & Z^T \\ Z & -Y \end{pmatrix} < 0. \quad (6)$$

**Lemma 4** (integral inequality [15]). *For any constant matrix  $Z = Z^T > 0$  and a scalar  $b$  such that the following integrations are well defined,*

$$b \int_{t-b}^t x(s)^T Z x(s) ds \geq \left( \int_{t-b}^t x(s) ds \right)^T Z \left( \int_{t-b}^t x(s) ds \right). \quad (7)$$

## 3. Main Results

First, we will present sufficient conditions for exponential stability of the impulsive switched system ((1a), (1b), (1c), and (1d)) without control input.

**Theorem 5.** *Consider the time-delayed impulsive switched system ((1a), (1b), (1c), and (1d)) with the cost function (4). Suppose there exist  $\alpha > 0$ ,  $\varepsilon_1 > 0$ ,  $P_{i_k} = P_{i_k}^T > 0$ , such that the following conditions are satisfied:*

(i)

$$\begin{bmatrix} k_{11} & 0 & \lambda_2 S_1 & \lambda_3 S_2 & 0 \\ * & k_{22} & \lambda_3 S_3 & \lambda_3 S_3 & 0 \\ * & * & k_{33} & 0 & 0 \\ * & * & * & k_{44} & 0 \\ * & * & * & * & k_{55} \end{bmatrix} < 0, \quad (8)$$

(ii)

$$\begin{bmatrix} P_{i_{k-1}} & (I + D_k)^T P_{i_k} \\ P_{i_k} (I + D_k) & P_{i_k} \end{bmatrix} > 0, \quad (9)$$

where,

$$\begin{aligned} k_{11} &= \widehat{A}_{i_k}^T P_{i_k} + P_{i_k} \widehat{A}_{i_k} + U_1 + U_2 - \lambda_2 S_1 - \lambda_3 S_2 + 2\alpha P_{i_k} + R_{i_k}, \\ k_{22} &= \widehat{B}_{i_k}^T P_{i_k} + P_{i_k} \widehat{B}_{i_k} - 2\lambda_3 S_3, \\ k_{33} &= -\lambda_2 U_1 - \lambda_2 S_1 - \lambda_3 S_3, \\ k_{44} &= -\lambda_3 U_2 - \lambda_3 S_2 - \lambda_3 S_3, \\ k_{55} &= h_1^2 S_1 + h_2^2 S_2 + (h_2 - h_1)^2 S_3. \end{aligned} \tag{10}$$

Then, the impulsive switched system ((1a), (1b), (1c), and (1d)) is exponentially stable.

*Proof.* When  $t \in (t_k, t_{k+1}]$ , consider the Lyapunov-Krasovskii function candidate

$$V(t, x_t) = \sum_{i=1}^4 V_i(t, x_t), \tag{11}$$

where

$$\begin{aligned} V_1(t, x_t) &= x^T(t) P_{i_k} x(t), \\ V_2(t, x_t) &= \int_{t-h_1}^t e^{2\alpha(s-t)} x^T(s) U_1 x(s) ds \\ &\quad + \int_{t-h_2}^t e^{2\alpha(s-t)} x^T(s) U_2 x(s) ds, \\ V_3(t, x_t) &= h_1 \int_{-h_1}^0 \int_{t+s}^t e^{2\alpha(\tau-s)} \dot{x}^T(\tau) S_1 \dot{x}(\tau) d\tau ds \\ &\quad + h_2 \int_{-h_2}^0 \int_{t+s}^t e^{2\alpha(\tau-s)} \dot{x}^T(\tau) S_2 \dot{x}(\tau) d\tau ds, \\ V_4(t, x_t) &= (h_2 - h_1) \\ &\quad \times \int_{-h_2}^{-h_1} \int_{t+s}^t e^{2\alpha(\tau-s)} \dot{x}^T(\tau) S_3 \dot{x}(\tau) d\tau ds. \end{aligned} \tag{12}$$

