Are we missing something? What are medical students missing out on, and why, when they are excluded from doctor patient encounters in general practice?

Yates, Natasha; Smith, Jane W; Ajam, Reza; Mellersh-Etherton, Holly-Jane

45 YEARS ANNIVERSARY
1973 - 2018
amee

25th to 29th August 2018
CONGRESS CENTRE, BASEL, SWITZERLAND

AMEE2018

Connecting at AMEE 2018

amee 2018
AN INTERNATIONAL ASSOCIATION FOR MEDICAL EDUCATION

AMEE Online Help Desk:
Need help or want to learn more about how to connect with AMEE Online? Why not visit our AMEE Online Help Desk located in the registration area,

Conference App:
Please consult our web-based App for Conference information. You can access the full programme and abstracts, and build your own schedule of sessions and presentations you would like to attend. You can also connect with AMEE Online: Facebook, Twitter, LinkedIn and YouTube Channels and upload your own photographs into the conference gallery. You can also take advantage of the 'Connect' feature to connect with other delegates. The App can be accessed on laptops, tablets and smartphones. Go to www.guidebook.com to download the Guidebook App and search for AMEE 2018.

Facebook:
Keep up to date with all AMEE news by 'liking' our Facebook page: www.facebook.com/AMEE.InternationalAssociationfor MedicalEducation

Twitter:
Follow @AMEE_Online and use hashtag #amee2018 to tweet about what you see and hear during the Conference. If you wish to tweet about a particular conference presentation remember to use the presentation hashtag e.g. #3D1.
If you are presenting at the conference you may wish to add your twitter name to your slides or poster. Look out for the screens throughout the exhibition area for the live twitter feeds.

LinkedIn:
www.linkedin.com/company/amee---internationalassociation-for-medical-education

YouTube Channels:
For a selection of videos and information related to AMEE Conferences and the MedEdWorld initiative, take a look at our YouTube Channels: AMEE_Online & MedEdWorldorg

MedEdWorld Forums:
MedEdWorld (www.mededworld.org) was launched by AMEE in a response to the identified need to create a more formal mechanism for AMEE members and others to keep in touch between AMEE conferences. MedEdWorld Forums are discussion threads on topics featured at AMEE 2018.
To access a Forum, go to www.mededworld.org and log in with your AMEE username and password. Click on Forums in the left menu and choose the most appropriate one for your post You can add your comments, join in the discussions, upload presentations and even arrange to meet other participants to follow up on the discussions face-to-face.

AMEE Live:
Sessions held in the Event Hall including the opening ceremony will be live streamed as well as interviews with speakers and participants through www.ameelive.org. Those unable to participate in person will be able to subscribe to the live stream and can take part in the discussions and ask questions of the speakers as an individual or with a group of colleagues. As a Conference participant you will also have free access to the recordings after the Conference, and can catch up with a session you missed when you're back home, except for Plenary 1 and 2, which will not be recorded. To access the stream either live or afterwards, simply go to www.ameelive.org and enter the username **amee** and password **basel2018**.

QR Codes:
You may wish to consider adding a QR code containing your contact information to your presentation slide or poster so that other delegates may contact you. For tips on how to do this, please see the videos available on the AMEE YouTube channel (AMEEOnline).

Videos and Photographs:
Please be aware that plenary and symposia sessions in the Event Hall will be live streamed and recorded for future use. Photographers will also be capturing the event. Images taken by our photographer will be posted on Facebook and Flickr. Also follow us on Instagram – AMEE_Online for photographs taken by the AMEE Team. Please feel free to tag us in your own photos and upload them to the Conference App and your own social media networks.

Sunday 26 August

1730-1915	Session 1		
	1	Plenary/Opening	Science fiction in medical education

Monday 27August

0830-0945	Session 2		
	2	Plenary	How to achieve the impossible
1015-1200	Session 3	**Simultaneous Sessions**	
	3A	Symposium	Not Your Mother's CPD! The Real World as we know it!
	3B	Symposium	The rise of virtual and augmented reality in medical education: are we breaking the final frontier in teaching?

	11A	Plenary	Broadening the Curriculum Beyond Bioscience

SESSION 1: Plenary

Sunday 26th August

1730-1900 hrs

1: Plenary: Science Fiction in Medical Education

Location: Event Hall
Date: Sunday 26th August
Time: 1800-1850 hrs

Bertalan Meskó
Medical Futurist
Director, Medical Futurist Institute

Summary: Disruptive technologies are changing how medicine is practiced and healthcare is delivered. All stakeholders of healthcare from patients to physicians should prepare to get the most out of the Digital Health revolution in a way that the human component remains the key. Education has great potentials in this if we all prepare.

Biography: Dr. Bertalan Mesko, PhD is The Medical Futurist analyzing how science fiction technologies can become reality in medicine and healthcare. As a geek physician with a PhD in genomics, he is also an Amazon Top 100 author. With 500+ presentations including courses at Harvard, Stanford and Yale Universities, Singularity University's Futuremed course at NASA Ames campus and organizations including the 10 biggest pharmaceutical companies, he is one of the top voices globally on healthcare technology.
Dr. Mesko was featured by dozens of top publications, including CNN, the World Health Organization, National Geographic, Forbes, TIME magazine, BBC, and the New York Times. He publishes his analyses regularly on medicalfuturist.com.

SESSION 2: Plenary
Monday 27th August
0830-0945 hrs

2: Plenary: How to achieve the impossible
Location: Event Hall
Date: Monday 27th August
Time: 0830-0945 hrs

Bertrand Piccard
Explorer
Chairman of the Solar Impulse Foundation

Summary: In order to achieve great things a pioneer spirit is necessary, together with a firm belief that change is required. All this is illustrated through Bertand Piccard's own experience with the Solar Impulse project.

Biography: With his dual identity as a medical doctor and explorer, Bertrand Piccard has become an influential voice heard among the most distinguished institutions across the globe as a forward-thinking leader in progress and sustainability. He is independent, not affiliated to a particular party or lobbying group, and as such is a trusted adviser and influencer for the development of new societal solutions, and a very sought-after speaker for private and public audiences.

It is in Bertrand's DNA to go beyond the obvious and achieve the impossible, as he did with his two round-the-world flights, recently in a solar-powered airplane, and before that non-stop in a balloon. The ocean depths and the stratosphere attracted his father and grandfather; the challenges of our time fascinate him. Rather than new territories, he wants to discover new ways of doing and thinking, in particular in the field of clean technologies for a better quality of life. Bertrand is the initiator and visionary behind Solar Impulse, the very first airplane capable of flying perpetually without fuel. Taking turns at the controls with André Borschberg for the first flight around the world on solar power, his ambition is to leverage pioneering spirit for a useful contribution to the cause of renewable energies. This is why he spent the last 15 years bringing together the major partners providing technologies and funds for this adventure. Together with his wife Michèle, he conceived the Solar Impulse project as a now widely recognized platform to raise public awareness and encourage political actions in favour of clean technologies and energy efficiency, the next stage of which includes the establishment to this end of the World Alliance for Efficient Solutions under the aegis of the Solar Impulse Foundation. The inspiration he received from other explorers and pioneers during his childhood gave him the desire to inspire young generations in return.

SESSION 3: SIMULTANEOUS SESSIONS
Monday 27th August
1015-1200 hrs

3A: Symposium: Not Your Mother's CPD! The Real World as we know it!
Location: Event Hall
Date: Monday 27th August
Time: 1015-1200 hrs

Organised by the AMEE CPD Committee:
Lawrence Sherman, Academy for Global Interprofessional Learning and Education, Geneva, Switzerland

Summary of theme and why it is important: CPD represents the longest and arguably the hardest part of a clinician's education. Hardest because it is often unstructured, and left to the learners to define their own journeys. In some regions of the world, CPD is more formal and uniprofessionals, while in other areas it is largely incidental and unregulated. The continuously developing field of Interprofessional continuing education (IPCE) will be a topic of focus as well. A very interactive format will engage all participants in the session from start to finish. The AMEE CPD will be the organizers of this session. This symposium will challenge the status quo, explore best practices, and talk about why CPD may not even be what you think it is.
Who should participate in the symposium? Participants should include those who are responsible for designing, developing, delivering, assessing, funding, participating in, and those with an interest in the topic. Those with innovative ideas, opportunities for global collaboration, and those who are just curious are encouraged to attend.
What will you gain from participating? Participants will gain a board perspective of the global differences in CPD, an opportunity to share their own best practices with colleagues from around the world, and to participate in the AMEE CPD discussion!

3B: Symposium: The rise of virtual and augmented reality in medical education: are we breaking the final frontier in teaching?
Location: Montreal, 2nd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Organised by the AMEE Technology Enhanced Learning Committee
Peter GM de Jong, Leiden University Medical Center, Netherlands (moderator)
Marlies EJ Reinders, Leiden University Medical Center, Netherlands (speaker)
Jennifer M McBride, Cleveland Clinic Lerner College of Medicine, USA (speaker)
Beerend P Hierck, Leiden University Medical Center, Netherlands (speaker)
Goh Poh-Sun, National University of Singapore (speaker)
James D Pickering, University of Leeds, UK (speaker)
Jos van der Hage, Leiden University Medical Center, Netherlands (opening discussant)

Summary of theme and why it is important: Virtual Reality (VR) and Augmented Reality (AR) are some of the most recent digital technologies being introduced in healthcare education with a potential to fundamentally change teaching. These technologies allow either an actual, simulated or augmented view of a real-world environment to be virtually projected, and provide opportunities for students to engage in unique learning experiences. Through the use of these computer-generated images, students can be exposed to virtual patients and to modern hospital settings in a safe environment that is able to be repeated numerous times. Currently, there is interest in the feasibility of applying these technologies in teaching medical students. Can they lead to curricula that require less training performed on patients or in stressful and chaotic high tech patient care environments? Do AR and VR help students better interact with concepts, functions or structures that are extremely difficult to visualize through traditional means, or prepare for surgical procedures that require knowledge of complex anatomical structures? This symposium will present state-of-the-art examples of the use of VR and AR in medical education, such as a 360 degree virtual operating theatre and a hospital setting of a ward round, and the use of holographic imagery in the anatomy curriculum. Theoretical perspectives regarding the pedagogy of VR and AR will be presented, alongside the importance of real-world training, with views on the extent to which these new technologies should either supplement or replace the current teaching models.
Who should participate in the symposium? This symposium will be beneficial to all involved in healthcare education who have an interest in virtual and augmented reality technologies, and who would like to learn more about utilising these technologies in their own teaching. It will also be of interest to those who are involved in longer-term policy-making for healthcare education programs.
What will they gain from participating? Participants in the symposium will gain a better insight into the current state-of-the-art of VR and AR techniques, their feasibility in today's teaching, the current obstacles for implementation, and the value and role of these technologies in the upcoming years.

