Systematic Review & Meta-Analysis: Automation tools to help your review

Alexandra Bannach-Brown & Justin Clark
Centre for Research in Evidence-Based Practice

What is a Systematic Review?

- Systematic review sets is a structured process to identify all data relevant to a specific research question.
- May be followed by meta-analysis, a statistical process that provides a summary estimate of the outcomes from a group of studies

Replication Crisis?

Journal of Personality
Journal of Experimental Psychology
Psychological Science
Psychological Bulletin
Journal of Abnormal Psychology
Journal of Personality and Social Psychology

Why – what are the causes?

- Fraud ?
- False positive studies ?
- Perverse incentives & publication bias ?
- True psychological heterogeneity of observed effects ?

Average
reproducibility
of psychology
studies is
only 36%
(Open Science
Collaboration
et al., 2013)

“Reproducibility in Science”, Begley & Ioannidis, Circulation Research. 2015;116:116-126

“Estimating the reproducibility of psychological science”, Open Science Collaboration, Science, 2015; 349(6251)

Reproducibility & Replication

Methods
reproducibility

Exactly the same exp.
procedures

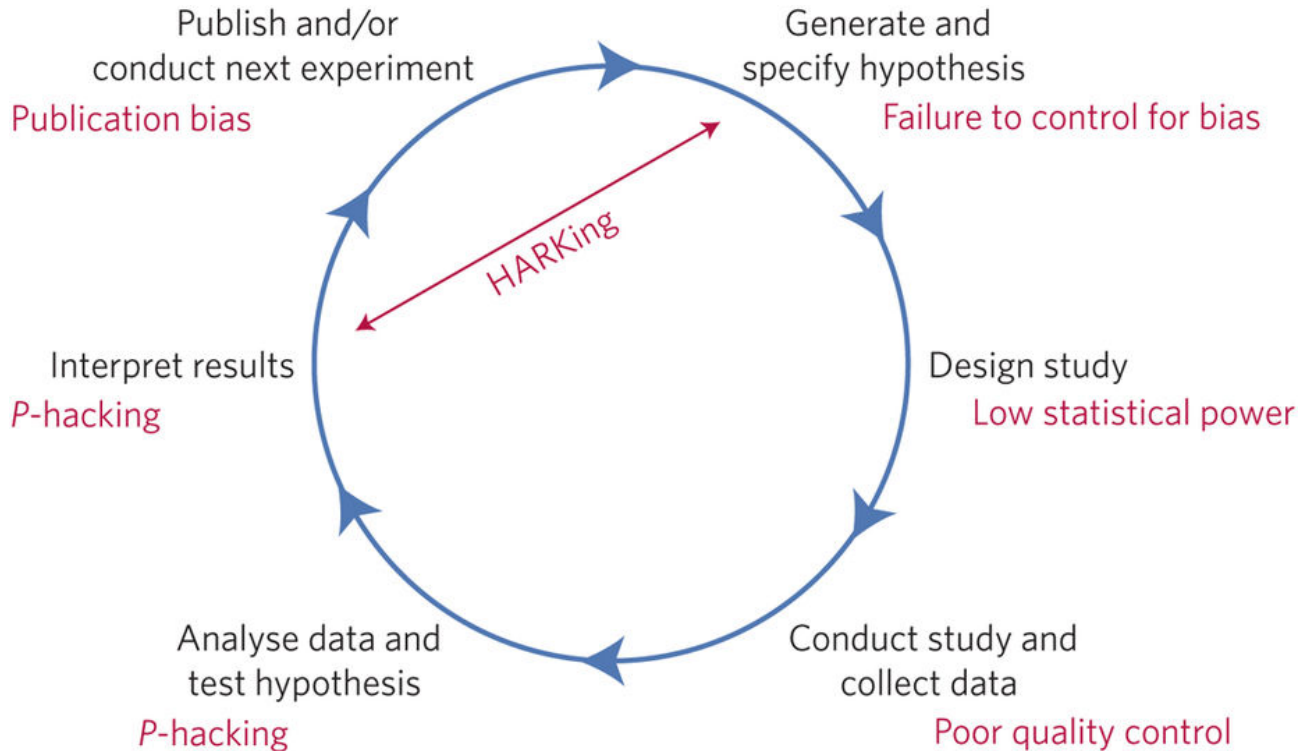

Results
reproducibility

Same methods in a
new study

Robustness

Variations in baseline
assumptions and
experimental
procedures

Threats to reproducible science

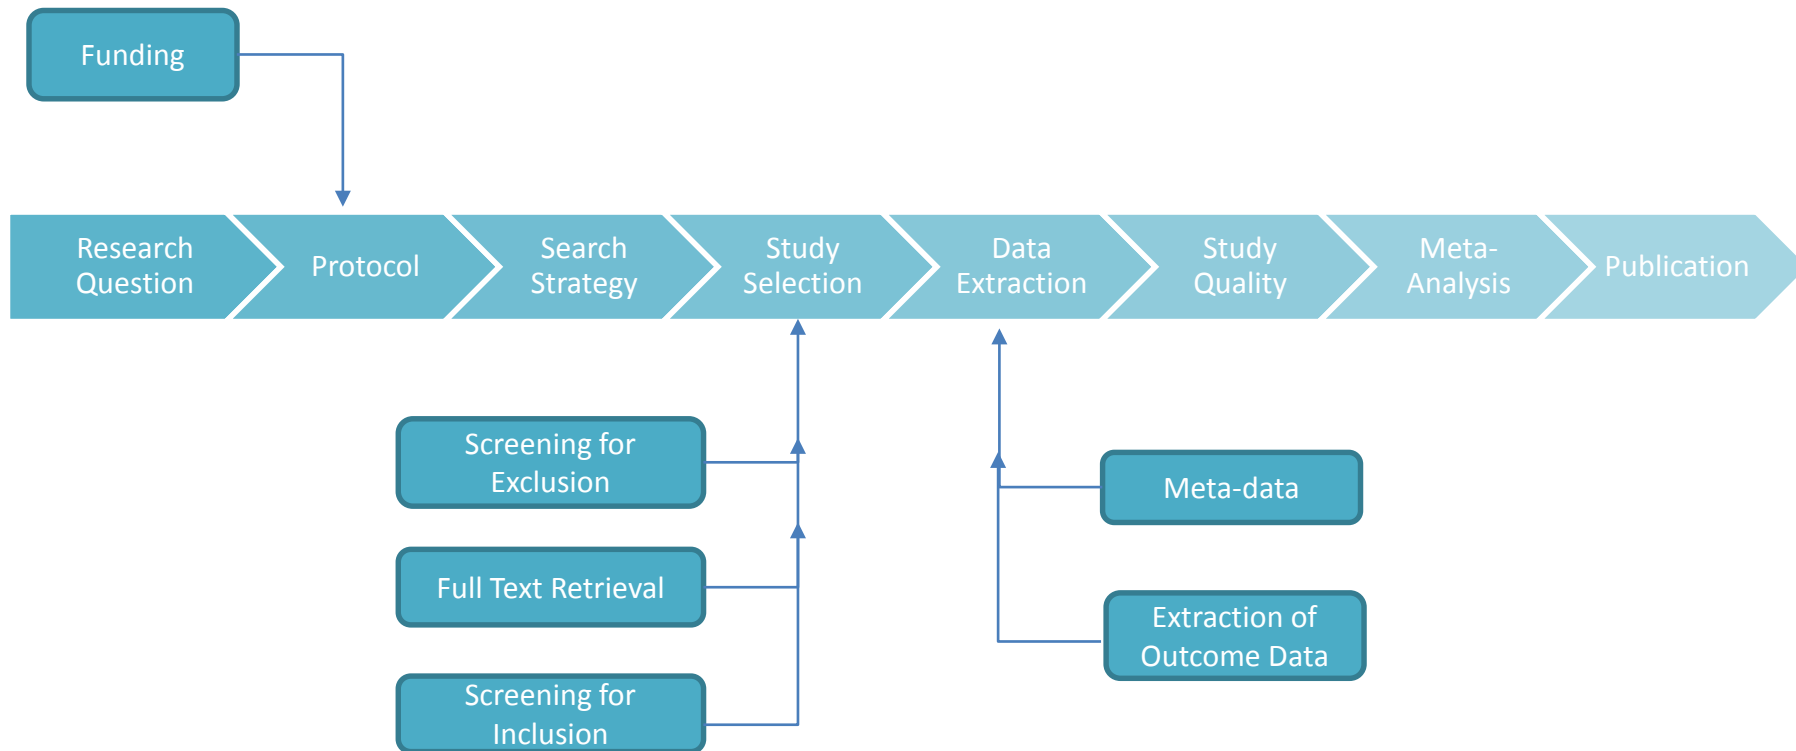

Why perform a systematic review?

