## I. INTRODUCTION

The power of countries, their estimations and their measurements have always been an issue of interest for military leaders, rulers and politicians, who needed fairly objective decision parameters. These expectations were initially addressed by philosophers, only to be subsequently replaced by specialized researchers.

The power of participants of international relations is studied within the subdiscipline of geopolitics – *powermetrics* – applied science concerned with measurements, estimates and assessment of power of participants in social life, especially that of particular states, as well as with modelling, simulations and forecasting of the relations between them, from a global, regional and local perspective.

However, it was only after the Second World War, which resulted in the division of the world into hostile camps, that this field of study began to thrive. This was prompted by a dynamic development of other scientific disciplines such as economics, econometrics, game theory, cybernetics and IT.

Powermetric studies intensified after the Cold War. The simplicity and stability of the bipolar system disappeared, followed by the formation of a new international order whose main feature is growing instability. This generated new interest in the study of the international balance of power, this time not only on the part of world leaders, politicians and commanders, but also the society at large, which now, thanks to the Internet, is able to keep track of the developments, exchange opinions and judgements on the international balance of power. Geopolitics was then also revived, as one of the scientific ways to study international relations.

There have emerged many models and concepts for measuring the power of individual states. This Report presents a uniform methodology, based on measurements of the power of states according to the formal model developed by Mirosław Sułek, professor of the University of Warsaw. This method, hereinafter referred to as the Sułek model, is based on the measurement of three types of state power – economic (general), military and geopolitical, and a derivative – militarization.

This Report presents changes in the international balance of power after the Cold War and covers the years 1992-2017, i.e. in the period from the end of the Cold War to the year in which the most recent statistical data is available. It was prepared to better understand the present and future changes taking place in the international system. We believe that this should lead to building better strategies in the area of state security and development.

The subject of the study presented in this Report is *the international balance of power*, understood as the balance of power between individual states. This means that all non-state actors are omitted in the study. The international balance of power is presented in a synthetic way, as it is based on a formula which we believe is easy to understand and apply also by non-specialists. At the same time, we accept Raymond Aron's proposition, according to which *the distribution of power is the most important feature of any international system*.

This Report does not refer to *hard power*, *soft power*, *smart power*, *sticky power* or *sharp power*. Our calculations of military power do not include nuclear weapons. Non-state actors are also omitted.

## II. SUMMARY

This Report presents changes in the international balance of power after the Cold War, i.e. in the years 1992-2017. For this purpose, a special methodology was adopted, which enabled us to estimate three types of state power: economic (general) power, military power (which is part of the economic power) and geopolitical power (which is the resultant of the economic and the military power).

- According to the above division, in 1992 there was a clearly unipolar system, represented in all its aspects by the United States.
- In 2017, the situation changed radically, with the emergence of a bipolar system of power (USA – China), founded on the basis of the economic power, while the unipolar system remained unchanged in terms of military power. As far as the geopolitical power is concerned, there emerged a "weak" bipolar system, with a large advantage of the USA).

Three forms of state militarization are referred to in this Report: economic (general) militarization, expressed by the share of the military power in the economic power; militarization of GDP, expressed by the share of military expenditures in a country's GDP, and demographic militarization, expressed in terms of the number of active soldiers in the general population with appropriate exponents, in accordance with the model.

- In 1992, the most militarized countries in economic terms included: Laos, Vietnam, Mongolia, Jordan, Oman, Bulgaria, Armenia, Turkmenistan, United Arab Emirates and Russia.
- In 2017, the order of countries ranked according to the above criterion changed significantly. The most militarized countries included: Oman, Saudi Arabia, Afghanistan, Israel, Iraq,

Armenia, Jordan, Algeria and South Sudan. This clearly shows that the level of economic militarization increased mainly in the Middle East region.

Major changes were reported in the classification of states according to the status of power.