Let

$$\begin{aligned} \Omega &= \lambda_{\max}(P_{i_k}) + h_1 \lambda_{\max}(U_1) + h_2 \lambda_{\max}(U_2) \\ &\quad + 0.5 h_1^3 \lambda_{\max}(S_1) + 0.5 h_2^3 \lambda_{\max}(S_2) \\ &\quad + (h_2^2 - h_1^2) (h_2 - h_1) \lambda_{\max}(S_3); \end{aligned} \tag{13}$$

then, we can easily check that

$$\lambda \|x(t)\|^2 \leq V(t, x_t) \leq \Omega \|x(t)\|^2, \quad t \in R^+. \tag{14}$$

Taking the derivative of  $V_i(t, x_t)$ ,  $i = 1, 2, 3, 4$ , along the trajectory of the closed-loop system, we obtain

$$\begin{aligned} \dot{V}_1(t, x_t) &= [\widehat{A}_{i_k} x(t) + \widehat{B}_{i_k} x(t-h(t))]^T P_{i_k} x(t) \\ &\quad + x^T(t) P_{i_k} [\widehat{A}_{i_k} x(t) + \widehat{B}_{i_k} x(t-h(t))] \end{aligned} \tag{15}$$

$$\begin{aligned} &= x^T(t) [\widehat{A}_{i_k}^T P_{i_k} + P_{i_k} \widehat{A}_{i_k}] x(t) \\ &\quad + x^T(t-h(t)) \widehat{B}_{i_k}^T P_{i_k} x(t) \\ &\quad + x^T(t) P_{i_k} \widehat{B}_{i_k}^T x(t-h(t)), \end{aligned}$$

$$\dot{V}_2(t, x_t)$$

$$\begin{aligned} &= -2\alpha e^{-2\alpha t} \left[ \int_{t-h_1}^t e^{2\alpha s} x^T(s) U_1 x(s) ds \right. \\ &\quad \left. + \int_{t-h_2}^t e^{2\alpha s} x^T(s) U_2 x(s) ds \right] \\ &\quad + e^{-2\alpha t} [e^{2\alpha t} x^T(t) U_1 x(t) - e^{2\alpha(t-h_1)} x^T(t-h_1) \\ &\quad \times U_1 x(t-h_1) + e^{2\alpha t} x^T(t) U_2 x(t) \\ &\quad - e^{2\alpha(t-h_2)} x^T(t-h_2) U_1 x(t-h_2)] \end{aligned} \tag{16}$$

$$\begin{aligned} &= -2\alpha V_2 + x^T(t) (U_1 + U_2) x(t) \\ &\quad - \lambda_2 x^T(t-h_1) U_1 x(t-h_1) \\ &\quad - \lambda_3 x^T(t-h_2) U_1 x(t-h_2), \end{aligned}$$

$$\dot{V}_3(t, x_t)$$

$$\begin{aligned} &= -2\alpha V_3 \\ &\quad + e^{-2\alpha t} \frac{d}{dt} \left[ h_1 \int_{-h_1}^0 \int_{t+s}^t e^{2\alpha \tau} \dot{x}^T(\tau) S_1 \dot{x}(\tau) d\tau ds \right. \\ &\quad \left. + h_2 \int_{-h_2}^0 \int_{t+s}^t e^{2\alpha \tau} \dot{x}^T(\tau) S_2 \dot{x}(\tau) d\tau ds \right] \end{aligned}$$

$$\begin{aligned} &= -2\alpha V_3 + \dot{x}^T(t) (h_1^2 S_1 + h_2^2 S_2) \dot{x}(t) \\ &\quad - h_1 \int_{-h_1}^0 e^{2\alpha s} \dot{x}^T(t+s) S_1 \dot{x}(t+s) ds \\ &\quad - h_2 \int_{-h_2}^0 e^{2\alpha s} \dot{x}^T(t+s) S_2 \dot{x}(t+s) ds. \end{aligned} \tag{17}$$

