**Catatan Penilaian Paper oleh Reviewer :**

- Kesesuaian dan kelengkapan unsur isi paper:** Makalah ditulis sesuai dengan guide for author pada IEEE conference. Penulisan makalah berisi abstract, introduction, hardware design, results and analysis, dan conclusion, serta references.
- Ruang lingkup dan kedalaman pembahasan:** Ruang lingkup makalah cukup fokus dengan pembahasan detail dari teori hingga desain sensor node untuk early warning system.
- Kecukupan dan kemutakhiran data/informasi dan metodologi:** Referensi berasal dari 9 paper-paper jurnal maupun international conference yang mutakhir.
- Kelengkapan unsur dan kualitas terbitan:** Makalah telah memenuhi unsur kelengkapan untuk diterbitkan dalam proceeding international IEEE conference, dan telah terindeks di IEEEExplore dan Scopus

### Abstract

View references (9)

Landslide is one of the most frequent disaster happened in Indonesia. It can occur due to some major factors, e.g.; high rainfall and soil moisture. In order to predict the occurrence of landslide disaster, data sensing system of these factors are acquired. A prototype of data acquisition is proposed. The prototype provides sensors for sensing of four parameters, which are MPU 6050 sensor, tipping bucket with reed switch, two of FC-28 humidity sensors, and 801s sensor, to measure slope, rainfall, moisture, and ground vibration, respectively. This system is also equipped with the process of data retrieval or log data in real-time with SD Card in the process directly and delivery via the server via SIM900. From the sensor test results, which are obtained from reading value of each sensor, the system shows low error values of 0.165, 0, 0, 0.39, and 0.71, for MPU6050, tipping bucket, 801S, and the two of FC-28 sensors, respectively. © 2018 IEEE.

### The Utility and Grid of the Future Electrical Power System: Challenges, Needs, Trends and Key Issues

**Prof. Dr. Ir. Mohd Wazir Mustafa**

*Universiti Teknologi Malaysia*

#### Abstract

Digital economy, national security, and sustainable living are highly dependent on reliable, safe, abundant, affordable, and secure electricity. Electric power systems through-out many parts of the world face challenges brought on by new technology trends, environmental concerns, a multiplicity of consumer needs, and regulatory requirements. These factors have partially accelerated global demand for low carbon power system and stimulated new technology trends. The vision for future power system is to transition away from carbon-based fuels toward increased penetration of renewable DERs and use of energy storage and electric transportation. Far-reaching change is transforming the electric power sector in the form of: government and regulatory action to address climate change concerns; increasingly empowered and demanding customers; proliferation of distributed generation, including solar and wind; digitization of the grid and information and operational technologies integration; increased risk of cyber-attacks on grid systems and infrastructure and energy reform as markets open to new forms of competition. Future electric power system is also expected to improve cost efficiency, service quality, and safety, offer reliability and withstand external threats such as superstorms and cyber threats, as well as flexibility respond in real time to fluctuations in demand and supply during major weather or security events. On the other hand, managing and optimizing the system will become increasingly challenging due to the complexities in system balancing between the load and the integrated RES generation, as a result of increased levels of system variability and uncertainty.

### **Area of Interest**

Smart Grid, Distributed Generation, Sustainable Energy, Regulated & Deregulated Power System, Renewable Energy, Power System Analysis, Power System Devices and Apparatus, Power Quality, Protection.

### **Project Leader/Project Member**

- i) Project Member, Non-Intrusive Load Monitoring and Management of Residential Electrical Appliances Using Steady-State Load Signatures. PY/2017/01321. Budget approved RM 40,500. (01/02/2018- 31/01/2020).
- ii) Project Leader, Enhanced Power Quality Controller in An Autonomous Microgrid Using Whales Optimization Algorithm, PY/2017/00612, Budget approved RM 40,000. (01/07/2017 - 30/09/2018).
- iii) Project Member, Passive Filter Size Optimization for Reducing the Harmonic Distortion Due to Electrical Vehicle Charging Station. PY/2016/06734. Budget approved RM 40,000. (01/10/2016- 31/07/2018).
- iv) Project Leader, Flexibility Constrained Unit Commitment Problem for Enhanced Operation of Low Carbon Power Systems by an Enhanced Priority List Based Particle Swarm Optimization Technique. PY/2016/06747. Budget approved RM 40,000. (01/07/2016- 30/06/2018).
- v) Project Leader, Enhancing Power System Oscillation Stability with Facts Devices using Fuzzy Logic and Bees Algorithm. Budget approved RM 50,000.00. (01/05/2015- 31/12/2016).
- vi) Project Member, Flexible Feed in Tariff Scheme for Photovoltaic in Residential Area Based on Artificial Neural Network Projection. Budget approved RM 20,000.00. (01/05/2015- 31/07/2016).
- vii) Project Leader, Coordinated and Robust Design of Power System Stabilizers using Bees Algorithm, Budget approved RM 88,000.00. (01/07/2014- 30/09/2016).
- viii) Project Leader, A Self-Configuring Methodology Of Future Smart Power Grid (A Solution Towards Future Potential Challenges) Budget approved RM 80,688.79. (01/04/2014- 31/03/2016).