- Provide an overview of available evidence
- Identify knowledge gaps
- Critical appraisal of study quality
- Identify factors influencing effects
- Inform experimental design of new studies
- Reduce waste in future research

Steps of A Systematic Review

Research Question

P – Population

- Characteristics of population

I – Intervention/Exposure

- Intervention

C – Comparison

- Alternative to intervention (e.g. placebo, standard care)

O – Outcome

- Relevant outcomes (How is it measured?)

T – Type of Scenario

- Therapy/Prevention, Diagnosis, Etiology, Prognosis

Protocol

- Research Question
- Searches & Search Strategy
- Define Inclusion & Exclusion Criteria
 - Population
 - Intervention
 - Control/Comparison
 - Type of Study
 - Primary Outcome
- Data Extraction Plan
- Quality Assessment
- Data Synthesis & Analysis Strategy
- Number of Reviewers at Each Stage

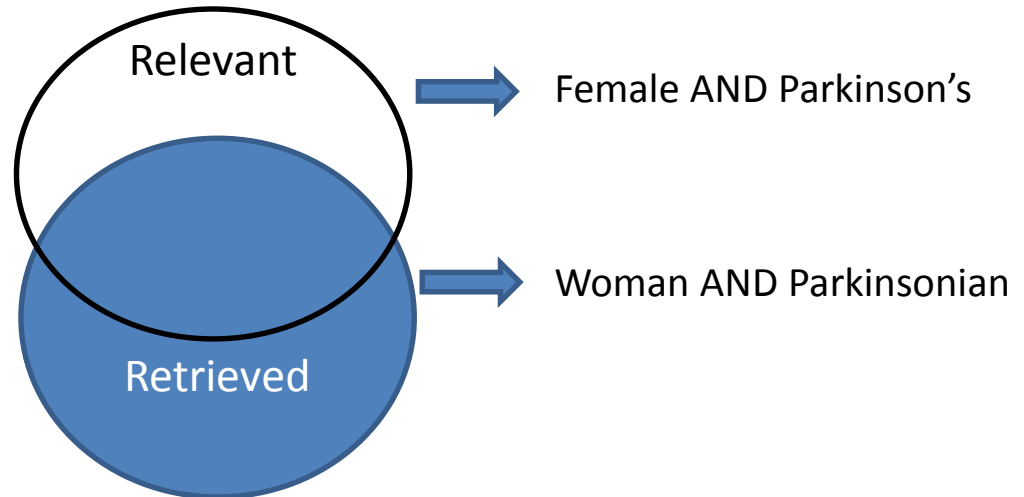

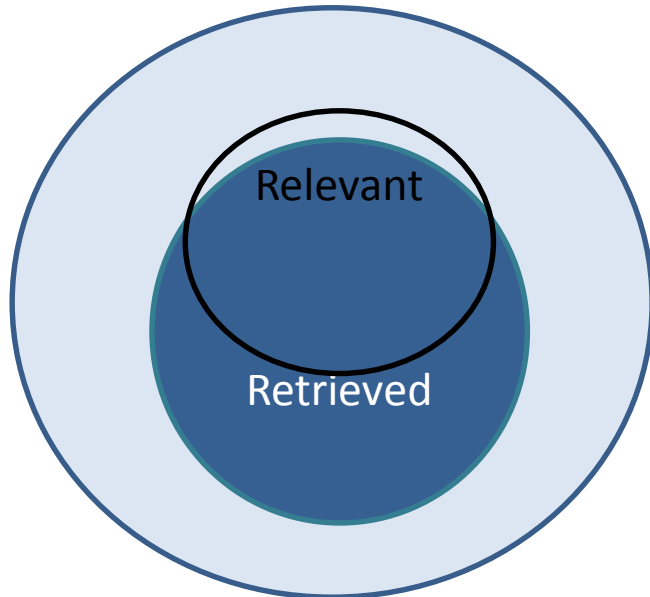

PROSPERO

International prospective register of systematic reviews

Comprehensive Search Strategy

- Ideally retrieve all relevant documents available
- balance between sensitivity & precision