3C: Symposium: Equity in the global health sciences education community: levelling the playing fields?

Location: Sydney, 2nd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Manuel João Costa, School of Medicine, University of Minho, Portugal
Susan Van Schalkwyk, Stellenbosch University, Centre for Health Professions Education (CHPE), Stellenbosch, Western Cape, South Africa
Ming Jung-Ho, National Taiwan University, Graduate Institute of Medical Education & Bioethics, Taipei, Taiwan
Marco Antonio Carvalho-Filho, School of Medical Sciences, University of Campinas, Brazil
Lambert Schuwirth, Flinders Medical Centre, Flinders University, Australia

Summary: The global health professions education (HPE) community is growing exponentially. This growth ought to be mirrored in concomitant changes in the way in which HPE is practiced, in particular in the context of global health education, and in the way in which it is researched. In this symposium we explore the extent to which the expanding global community is experiencing participation in the sector, acknowledging that current literature suggests that most innovations and knowledge about health professions education originates from very few countries. Specifically we hope to provide an analysis of key bibliometrics related to HPE research with a view to providing insight into the current status quo. Thereafter we present work that has explored issues of 'powerful knowledge' and 'dominant discourses', and how these can influence the extent to which meaningful participation in a community of practice can be enabled or constrained leading to global players feeling either alienated or engaged. According to Wenger, 'belonging' is enabled in three ways: through engagement, imagination and alignment. Engagement in this context is seen as doing things with others within that community of practice. Imagination refers to a cognitive act of seeing oneself as a member of that community (a reconstruction of an existing identity or the construction of a new identity or identities). Alignment speaks to facilitating a synergy between the new ways of thinking and doing that a newcomer may introduce, and the more established practices within the community. Finally, we present perspectives from a newcomer researcher situated in a traditionally less participatory country and from a director of a research centre and experienced journal editor as to how they currently experience 'the playing field'.
The symposium is important because it will
Encourage reflection and debate on how the health sciences education community is moving forward;
Examine whether the worldwide education community is:
1. taking in contributions from everyone; 2. non-intentionally privileging particular cultures (the westernization hypothesis);

Provide insight into how colleagues across the world are seeing, finding and overcoming barriers to participation; Start a conversation about dominant discourses and practices, and how to reframe.
Who should participate in the symposium? Delegates who:
- Have ideas or concerns with participation/equity issues across the global health sciences education community;
- Would like to contribute to the conversation of examining and promoting international equity in the field;
- Participate as leaders of international programs, journals, meetings, etc…;
- Hold responsibilities in national communities related to the field and would like to participate in a discussion about national participation in the international playing field;
- Researchers and academics devoted to equity issues
What will they gain from participating?
- An understanding of asymmetries across the world
- An awareness of perspectives from across the community
- Insights and ideas to shift the status quo

The effect of effort-reward imbalance and overcommitment on academic engagement and burnout among medical students

Authors
Jung Eun Hwang
Na Jin Kim
Nani Kwon
Su Young Kim

Presenter: Jung Eun Hwang, College of Medicine, The Catholic University of Korea, Seoul, South Korea

Background: Academic engagement is a notable factor in higher education that predicts academic achievement and satisfaction. In contrast, 50-60% of medical students suffer from academic burnout. Recently, academic burnout and negative psychosocial consequences in adolescence have been explained by effort-reward imbalance model. Out of previous studies, influence of overcommitment varied depending on participants or outcome variables. Therefore, this study investigated effect of effort-reward imbalance on academic engagement and burnout of medical students.
Methods: Online questionnaires were sent to premedical, medical students in the Catholic University of Korea. Ninety-eight students responded to the survey. Effort, reward, effort/reward (E/R) ratio, overcommitment, academic engagement, academic burnout, and negative affect were assessed. We used hierarchical regression analysis to examine effects of demographic variables, negative affect (confounder), effort, reward, E/R ratio, overcommitment, E/R ratio X overcommitment (interaction) on academic engagement and burnout.
Results: For academic engagement, reward had a significant impact on academic engagement, after all variables had been added. The interaction term also influenced academic engagement at significance level of 0.1. That is, in the group with E/R ratio below 1, academic engagement was high regardless of level of overcommitment. However, in the group with E/R ratio more than 1, academic engagement decreased only when overcommitment was low. As for academic burnout, affiliation, age, negative affect, and reward significantly predicted academic burnout, after all variables had been entered.
Conclusion: This research explained medical students' academic engagement and burnout with an effort-reward imbalance model. The variable that commonly affected academic engagement and burnout was reward (respect from professors and fellow students, having a positive prospect for academic achievement). In addition, high overcommitment buffered negative impact of effort-reward ratio on academic engagement, as opposed to previous research that overcommitment aggravates negative impact of effort-reward imbalance. Among medical students with chronic academic stress, highly overcommitted students may continue to engage in learning, but less overcommitted may not. To reduce medical students' academic burnout and improve engagement, a learning environment to foster their esteem and positive prospect for academic achievement is needed.

The association between burnout and depression in medical students

Authors
Orla Fitzpatrick
Regien Biesma
Ronan Conroy
Alice McGarvey

Presenter: Orla Fitzpatrick, Royal College of Surgeons in Ireland, Dublin, Ireland

Background: Burnout and depression have emerged as priority mental health issues in universities and medical schools as evidence begins to accumulate showing the next wave of medical health professionals suffer from alarming rates of both. We aimed to quantify and understand burnout and depression in a medical student population, comparing the early and later years of medical education, as well as exploring the relationship between the extent of burnout and likelihood of depression.
Methods: A survey was conducted among 269 medical school students in both preclinical and clinical years at the RCSI. Students were asked to complete the Beck Depression Inventory (Fast Screen) and the Maslach Burnout Inventory (Student Survey). Burnout scores were calibrated to probability of depression caseness and classified as low risk (< 25%), intermediate (25-50%) and high risk (> 50%) of depression.
Results: The results showed a 39% (97/251) prevalence of depression based on a Beck Depression Inventory Fast Screen tool, and this did not vary significantly between clinical and preclinical years. The rate of burnout varied significantly between years (p=0.032) 35% in the high burnout category in clinical years compared with 26% in preclinical years. Those in the low, intermediate and high burnout categories had a 13%, 38% and 66% prevalence of depression, respectively.
Discussion: Burnout increases significantly as the learning environment changes between the early and later more clinical years. The severity of burnout correlates with the prevalence of depression. This highlights the importance of changing current types and delivery of welfare support in the RCSI, and indeed other medical colleges, to resolve the developing mental health difficulties in medical students as they progress through their medical education and into the workforce
Conclusion: There is a wealth of evidence indicating the need for changing strategies in tackling mental health issues in medical students, ones that should be begin early in students medical education in an effort to prevent the

worsening mental health associated with progression through medical school.

Stress and Management among Medical Students in Chiang Rai Hospital, Thailand

Authors
Narisararat Triamvisit, Faculty Of Medicine, Chiang Mai University, Chiang Mai, Thailand
Vich Thampanya, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Kittirat Netrkaew, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Chulaphong Chan-Ta,Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand

Presenter: Narisararat Triamvisit, Faculty Of Medicine , Chiang Mai University, Chiang Mai, Thailand

Background: The Medical Education Center of Chiang Rai Hospital (MECCR) is responsible for providing education and clinical clerkships (4th-6th years) for medical students. The new study environments which is different from the pre-clinical years at Faculty of Medicine, Chiang Mai University may create stress for these students.
Methods: To study the stress and depressive mood in our medical students, and how they deal with these issues, online anonymous questionnaires regarding stress patterns and management were created. Both stress and depressive mood were evaluated by standard questionnaires; Suan Prung Stress Test-20 (SPST-20) and a 9Q questionnaire, respectively. Data was analyzed using descriptive and logistic regression to identify factors associated with stress and depressive mood.
Results: In 2017, ninety-six of 104 medical students, primarily 4th-year (43.8%) responded. Overall, sixty-one students (63.5%) had a high-stress level and forty-eight students (50%) showed a depressive mood. The high-stress level that developed in 71.4% of the 4th-year students, was higher than in the 6th-year students (45.8%). Students with a high-stress level were 8.4 times more likely to develop a depressive mood compared with low-stress students (OR = 8.46, 95% CI = 3.19-22.38, p < 0.001). The factors associated with stress were major ward rotations (Internal medicine, Surgery), shortened time for final examinations and personal factors e.g., time management and health problems (p < 0.001). The top three solutions for relieving stress were resting (31.2%), watching media and/or listening to music (29.2%), and social media usage (15.6%).
Conclusion: Medical students under high-stress tended to have a depressive mood, especially in some specific ward rotations. Good support systems including mentors, institutional resources, and facilities might help them to deal with the stressful events. Appropriate extracurricular activities should be arranged to suit the medical students' preference such as meditation/mindfulness, music therapy, and sports.
Medical students have a high-stress level and depressed mood especially, when their learning environments change. Teachers should identify the high-risk students early and then take proper actions.

Mindfulness-Based Cognitive Therapy (MBCT) as a Well-Being Programme for Medical Students: Evaluation of a Pilot Programme

Authors
Wong SYS
Lee KP
Zhang DX

Presenter: Samuel Y.S. Wong, The Chinese University of Hong Kong, Hong Kong

Background: Psychological distress and burnout is common among medical professionals and medical students. Studies suggested that mindfulness-based interventions may improve well- being and reduce psychological distress among medical students.
Methods: Two mindfulness-based cognitive therapy (MBCT) classes were piloted; each class was conducted by an academic family doctor and a social worker/psychologist. A mass email was sent to all medical students of the Chinese University of Hong Kong in May, 2017 to invite them to join a 2-hour weekly MBCT for 8 weeks. The MBCT programme was run from July to August, 2017 and a questionnaire consisted of General Health Questionnaire (GHQ-12) and questions asking students' preferences for time and location of programme in addition to a question rating the importance of MBCT course was distributed to all students before and after each course.
Results: A total of 38 medical students from all years joined the 8 week program and 22 questionnaires were returned (58%). Only 16 students have completed both pre and post questionnaires and the results were analyzed using paired t test for comparisons. There were significant improvement of GHQ-12 score from 3.38 (3.03) to 0.81 (1.38) with p = 0.0055. The majority of respondents agreed the best time to run MBCT was during the summer before the start of semester (86%). They agreed that the teaching hospital was the most optimal location to run the course (82%). On a scale of 1 to 10 to rate the importance of MBCT to them, 82% rated the course as important to extremely important (a score of 6 or above).
Conclusion: It is feasible to run mindfulness-based course for medical students and may be useful for them to reduce psychological distress during their medical training.