From Lemma 4, we have

$$\begin{aligned} \dot{V}_3(t, x_t) &\leq -2\alpha V_3 + \dot{x}^T(t) (h_1^2 S_1 + h_2^2 S_2) \dot{x}(t) \\ &\quad - x^T(t) (\lambda_2 S_1 + \lambda_3 S_2) x(t) + 2\lambda_2 x^T(t) S_1 x(t - h_1) \\ &\quad - \lambda_2 x^T(t - h_1) S_1 x(t - h_1) + 2\lambda_3 x^T(t) S_2 x(t - h_2) \\ &\quad - \lambda_3 x^T(t - h_2) S_2 x(t - h_2), \end{aligned} \quad (18)$$

$$\begin{aligned} \dot{V}_4(t, x_t) &= -2\alpha V_4 + e^{-2\alpha t} (h_2 - h_1) \\ &\quad \times \int_{-h_2}^{-h_1} \left[ e^{2\alpha t} \dot{x}^T(t) S_3 \dot{x}(t) \right. \\ &\quad \quad \left. - e^{2\alpha(t+s)} \dot{x}^T(t+s) S_3 \dot{x}(t+s) \right] ds \\ &= -2\alpha V_4 + (h_2 - h_1)^2 \dot{x}^T(t) S_3 \dot{x}(t) \\ &\quad - (h_2 - h_1) \int_{-h_2}^{-h_1} e^{2\alpha s} \dot{x}^T(t+s) S_3 \dot{x}(t+s) ds \\ &\leq -2\alpha V_4 + (h_2 - h_1)^2 \dot{x}^T(t) S_3 \dot{x}(t) \\ &\quad - (h_2 - h_1) e^{-2\alpha h_2} \left[ \int_{-h_2}^{-h_1} \dot{x}^T(t+s) S_3 \dot{x}(t+s) ds \right. \\ &\quad \quad \left. + \int_{-h_1}^{-h_2} \dot{x}^T(t+s) S_3 \dot{x}(t+s) ds \right] \\ &\leq -2\alpha V_4 + (h_2 - h_1)^2 \dot{x}^T(t) S_3 \dot{x}(t) \\ &\quad - \lambda_3 \left[ 2x^T(t - h(t)) S_3 x(t - h(t)) \right. \\ &\quad \quad - 2x^T(t - h(t)) S_3 x(t - h_2) \\ &\quad \quad + x^T(t - h_2) S_3 x(t - h_2) \\ &\quad \quad + x^T(t - h_1) S_3 x(t - h_1) \\ &\quad \quad \left. - 2x^T(t - h(t)) S_3 x(t - h_1) \right]. \end{aligned} \quad (19)$$

Then, we add (15) to (19) together to yield

$$\begin{aligned} \dot{V}(t, x_t) + 2\alpha V(t, x_t) &\leq x^T(t) \left[ \widehat{A}_{i_k}^T P_{i_k} + P_{i_k} \widehat{A}_{i_k} + U_1 + U_2 \right. \\ &\quad \left. + 2\alpha P_{i_k} - \lambda_2 S_1 - \lambda_3 S_2 + R_{i_k} \right] x(t) \\ &\quad + x^T(t - h(t)) \left[ \widehat{B}_{i_k}^T P_{i_k} + P_{i_k} \widehat{B}_{i_k}^T - 2\lambda_3 S_3 \right] \\ &\quad \times x(t - h(t)) \end{aligned}$$

$$\begin{aligned} &+ x^T(t - h_1) [-\lambda_2 U_1 - \lambda_2 S_1 - \lambda_3 S_3] x(t - h_1) \\ &+ x^T(t - h_2) [-\lambda_3 U_2 - \lambda_3 S_2 - \lambda_3 S_3] x(t - h_2) \\ &+ 2\lambda_3 x^T(t) S_2 x(t - h_2) + 2\lambda_2 x^T(t) S_1 x(t - h_1) \\ &+ 2\lambda_3 x^T(t - h(t)) S_3 x(t - h_2) \\ &+ 2\lambda_3 x^T(t - h(t)) S_3 x(t - h_1) \\ &+ \dot{x}^T(t) [h_1^2 S_1 + h_2^2 S_2 + (h_2 - h_1)^2 S_3] \dot{x}(t) \\ &- x^T(t) R_{i_k} x(t). \end{aligned} \quad (20)$$

Let  $\xi^T(t) = [x^T(t), x^T(t - h(t)), x^T(t - h_1), x^T(t - h_2), \dot{x}^T(t)]$ ,

$$k = \begin{bmatrix} k_{11} & 0 & \lambda_2 S_1 & \lambda_3 S_2 & 0 \\ * & k_{22} & \lambda_3 S_3 & \lambda_3 S_3 & 0 \\ * & * & k_{33} & 0 & 0 \\ * & * & * & k_{44} & 0 \\ * & * & * & * & k_{55} \end{bmatrix}. \quad (21)$$

We have

$$\dot{V}(t, x_t) + 2\alpha V(t, x_t) \leq \xi^T(t) k \xi(t) - x^T(t) R_{i_k} x(t). \quad (22)$$

Since  $k < 0$  from ((1a), (1b), (1c), and (1d)), it is clear that  $\dot{V}(t, x_t) + 2\alpha V(t, x_t) < 0$  or, equivalently,  $V(t, x_t) \leq V(0, x_0) e^{-2\alpha t}, \forall t \in \mathbb{R}^+$ .