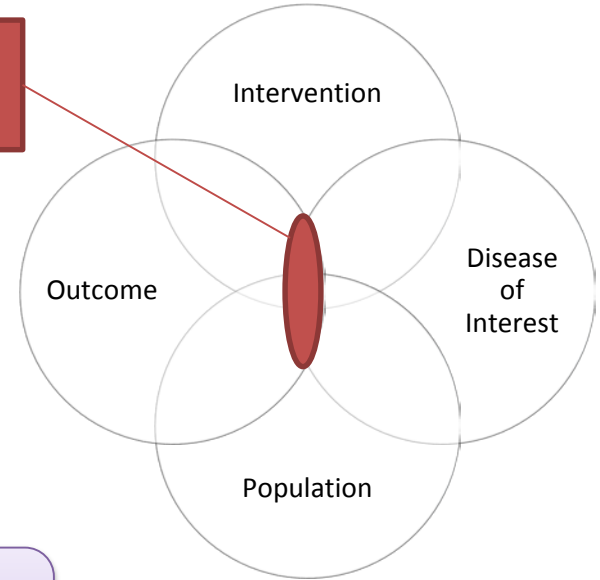

Comprehensive Search Strategy

Step A: Search Components

- Build your search
- Are there synonyms/standardised terms?

Relevant Studies

Step B: Search Strategy

- Where will you search?

Ask your librarian!

Why is searching properly important

Results of the search

*The search strategy found **8416** references in CENTRAL, MEDLINE, EMBASE and CBLD, whose titles and abstracts were screened, **8318** references were excluded and the remaining **98** articles were retrieved for detailed evaluation. On detailed examination, we excluded **68** articles.**

Access provided by: Bond Univer:

Trusted evidence.

Open Access

Better duplicate detection for systematic reviewers: evaluation of Systematic Review Assistant-Deduplication Module

John Rathbone*, Matt Carter, Tammy Hoffmann and Paul Glasziou

- *“The criteria used for including and excluding studies form the operational definition of the problem.”* Abrami et al., 1988
- Research question
- Study design
- Adequate data to extract meaningful information from
- Ambiguous methods/ methodological quality
- Often conducted in two stages: (e.g. title & abstract, then full text)
 1. Liberally applied to ensure relevant studies are included & no study is excluded without thorough evaluation
 2. More thorough application

Screening Tools

Tools to help speed up this process:

Why assess study quality?

- Low methodological quality can cause bias in the study results
 - Leads to an over- or under-estimation of true treatment effect

- The conclusions from your SR depend on the quality of the included studies!

Assessing External Validity

- What factors are necessary to generalise the study results to other populations/patients/studies:
 - Participant characteristics (gender, age ..)
 - Intervention characteristics (timing, mode of delivery, intensity)
 - Modalities of outcome measure (how assessed, type, duration of follow-up..)

Internal Validity

Type of Bias	Description	Reduced By..
Selection Bias	Systematic difference in baseline characteristics of groups at baseline	Allocation Concealment Randomisation
Performance Bias	Systematic differences between groups in exposure to factors other than intervention of interest	Blinding Randomisation
Detection Bias	Systematic differences between groups in how outcomes are determined	Blinding Randomisation
Attrition Bias	Systematic differences between groups in the way drop-outs are handled	Reporting of Drop-outs

Risk of Bias Checklists

- [EQUATOR Network](#)
- Cochrane Risk of Bias (for controlled trials)
- Risk Of Bias In Non-Randomized Studies - of Interventions: ([Sterne et al., 2016](#))
- Transparent Reporting of Evaluations with Nonexperimental Designs: ([Des Jarlais et al., 2004](#); [CDC](#))
- Checklist for Reporting Results of Internet E-Surveys: ([Eysenbach et al., 2004](#))
- Self-Report Data: ([Stone & Shiffman, 2002](#))
- Qualitative Research: ([Elliott, Fischer & Rennie, 1999](#))
- Mixed Research: ([Leech & Onwuegbuzie, 2010](#))

Prespecified

Meta-Analysis

1. Check for homogeneity of included studies
2. Assemble relevant study data
3. Choose an effect size measure
4. Calculate the effect size for each study
5. Choose random or fixed effects model
6. Specify subgroups (if applicable)
7. Calculate the summary effect (per subgroup and overall)
8. Interpret results
9. Sensitivity analysis
10. Check for presence of publication bias