## Keynote Speech 2

### Preparing Engineers for the Internet of Things Network for Circular Economy and Sustainable Building Management

**Prof. Dr. Ir. Riri Fitri Sari, MM MSc, DTM, SMIEEE**

*Universitas Indonesia*

#### Abstract

The Internet of Things (IoT) in the disruption era has come towards its peak time which includes smart cities, smart buildings, smart homes, smart kitchens, smart appliances, security, smart home, smart health, smart factories, smart machines, smart supply chain, smart transportation, smart manufacturing, autonomous vehicles, smart consumer devices, etc. All infrastructure and its management will be based on the smart systems which have sensors and crowdsourcing as information sources.

At the university of Indonesia, we have been using NS-2 and NS3 as the de facto open source network simulator in which we can contribute to the development and performance evaluation of different protocols, and contribute new ideas by providing C and tcl codes. As the result of the open source approach we can experiment with different protocol such as congestion control mechanism, adhoc network, vanet, and other 802.11 series protocols. Students could quickly experience how to collaborate to upgrade our Internet Protocol to advancement, from Adhoc Network to Blockchain Architecture. Our latest work on the Lorawan, NB-IOT and Blockchain based in NS-3 have shown that the issue of infrastructure development will not only dictated by proprietary software approaches but also worldwide collaboration in which we can train the next information infrastructure engineers.

During all the 30 years of the development of Internet Protocol through Internet Engineering Task Force (IETF) and 3GPP we have witnessed that Internet engineer are collaborating all over the world towards the advancement of our information super highway. The trace can be found from the website of contributed code of ns-2 of Lawrence Berkeley laboratory in which engineers shows their simulator code, introduce their new ideas, writing the Internet Draft, while at the same time companies such as Huawei, ZTE, and Mediatech quickly turn that in to manufacturing products that lower the cost with improved quality.

We have witnessed how open source language such as Java, PHP, and C have flourished and support the development of open source operating system such as Linux and its derivation. Lately it becomes Android based devices which currently immensely used worldwide to support us in daily activity decision making processes based on connected information.

All of the advancement of computer and communication technology in Silicon Valleys of the US, China, Taiwan, Singapore, etc would not happen this fast without tools that could provide the current surrounding environment that should be extended. Therefore, lecturers and senior researchers plays an important role in making sure that the new students could go directly to the problem as soon as possible without reinventing the wheel, using problem based learning. The short time to the product development life cycle pushed all of us to collaborate to reach win-win consensus through standardization.

This talk will discuss some state of approaches in training the IoT Network engineers to solve the problem found to achieve balanced circular economy and sustainable building management. We will some example learned from different approaches used across the globe to overcome challenges such as resource constraint, scalability, heterogeneity, mobility and security for wireless monitoring system. We will also discuss the role of engineers to provide applications and communication mechanism for indoor and outdoor purposes for sustainability purposes.

### **Biography**

Riri Fitri Sari received a Ph.D. from the School of Computing, University of Leeds, UK, with specialization in Multimedia Network in 2004. From 2006-2014, she was the IT Director of the University of Indonesia. In 2009, she has become a Full Professor of Computer Engineering at the Faculty of Engineering, University of Indonesia. She has written more than 60 journal papers, 130 conference articles, 10 books. She has also worked in different teams and granted with 11 patents/copyrights, and supervised more than 20 doctoral students. She is a Senior member of the IEEE and a Professional Engineers from PII.