Taking (14) into account, we have

$$\lambda \|x(t)\|^2 \leq V(t, x_t) \leq V(0, x_0) e^{-2\alpha t} \leq \Omega e^{-2\alpha t} \|x(0)\|^2, \quad (23)$$

and hence

$$\|x(t)\| \leq \sqrt{\frac{\Omega}{\lambda}} \|x(0)\| e^{-\alpha t}, \quad (24)$$

which shows that the impulsive switched system ((1a), (1b), (1c), and (1d)) is exponentially stable when  $t \in (t_k, t_{k+1}]$ .

Next, let us consider the case at the impulsive and switching time point  $t_k, t_k = 1, 2, 3, \dots$ ,

$$V(t_k^+) - V(t_k^-) = x(t_k^+)^T P_{i_k} x(t_k^+) - x(t_k^-)^T P_{i_{k-1}} x(t_k^-). \quad (25)$$

Noting that  $\Delta x(t_k) = x(t_k^+) - x(t_k^-)$ ,  $x(t_k^-) = x(t_k)$ , we have

$$\begin{aligned} V(t_k^+) - V(t_k^-) &= x(t_k^+)^T P_{i_k} x(t_k^+) - x(t_k)^T P_{i_{k-1}} x(t_k) \\ &= x(t_k)^T \left[ (I + D_k)^T P_{i_k} (I + D_k) - P_{i_{k-1}} \right] x(t_k). \end{aligned} \quad (26)$$

From (ii), we know that  $\begin{bmatrix} P_{i_{k-1}} & (I+D_k)^T P_{i_k} \\ P_{i_k} & P_{i_k} \end{bmatrix} > 0$ , which is equivalent to  $(I + D_k)^T P_{i_k} (I + D_k) - P_{i_{k-1}} < 0$ .

So,  $V(t_k^+) - V(t_k^-) < 0$ . Therefore, we can conclude that the impulsive switched system ((1a), (1b), (1c), and (1d)) is exponentially stable.

Theorem 5 develops sufficient conditions for exponential stability of the impulsive switched system ((1a), (1b), (1c), and (1d)) under the case that  $u(t) = 0$ . In the next theorem, we will design the guaranteed cost controller in the form of  $u(t) = F_{i_k} x(t)$  and sufficient conditions for the existence of a guaranteed cost control are also presented as well.  $\square$

**Theorem 6.** Consider the impulsive switched system with time delay ((1a), (1b), (1c), and (1d)) with the cost function (4) and suppose there exist  $\alpha > 0$ ,  $\varepsilon_1 > 0$ ,  $P_{i_k} = P_{i_k}^T > 0$ . If there exist symmetric positive definite matrices  $U_1, U_2, S_1, S_2, S_3$ , and  $K$  such that the following conditions are satisfied:

(i)

$$\begin{bmatrix} \varepsilon_1 I & E_{i_k}^T P_{i_k} \\ P_{i_k} E_{i_k} & P_{i_k} \end{bmatrix} > 0, \quad (27)$$

(ii)

$$\begin{bmatrix} \Pi_1 & \Pi_2 \\ * & \Pi_3 \end{bmatrix} < 0, \quad (28)$$

(iii)

$$\begin{bmatrix} P_{i_{k-1}} & (I + D_k)^T P_{i_k} \\ P_{i_k} (I + D_k) & P_{i_k} \end{bmatrix} > 0, \quad (29)$$

where

$$\Pi_1 = \begin{bmatrix} \widetilde{w}_{11} & 0 & \lambda_2 S_1 & \lambda_3 S_2 & 0 \\ * & \widetilde{w}_{22} & \lambda_3 S_3 & \lambda_3 S_3 & 0 \\ * & * & w_{33} & 0 & 0 \\ * & * & * & w_{44} & 0 \\ * & * & * & * & w_{55} \end{bmatrix},$$