- 1992 and 2017 saw no "superpower" in terms of the economic (general) power. The United States maintained the position of a "superpower" in terms of the military and geopolitical power.
- In 1992, China held the status of a "regional power" in all categories of power, but in 2017 it reached the status of a "world power" in terms of economic (general) power and a "great power" in terms of the military and geopolitical power.

It is interesting to observe the results showing the biggest winners and the biggest losers in terms of the economic (general) power. This indicator is the most objective measure of power in a zero-sum game, which means that if one wins, another has to lose. In the short term, it does not depend on political decisions, unlike the military and indirectly – geopolitical power.

- The biggest winners group in terms of the economic (general) power included: China, Vietnam, Nigeria, United Arab Emirates, India, Bangladesh, Indonesia, Romania and Pakistan.
- The most losing countries in terms of the economic power include: Japan, Ukraine, Italy, the Central African Republic, Libya, Greece, Germany, France, and Sweden.
- Regionally, the biggest winners include: South Asia and the sub-Saharan Africa. The biggest losers group includes practically one region – Europe and

Central Asia. A slight decrease was also recorded in North America.

### III. METHODOLOGY

#### 3.1. Introductory remarks

The results of our calculations are based on the Sułek model. We believe that it is understandable and easy to use also by non-specialists. The model enables calculation of three types of state power: *economic (general) power*<sup>1</sup>, *military power* and *geopolitical power* as a resultant of the two former ones.

The *economic (general) power* consists of *economic outcomes* (gross domestic product), *demographic factors* (population) and *spatial factors* (territory area). The *military power* consists of *military and economic factors* (military expenditures, which are part of GDP), *demographic and military factors* (number of active duty soldiers) and *spatial factors* (territory area).

*Geopolitical power* is calculated as the arithmetic mean of economic (general) power and double military power (to indicate the significance of the military factor in shaping the current distribution of power).

The presented methodology has its roots in the international relations theory and geopolitics. It also draws heavily from the findings of cybernetics and praxiology. The international balance of power, which is the main subject of this report, is presented in a quantified way. The main content of the report is concerned with the

measurement of the power of states and values of the derivatives. The formula applied is based on a dimensional analysis, which was neglected in previous approaches, and depends solely on solid factors, determining the completeness of description<sup>2</sup>. The functioning of any state, being the basic political unit, depends *sine qua non* on *people* – operating on a given *area* in a given *time*, presenting specific *organizational and production skills*, or *capacity for collective actions*. In other terms, it translates into the ability to process matter, energy and information.

Relations between political units are relations between people, and bear the characteristics of either *cooperation* or *struggle*. For this reason, some people engage in production and service activity, oriented to the periods of peace, while some – to the periods of war.

It is assumed that in the case of economic (general) power, the organizational and production skills or the capacity for collective action are expressed by the gross domestic product, while in the case of military power, the military expenditure is the main indicator. Adding population size or the number of active duty soldiers and the country's area (a) to these calculations results in the military

<sup>1</sup> *Economic power* may be understood broadly, or in its narrow sense. For example, in its narrow sense, it may be identified with GDP, while in broad terms, economic power is also determined by demographic and spatial factors. Therefore, it may as well be referred to as general power. This report adopts the broad meaning of economic power, which is why the notions of economic power and general power are treated synonymously.

<sup>2</sup> A thorough overview of approaches and models of calculating state power are presented especially in: Mirosław Sułek, *Potęga państw. Modele i zastosowania* (The Power of Nations. Models and Applications), Rambler, Warsaw 2013 and Karl Höhn, *Geopolitics and the Measurement of National Power* (PhD dissertation), University of Hamburg, Hamburg 2011.

power. Considering the fact that the country's strength of impact depends on both types of power, the third type is introduced in the report – geopolitical power.