She has focused on Protocol Engineering, Multimedia Network, Vehicular Area Network, Internet of Things, and IT for Sustainability Development Goals. She was the recipient of the IEEE Region 10 WIE Most Inspiring Engineer Award 2012 in Kalkuta India. She is awarded as an Honorary Professor at the Kazakh National Agrarian University, Almaty Kazakhstan, in June 2017. She has been using the power of Information Technology and Social Media to develop the UI GreenMetric Rankings of World Universities which have been widely used in more than 516 universities in 75 countries as a voluntary standard for improving their sustainable and green campus programs. Under her leadership, the UI GreenMetric University Network has conducted workshops organized in more than 20 countries, making UI GreenMetric as a reference for infrastructure development of smart sustainable campus.

## Keynote Speech 3

### D2D Challenges and Opportunities

**Assoc. Prof. Dr. Razali Ngah**

*Universiti Teknologi Malaysia*

#### Abstract

Device-to-Device (D2D) communication, which alludes to direct transmission between two devices without passing through the base station. It has been broadly anticipated to be an essential cornerstone to enhance system performance and bolster new amenities beyond 2020 in future fifth generation (5G) systems [1]. In 5G networks, it is anticipated that controlled D2D communication offers the open door for short distance communication, local management and permits the isolation of local activity from the global activity, for example locally data offloading. D2D communication evacuates the data traffic heap load on the backhaul and center systems and decreases the vital exertion for managing data traffic at the center system. Due to proximity services, D2D communication viewed as a promising remedy for enhancing communication accomplishment and system capacity of long term evolution-advanced (LTE-A) network. The potential enhancements in proximity services that can be provided by D2D are not entirely exploited yet. In the 5G network, such confinement does not exist any longer, and it is anticipated that D2D operation in the in-band cellular network will be locally incorporated as a component without any bounds in the 5G network. There are also many more challenges to implement D2D communication such as discovery (location and position) of the devices with ensured accuracy and efficiency, signaling techniques need to be amended with signaling overhead evaluation, network integration, and local support in future 5G systems.

#### Biography

Razali Ngah received the Ph.D. degree from the University of Northumbria, United Kingdom, in 2005. Since 1989, he has been with the Faculty of Electrical Engineering, Universiti Teknologi Malaysia (UTM), where he is currently a Associate Professor. He is also the Deputy Director of Wireless Communication Centre in UTM. His research interests include antennas and propagation for communications, device-to-device communication, UWB communication, radio over fiber and photonic networks.

**Abstract**—The short-term of power forecasting represents as one of the substantial roles in the safe and economic uses of the power system. The climate consideration is the main challenge which is facing the improvement of the load forecasting accuracy. In this paper hybrid PSO and SVM methods used to forecast non-linear load data was proposed. First, description of the detail of a hybrid method between PSO and support vector machines learning method. Secondly; applying this method for forecasting the load in Bagdad city. Finally, the proposed method implemented by MATLAB and compared with classical support vector machines method. The results show that the proposed method was very clear in the accuracy of the forecasting depends on terms of absolute proportional error (MAPE).

**Index Terms**— Load Forecasting, PSO, SVM.

## I. INTRODUCTION

The optimization by adaptive intelligent methods with PSO was very common terms in power system studies in last ten years [1]. Since PSO has been proposed by Kennedy and Eberhart; the method was used to solve many problems of power system [2]. Also, the support vector machines learning method was faced many challenges in the accuracy of the power system forecasting [3],[4]. The power system operators and engineering are relying on the short and long time forecasting to give a high quality of services. Many works have been done to get that quantity of knowledge in power system data behavior especially after the term of DGs was come out. A clustering method based on a short time Load predation depends on (SVM) was introduced by Jain, and Satish [5]. Xing et al. have been proposed multi prediction methods based on multiple support vector machine (SVM); such as least squares support vector machine (LSSVM) [6]. Hybrid intelligent approaches of load forecasting field methods have increased their importance last years[7]. Different statistical techniques include regression analysis, Kalman filtering method weighted exponential method, and Box-Jenkins's autoregressive internal moving average methods have been suggested in grid prediction field [8]. A load forecasting using ANNs was applied to procure the power demand for short time, and PSO was optimized SDC parameters to increase the stability [9]. However, Bagdad data consist of a special-event or non-linearity behavior. So, the previous prediction models gave a few promising results. Qi Wu was introduced a hybrid method between PSO and SVM to

predict the demand but without taking on the effect of climate[6].

In this work, a short time forecasting of power system load has been proposed using PSO- SVM intelligent technique. The study has done starting from the mathematical analysis of PSO, SVM, and the forecasting, ending to the simulation of the proposed method and the comparison of the results. The results comparison was depended on the error calculation concept to validate the system using MATLAB. The prediction results proved that PSO- SVM strategy is more accurate concerning with the classical support vector machines method.