$$\Pi_2 = \begin{bmatrix} A_{i_k}^T E_{i_k} & K & K(C_{i_k}^{-1})^T & H_{i_k}^T & 0 \\ 0 & 0 & 0 & 0 & (B_{i_k} + \Delta B_{i_k})^T \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix},$$

$$\Pi_3 = \text{diag} \left( E_{i_k}^T E_{i_k} - \varepsilon_1 I, -I, -Q_{i_k}^{-1}, -\frac{1}{\varepsilon_1} I, -I \right),$$

$$\widetilde{w}_{11} = A_{i_k}^T A_{i_k} + 3P_{i_k}^2 + U_1 + U_2 - \lambda_2 S_1 - \lambda_3 S_2 + 2\alpha P_{i_k} + R_{i_k},$$

$$\widetilde{w}_{22} = -2\lambda_3 S_3,$$

$$w_{33} = -\lambda_2 U_1 - \lambda_2 S_1 - \lambda_3 S_3,$$

$$w_{44} = -\lambda_3 U_2 - \lambda_3 S_2 - \lambda_3 S_3,$$

$$w_{55} = h_1^2 S_1 + h_2^2 S_2 + (h_2 - h_1)^2 S_3,$$

$$\lambda_1 = e^{-2\alpha(h_1+h_2)}, \quad \lambda_2 = e^{-2\alpha h_1},$$

$$\lambda_3 = e^{-2\alpha h_2}, \quad \lambda = \lambda_{\min}(P_{i_k}), \quad (30)$$

then the guaranteed cost control law  $u(t) = C_{i_k}^{-1} K^T x(t)$  can ensure that the impulsive switched system ((1a), (1b), (1c), and (1d)) is exponentially stable. Moreover, the guaranteed cost value is

$$J^* = V(0, x_0). \quad (31)$$

*Proof.* When  $t \in (t_k, t_{k+1}]$ , choose the Lyapunov-Krasovskii function candidate to be similar to Theorem 5

$$V(t, x_t) = \sum_{i=1}^4 V_i(t, x_t), \quad (32)$$

where

$$V_1(t, x_t) = x^T(t) P_{i_k} x(t),$$

$$V_2(t, x_t) = \int_{t-h_1}^t e^{2\alpha(s-t)} x^T(s) U_1 x(s) ds + \int_{t-h_2}^t e^{2\alpha(s-t)} x^T(s) U_2 x(s) ds,$$

$$V_3(t, x_t) = h_1 \int_{-h_1}^0 \int_{t+s}^t e^{2\alpha(\tau-s)} \dot{x}^T(\tau) S_1 \dot{x}(\tau) d\tau ds + h_2 \int_{-h_2}^0 \int_{t+s}^t e^{2\alpha(\tau-s)} \dot{x}^T(\tau) S_2 \dot{x}(\tau) d\tau ds,$$

$$V_4(t, x_t) = (h_2 - h_1) \times \int_{-h_2}^{-h_1} \int_{t+s}^t e^{2\alpha(\tau-s)} \dot{x}^T(\tau) S_3 \dot{x}(\tau) d\tau ds. \quad (33)$$

Taking the derivative of  $V_i(t, x_t)$ ,  $i = 1, 2, 3, 4$ , along the trajectory of the closed-loop system, we obtain

$$\begin{aligned} \dot{V}_1(t, x_t) &= [\widehat{A}_{i_k} x(t) + \widehat{B}_{i_k} x(t-h(t)) + C_{i_k} u(t)]^T P_{i_k} x(t) \\ &\quad + x^T(t) P_{i_k} [\widehat{A}_{i_k} x(t) + \widehat{B}_{i_k} x(t-h(t)) + C_{i_k} u(t)]. \end{aligned} \quad (34)$$