### 3.2. Main formula of power

The main formula expresses three types of power: economic (general), military and geopolitical. We recommend the following calculating method to those interested: all the collected data are divided by the respective global values, and the resulting fractional values are entered into the formula. The result of the calculation is the power of states expressed as a fraction of the world power.

$$EP = GDP^{0.652} \times L^{0.217} \times a^{0.109}$$

$$MP = MEX^{0.652} \times S^{0.217} \times a^{0.109}$$

$$GP = \frac{EP + (2 \times MP)}{3}$$

Symbols: EP– economic (general) power, MP– military power, GP– geopolitical power, *GDP* – gross domestic product, *L* – population, *a* – territory, *MEX* – military expenditures, *S* – active soldiers.

It must be recognized that the notion that GDP is representative of capacity for collective action has been widely criticized for decades. So far, however, there seems to be no better indicator available. The same applies to military expenditures (MEX), whose share in the aggregated indicator of capacity for collective action was adopted as a measure of defence (military) effort of the society.

While the size of the population (*L*) is a quantitative indicator, the size of GDP (more strictly – GDP per capita) presents a qualitative indicator of human resources. This reasoning is illustrated by the main formula.

We adopt the assumption that all three types of power have power dimension in a physical sense ( $\frac{kg \times m^2}{s^3}$ ). Power in this sense is a stream of energy and denotes the amount of work performed per unit of time. The formula also enables calculation of power in terms of potential energy, treated as the size of the resource in a given point in time, yet it is a more complex and time-consuming problem.

All of the types of power mentioned certainly share the same dimension, but they all differ in their nature. Economic (general) power reflects the distribution of power between states (political units), which results from the long process of historical development, and it cannot be increased by means of political decisions (however, it can be decreased). In this sense, it is *objective* by its nature. On the other hand, military power is *subjective* by its nature, as it is largely dependant on political decisions. Finally, geopolitical power places somewhere in between, although political decisions have a big impact on its value.

It is essential to be aware of these differences when assessing international relations in terms of power relations. In the long run, it is economic (general) power that is of decisive importance, which is why it is the main subject of rivalry between superpowers. In the short run, especially in a situation of an armed conflict, priority is given to military power and, to a lesser extent, to geopolitical power.

Each reliable measurement requires adoption of units of measurement. We adopted the basic unit of 1 mir as an expression of the world power ("mir" stands for "world" in the Russian language). Consequently, power of individual states is a fraction of this variable. For the sake of clarity of the presented results, the obtained fractions (decimal values) may be multiplied by any number. If multiplied by 100, the obtained results will be expressed as percentage of world power (where world power = 100). In our case, it is more

convenient to multiply them by 1000 (the world power will then = 1000), which results in the figures being expressed in millimirs (abbr. mM), i.e. in thousandths of the total world power.

In the case of small and very small countries, it is convenient to express their power in micromirs (abbr.  $\mu\text{M}$ ), i.e. in millionths of the world power (where world power = 1000000). All three types of power refer to the world as a whole, which means that each of these powers has the value = 1 (100, 1000).

### 3.3. Militarization indices

Three types of militarization are distinguished: economic (general) militarization, militarization of GDP and demographic militarization. Militarization indices are non-dimensional values. The economic (general) militarization index is expressed as a ratio of military power to economic (general) power, therefore:

$$m_e = \frac{MP}{EP}$$

It can also be interpreted as a *mobilization index*, which represents the amount of resources allocated (mobilized) for military (defence) purposes, and as a *defence readiness index*. It is a quotient of two indices, as illustrated by the following formula:

$$m_e = \frac{MEX^{0.652} \times S^{0.217} \times a^{0.109}}{GDP^{0.652} \times L^{0.217} \times a^{0.109}}$$

Once simplified, the formula takes the following form:

$$m_e = \left( \frac{MEX^{0.652}}{GDP^{0.652}} \right) \times \left( \frac{S^{0.217}}{L^{0.217}} \right)$$

We see that the economic (general) militarization index is a product of two partial indices. The first index ( $m_{GDP}$ ) expresses militarization of GDP, while the other index ( $m_d$ ) expresses demographic militarization, as shown by the following formulas:

$$m_{GDP} = \frac{MEX^{0.652}}{GDP^{0.652}}$$

$$m_d = \frac{S^{0.217}}{L^{0.217}}$$

The above indices are an essential means to describe defence policies of different states. Two extreme cases can be distinguished here: one where the index of GDP militarization is high, while the demographic militarization index is low, and one where the situation is reverse. In addition, there are many intermediate situations. These indices inform us of the type of military strategy that a state adopts and of its willingness to follow it.