## II. RELATED WORK

Support Vector Machines (SVM) is a set of assortment techniques, which was introduced by Vladimir N. Vapnik in the end of the decade of the last century [3],[10]. The classification or regression, was the main topic of SVM applications [10].

For  $m$  of dimension of input vector, the SVM optimization equations can be showed as in [3]:-

$$\min J = \frac{1}{2} \|\omega\|^2 + \frac{1}{2} C \sum_{i=1}^l e_i^2 - \sum_{i=1}^l \alpha_i (\omega^T \varphi(x_i) + b + e_i - y_i) \quad (1)$$

Where  $e_i$  is initial error,  $e \in R^{l \times 1}$  is the vector error,  $C$  is the regularization parameter.  $\alpha$  is the Lagrange multipliers,  $\alpha \in R^{l \times 1}$ . Also the nonlinear forecasting power  $P(x)$  can be expression in terms of  $x_i$  (the input vector) and temperature  $T(x)$  by (2) [9]:-

$$P_{i+1} = \sum_{i=1}^m \alpha_i K(x_i, x) + b \quad i = 1, \dots, m \quad (2)$$

Where the natural illumination  $L(x)$ ;  $X$ - coordinates of the center of the scattering vector;  $\alpha_i, b$  - linear coefficients;

$K(x_i, x)$  - Kernel function, which performs a nonlinear mapping the input space of input data.

At the same decade of SVM introducing, Particle Swarm Optimization was proposed by [11]. A birds swarm was simulate as random particles to search of maximum food place after some of iterations [12].

**Abstract**— To date, sulphur hexafluoride (SF<sub>6</sub>) gas has been the predominant insulation medium in high voltage applications which mainly due to its exceptional physical and electrical properties. However, environmental concerns arise since SF<sub>6</sub> is a potent greenhouse gas. In this study, the breakdown behavior of SF<sub>6</sub>/N<sub>2</sub> gas mixtures under non-uniform field is investigated. A breakdown voltage test on SF<sub>6</sub>/N<sub>2</sub> gas mixtures which subjected to AC voltage was conducted inside a pressure vessel. The gas mixture ratio was fixed to 10/90, while the total gas pressure was varied between 0.11 MPa to 0.15 MPa with 0.01 MPa intervals. Meanwhile, R6-Plane electrode configuration was used to produce a non-uniform field where the electrodes gap distance was varied between 5 mm to 30 mm. The results show that the breakdown voltage of SF<sub>6</sub>/N<sub>2</sub> (10/90) gas mixtures increases linearly with the increase of gas pressure and electrodes gap distance. However, it is found that the effect of electrode gaps distance is more dominant to cause the breakdown voltage of SF<sub>6</sub>/N<sub>2</sub> gas mixtures to increase, as compared to the effect of small range of pressure levels.

**Keywords**—gas insulation, SF<sub>6</sub> gas mixtures, AC breakdown voltage, non-uniform field

## I. INTRODUCTION

Gaseous insulation serves a vital role in high voltage applications; as an insulating medium and/or arc quencher (current interrupter). Due to its superior properties in both functions aforementioned, sulphur hexafluoride (SF<sub>6</sub>) gas has been widely used in gas-insulated equipment such as circuit breaker, switchgear, and transmission line [1–3]. SF<sub>6</sub> is a strong electronegative gas which has the ability to capture free electron and forming itself a low mobility negative ion, hence prevents the electron avalanche that leads to breakdown [4].

Despite of its advantages, SF<sub>6</sub> has been identified as a strong greenhouse gas that gives adverse effect to the environment [5–6]. In Kyoto Protocol 1997, SF<sub>6</sub> gas was listed as one of the greenhouse gas that being restricted its

emission and usage [7]. Although SF<sub>6</sub> is non-toxic in its pure state, an electrical discharge or arc event causes the SF<sub>6</sub> molecule to decompose and forms highly toxic and corrosive byproducts (e.g. S<sub>2</sub>F<sub>10</sub>, SOF<sub>2</sub>). In addition, its chemical inertness properties makes the SF<sub>6</sub> gas last longer in the atmosphere once released [3].