Put (1d) and  $u(t) = F_{i_k} x(t)$  into it and then we can get

$$\begin{aligned} \dot{V}_1(t, x_t) &= x^T(t) \left[ (A_{i_k} + \Delta A_{i_k})^T P_{i_k} + P_{i_k} (A_{i_k} + \Delta A_{i_k}) \right. \\ &\quad \left. + F_{i_k}^T C_{i_k}^T P_{i_k} + P_{i_k} C_{i_k} F_{i_k} \right] x(t) \\ &\quad + x^T(t-h(t)) (B_{i_k} + \Delta B_{i_k})^T P_{i_k} x(t) \\ &\quad + x^T(t) P_{i_k} (B_{i_k} + \Delta B_{i_k}) x(t-h(t)). \end{aligned} \quad (35)$$

Next, it follows from Lemma 2 that

$$\begin{aligned} &(A_{i_k} + \Delta A_{i_k})^T P_{i_k} + P_{i_k} (A_{i_k} + \Delta A_{i_k}) \\ &\leq (A_{i_k} + \Delta A_{i_k})^T (A_{i_k} + \Delta A_{i_k}) + P_{i_k}^2 \\ &\leq A_{i_k}^T A_{i_k} + A_{i_k}^T E_{i_k} (\varepsilon_1 I - E_{i_k}^T E_{i_k})^{-1} E_{i_k}^T A_{i_k} \\ &\quad + \varepsilon_1 H_{i_k}^T H_{i_k} + P_{i_k}^2, \end{aligned} \quad (36)$$

$$\begin{aligned} &x^T(t-h(t)) (B_{i_k} + \Delta B_{i_k})^T P_{i_k} x(t) \\ &\quad + x^T(t) P_{i_k} (B_{i_k} + \Delta B_{i_k}) x(t-h(t)) \\ &\leq x^T(t) P_{i_k}^2 x(t) + x^T(t-h(t)) \\ &\quad \times (B_{i_k} + \Delta B_{i_k})^T (B_{i_k} + \Delta B_{i_k}) x(t-h(t)). \end{aligned}$$

Substituting (36) into (35) yields

$$\begin{aligned} \dot{V}_1(t, x_t) &\leq x^T(t) \left[ A_{i_k}^T A_{i_k} + A_{i_k}^T E_{i_k} (\varepsilon_1 I - E_{i_k}^T E_{i_k})^{-1} E_{i_k}^T A_{i_k} \right. \\ &\quad \left. + \varepsilon_1 H_{i_k}^T H_{i_k} + 3P_{i_k}^2 + F_{i_k}^T C_{i_k}^T C_{i_k} F_{i_k} \right] x(t) \\ &\quad + x^T(t-h(t)) \left[ (B_{i_k} + \Delta B_{i_k})^T (B_{i_k} + \Delta B_{i_k}) \right] \\ &\quad \times x(t-h(t)). \end{aligned} \quad (37)$$

The derivatives of  $V_2(t, x_t)$ ,  $V_3(t, x_t)$ , and  $V_4(t, x_t)$  are the same as those in Theorem 5. Then, we can put (37), (16), (18), and (19) together to obtain

$$\begin{aligned} &\dot{V}(t, x_t) + 2\alpha V(t, x_t) \\ &\leq x^T(t) \left[ A_{i_k}^T A_{i_k} + A_{i_k}^T E_{i_k} (\varepsilon_1 I - E_{i_k}^T E_{i_k})^{-1} E_{i_k}^T A_{i_k} \right. \\ &\quad + \varepsilon_1 H_{i_k}^T H_{i_k} + 3P_{i_k}^2 + F_{i_k}^T C_{i_k}^T C_{i_k} F_{i_k} + U_1 \\ &\quad + U_2 - \lambda_2 S_1 - \lambda_3 S_2 + 2\alpha P_{i_k} + R_{i_k} \\ &\quad \left. + F_{i_k}^T Q_{i_k} F_{i_k} \right] x(t) \end{aligned}$$

$$\begin{aligned} &+ x^T(t-h(t)) \left[ (B_{i_k} + \Delta B_{i_k})^T (B_{i_k} + \Delta B_{i_k}) - 2\lambda_3 S_3 \right] \\ &\quad \times x(t-h(t)) \\ &+ x^T(t-h_1) [-\lambda_2 U_1 - \lambda_2 S_1 - \lambda_3 S_3] x(t-h_1) \\ &+ x^T(t-h_2) [-\lambda_3 U_2 - \lambda_3 S_2 - \lambda_3 S_3] x(t-h_2) \\ &+ 2\lambda_3 x^T(t) S_2 x(t-h_2) + 2\lambda_2 x^T(t) S_1 x(t-h_1) \\ &+ 2\lambda_3 x^T(t-h(t)) S_3 x(t-h_2) \\ &+ 2\lambda_3 x^T(t-h(t)) S_3 x(t-h_1) \\ &+ x^T(t) [h_1^2 S_1 + h_2^2 S_2 + (h_2 - h_1)^2 S_3] \dot{x}(t) \\ &- x^T(t) [R_{i_k} + F_{i_k}^T Q_{i_k} F_{i_k}] x(t). \end{aligned} \quad (38)$$