### 3.4. *Dialectics of absolute and relative increase/decrease*

The key to describing geopolitical rivalry (rivalry for power) as a zero-sum game is to understand the absolute and relative increase/decrease. Typical absolute increase includes population growth (expressed in thousands or millions of people), GDP increase, or growth in military expenditure (in millions or billions of dollars, euro, etc.). However, a fast pace of GDP increase as a synthetic indicator of the efficiency of an economic system does not necessarily guarantee an increase of

power; it all depends on what is currently happening in the entire global system. If the rest of the world develops even faster, then the power of a given state decreases, instead of increasing. It may also be the other way round – GDP of a given country may be declining while its power will be growing despite other countries' GDP decreasing even more. Four possible situations arise as a result of the combination of absolute and relative increase and decrease, as illustrated below.

	<b>Relative increase</b>	<b>Relative decrease</b>
<b>Absolute increase</b>	(1) <i>Absolute increase</i> – <i>relative increase</i>	(2) <i>Absolute increase</i> – <i>relative decrease</i>
<b>Absolute decrease</b>	(3) <i>Absolute decrease</i> – <i>relative increase</i>	(4) <i>Absolute decrease</i> – <i>relative decrease</i>

From the perspective of international rivalry, two of these situations are advantageous – (1) and (3); the other two are disadvantageous. From the observer's point of view, in the case of (2), absolute increase is difficult to reconcile with absolute decrease; in the case of (4) – a clearly noticeable absolute decrease is combined with relative increase, which is not easily noticeable.

Absolute and relative changes often carry contradictory information, which is confusing for both politicians and researchers. It is noteworthy to remember that in terms of struggle for power, i.e. from the geopolitical perspective, only the relative increase/decrease are truly important.

### 3.5. *Statistical database*

The statistical data used in this report were obtained from several sources, whose number was limited to the minimum. Data on the population, GDP at the exchange rate and countries' territory area are mainly derived from the World Bank database, with the exception of data for Taiwan, where the GDP data are derived from the

database of the International Monetary Fund (IMF), and the data on population and the territory size from the United Nations (UN) database.

Data on the number of active duty soldiers and military expenditures expressed in US dollars were acquired from *The Military Balance*, an annual publication

of the International Institute for Strategic Studies (IISS).

Missing data from the sources mentioned above were supplemented with data from the following sources, in the order of priority: the International Monetary Fund (IMF), the Stockholm International Peace Research Institute (SIPRI) and the US Central Intelligence Agency (CIA).

## IV. RESULTS

This chapter contains four groups of country rankings. The first one presents the classification of countries according to their economic (general) power, military power and geopolitical power (Table 1), along with the assessment of the international system in terms of polarity. The second group includes a ranking of countries according to militarization indices (Table 2), while the third one categorizes according to the power status (Table 3), and the fourth one according to the highest growths and the highest declines in economic power (Table 4). The

The list of the countries studied includes the 193 Member States of the UN, as well as Taiwan, which represented China in the UN until 1971, and Kosovo as a protectorate of the UN and a partially recognized state established after the breakup of Yugoslavia. No data available for calculation was marked as "N/A"

The names of countries and regions are presented according to the ISO 3166-1 standard.

latter ranking is limited to the economic (general) power, due to its most objective character.

The power of states is inherently relative in nature, and is therefore measured in relation to the power of the entire world as a fixed point of reference. In this approach, the power of a state is part of the total power of the world, which is understood as a whole. For convenience, power of states is presented here in millimirs, where the power of the world equals 1,000.