Since 1970s, the researches on SF<sub>6</sub> gas mixtures have gained much attention to minimize the usage of SF<sub>6</sub> in high voltage apparatus, instead of completely replace the SF<sub>6</sub> gas. Until now, one of the mostly studied gas mixtures is SF<sub>6</sub>/N<sub>2</sub> (i.e. sulphur hexafluoride and nitrogen). This is because N<sub>2</sub> has low cost, indefinite resources, and environmental friendly. By focusing on SF<sub>6</sub>/N<sub>2</sub> gas mixtures, various studies have shown a positive synergistic effect where the breakdown voltage of pure N<sub>2</sub> is obviously improved by adding a small amount of SF<sub>6</sub> [8–11].

A recent work done by Guo et. al [8] is shown in Fig.1. Under non-uniform field condition, the addition of 10 % SF<sub>6</sub> (i.e. gas pressure ratio of SF<sub>6</sub>/N<sub>2</sub> is 10/90) improves the AC breakdown voltage of N<sub>2</sub> by 49 % and it is about 64 % of pure SF<sub>6</sub> (i.e. at 0.1 MPa, and gap distances of 33 mm). However, it can be seen that there is not much difference in the breakdown voltage values at low pressure of 0.1 MPa as the SF<sub>6</sub> is increased above 10 %. This result is in agreement with Sun et. al [10].

Fig. 1. AC Breakdown voltage of SF<sub>6</sub>/N<sub>2</sub> as a function of gas pressure under R8-plane configurations [8].

# Analysis of Single Axis Sun Tracker System to Increase Solar Photovoltaic Energy Production in the Tropics

**Abstract** — *The utilization of Solar Photovoltaic (SPV) generation system is generally installed at some certain tilted angles, therefore it does not obtain the optimum solar radiation from the sun. In order to overcome this weakness, the SPV generation system that is equipped with a single axis sun tracker was designed and analyzed in this paper. The sun tracker system has two LDR sensors to estimate the position of the sun. Arduino Uno 3 was implemented as a controller system. The Arduino Uno 3 instructs a servo motor to drive SPV panel from the east to the west to track the movement of the sun in a similar direction. In order to understand the energy gain of single axis sun tracker, it has been compared with SPV generation system installed at the certain number of tilted angles. It can be noted from the results that the SPV generation system with single axis sun tracker has a significant increase in energy production than without tracker where its energy gain is up to 22%. Therefore, it can be concluded that there is a promising potential increase in energy when the SPV panel is equipped with the single axis sun tracker generally in tropical regions.*

## I. INTRODUCTION

The availability of electrical energy is one of the most important issues in the world, especially in Indonesia. Indonesia is still relying on fossil fuel energy sources. When the supply of fossil fuels is low, then it may be the energy crisis that could lead to problems in other sectors in Indonesia. Therefore, efforts are needed to find and develop renewable energy that exists around the country, such as solar energy. Geographically, Indonesia is a region located around the equatorial belt. Therefore, the country has a tropical climate which is blessed with the sun shines more than 6 hours a day or more than 2,400 hours in a year with the solar intensity of 600-700 watt/m<sup>2</sup> [1], [2].

When using the Solar Photovoltaic (SPV) generation system on a stand-alone mode, the SPV panels are usually installed on a rooftop or mechanical structure with a certain titled angle. This type of installation has its own weakness because of the incident angle of solar radiation is not perpendicular to SPV panels surface. Therefore the energy production is not optimal and affects the energy production of

SPV generation system [3]. On the other hand, the SPV panels equipped with sun tracking system maximize the solar radiation received by the panels and drive the panel towards sunshine [4].

This paper aims to design and implement a single axis sun tracker and analyze energy gain. Single axis sun tracker is working based on active tracking techniques. This type of tracker designed in this paper is a horizontal single axis sun tracker (HSAT). The HSAT type is suitable for use in tropical region like Indonesia [5].

The designed single axis sun tracker is considered as a control system that uses two LDR, namely LDR1 and LDR2. LDR 1 serves to detect the position of the sun on the east side, while LDR 2 is placed on the west side to detect the position of the sun while in the west region of the city. The feedback of the control system is coming from different output voltage values between LDR 1 (East) and LDR 2 (West). This voltage difference is used by Arduino microcontroller to give command to the servo motor to drive the SPV panel to follow the movement of the sun from East to West.

The organization of the rest of the paper can be summarized as follows. In Section II, the sun tracking system is described. The author's design of single axis sun tracker is presented briefly in section III. Section IV and section V provide the experimental demo and the analysis of the designed system while conclusion of the work and the future work are discussed in section VI.