Educational justice and its relation to Academic Burnout in Medical Students

Authors
Zahra Abbasi Shaye,Clinical Research & Development Unit, Akbar Hospital, Mashhad University of Medical Sciences, Mashhad, Iran
Zahra Mostafavian,Department of Community Medicine, Mashhad Branch, Islamic Azad University, Mashhad, Iran

Presenter: Zahra Abbasi Shaye, Clinical Research & Development Unit, Akbar Hospital, Mashhad University of Medical Sciences, Mashhad, Iran

Background: Academic burnout is the feeling of inadequacy and mental fatigue induced by chronic stress in students lacking the necessary resources to carry out their duties and tasks assigned to them. Some people believe that fair communication between teacher and student and encouraging students from the professor can lead to a reduction in students' academic burnout.
Methods: The present study was a descriptive-analytic cross-sectional study. The research population was medical students of Islamic Azad University of Mashhad in the year of 2017.The subjects were entered into the study by target- based sampling method.The instruments used in this study included two questionnaires of educational justice and academic burnout.
Results: 117 basic sciences medical students were entered in the study.The mean age of participants was 21.63 ± 2.78 and 69.2% (81) were female. In academic burnout the highest score was related to emotional exhaustion (38 ± 9.40) and the lowest score was related to academic unwillingness (8.73 ± 4.22). The score of educational justice was 56 ± 16.The total scores of academic burnout (r=-0.4 p-value: 0.0001), emotional exhaustion (r=-0.4 p-value: 0.001) and academic unwillingness (r=-4.8 p-value: 0.001) had statistically inverse significant relationship with educational justice score, and the only branch of educational inadequacy was not statistically significant with educational justice (r=-0.1 p-value: 0.26).
Regarding the results of this study and the relationship between educational justice and academic burnout in students, the creation of fair educational opportunities by professors, directors and heads of universities should be considered. Managers and heads of educational institutions can change the beliefs and views of the professors in the positive direction, by creating the same facilities for all students at the university level and creating workshops and appropriate training programs that help create educational justice through a similar and neutral approach to the students.
Conclusion: Educational justice can affect students' academic burnout and help their academic achievement so that attention to providing educational justice for students especially among medical students is necessary and appropriate solutions should be made to resolve it.

A nationwide questionnaire examining the impact of a time limiting structural reform on the mental health of medical students in Denmark

Authors
Andrea D. Maier
Linnea T. Gerdes
Annarita G. Andersen
Eva Rudjord
Maria Vestager

Presenter: Andrea Maier, The Danish Association of Medical Students (FADL), Copenhagen, Denmark

Background: Politicians in Denmark have recently enacted strict time limits for students to complete their university degrees and for young doctors to begin their speciality training. The Danish Association of Medical Students (FADL) designed a questionnaire in order to better understand how the pressure from these new policies affects the behaviour and mental health of medical students.
Methods: A nationwide questionnaire examining medical students' satisfaction with their clinical training, the amount of career guidance, and their mental health was completed by 2883 medical students evenly distributed among all semesters of the four medical faculties in Denmark. Results were compared to the 2015 questionnaire to show changes over time since the introduction of the new policies.
Results: Key points from the questionnaire:
33% of Danish medical students have been engaged in a research project, and 62% are doing it to strengthen their curriculum vitae.
67% feel pressured by the strict time limits, and 85% believe that the postgraduate time limit for choosing speciality will give them less clinical experience.
55% are struggling with mental health problems including stress or anxiety, and 70% of these have sought professional help from a psychologist.
85% believe that the time limit policies contribute to the increasing stress among the students.
Discussion: The questionnaire shows that Danish medical students are shifting their extracurricular activities towards improving their curriculum vitae through research and clinical training that is not already in the curriculum. With less time to immerse themselves through education and student life, more and more are experiencing symptoms of stress and burnout before finishing medical school and more students seek professional help in order to cope. When implementing new policies it is important to consider the possible effects on students' opportunities for professional development and their mental health.
Conclusion: Structural changes in the education system, leading to a more rigid temporal structure of the medical education, encourages medical students to increasingly spend their spare time on CV-improving activities and creates a stressful environment among students.

Elizabeth Howey, McMaster University, Hamilton, Canada
Geoffrey Norman, McMaster University, Hamilton, Canada

Presenter: Sandra Monteiro, McMaster University, Hamilton, Canada

Abstract Text:
Introduction: A core component required of CBME is demonstration of competence prior to unsupervised practice. Therefore, there is a need to develop a new set of assessment instruments that determine competent practice in an authentic environment. While many skills must be evaluated in a context or specialty specific manner, visual diagnosis is a complex task nearly universal to medicine. X-rays and (often ECGs) are part of internal medicine, surgery emergency medicine, pediatrics, radiology and related subspecialties. The goal of the current study was to develop an assessment tool that establishes a benchmark of performance for diagnosing ECGs and lung radiographs.
Methods: Using a speeded protocol in which participants view diagnostic images for very brief time windows, we tested physicians' sensitivity to detecting abnormalities in ECGs and lung radiographs. This protocol has been shown to discriminate between novices and experts when diagnosing mammograms, however this is the first attempt to use this protocol as a competency assessment tool. We consulted experts from Radiology and Cardiology to develop materials for each specialty/format of imaging. Residents (12) and staff physicians (17) in Emergency Medicine were recruited as participants. Each participant completed two versions of the study. In both versions participants viewed diagnostic images and indicated whether the image was clinically normal or abnormal. Version 1 contained 100 ECGs and version 2 contained 100 lung radiographs. In each version, 50 images were normal and 50 were abnormal. Images were displayed at one of four time windows: 175ms, 250ms, 500ms and 1000ms. Images and timing windows were counterbalanced to ensure a balanced design. For each participant, we calculated a d' statistic as a threshold independent, normally distributed measure of accuracy, at each exposure time. The goal was to measure increasing d' from shorter to longer viewing times and also from less to more experience.
Results: Average d' was 0.83 for ECGs and 0.97 for radiographs. Critically, d' for junior residents was lower, (0.95) than senior staff (1.12) for radiographs. Similarly, d' for junior staff and residents was lower (0.79) than senior staff (0.87). As shown in previous studies, d' was smallest for the shortest viewing time, on average (0.72) at 175ms compared to (1.10) for 1000ms for both versions.
Discussion & Conclusion: The current study demonstrates the potential for using speeded tests as indicators of experience and competence. While in-depth data gathering and additional diagnostic testing may help confirm a working diagnosis, physicians rely only on their own experience to determine if there is any underlying pathology present in a diagnostic image. The study is a novel approach to isolating the effect of direct experience on clinical expertise.

Gerda Croiset, VUmc School of Medical Sciences, Amsterdam, Netherlands
Rashmi A Kusurkar, VUmc School of Medical Sciences, Amsterdam, Netherlands

Presenter: Marianne Mak-van der Vossen, VUmc School of Medical Sciences, Amsterdam, Netherlands

Abstract Text:
Introduction: Evaluation of medical students' professional performance is difficult. Standardized narratives or 'profiles' offer a promising approach to evaluate performance and can facilitate identification of students who could benefit from remediation. In earlier research, three different profiles of medical students' unprofessional behaviours were identified: 1)Poor reliability; 2)Poor reliability and poor insight; 3)Poor reliability, poor insight and poor adaptability. The factor distinguishing between these three profiles appeared to be the capacity for self-reflection and adaptability.(1) Adding information that is generally agreed upon by experienced faculty could elaborate on these findings and underscore its use for the evaluation of professional performance. The aim of this study was to confirm and improve the profiles.
Methods: To confirm and improve the profiles we used Nominal Group Technique, a consensus method in which participants discuss and rank their perspectives on a certain concept.(2) We collected quantitative (rankings) and qualitative (interview) data through meetings with panels of faculty from different medical schools in the Netherlands, purposively sampled for their knowledge and experience in assessment and remediation of students

displaying unprofessional behaviour. Two experienced researchers facilitated the meetings (in pairs). After a presentation of the three profiles, participants individually generated supportive and additional ideas to strengthen and improve the profiles, and subsequently took part in a group debate about their ideas. Finally, they individually ranked the top 5 of all generated ideas, by giving 1-5 votes. The researchers adopted the five highest ranked ideas (receiving the most votes) as the group's consensus. The qualitative data analysis was done by two researchers who initially coded two transcripts of the group debate independently, and established a codebook after several cycles of reading, coding, and discussing. One researcher coded all transcripts using the codebook, discussing any difficulties with the second coder. By iteratively checking our findings, we ensured that conclusions were grounded in the data. The results were finalized through discussions in the full research team.

Results: We performed five nominal group meetings at five different medical schools in the Netherlands, with a total of 30 participants (5-8 participants per group). Participants were content with the three profiles, in which they recognized 'real' students. From 11 ideas to improve the profiles, the top 5 (combined receiving 85% of all votes) were: 1)Emphasize that the profiles represent a continuum, in which profile two and three can only be discovered after following the student over time (32%); 2)Add a profile describing students who are willing to change, but fail to show improvement because of limited skills (17%); 3)Specify that students can initially present themselves with all kinds of unprofessional behaviour, not reliability concerns exclusively (16%); 4)Allow for differences between the student profiles based on cultural aspects (12%); 5)Indicate that behaviours are not conclusive, but that the ability to reflect and adapt is crucial (8%).

Discussion: This study further developed an overview of stakeholders' opinions on the evaluation of professional behaviour in undergraduate medical education. Empirically found profiles were confirmed and elaborated on by experienced faculty. Additional information included that experienced faculty wish to follow students over time to discover students' reflexivity and capacity to adapt. Willingness to change and ability to improve are considered critical competencies for future doctors. These findings could add to remediation frameworks that are currently being developed within medical education, aiming to define expertise to conduct effective remediation.