### 4.1. Ranking of countries by economic (general), military and geopolitical power

The amount of power determines the position (order) of the countries in the ranking. Most often, an increase in power leads to an increase in position, while a decrease in power usually results in a decrease in position. However, it is not

always the case – an increase in power and a subsequent decrease in position may occur, as well as a decrease in power and increase in position. Therefore, there may occur four situations, as illustrated below.

	<b>Position increase</b>	<b>Position decrease</b>
<b>Power increase</b>	(1) <i>Power increase – position increase</i>	(2) <i>Power increase – position decrease</i>
<b>Power decrease</b>	(3) <i>Power decrease – position increase</i>	(4) <i>Power decrease – position decrease</i>

From the perspective of the analysis of power relations, power and the direction of its changes appear to be more important; position is rather a matter of prestige, yet in some situations it may constitute a crucial criterion for including a country in a given group. This is largely dependant on what type of power is the reference point. In times of peace and wide international cooperation, economic (general) power appears to be of crucial importance. On the other hand, when political and military tensions increase, the significance of the military factor, and consequently the military power and geopolitical power, also grow.

In terms of military power, three groups of countries are distinguished. One

is a group of countries with similar economic (general) and military power (for example, in 2017 they included France and Japan). Another group consists of countries with significantly greater economic (general) power than military power; in other words, these include less militarized countries such as Japan, Argentina or Germany. Finally, the third group includes countries with significantly higher military power than economic (general) power (e.g. Saudi Arabia, Afghanistan, Israel, Iraq). It is imperative to note that the high level of militarization in this group may be the result of either aggressive or defensive policy.

N/A – no data available for formula calculation.

The military power was calculated on the basis of the military expenditures as of 2017 and the number of active duty soldiers as of 2018 (after *The Military Balance 2018*).

#### *4.2. Ranking of countries by militarization indices*

Militarization of power is considered in terms of: economic (general) militarization understood as a share of military power in the economic (general) power, militarization of GDP as a share of military expenditures in GDP, and demographic militarization as a share of active duty soldiers in the general population (with the corresponding power exponents – according to the model). In all three cases, the militarization index of the world takes the value of 1. Countries with militarization greater than 1 are considered to be strongly militarized, while those with the index lower than 1 are considered to be poorly militarized (Table 2).

As many as three possible model situations are possible. First, when the position of a country determined by all three types of militarization is similar

(balanced position). However, it must be noted that this can be achieved at various levels of militarization, both high and low ones. Second, when the position resulting from the militarization of GDP is evidently higher than the one resulting from the demographic militarization (imbalanced position). Third, when the position resulting from demographic militarization is clearly higher than the position resulting from the militarization of GDP (imbalanced position). The high level of militarization of GDP in relation to demographic militarization is indicative of a country which maintains small-sized and typically professional, well-armed and well-equipped forces. In the opposite case, a large army is maintained, which is usually made up of conscripts who are poorly armed and poorly equipped.

**Table 2. Ranking of countries according to the economic (general) militarization index, index of GDP militarization and demographic militarization index in the years 1992 and 2017**

### 4.3. Ranking of countries by power status

The power status criteria may be classified in two major ways – sectorially and synthetically. In the former case, the military, economic, and energy/resource power status are considered. In the latter case, the main point of consideration while

assigning countries to particular sections is synthetic power measures.

Table 3 presents classification of power status, with the use of synthetic power measures, based on the accepted criteria.

**Table 3. Classification of power status based on synthetic power measures**

Power status	Symbol	Criterion in percentage of the world power
Superpower	SP	above 18%
World Power	WP	12–18%
Great Power	GP	7–12%
Regional Power	RP	3–7%
Local Power	LP	1–3%
Small Power	PP	0.1–1%
Micro Power	MP	below 0.1%

Table 4 includes a list of countries meeting the power status criteria on the basis of economic (general) power, military power and geopolitical power as of 1992 and 2017, with a share equal or higher than 1% of the world power. Countries with the status of a small power or a micropower are omitted in the report.