## II. REVIEW OF SUN TRACKING SYSTEM

Generally, sun tracking system can be divided into single axis and double axis system. The single axis sun tracker is classified into two types, namely: Horizontal Single Axis Tracker (HSAT) and Vertical Single Axis Tracker (VSAT). The focus of this paper is to design the HSAT and analyze the energy gain achieved when compare with the SPV generation system installed at the certain tilted angle [4]. The use of the HSAT is considered to be appropriate for the location around the equator belt area such as Pekanbaru City Indonesia where the sun's path is above the observer. On the other hand, the VSAT is suitable to be applied in sub-tropical region where

# FEXT Analysis and its Mitigation Using Double-slit Complementary Split-Ring Resonators

azhagumurugan.eee@sairam.edu.in

**Abstract** — *The operating speed of a digital signal and systems are in several GHz range to initiate faster response. Due to this high frequency and operating speed of the signals more and more signal integrity related issues may arise and these issues has to be solved for the better performance of the system. Now a day's integration and miniaturization of digital devices of printed circuit boards (PCBs) are the key features in high speed technology. The printed circuit boards traces are crowded in the design and creates magnetic coupling interference between them. These traces are considered as transmission lines which carrying signal and power between two more points. When current flows through the traces a magnetic field is always set up and interact with the neighboring conductor due to close proximity. The magnetic coupling is mutual and not possible to avoid it. In the result the signal gets affected which degrades the performance of the system to great extent. So, it is necessary to reduce the effect of mutual coupling to improve the performance of the system for its better signal integrity. The mitigation of mutual coupling effect is analyzed and suppression is achieved using metamaterial based complementary split-ring resonators. A new design of double-slit CSRR is used to reduce the crosstalk which is due to coupling. The FEXT analysis is carried out for the frequency range of 5 GHz to 10 GHz.*

**Keywords** — *Crosstalk, NEXT, FEXT, metamaterials, electromagnetic coupling.*

## I. INTRODUCTION

In this digital world the digital systems are operating at very high frequency and this creates frequency dependent issues. Now-a-days, the integration of digital devices and miniaturization in physical sizes of printed circuit boards are the key features in the design. The electromagnetic crosstalk due to coupling of signals is a major concern in the high-speed systems and need to be reduced. It is mainly due to radiation coupling of lines when the lines are in close proximity and degrades the quality of the signal, in turn causing signal integrity issues. Now-a-days, the crosstalk is a major concern and mitigation of crosstalk is the fundamental topic of interest.

Two types of crosstalk are far-end crosstalk (FEXT) and near-end crosstalk (NEXT) which are due to the electromagnetic coupling of signals between the traces of the PCB. The FEXT is due to the forward crosstalk behavior of mutual capacitance and inductance in the victim trace and the NEXT is due to the backward crosstalk of mutual

capacitance and inductance. The parallel routing of traces are closer to each other which are unavoidable in case of a PCBs. Hence, crosstalk is unavoidable and minimization of crosstalk can be achieved by proper design topologies.

This article focuses on the crosstalk and the impact of crosstalk on signal integrity in PCBs. The mitigation of crosstalk is achieved by metamaterials based complementary split-ring resonators in the ground plane. The unit cell of CSRRs is etched in the ground plane and the resulting designs are simulated to obtain frequency domain S-parameters.

A conventional guard trace, grounded guard trace and trace are designed with serpentine form in between the microstrip parallel lines to reduce the magnetic coupling and hence the far-end crosstalk [1]. In the conventional guard method, a bare conductor terminated at both ends and equal to the width of the line is inserted between the PCB traces. In the via stitch guard method, the transmission line with grounded vias are placed between the lines and makes the crosstalk potential to zero.

To reduce the crosstalk in the high density printed circuit board by placing a composite magnetic material made up of Fe-Si-B-Cr amorphous particle with a mean diameter of 6 micrometer in between the signal lines [2]. With a volume of 51% of amorphous composite material, a 20dB of crosstalk reduction is achieved. A guard trace with open stub is inserted in between the lines of a PCB trace to reduce the crosstalk [3].

The FEXT in the stripline structure can be eliminated under homogeneous environment. The idea of complementary split-ring resonators structure for the reduction of electromagnetic interference in the low frequency and radio frequency signals in analog circuits are discussed [4]. The interference effect is suppressed by the CSRRs in combination with analog printed circuit boards' layout. The concept of artificial magnetism from a non-conducting material, where the split ring resonators are one of its kind to produce artificial dielectrics [5]. In this paper, the author proved that periodic microstructures built from non-magnetic conducting sheets exhibit an effective permeability in which the  $\mu$  can be tuned to such a value which is not available in the naturally occurring materials.