Examining practice effects with an Online Situational Judgement Test (CASPer)

Authors
Christopher Zou, Altus Assessments, Toronto, Canada
Patrick Antonacci, Altus Assessments, Toronto, Canada
Harold Reiter, McMaster University, Hamilton, Canada
Kelly Dore, McMaster University, Hamilton, Canada

Presenter: Kelly Dore, McMaster University, Hamilton, Canada

Abstract Text:
Introduction: Most standardized tests offer applicants the opportunity to retake the test if they did not perform as well as they would have liked. However, retest or practice effects may compromise the validity of the test if it introduces construct irrelevant variables, such as increased familiarity with the test content from their initial attempt or using enhanced test-taking strategies during the retake. Many medical school applicants are unsuccessful on their first attempt and reapply in subsequent years, so practice effects are of a concern for any test used during the medical school admissions process. However, not all tests are equally susceptible to practice effects, with some tests even showing no improvement with subsequent performance. In this presentation, we examine practice effects for one test in particular that is being quickly adopted across medical programs around the world (CASPer) and outline a number of features of the test that make it resilient to practice effects.

Methods: We collected data from all CASPer test takers from 2015 to 2017 across several health science programs. First, we examined if students retaking CASPer in a subsequent application cycle improved their scores on their second try (n=2,110). Second, we examined if students improved their scores when retaking CASPer in another region (e.g., Canada to USA) during the same application cycle (n = 2,432). Lastly, we examined whether we may see improved performance within the test, where student performance may improve as they progress through the test and are exposed to more content (n=70,702).

Results: There was a mean increase in score of 0.5 points out of 9 possible points among students who retook the test in a subsequent application cycle. There was a mean increase of .32 points out of 9 among students who retook the test in the same application cycle in another geographic region. Looking within the test, there was no increase nor decrease in CASPer scores as students progressed through the test. Across these three datasets, we do not see any evidence of practice effects for CASPer.

Discussion and Conclusions: Test administrators often need to be wary of practice effects, as they may compromise the validity of the test. This is especially true in contexts such as medical school admissions where a significant proportion of applicants retake the test. However, the literature has found inconsistent effects of practice across various tests, with some tests showing little to no benefit with subsequent retakes. In a high-powered study across three independent analyses, we found very small evidence of practice effects for CASPer,

an online Situational Judgement Test. Its practice effects were substantially smaller than what is typically found with other types of tests (e.g., knowledge tests, personality tests). This suggests that students do gain little to no benefit from seeing content prior to taking the CASPer test.

3E4 (152)
A cost-description study of the OSCE in medical education

Authors
George Rivers, Monash University, Melbourne, Australia
Stephen Maloney, Monash University, Melbourne, Australia
Jonathan Foo, Monash University, Melbourne, Australia
Dragan Ilic, Monash University, Melbourne, Australia

Presenter: Jonathan Foo, Monash University, Melbourne, Australia

Abstract Text:
Introduction: The utility of an assessment method can be conceptualised as a function of its reliability, validity, educational impact, acceptability, and cost (van der Vleuten, 1996). The objective structured clinical examination (OSCE) has been evaluated for many of these properties, however the latter of these – cost – has been largely overlooked. In assessment, there are fixed costs which only occur once regardless of how many times it is used (e.g. the cost to write an OSCE scenario), and there are variable costs which increase with use (e.g. examiner time). Knowledge of how costs fall into these two categories assists with decision-making into cost-effective OSCE design, with implications across the number of OSCE stations, the use of sequential testing, and the cost of repeat assessments. Our research aims for this study were to: 1. Calculate OSCE fixed and variable costs, and 2. Calculate the additional cost of the OSCE when used as a repeat assessment.
Methods: A cost-description study was conducted based on the MBBS program at Monash University, Australia in 2017. The Monash MBBS has approximately 500 students per cohort, who complete 10 8-minute OSCE stations per semester. Costs included development of OSCE scenarios, training of assessors and simulated patients, assessor and simulated patient time, facilities, organisation, and administration. Costs were categorised into fixed (cost always occurring), station-variable (cost varying based on the number of OSCE stations), and student-variable (cost varying based on the number of students). All costs are in 2017 Australian Dollars.
Results: For the Monash MBBS, the total OSCE cost is $204,503 for 500 students with 10 OSCE stations. The largest component of this cost is examiner time at $155,720 (76%). There is a $2,441 fixed OSCE cost, which occurs regardless of the number of OSCE stations or number of students. Keeping the number of students constant, the cost to add (or savings by removing) one station, is $17,085. On the other hand, keeping the number

of stations constant, the cost to add (or savings by removing) one student, is $376. Assuming a failure rate of 5%, the cost of repeat assessments is $6,148 (25 students with 5 OSCE stations).
Discussion & Conclusion: This study investigated OSCE costs according to the number of stations and number of students. The average cost per student in this study ($409) is lower than that reported in a 2013 study of £483 (approximately $850), which utilised 15 8-minute OSCE stations (Brown, Ross, Cleland, & Walsh, 2015). When used for repeat assessment, certain fixed costs are not incurred, lowering the average cost per student to $246.
The relatively large station-variable cost highlights the need for cost-effective OSCE design to consider the number of stations used. Concepts such as sequential testing may enhance the cost-effectiveness of OSCEs. Another potential area of cost-savings is examiner time, being the largest cost component. Solutions may include using 'best-fit' approaches to matching examiner experience with station content, avoiding utilising over-qualified examiners, without compromising assessment properties.
Consideration of these factors is not new. However, the calculation of costs in this study provides a logical framework and objective criteria for educators to evaluate their OSCEs against, facilitating explicit cost-consideration in striving for 'good value' in assessment.

Does Emotional Intelligence at Medical School Admission Predict Licensing Examination Performance

Authors
Timothy J. Wood, University of Ottawa, Ottawa Canada
Susan Humphrey-Murto University of Ottawa, Canada
Geneviève Moineau, University of Ottawa, Canada
Melissa Forgie, University of Ottawa, Canada
Derek Puddester, University of Ottawa, Canada
John J. Leddy, University of Ottawa, Canada

Presenter: Timothy Wood, University of Ottawa, Canada

Abstract Text:
Introduction: Many medical school admissions committees are seeking alternatives to cognitive measures when selecting students for entry to medical school. Given the importance of physician skills like communication, empathy and interpersonal abilities, assessing a non-cognitive skill at admissions like emotional intelligence (EI) is of interest. EI has been described as the ability to monitor and discriminate one's own and others' emotions and to use this information to guide reasoning and actions. Higher EI scores have been reported to contribute to improved doctor-patient relationship, increased empathy,

teamwork and communication skills. If EI is to be used as an admissions criterion, it is important to demonstrate the degree to which it can predict future performance.

The purpose of this study is to compare EI scores at admissions to medical licensure scores. It is expected that EI scores should be poorly correlated to aspects of a licensure examination that measure basic medical knowledge and clinical decision making, but should be correlated with scores that measure patient interaction skills. Presumably, the ability to recognize emotions in one's self and others would improve patient-physician interactions.

Methods: All medical school applicants offered an interview in 2006 and 2007 were invited to complete the Mayer-Salovey-Caruso Emotional Intelligence Test (MSCEIT v2.0), an abilities test of EI, at the time of their interview. Students were then tracked through medical school into licensure. EI scores were correlated to student scores on the Medical Council of Canada Qualifying Examination (MCCQE). The MCCQE Part I is written at the end of medical school and is designed to examine basic medical knowledge and clinical decision making. The MCCQE Part II is attempted after one year of clinical post-graduate training and is designed to measure clinical skills related to history taking, data acquisition and patient interaction skills. Pearson correlations were used to compare participants' MSCEIT scores with their overall MCCQE Part I and MCCQE Part II scores.

Results: Of the 206 participants who had both MSCEIT and MCCQE Part I scores (2006 = 105, 2007 = 101), the correlation between measures was $r(204) = .01$ 95% CI [-.13, .15]. Of the 201 participants who had both MSCEIT and MCCQE Part II scores (2006 = 102, 2007 = 99), the correlation between measures was $r(199) = .05$ 95%CI [-.09, .19].

Discussion and Conclusion: The low correlations between EI scores and licensure scores replicate other studies that have found weak correlations between EI scores and scores on other tests administered at admissions and during medical school. However, there are also studies that have found significant correlations between EI scores and other measures. Given that an important aspect of validity is that scores that measure similar constructs should be related, the non-significant correlations we found and the variation in findings compared to other studies might lead one to question the validity of using EI as a non-cognitive measure for admissions. On the other hand, it is possible that EI is measuring something completely different from other assessments tools and therefore the results are encouraging. Currently, it is not clear which of these interpretations is most accurate but caution should be used if one is planning to use EI as an admissions tool.

The interdependence of clinical performance: Advancing assessment in the age of entrustment

Abstract Text:
Introduction: The ability to assess independent trainee performance is a key element of competency-based medical education (CBME). In clinical workplace-based settings, however, trainee performance can be deeply entangled with others on a healthcare team. This presents a fundamental challenge. Given the need to assess trainees based on the evolution of their independent clinical performance, we set out to better understand what faculty and trainees characterize as independent performance in a variety of clinical specialty contexts.
Methods: Following constructivist grounded theory, and using both purposive and theoretical sampling, we conducted individual interviews with 11 clinical teaching faculty and 10 senior trainees (PGY4/5) across 12 postgraduate specialties. We sought a diverse sample because we anticipated that trainees' independent clinical performance would be portrayed differently in various specialty programs. Constant comparative inductive analysis was conducted. This is an iterative process by which regular data analysis meetings influenced subsequent data collection and consequent data analysis. Our approach also included strategies to return findings to the broader, interdisciplinary research team and physician stakeholders for refinement, elaboration, and transferability.
Results: According to participants, independent practice is an exception, not the norm in clinical workplace-based settings. While the ordering of medications, tests or imaging were most frequently cited as types of performance depicted as independent, many faculty participants explained that such performances, even when they appear independent, are often interdependent or 'coupled' with another team member. This usually tends to occur because trainees' clinical actions and decisions are regularly influenced by communication and consultation with other team members. Furthermore, the nature and degree of interdependence that exists depends on the clinical context and the type of supervision provided. In our data, we identified three configurations of coupling: 1) coupling between trainees and supervisors; 2) coupling between trainees at various levels of training; and 3) coupling between trainees and other healthcare team members such as nurses, social workers, and laboratory technicians.
Discussion: Trainees rarely, if ever, perform independently in the clinical workplace. Most often, their performance is interdependent, most notably with their supervisor. This has critical implications for workplace-based assessment in terms of the feasibility and accuracy of measuring trainees' competence. Many psychometric and assessment approaches have independence assumptions, which are not currently being met in the context of clinical workplace-based settings. Thus, we require models and approaches that can identify, and account for, interdependence and coupled performance. We propose that the conceptualization of coupling can be used as a starting point to allow us to better distinguish independent from interdependent trainee performances so that we begin to assess interdependent performances as interdependent.
Conclusion: These findings call into question the assumption of independent performance in clinical workplace-based settings, and offers an important step toward accurately measuring coupled performance. As the adoption of CBME continues to become widespread, we need methods and approaches to capture interdependent performance, which traditionally have been masked as independent markers of competence. Our understanding of coupling can help to better distinguish independent and interdependent performances, so that we are clear when we are measuring each in our implementation of CBME.