Tables 5-7 present rankings of powers according to the order of their position based on the economic (general) power as of 2017. The presented classification of power status is based on absolute criteria

(and therefore referring to the world). This means that in the event of a considerable fragmentation, there may no longer exist superpowers, world powers or even great powers. In a situation like this, countries occupying the leading positions would still be the strongest, without, however, meeting the top criteria. For this reason, for example, the strongest country in the region should not be treated as a “regional power” unless it met the relevant criteria (3–7% of the world power).

#### 4.4. Winners and losers in the international distribution of power

It shall be remembered that power struggle is a zero-sum game, which indicates that an increase in power of some countries goes along with a decrease in power of the other. The total sum of increase and decrease expressed in the adopted units (here: in mM) is equal to zero. This, obviously, does not apply to percentage increase/decrease.

Table 8 presents a ranking of countries with the highest percentage increase and decrease in the economic (general) power in relation to the world.

Table 9 presents changes in the distribution of power between regions, which is merely for illustrative purposes.

**Table 8. Countries with the highest increase and decrease in economic (general) power in 2017 relative to 1992**

#### 4.5. Regional distribution of power

Due to the multitude of criteria, a division into regions is always a matter of convention, based on more or less justified premises. In this regard, the World Bank division was adopted.

Table 9 presents changes in the regional distribution of power, with the

proviso that these changes may not be compatible with the changes in the global distribution. For example, a country which is losing on a global scale may be gaining on a regional scale and vice versa.

Graph 1 presents regions in the years 1992-2017.

**Table 9. Regions according to economic (general) power in the years 1992 and 2017 (world = 100%)**

Position	1992		2017	
	Region	Percentage	Region	Percentage
1	Europe & Central Asia	30.25	East Asia & Pacific	29.27
2	East Asia & Pacific	25.32	Europe & Central Asia	22.52
3	North America	18.59	North America	17.41
4	Latin America & Caribbean	7.07	Latin America & Caribbean	8.75
5	Middle East & North Africa	3.47	South Asia	6.34
6	South Asia	3.23	Middle East & North Africa	5.12
7	Sub-Saharan Africa	2.87	Sub-Saharan Africa	4.30

**Graph 1. Regions according to economic (general) power in the years 1992-2017 (world = 100%)**

## CONCLUSION

### *General distribution of power*

The results of our calculations are based on Sułek's model, which we believe is easy to understand and use also by non-professionals. This model enables calculation of three types of power: *economic (general) power*, *military power* and *geopolitical power* – the latter being the resultant of the previous two. Economic power is determined by a combination of economic factors (GDP – Gross Domestic Product), demographic factors (population) and spatial factors (territory area). Military power is determined by military and economic factors (military expenditures), demographic and military factors (number of active duty soldiers) and area. Geopolitical power is calculated as the arithmetic mean of the economic (general) and double military power.

Considering *economic (general) power* as the main criterion, in 1992, a unipolar system was formed, determined by the United States. Japan took the second place, followed by Germany, China, France, Italy, Russia, the UK and India. In 2017, the distribution of power changed significantly and a bipolar system was established, headed by China and the United States. Yet, China took the first place for the first time after the Cold War, followed by India, Japan, Brazil Germany, Russia, France, the UK and Canada.

Based on the *military power* as the main criterion, in 1992 a new international order emerged, characterized as unipolar, with the United States as the dominant power. Russia, which ranked second, was considered almost three times less

powerful. The other spots were taken by China, France, Germany, Great Britain, India, Japan, Saudi Arabia and Italy. In 2017, the system remained unipolar, headed by the United States, with a nearly double advantage over China (2nd place). Further down the list were: India, Russia, Saudi Arabia, Brazil, France, Japan, Great Britain and Germany.