Let

$$w = \begin{bmatrix} w_{11} & 0 & \lambda_2 S_1 & \lambda_3 S_2 & 0 \\ * & w_{22} & \lambda_3 S_3 & \lambda_3 S_3 & 0 \\ * & * & w_{33} & 0 & 0 \\ * & * & * & w_{44} & 0 \\ * & * & * & * & w_{55} \end{bmatrix},$$

$$\begin{aligned} w_{11} &= A_{i_k}^T A_{i_k} + A_{i_k}^T E_{i_k} (\varepsilon_1 I - E_{i_k}^T E_{i_k})^{-1} E_{i_k}^T A_{i_k} \\ &\quad + \varepsilon_1 H_{i_k}^T H_{i_k} + 3P_{i_k}^2 + F_{i_k}^T C_{i_k}^T C_{i_k} F_{i_k} + U_1 \\ &\quad + U_2 - \lambda_2 S_1 - \lambda_3 S_2 + 2\alpha P_{i_k} + R_{i_k} + F_{i_k}^T Q_{i_k} F_{i_k}, \\ w_{22} &= (B_{i_k} + \Delta B_{i_k})^T (B_{i_k} + \Delta B_{i_k}) - 2\lambda_3 S_3, \\ w_{33} &= -\lambda_2 U_1 - \lambda_2 S_1 - \lambda_3 S_3, \\ w_{44} &= -\lambda_3 U_2 - \lambda_3 S_2 - \lambda_3 S_3, \\ w_{55} &= h_1^2 S_1 + h_2^2 S_2 + (h_2 - h_1)^2 S_3. \end{aligned} \quad (39)$$

Then, we have

$$\begin{aligned} &\dot{V}(t, x_t) + 2\alpha V(t, x_t) \\ &\leq \xi^T(t) w \xi(t) - x^T(t) [R_{i_k} + F_{i_k}^T Q_{i_k} F_{i_k}] x(t). \end{aligned} \quad (40)$$

By Lemma 3, it proves that  $w < 0$  holds if

$$\begin{bmatrix} w_{11} & w_{22} \\ * & w_{33} \end{bmatrix} < 0, \quad (41)$$

where

$$\begin{aligned}
 w_1 &= \begin{bmatrix} \widetilde{w}_{11} & 0 & \lambda_2 S_1 & \lambda_3 S_2 & 0 \\ * & \widetilde{w}_{22} & \lambda_3 S_3 & \lambda_3 S_3 & 0 \\ * & * & w_{33} & 0 & 0 \\ * & * & * & w_{44} & 0 \\ * & * & * & * & w_{55} \end{bmatrix}, \\
 w_2 &= \begin{bmatrix} A_{i_k}^T E_{i_k} & F_{i_k}^T C_{i_k}^T & F_{i_k}^T & H_{i_k}^T & 0 \\ 0 & 0 & 0 & 0 & (B_{i_k} + \Delta B_{i_k})^T \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}, \\
 w_3 &= \text{diag} \left( E_{i_k}^T E_{i_k} - \varepsilon_1 I, -I, -Q_{i_k}^{-1}, -\frac{1}{\varepsilon_1} I, -I \right), \\
 \widetilde{w}_{11} &= A_{i_k}^T A_{i_k} + 3P_{i_k}^2 + U_1 + U_2 \\
 &\quad - \lambda_2 S_1 - \lambda_3 S_2 + 2\alpha P_{i_k} + R_{i_k}, \\
 \widetilde{w}_{22} &= -2\lambda_3 S_3.
 \end{aligned} \tag{42}$$