Abstract Text:
Introduction: In clinical emergencies, individual health care providers must perform as a team.
The importance of leadership, situational awareness, and closed-loop communication has been the focus of previous research on teamwork. However, these factors relate to individual performances and we currently see a shift in conceptualization of team competence expanding the individualistic discourse with an added collectivistic approach to competence.
The social construct of teamwork is not fully understood. Recent studies outside the domain of medicine suggest that social ties and especially affective factors among team members may influence team performance and patient satisfaction.
The role of social ties among emergency team members and their influence on patient satisfaction are not known. Hence, the research question was
What is the association between social ties within obstetric teams performing simulated emergency caesarean sections and simulated patient ratings?
Methods: During our annual team training, two hundred seventy two participants were allocated to 33 teams, who performed a simulated emergency caesarean section. A trained midwife portrayed the mother in labour. Training covered all aspects of clinical management.
Before training, we collected data on participants´ professional (n=21 features), personal (n= 21 features) and affective ties (n=42 features) to other team-members. In addition, we collected data on participants´ knowledge of role-distribution within the team and demographic data as gender, age, clinical experience and performed number of caesarean sections (n=25 features). Simulated patient satisfaction was measured on a global rating scale. To capture the complexity of the network structures, the large set of associations was analysed by machine learning approach, elastic net. Elastic net is a linear regression using LASSO and Ridge penalty. We used Cross-validation (leave-one-out) to increase power of model estimates. Analysis included Bonferroni correction. P-values < 0,01 were considered significant.
Results: In total, 109 associations were analysed including 84 related to social ties and 25 related to role distribution and demographics. Of 84 associations reflecting social ties 50% had significant association with patient satisfaction. Of the 25 associations reflecting role-distribution and demographics, only 4% had significant association with patient satisfaction.
Of 44 significant associations, 27 were related to a high patient satisfaction and 17 to a low patient satisfaction. High patient satisfaction was associated with the following ties: Affective (n=12, 44%), Professional (n=8, 30%) and Personal (n=7, 26%). In associations with low patient satisfaction the representation of ties was: Affective (n=10, 59%), Professional (n=2, 12%) and Personal (n=4, 24%). Many "Year since graduation for Obstetric consultant" was the only demographic feature that significantly associated with low simulated patient ratings (n=1, 6%).

Discussion: This study shows that Social ties represented the majority of associations related with simulated patient satisfaction. Our results indicate that affective ties are more important for patient satisfaction than professional and personal ties. In clinical practice professionals may assume that they are able to act as professionals and that, affective ties in the team have no influence on atmosphere and teamwork. Our findings question this assumption. Future studies are needed to investigate to what extend social ties impact on team performance and whether enhancing social relations between co-workers in practice or during training interventions may improve patient satisfaction and team performance.
Conclusion: Social ties between members of emergency teams may have significant impact on patient-perceived quality of care. Affective ties are more important than professional and personal ties.

'It's not just about getting along': Discourses of Collaboration and Team Learning

Authors
Maria Athina (Tina) Martimianakis, Department of Paediatrics and Wilson Centre, University of Toronto, Toronto, Canada
Shirley Tse, Department of Paediatrics, University of Toronto, Toronto, Canada
Rayfel Schneider, Department of Paediatrics, University of Toronto, Toronto, Canada
Maria Mylopoulos, Department of Paediatrics and Wilson Centre, University of Toronto, Toronto, Canada

Presenter: Maria Athina (Tina) Martimianakis, Department of Paediatrics and Wilson Centre, University of Toronto, Canada

Abstract Text:
Introduction: The construct of team learning refers to workplace learning that helps clinical teams develop competency in collaborative practice. By applying a governmentality theoretical framework and using a data collection approach that combines text analysis, observations and informal and semi-structured interviews, we studied how sub-specialty paediatric rheumatology trainees are socialized into a team orientation through exposure to day –to- day team interactions that were not previously conceptualized by their training program to be part of their formal curriculum.
Methods: We conducted 72 hours of observation at a complex care paediatric setting through 24 visits and 10 semi-structured interviews with participating Subspeciality Fellows health care professionals. We also compiled an archive consisting of hospital text, posters, strategic plans, and gray literature etc which related to team function and interprofessional collaboration (N=362). We used critical discourse analysis to describe how values of collaboration enabled team learning and theories of expertise to understand how expertise was enacted, negotiated and performed. Specifically, we were attentive to shifts in organizational rationales and priorities in relation to team practice and team learning at our chosen study site and tried to establish the organizational markers of success

trainees and faculty may be working to fulfill in their day to day interprofessional activities. We applied the theoretical framework of governmentality to capture institutional discourses related to team practice and individual professional rationales for participating in team care. The theoretical frameworks of adaptive expertise and situated cognition informed deductive analysis related to team learning and team decision-making.

Results: The notion of "team" took shape around the patient conceptually and formatively. All members of the division and the unit had a clear understanding of each other's role and function. The Fellows acted as an appendage of physician, a new form of apprenticeship, empowered by the nuances of the workplace and a culture of collaboration. They were treated as knowers and decision makers by other members of the team, while the culture of collaboration allowed them to slip into learner mode at any point in time to access input, support and expertise from other members of the team, avoid mistakes, ensure efficiency of care, and become better at their task. Clinical reasoning and expertise were very closely associated to being collaborative. Stereotypical functions of the Physician as having the final say were contested by daily exhibitions of humbleness and openness to new knowing and understanding. Cognition was perceived as distributed and mediated through relationships, while learning was perceived and experienced as ongoing and the responsibility of the entire team. This appreciation of learning as dynamic, was perceived to be a by product of collaboration which has validated and enabled a sharing of expertise that is multidirectional. Knowledge flow was organized around notions of continuity of care and problem solving. The acuity of patient care in this complex setting has set of tone of cooperation and humbleness that has been generative and productive.

Discussion and Conclusions: We have critically examined institutional mandates and processes related to team practice to understand the relationship between discourse, professional identity formation and team learning as a socio-cultural and cognitive process. We have begun to catalogue examples of team learning in the clinical context specific to rheumatology practice, and contribute to the literature on how work place learning can be operationalized in sub-specialty rheumatology curriculum development.

Abstract Text:
Introduction: As trainees share experiences during interprofessional (IP) clinical training, they may also develop shared understandings – or shared mental models – around critical aspects of clinical practice: patient care, professional roles and teamwork. However, little is known about how health professional trainees construct knowledge while working together. To address this gap, we use Gunawardena's knowledge construction (KC) framework[1] to explore KC in IP student teams as they work together to evaluate and make treatment recommendations for patients who have fallen in a skilled nursing facility. We explore patterns of participation among the students and describe facilitators and barriers to KC in IP student teams.

Methods: We developed a 2-week, IP clinical elective in which students from medicine (MD), pharmacy (PH) and physical therapy (PT) cared for multiple geriatric patients. One author (LCF) took extensive field notes as the students worked together during preparation, patient interviewing and care planning (~3 hrs./week/team). After developing initial coding categories based upon Gunawardena's[1] KC framework, we applied directed, qualitative content analytic techniques[2] to transcribed field notes from the observations of three teams (Team 1, 2 and 3; ~18 hrs. total). We applied our coding scheme, focused on five KC levels [Level I – share and compare; Level II- exploration of dissonance; Level III- knowledge co-construction; Level IV – knowledge application; Level V- summarization/agreement] as well as facilitators and barriers to KC, to observed behaviors, individual utterances and interactive dialogue.

Results: KC at the lowest level of interactivity [Level I] predominated in all teams. At this level, students did things such as explain aloud their clinical reasoning process, with no discussion. Students also frequently demonstrated Level III interactions as they planned how they would approach the patient exam or strategized chart note development. Students in Teams 1 and 2 rarely interacted at Levels II, IV and V, but interactions at these levels were more frequently observed in Team 3. KC facilitators included: peer teaching; perspective sharing; and inclusive team behaviors. KC barriers included: lack of learner engagement, working in parallel rather than collaboratively and, in Team 2, pervasive exclusion of one team member.

Discussion: In this study, we found that KC in IP students occurred primarily at the lowest level of interactivity [Level I], but with some evidence of co-construction [Level III]). Based on characterizations of KC facilitators and barriers, two general contextual factors affected KC level: 1) team

composition (e.g., learners' clinical experience; team dynamics) and 2) patient characteristics ((i.e., features of clinical presentation may interest some learners more than others (e.g., medication issues might be less relevant for PT)).

Conclusion: Higher levels of KC support higher levels of learning during team-based activities.1 Our findings suggest that students may not be maximizing the learning opportunities afforded by IP clinical team activities and highlight potential contextual factors educators may be able to adjust through more deliberate design of IP learning activities. Future work can build on findings from this small study to investigate how educators might support higher-level KC by designing IPE curricula to deliberately prompt knowledge co-construction, application and team consensus-building.

A new wave? A proposal for the future of education for collaboration

Authors

Elise Paradis, Leslie Dan Faculty of Pharmacy, University of Toronto, Toronto, Canada
Cynthia R Whitehead, The Wilson Centre, University of Toronto and University Health Network, Toronto, Canada

Presenter: Cynthia R Whitehead, The Wilson Centre, University of Toronto and University Health Network, Toronto, Canada

Abstract Text:

Introduction: Interprofessional education (IPE) is an increasingly popular educational intervention that aims to educate healthcare students to be better collaborators by enabling them to learn "with, from and about each other" (CAIPE 2002). This rising popularity is visible in the explosion of scholarship on IPE over the past decades, as well as in the multiplication of countries where this scholarship is produced (Paradis & Whitehead, 2015). This presentation briefly describes three historical "waves" of IPE, the limitations of the current wave, and argues for a new fourth wave of education for collaboration.