As far as *geopolitical power* is concerned, in 1992 the system remained unipolar, with the United States in the lead, having a threefold advantage over Russia. Next down the list were China, Japan, Germany, France, the UK, India, Italy and Canada. In 2017, a bipolar system emerged, headed by the United States and China. This bipolar system, however, may be described as “weak” due to the nearly double advantage of the United States.

It shall be noted that the most reliable comparisons of long-term changes in the international distribution of power should be based on the economic (general) power. In current day-to-day politics, military power, and consequently, geopolitical power assume a prime role.

### *Militarization*

There are three domains of militarization of the economic (general) power which are taken into consideration: economic (general) militarization, which is a share of the military power in the economic power; militarization of GDP, which is a share of military expenditures in GDP; and demographic militarization, expressed as a share of active duty soldiers in general population (with the respective exponents as shown in the model).

In 1992, the most militarized countries in economic (general) terms included Laos, Vietnam, Mongolia, Jordan, Oman, Bulgaria, Armenia, Turkmenistan, United Arab Emirates and Russia.

The distribution of power differed slightly in terms of militarization of GDP. Here, the list was headed by Laos, Kuwait, Mongolia, Vietnam, Turkmenistan, Bulgaria, Oman, Mozambique, Armenia and Jordan. Yet another ranking is presented based on the criterion of demographic militarization. The top ten countries in the ranking included Israel, Syria, United Arab Emirates, Jordan, Croatia, Iraq, Taiwan, Russia, Libya and Oman.

2017 saw a significant change in the rankings of countries based on the aforementioned criteria. The most militarized countries in the general sense included Oman, Saudi Arabia, Afghanistan, Israel, Iraq, Armenia, Jordan, Algeria and South Sudan. The order of countries based on militarization of GDP was as follows: Oman, Saudi Arabia, Afghanistan, Iraq, Algeria, Congo Israel, Kuwait, Mali and Bahrain. Finally, the most demographically militarized countries in 2017 were: North Korea, Israel, Brunei, Armenia, South Sudan, Greece, Singapore, Cyprus, South Korea and Sri Lanka.

### *Power status*

In the period studied (1992-2017), no country reached a superpower status in terms of economic (general) power. The United States maintained its position of a world power, while China progressed to this position from the regional level, and Japan, Germany and France fell in the rankings, assuming a regional power status. In terms of military power, the United States maintained its position of the only superpower, while China rose from the

position of a regional power in 1992 to the great power level. Meanwhile, Russia lost its position of a great power and moved to the regional power level. In terms of geopolitical power, in 2017 the United States maintained its position of a superpower, while China moved up from the regional to the great power level. Russia remained its regional power status.

### *Winners and losers*

The biggest winning and losing countries are only considered in terms of economic (general) power, being the most reliable in the long term. This picture is as interesting as it is surprising. In the period of 1992-2017, there were several spectacular wins and as many spectacular losses. The countries were ranked by percentage growths/declines in power.

The first group includes – as far as larger countries are concerned – China, Vietnam, Nigeria, United Arab Emirates, India, Bangladesh, Indonesia, Romania and Pakistan. In the winners group there were also Chile, the Czech Republic, Slovakia, Turkey, Poland and Israel. Russia was a winner too, yet its growth was minimal.

The ranking of the biggest losers is headed by Japan, Ukraine, Italy, the Central African Republic, Libya, Greece and Germany. The list of the biggest losers also includes the United States, yet the decline of its power is only slight.

It is clearly noticeable that in terms of power, the biggest winners are medium and less developed countries, which joined the process of globalization. Thanks to this process the level of development evens out which means that population is becoming an accurate measure of power. This is why, if the level of development was the same in the entire world, population would be a sufficient measure of power. The biggest

losers, with a few exceptions, are Western countries.