Letting  $F_{i_k}^T C_{i_k}^T = K$ , we get  $F_{i_k} = C_{i_k}^{-1} K^T$ . Then, we have

$$\begin{aligned}
 \begin{bmatrix} w_1 & w_2 \\ * & w_3 \end{bmatrix} &= \begin{bmatrix} \Pi_1 & \Pi_2 \\ * & \Pi_3 \end{bmatrix} < 0, \\
 \Pi_1 &= w_1, \\
 \Pi_2 &= \begin{bmatrix} A_{i_k}^T E_{i_k} & K & K(C_{i_k}^{-1})^T & H_{i_k}^T & 0 \\ 0 & 0 & 0 & 0 & (B_{i_k} + \Delta B_{i_k})^T \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix} \\
 \Pi_3 &= w_3.
 \end{aligned} \tag{43}$$

In addition, since  $\begin{bmatrix} \Pi_1 & \Pi_2 \\ * & \Pi_3 \end{bmatrix} < 0$  (see Theorem 6 (ii)),  $\begin{bmatrix} w_1 & w_2 \\ * & w_3 \end{bmatrix} < 0$ , then we plug it into (40) and obtain

$$\dot{V}(t, x_t) + 2\alpha V(t, x_t) < 0. \tag{44}$$

Now, we can easily conclude that the impulsive switched system ((1a), (1b), (1c), and (1d)) is exponentially stable. Looking back to (40), we can get

$$\begin{aligned}
 \dot{V}(t, x_t) &\leq -x^T(t) [R_{i_k} + F_{i_k}^T Q_{i_k} F_{i_k}] x(t), \tag{45} \\
 J &= \sum_{k=0}^{\infty} \int_{t_k}^{t_{k+1}} [x^T(t) R_{i_k} x(t) + u^T(t) Q_{i_k} u(t)] dt \\
 &\leq -\lim_{k \rightarrow \infty} \sum_{j=0}^k \int_{t_j}^{t_{j+1}} \frac{dV(t, x_t)}{dt} dt \\
 &= -\lim_{k \rightarrow \infty} \left\{ -V(0, x_0) + V(t_1^-, x_{t_1}^-) - V(t_1^+, x_{t_1}^+) \right. \\
 &\quad + V(t_2^-, x_{t_2}^-) - V(t_2^+, x_{t_2}^+) \\
 &\quad + \dots - V(t_k^-, x_{t_k}^-) \\
 &\quad \left. + V(t_k^+, x_{t_k}^+) - V(t_{k+1}^-, x_{t_{k+1}}^-) \right\} \\
 &= \lim_{k \rightarrow \infty} \left\{ V(0, x_0) + \sum_{j=1}^k \left\{ V(t_j^+, x_{t_j}^+) - V(t_j^-, x_{t_j}^-) \right\} \right. \\
 &\quad \left. + V(t_{k+1}^-, x_{t_{k+1}}^-) \right\} \\
 &= V(0, x_0) \\
 &\quad + \lim_{k \rightarrow \infty} \sum_{j=1}^k x(t_j)^T \left\{ (I + D_j)^T P_{i_j} (I + D_j) - P_{i_{j-1}} \right\} x(t_j) \\
 &\quad + \lim_{k \rightarrow \infty} V(t_{k+1}^-, x_{t_{k+1}}^-).
 \end{aligned} \tag{46}$$

We know that

$$\begin{aligned}
 \lim_{k \rightarrow \infty} V(t_{k+1}^-, x_{t_{k+1}}^-) &= 0, \\
 \lim_{k \rightarrow \infty} \sum_{j=1}^k x(t_j)^T \left\{ (I + D_j)^T P_{i_j} (I + D_j) - P_{i_{j-1}} \right\} x(t_j) &< 0.
 \end{aligned} \tag{47}$$

Thus, we can get

$$J < V(0, x_0) = J^*. \tag{48}$$

This completes the proof.  $\square$

### 4. Conclusion

The exponential stabilization problem for impulsive switched systems with time delays is considered in this paper. Sufficient conditions for exponential stability of the impulsive switched systems without control input are derived via the Lyapunov-Krasovskii functional method. Moreover, sufficient conditions for the exponential stability of the impulsive switched

systems under the designed guaranteed cost control law are established and the corresponding guaranteed cost value can be obtained as well.

### Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