Methods: This paper provides a critical narrative review of the literature on IPE (defined here as undergraduate or pre-licensure large-scale interventions), with a specific focus on critiques of interprofessional education that arise from social scientific perspectives. It also builds upon the authors' previous historical and critical work.

Results: We identified three discursive waves in the IPE literature, which unfolded historically but did overlap: "managing the workforce through shared curriculum" (1954-79), "maximizing population health through regulation" (1978-2000), and "fixing individuals to fix healthcare" (1999-present). Insights from the social sciences show six reasons why the third, contemporary wave of IPE is likely to fall short of its aims: IPE (1) is logistically complex and costly, (2) is often developmentally inappropriate, (3) has not yet demonstrated impact on key outcomes, (4) insufficiently engages with social aned educational theory, (5) avoids power and conflict, and (6) puts undue burden on individuals working in an inertial system.

Discussion & Conclusions: Given the importance of teamwork in many accreditation standards and for high-quality healthcare delivery, we must teach our students how to collaborate. How we do this remains open to debate. We propose what we call a "fourth wave of education for collaboration," which we label "addressing workplace systems and structures." Our research suggests that the following approach is the most likely to be effective: to combine (1) uniprofessional education for collaboration that helps students learn the key skills of collaboration while also addressing issues of power, conflict, and structure with (2) practice-based team learning activities that address local issues and build local skills, and (3) work to address systems and structures that constrain collaborative care. By the end of this presentation, attendees will be able to identify the current limitations of IPE interventions, and will hopefully be inspired to transform the way they think about and enact education for collaboration.

The Global Health Classroom: Experiences and learning outcomes of collaborative global health learning between New Zealand and Samoan medical students in a virtual classroom

Authors
Tim Wilkinson, University of Otago, Christchurch, New Zealand
Susan Jack, University of Otago, Dunedin, New Zealand
Jen Desrosiers, University of Otago, Christchurch, New Zealand
Malama Tafuna'i, National University of Samoa, Samoa
Philip Pattemore, University of Otago, Christchurch, New Zealand
Andrew Miller, University of Otago, Christchurch, New Zealand

Presenter: Roshit Bothara, University of Otago, Christchurch, New Zealand

Background: Global Health Classroom (GHCR) is a virtual case-based collaborative global health learning model being developed and delivered at the Otago Medical School, New Zealand (OMS) in partnership with Patan Academy of Health Sciences, Nepal (PAHS) and School of Medicine, National University of Samoa, Samoa (NUS).
Method: The project explored the learning and experiences of New Zealand and Samoan medical students in the GHCR, and ascertain the key elements contributing to their learning and experience. A mixed-method study approach using a post-GHCR questionnaire and semi-structured interviews. A triangulation approach informed the synthesis of the data.
Results: Of the participants, 85% (74/87) responded to the post-GHCR questionnaire. Nineteen semi-structured interviews were conducted: 13 OMS students and six NUS students. Students reported gaining knowledge about patient care, healthcare systems, and the culture and determinants of health, with regards to their partner country. There was evidence that attitudes such as cultural understanding and respect were promoted among students by their GHCR experiences. A majority (64%) of students reported increased interest in learning about global health after their GHCR experience. Reported outcomes in the GHCR align favourably with the recommended global health learning concepts in the literature.
Discussion: Key elements that promoted learning in the GHCR were: use of clinical cases and global health-themed guiding questions, teachers as facilitators not deliverers of content, promotion of students as self-directed learners, peer learning, social interactions, and video-conferencing. Students in the GHCR found that learning with their international peers in a virtual classroom made learning about global health "more real and tangible" and "much more accessible than learning on a purely theoretical basis."
Conclusion: The findings of this study suggest that GHCR presents a promising global health learning model with core values of partnership, collaboration and reciprocity between medical students and institutions. GHCR continues to be delivered at the OMS, with plans to extend partnership to other overseas medical schools. Medical schools in different countries can partner together to deliver global health learning for their students by integrating the GHCR into their curriculum.

The Purple List - a gay dementia venture. Diversity and Professionalism

Authors
Janine Henderson

Presenter: Janine Henderson, Hull York Medical School, York, UK

Background: Moving from largely university-based education to full immersion in clinical environments is a critical point for medical students and the development of constructive attitudes and professional behaviours. There are difficulties inherent in 'teaching' in this area, navigating the generation gap to facilitate learning of important, sensitive information. For some, professionalism also fails the student 'legitimacy test', lacking the objective scientific parameters that define much of the core curriculum. But 'Medical Education must aim to transform students into 'the sort of person' who does the kind of work that doctors do in the real world' (Langendyk et al 2017), a challenging area.
This abstract describes the delivery and evaluation of a short play delivered to third-year students at the Hull York Medical School.
Method: In developing students as humanistic, sensitive practitioners, we adopted a transformative approach to learning (Mezirow 1990) to challenge established views, whilst engaging and 'entertaining' without patronising. 2 of our talented Simulated Patients had written 'The Purple List'- a one-act drama, delivered as a monologue, in which Sam enacts his own, and husband Derek's, experiences as Derek's dementia progresses over 2 years, which we used as a basis for a powerful learning experience. We developed a workshop in consultation with the author/actor based on this intense, emotive drama which raises important issues around professionalism, diversity and humanistic care. The 40-minute play was followed by facilitator-led reflective workshops.
Results: The students` response to the play was overwhelmingly positive. They were engaged, moved, empathic and clearly immersed in the story. Their animated and insightful discussions demonstrated a level of engagement with the core issues which students acknowledged would not be likely with a more traditional educational approach. Structured reflective feedback was collected from all 140 students.
Conclusion: Students found the play challenging and emotive and their detailed feedback confirmed the

transformative impact of the experience. Feedback identified clear changes in perspective and professional attitudes and sensitive consideration of the core issues, with identified achievable aims for personal change in the future.

Take-home message: Carefully-constructed arts-based teaching can be powerful tool for teaching professionalism

Battling the tedium: an engaging, value-driven orientation for undergraduate students at AKU

Authors
Saad Zubair, AKU, Karachi, Pakistan
Aisha Sanober, AKU, Karachi, Pakistan
Ayesha Mian, AKU, Karachi, Pakistan
Asfandyar Butt, AKU, Karachi, Pakistan
Amin Lakhani, AKU, Karachi, Pakistan

Presenter: Ayesha Mian, AKU, Karachi, Pakistan

Background: The Aga Khan University (AKU) was established in the early 1980s as the first private university in Pakistan. While excelling in academics, student life and experience were not formally addressed. An Office of the Dean of Students was created in 2017 to adopt a more student-centered approach to teaching and learning. The Office identified core values of Innovation, Collaboration, Compassion, Advocacy, and Leadership as guiding principles for the AKU ethos and as the basis for developing an integrated longitudinal curriculum for all undergraduate students.

Method: A three-day orientation program was developed as an immersive introduction that would lead in to the above-mentioned longitudinal curriculum. The curriculum was standardized across the Medical College and School of Nursing and Midwifery and used experiential sessions built around teamwork and collaboration to emphasize the AKU core values. Pedagogy included case-based exercises, reflections, role-plays, peer feedback, appreciative inquiry, and brief inspirational presentations by experts. Learning Circles spanning the three days grouped students in a safe learning environment. Hackathon-like groups sustained student engagement throughout the program. Leadership was showcased through an interactive panel discussion featuring student-centered faculty leaders. The Implicit Association Test introduced students to the concept of unconscious bias. Students wrote a note to their future selves envisioning their own personal and professional development over the course of their program.

Results: Daily feedback and structured evaluation forms were used to measure program efficacy. Students completed an Emotional Intelligence scale and a Professional Identity Formation questionnaire. Students' responses were overwhelmingly positive in both written and oral feedback.

Discussion: According to our literature review this may be the first time an orientation program has been designed or implemented in Pakistan or South Asia that focused on student wellness and was informed by an institution's guiding principles.

Conclusion: Demonstrating the cultural ethos of an educational institution from day one may allow institutions to effectively foster their core values within students. Early emphasis on student wellness, critical thinking, and collaborative practice are likely to affect student sense of belonging, retention, and engagement.

3G4 (967)
An experiencing method for guiding students into the psychiatric patients' world - the application of social drama

Authors
Gin-Hong Lee, Department of Clinical Psychology, Fu Jen Catholic University, New Taipei City, Taiwan
Ming-Teh Lin, Department of Clinical Psychology, Fu Jen Catholic University, New Taipei City, Taiwan

Presenter: Gin-Hong Lee, Fu Jen Catholic University, New Taipei City, Taiwan

Background: To empathize with other people is difficult, not to mention empathizing with peculiar psychiatric patients. We created an innovative world in the classroom via social drama, hoping that students can empathize with the patients' internal suffering and social stigma more deeply.

Method: The authors invited two drama experts to assist teaching in the psychopathology class in 2017. Eleven graduate students participated in three 3-hour sessions of social drama class. Before the three sessions, students read two first-person narrative novels on schizophrenia and manic depressive psychosis patient respectively. Through a series of warm-up, enactment and sharing, the experts led students to experience hallucination, moodiness, family quarrels and social stigma. The quantitative evaluation method was designed according to the concepts of engagement with the arts, constructing of new meanings and translation into practice (Haidet, et.al., 2016).The qualitative data of videos, observation records and students reflection notes was also collected and analyzed.

Results: All of the quantitative measurement reached the statistical significance difference (Mean>3, p<.05). The qualitative analysis indicated that through embodiment and group interaction, students vividly experienced (1) the patients' long-term suffering and helplessness, (2) the family conflicts and the reactions from outside world, (3) a gentle and well-intentioned attitude toward all the roles involved in the stories. The author will introduce the various guiding skills in the presentation.

Conclusion: In sum, the educational impact brought by social drama is excellent. This method created a breakthrough for empathy teaching. Under some circumstances, specific students had difficulty in role-playing or role-creating. Further skills need to be developed for individual needs.

Take-home message: The social drama is a remarkable method for students to get into the psychiatric patients' world of disease suffering and social refusal.