In the regional ranking, the largest growth in the economic (general) power was recorded by South Asia and the sub-Saharan Africa. The biggest losing region, and practically the only one, is Europe and Central Asia (a slight decline was recorded by North America). The West has become even weaker.

Common wisdom says that globalization results in an even deeper division into the poor and the rich. Studies show, however, that this statement turns out to be false (with China and India being prime examples). The presented changes in

the international balance of power indicate that the international system of the past 26 years has contributed to a significant improvement in the position of underdeveloped countries, mainly in Asia and Africa. This was largely due to demographic changes, yet these were excluded from further analysis.

Changes in the international distribution of power may influence policies of individual states – growth in power and international position may embolden them, while a decline in power may discourage them or lead to adventurism. This is an interesting area for further study.

## ABOUT THE AUTHORS

**Robert Białoskórski** – PhD hab. Eng., Assistant Professor at the Department of International Security and Strategic Studies at the Social Sciences and Security Institute in the Faculty of Humanities at Siedlce University of Natural Sciences and Humanities. Specialist in international security. He has recently published a monograph *The Geostrategic Position of the Russian Federation. A Powermetric Study*, UPH, Siedlce 2018. Co-author: *Potęga państw 2018. Raport potęgometryczny* (Power of States 2018. A Powermetric Report), Oficyna Wydawnicza ASPRA-JR, Warsaw 2018.

**E-mail:** robert.bialoskorski@uph.edu.pl

**Łukasz Kiczma** – PhD student at the Department of International Economic Relations and European Integration at the Institute for Social Studies in the Faculty of Social Sciences at the University of Wrocław. Entrepreneur and co-author of

*Potęga państw 2018. Raport potęgometryczny* (Power of States 2018. A Powermetric Report), Oficyna Wydawnicza ASPRA-JR, Warsaw 2018.

**E-mail:** lukasz@kiczma.pl,  
lukasz.kiczma@uwr.edu.pl

**Web:** <http://kiczma.pl>

**Mirosław Sulek** – Prof. PhD hab., economist, praxiologist, strategic studies analyst, based at the Institute of International Relations in the Faculty of Political Science and International Studies at the University of Warsaw. He published a monograph: *Potęga państw. Modele i zastosowania* (Power of Nations. Models and Applications), Rambler, Warsaw 2013. Co-author: *Potęga państw 2018. Raport potęgometryczny* (Power of States 2018. A Powermetric Report), Oficyna Wydawnicza ASPRA-JR, Warsaw 2018.

**E-mail:** m.sulek@uw.edu.pl

**The Powermetric Research Network**, has its registered office in Warsaw, Poland.

The Association was founded in 2017 by three authors of this Report. Its mission is to develop and promote powermetrics as an applied science concerned with measurement, estimation and assessment of power/force of particular social entities, especially that of states, as well as with modelling, simulations and forecasting of

relations between them in global, regional and local scales.

The Association pursues its mission by fulfilment of the following tasks: conducting scientific studies in the field of powermetrics, promoting knowledge of powermetrics, organizing conferences, workshops, lectures, as well as popular science activities, including publishing.

This Report can be accessed and used for free.  
Authors welcome any form of support of the statutory tasks performed by the Powermetric Research Network.

Donations will primarily go towards:

- conducting scientific studies in the field of powermetrics
- promoting knowledge of powermetrics
- organization of conferences, workshops and lectures
- popular science activities, including publishing

The "Powermetric Research Network" Association was founded in 2017 by three authors of this Report. Its mission is to develop and promote powermetrics as an applied science concerned with measurement, estimation and assessment of power/force of particular social entities, especially that of states, as well as with modeling, simulations and forecasting of relations between them in the global, regional and local scale. The Association pursues its mission by fulfillment of the following tasks: conducting scientific studies in the field of powermetrics, promoting knowledge of powermetrics, organizing conferences, workshops, lectures, as well as popular science activities, including publishing. We welcome any form of support of the statutory tasks performed by the Powermetric Research Network.