3G5 (1272)
Escape Game as a Theatre-Based Simulation for Teamwork Skills Training in Undergraduate Medical Education

Authors
Anthony Seto, University of Calgary, Calgary, Canada

Presenter: Anthony Seto, University of Calgary, Canada

Background: One use of theatre-based simulation in undergraduate medical education is teaching around clinical content. This education innovation uses an escape game as a non-clinical simulation to gamify teamwork skills training, with focus on the collaborator CanMEDS role. An escape game tests teamwork skills by having groups solve puzzles in order to escape a room within a time limit.
Method: A simulation theatre from the University of Calgary was transformed into an escape game. Second year medical students piloted the escape game, designed to surface teamwork competencies from the four University of Calgary Team Scheme domains (adapted from CIHC's National Interprofessional Competency Framework and TeamSTEPPS™): Leadership/Membership, Communication, Situation Monitoring, and Collaborative Decision-Making/Mutual Support. Post-game, students engaged in a debrief and written reflective exercise to critically analyze successes and challenges in demonstrating Team Scheme competencies and propose solutions to challenges. Students then documented up to 3 goals on how they would further apply teamwork competencies to their own practice and/or life.
Results: Through the escape game pilots, students were able to demonstrate teamwork competencies, under every Team Scheme domain, which they will need to apply when collaborating with teams in future simulations and clinical practice.
Discussion: Advantages of this innovation include its use as an acclimatizer to the simulation training environment and process, portability and low start-up cost, transferability to non-medical disciplines, and customizability of puzzles to target specific objectives. The escape game will launch in Intro to Clinical Practice, a second-year medical student course at the University of Calgary.
Conclusion: A teamwork simulation, in the form of an escape game, enables medical students to apply and demonstrate teamwork skills, identify strengths and challenges in their teamwork skills, and discuss areas of teamwork skills needing improvement.

Examination Man: Using QR Codes to Connect Medical Students to Education Materials

Authors
Gurdeep Seyan
Georgia Layton
Izu Chukwulobelu
Phil Jevon
Steven Webb
Jonathan Pepper

Presenter: Gurdeep Seyan, Walsall Healthcare NHS Trust, Birmingham, UK

Background: Quick Response (QR) codes are used in all aspects of society and industry; bridging the gap between physical and digital worlds and allowing for quick easy access to interactive information through printed media. QR codes have previously been used in healthcare to connect patients with healthcare information, however, there is little published work exploring the use of QR codes to connect medical students to clinical learning resources. We aimed to establish a way to to connect medical students with educational materials at the point of need.
Method: Pre-interventional qualitative analysis was undertaken to establish the number of students with access to a smart-phone and barriers to acquiring practical skills through traditional paper-based methods. Following this, we developed a to-scale human body model with systems-based clinical examination videos accessible via static QR codes printed upon the model. The codes could be exploited using free mobile applications.
The large printed poster was displayed in communal student areas. Approximately 80 students had access to the poster. A qualitative post-interventional analysis gained student feedback. Online analytics services allowed number and duration of video views to be monitored for quantitative usage analysis. All medical students in our establishment have access to smart-phone technology.
Results: Feedback showed students found this to be an interactive and engaging learning tool by provision of instant access to high-quality educational resources. Students reported that the project had helped them to over-come self-identified difficulties that accompany development of practical and clinical skills from static, printed media.
Conclusion: QR codes allow dissemination of large amounts of information in an easily accessible, low-cost manner. Dynamic QR codes would allow for linked content to be updated regularly without having to reprint or repeatedly disseminate the new updates and is scope for further development of this project in future.
Take-home message: QR codes allow for interactive and engaging learning to take place instantaneously at the point of contact, are well received by medical students and their use to enhance learning should be further explored.

Nancy Davies, University of Leeds. Leeds, UK

Presenter: Caitriona Dennis, University of Leeds, UK

Background: 75% of teaching on the Leeds MBChB occurs on placement, delivered by clinical and non-clinical professionals, many of whom have no formal educational training. Teaching is driven through faculty development and technological innovations from the medical school but challenges to consistency exist due to the dispersed and diverse nature of the faculty. TimetoTeach is an innovative communications approach to provide accessible and convenient faculty development in spite of time constraints and lack of resources within the healthcare environment.

Initiative: TiMEtoTeach is an educational outreach initiative. Ambassadors of the MBChB (staff, students and members of the Patient and Carer Community) visit placements providing bespoke training and 'pop-up' Continuing Professional Development sessions, supporting transition into teaching and enabling those who wish to develop. By supplying bespoke educational guidance, the importance of high quality teaching, assessment and feedback is promoted, engaging staff, patients and public in shaping Tomorrow's Doctors. This ensures sustainable growth of the medical education community and promotes an excellent educational experience for students.

Our visits directly answer the requests of educators, patients and public to know more about delivery of medical education. We ensure all placements hear about good practice, and place their teaching in context with the rest of the curricula, thereby increasing capacity and enhancing capability of faculty.

Without focussed visits to practice areas we miss a significant opportunity to ensure consistent teaching of the curriculum to secure an excellent student learning experience and increase competence and confidence through reward and recognition.

By tailoring visits to medical educators, support for teaching has become efficient, accessible and focussed. Outreach in placement areas has raised awareness of medical education, encouraged enthusiastic teachers and provided a consistent message from the medical school. Through building relationships, we can help support development of future medical educators.

Conclusion: Faculty Development opportunities can be flexible yet directed. Outreaching in the workplaces promotes working in partnership and encourages all to develop their educational skills within a community of practice.

Walking the Footsteps and Feeling the Pain: Patientization

Authors
Jamie Lim
Tham Kum Ying

Presenter: Jamie Lim, Tan Tock Seng Hospital, Singapore

Background: In 2013, the first cohort of students from Lee Kong Chian School of Medicine (LKCMedicine) arrived in Tan Tock Seng Hospital for Hospital Week (HW) Orientation. The objective is to immerse students in the "real world" and through experiential learning, walk the patients' footsteps.
Method: Moving away from the traditional all-physician-orientation, each team of 6 students was assigned to one medical discipline, co-supervised by a physician and a non-physician. Within safety guidelines, supervisors planned a 5-day-program that allowed students to experience the typical patient's journey. Supervisors were reminded not to teach doctoring skills. The outcomes were (1) to present a 5-minute performance on the theme "My Patient's Journey" on Day 5 and (2) every student would complete a 500-word reflection.
Led by a Cardiologist and an Advanced Practice Nurse (APN), the students started at the Emergency Department triage area. On Day 1, one student was "patientized" i.e. immersed into patient's role: diagnosed with a heart attack, whizzed into resuscitation area, had a 12-lead ECG performed, spoken to by the cardiologist about treatment, and rushed to the Invasive Cardiac Lab for coronary angiogram. For the rest of the week, other students volunteered to be "patientized": wore patient's hospital attire, hooked to multiple cables in Coronary Care Unit, assisted for hygiene needs and had cardiac echocardiogram performed, restrained for being "uncooperative", ate special diet and received counselling from other healthcare professionals.
The supervisors debriefed the students at the end of each day and they wrote daily reflections and shared their "Ah-Ha" moments. Team performances on Day 5 reflected the students' understanding of their patient's experiences.
Results: Overall, HW received overwhelming positive feedback from students, supervisors and faculty and is now a signature program in LKCMedicine.
Conclusion: Active learning in almost-real situations shifted students from passive-observation to committed-participation and "patientization" has creatively transformed an orientation process.

3H2 (3215)
Change and process management for future doctors: Leading positive change with a teaming mindset

Authors
Sigrid Vest Arler, Central Region Denmark, Corporate HR, Aarhus, Denmark
Rasmus Thøger Christensen, Department of Clinical Medicine, Aarhus University, Denmark
Marie Højriis Storkholm, Medical Management Centre/LIME Karolinska Institutet, Stockholm, Sweden

Presenter: Sigrid Vest Arler, Central Region Denmark, Corporate HR, Aarhus, Denmark

Background: Change and process management for future doctors: Leading positive change with a teaming mindset Physician leadership can improve hospital performance in terms of care quality, costs, social responsibility, staff satisfaction, information technology adoption and reform approval. Yet, leadership skills or medical management has not traditionally been taught in Danish Medical Schools. In 2017, we introduced an optional course that combined personal leadership, "teaming" and development of innovative solutions to leadership challenges. The focus of the course was on teaching personal leadership and teaming leadership practices, while solving real managerial leadership challenges together with clinical leaders.
Method: A mixed method study was conducted to evaluate the extent that students obtain the intended learning outcomes and how students' general self-efficacy was affected. A questionnaire was distributed before and after the month-long course together with a summative course evaluation. Moreover, a focus group interview was conducted one month after students finished the course.
Results: The course differently affected student´s self-efficacy, dependent on their baseline score. Students with a high baseline score seem to develop more self-awareness and realize that teaming skills are highly necessary to lead positive change in health care, and as a result scored significantly lower after the course, while students that scored below average had a tendency to improve their score after the course.
Teaming leadership practices; especially creating psychological safety and learning form failure was highlighted by students. Furthermore, they describe a new awareness of the importance of teamwork in their future medical practice; a positive feeling of becoming less self-confident and able to admit "mistakes" and reflect with peers.
Conclusion: This presentation provides a visual tour of the students' journey through the course elements in a challenging learning environment.

Virtual Reality Fully Immersive Interactive Videos as a new teaching tool

Authors
Thomas Judd, Musgrove Park Hospital, Taunton, UK
Nicola Cook, Musgrove Park Hospital, Taunton, UK
Ian Hunter, Musgrove Park Hospital, Taunton, UK
Alexander Young, Virti, Bristol, UK

Presenter: Thomas Judd, Musgrove Park Hospital, Taunton, UK

Background: With the birth of the smart phone there is now a rapid expansion in the use of this technology to improve and enhance medical education. A recent literature review by Valle et al. (2017) concluded "Smartphone use is clearly an effective and efficient method of enhancing patient care and medical education in the health care industry."
The "Virtual patient" is not new to medical education. Kononowicz et al. (2015) explored what was meant by virtual patients in educational literature stating, "The primary form of Virtual Patients in the educational literature are Interactive Patient Scenarios despite rapid technical advances that would nowadays support more complex applications."
Method: Recent technology advancements allow a smartphone to be converted into a virtual reality headset. We have developed a method of Virtual Reality Fully Immersive Interactive Technology Teaching (VR FIITT) where a student may be fully immersed in a virtual reality teaching scenario. We are at the stage of starting research projects to assess students' performance of resuscitation skills, if trained with the interactive videos or standard teaching methods. The students are able to receive live feedback on their performance which can then be sent to the students' educator to review trend in performance and areas for improvement.
Conclusion: This new technology has multiple applications across the whole of medical education, and can be applied to undergraduate as well as postgraduate training.
In this presentation we will discuss the applications for this technology, and touch on what is now meant by the term "Virtual patient".

3H5 (1441)
Future Doctors collaborating for change for vulnerable communities

Authors
Shilpa Suresh
Margot Turner
Isabelle Guest

Presenter: Shilpa Suresh, St George's University of London, UK

Background: Thirty years ago, the Edinburgh Declaration encouraged medical education to train future doctors to be more effective at meeting the needs of society. As students at St George's we are encouraged to understand the contribution of community health projects whilst also being encouraged to give back to the community we have trained in. We will visually introduce the audience to some of this work and the outline the development of a community conference which grew out of a need we identified on a short course on sexual violence. Statistics have shown there has been a 53% increase in "honour" based violence and some studies have shown that women present five times to a doctor before being killed. On our placements, we found out anecdotally that organisations were struggling to know where to refer people affected by familial violence. We will present the work we have undertaken and our project of setting up a collaborative conference on familial violence (including forced marriage, "honour" based violence, and witchcraft). St George's is located within a diverse community which includes the groups most often affected by famial violence. We invited a variety of community, voluntary and religious organisations as well as doctor, midwives, social workers and police to work with senior health care students to share practice and challenges and worked towards identifying strategies to improve outcomes for people affected by familial violence. We will present the evaluation from this day, a snap shot of the discussions and outcomes for future practice.
Conclusion: Developing a conference has been invaluable experience to us as future doctors and helped us understand how we may be able to affect change for some of the most vulnerable patients we will be working with in future.

3H6 (1087)
Build it, and they will come? A need to move beyond Knowles theory of andragogy for busy residents

Authors
Daniel Nicklas, University of Colorado School of Medicine, Aurora, USA
Lindsey Lane, University of Colorado School of Medicine, Aurora, USA
Janice Hanson, University of Colorado School of Medicine, Aurora, USA

Presenter: Daniel Nicklas, University of Colorado, Aurora, USA

Background: We thought that if we built Pediatric Primary Care Curriculum (to be amazing), the residents would come (and engage in the curriculum). We relied on Knowles theory of andragogy, a seminal education theory that emphasizes respect for learners' independence and posits little need for extrinsic motivation. We thought that residents' intrinsic motivation to meet children's primary care needs would motivate them to engage.

Method: We implemented an inverted classroom model, aiming for strong learner outcomes. Curricular content was delivered weekly with multi-modal opportunities to engage, including 10-minute peer-reviewed readings (Yale Primary Care Pediatric Curriculum), short resident-made quizzes, and resident-made one-page "Fast Facts," all delivered with links in a weekly email and organized by a learning management system (LMS) for mobile access anytime.

Results: An annual review revealed that 50% (53/105) of residents had never accessed the curriculum on the LMS, although they had asked for availability on this platform. Only 3% of residents visited half or more of topics; 7/49 topics were visited on average. Only 37% of residents completed quizzes; on average, even these completed just 8% of quizzes.

Discussion/Conclusion: Reflecting on our failure to engage the residents we wondered if the busy clinical environment, with little time arranged for independent learning, overwhelmed their intrinsic motivation to learn. We plan to shift our focus from topics to their motivation. We hope that self-determination theory with its emphasis on autonomy, competence, and relatedness will provide clues to intrinsic motivation.

We know now that building a curriculum is not enough. We suspect that using the curriculum as the basis for resident reflection-in-action and in-the-moment faculty coaching and assessment during patient care may build motivation by supporting residents' autonomy, increasing their awareness of their competence, and creating meaningful relationships for learning. If we partner with them in a different way, perhaps they will "come".

3H8 (992)
Learning medical practices: moving beyond a cognitive perspective

Authors
Anneke van der Niet, Maastricht University, Maastricht, the Netherlands

Presenter: Anneke van der Niet, Maastricht University, Maastricht, Netherlands

Background: Although there is increasing awareness that learning entails more than an isolated individual gaining knowledge, the dominant theory in medical education is still focused on this individual acquiring rational knowledge that can be carried over. Moreover, it is suggested that this learning process is taking place solely in the head of the individual, reducing the human body to a brain that is positioned on top of an otherwise uncontrolled body. These cognitive theories advocate that individuals will gain medical knowledge by building models (scripts, schemas or representations) in the brain. When the learner is presented with a clinical case, the features of this case will be compared with the model stored in long term memory. Over time, the models will be developed and extended. Context is now sometimes added to this model, atop of underlying core psychological processes. In this presentation, I will explain why these theories fall short to explain learning and performance in the complex and dynamic context of medical care. I will introduce an alternative theory in which the learner and the environment form the unit of analysis. The theory of affordance perception implies that learning is about finding differences in the world rather than building generalities in the brain. Knowledge is not seen as a context free, abstract set of ideas to be stored in memory, knowledge is a context dependent activity of individuals in their environments. When a task is performed, a coordinated system of organism and environment is formed based on the available affordances. By practicing this task, the relationship between body and world for that particular task is modified, including how materials and other persons act in this practice. This theory offers a way to understand learning in the sociocultural medical context and forms a basis to understand transfer of learning across situations.

Contents and conceptions - evaluation for change

Authors
Katrine Wennevold, University of Tromso, Tromso, Norway
Sean McAleer, University of Dundee, Dundee, UK

Presenter: Katrine Wennevold, University of Tromso, Norway

Background: At the Medical School at the University of Tromso, Norway, assessment practice has more or less remained the same since the Medical School opened in 1973. All summative written exams have traditionally been in the format of short answer questions. Clinical skills are tested by long oral cases, which is a format generally perceived in current medical education literature to have low reliability and be too subjective. While evidence based medical education internationally over the last decades has increasingly used psychometrics in assessment evaluation, the Medical School at the University of Tromso has never evaluated its assessment system. This study seeks to investigate how an exam performs upon critical evaluation, given this lack of quality assurance procedures. Also, the teachers constitute the faculty responsible for assessment, and their conceptions are crucial in order to understand why this Medical School has not concerned itself with recommended best practice in assessment.
Methods: The year six written exam was chosen for analysis as this is the most important exam due to its high-stake, certifying nature. Exams from 2013-2016 were analysed looking for evidence of reliability and validity. In addition, questionnaires were used to explore teachers' conceptions of the year six written exam in particular and assessment in general.
Results: The results showed that there was little evidence of validity or reliability for the year six written exam. However, the teachers' conceptions of this exam is that it is valid and necessary to test cognitive knowledge.
The lack of evidence of validity and reliability of the year six written exam is mirrored in a national scepticism towards assessment that probably shapes opinions of the teachers and current assessment practice. Information on teachers' conceptions is important to understand current practice, and in order to invoke change.
Conclusion: Introduction of better quality assurance measures in assessment is very important, and should receive urgent priority by stakeholders. Using a combination of content analysis and investigation of conceptions are helpful tools in a needs analysis for the change of quality assurance policies.

3I2 (722)
A Scoping Review of the Use of Certainty Ratings in Educational Assessments

Authors
Anna Ryan
Marcia Chew
Terry Judd
Mike Tweed

Presenter: Anna Ryan, University of Melbourne, Australia

Background: For health professionals, the ability to self-regulate practice and learning is highly valued. The challenges of self-assessment are well recognized. Educators, including within the health professions, search for robust methods of assessment to highlight misconceptions. Certainty rating is one way to shed light on this and to differentiate misinformed and uninformed responses in knowledge assessments. With the increasing use of such scales in written and computer-based assessments, it is critically important to understand the types of scales and their application.
Methods: To address this aim we conducted a scoping review using Arksey & O'Malley's approach. We included all English language publications concerning empirical research into certainty scales in written assessments in secondary, tertiary or college settings. 14,075 references were found across Medline, CINAHL, PsycINFO, EMBASE, ERIC and Education Complete Research databases, and through reference checking. Title and abstract screening refined this 278, and full text screening revealed 167 articles for charting, collating and summarizing.
Results: We charted the year, country, study population, type and aims of the study, and field of research. Certainty ratings were used: at both a micro (item) and a macro (entire test/assessment) level; in a wide variation of assessment formats (written, computer based); and with different stakes (summative and formative). We found disparity in terminology used (eg. certainty, surety, confidence) and the type of scale used (eg. Likert, visual analogue). The conceptual frameworks and intent behind the use of certainty in different assessments influenced the outcomes explored and conclusions drawn.
Discussion/Conclusion: Certainty rating is one method of providing insight into metacognitive processes underpinning assessment responses. There is large variation in the types of scales and their utility in different contexts. We found two key approaches: the first being instructor driven and aimed at improving the assessment of learners (e.g. minimizing guessing); and the second learner driven and associated with self-regulation (what do I know/need to work on).
Health professional educators need to choose the scale that best suits their intended educational outcomes. This scoping review is an important resource for health professionals considering use of certainty ratings.

3I3 (820)
UCAN: 13 years of experience in cooperative medical assessment

Authors
Konstantin Brass

Presenter: Konstantin Brass, Insitute for Communication and Assessment Research, Heidelberg, Germany

Background: In order to face the current challenges in medical assessment, institutions have to cooperate more intensively. To this end, the Umbrella Consortium for Assessment Networks (UCAN) was formed 13 years ago as a platform for inter-institutional, academic and non-profit cooperation. Today, 66 schools, boards and councils from eight countries work closely together to combine and optimize their resources, to share their knowledge, to engage in collaborative research and to develop new methods and standards to establish quality-assured exams. In the presentation, the work results of UCAN will be discussed to showcase the potential of collaboration in medical assessment.
Methods: In 2005, UCAN developed a platform for authoring, sharing and reviewing items and exams. Since 2007, exams can be delivered on computers or on scanner-readable sheets, evaluated with automated test-statistics and graded with customizable algorithms. In 2010, a Simulated-Patients-Database was added to administer the simulated patients programs. Since 2012, OSCEs and MCQ exams can be delivered on tablets. Since 2013, a competency-based progress test is delivered online at (currently) 15 institutions.
So far, 8000 colleagues added more than 350,000 items to the common platform. Best practice examples for reliable exams, assessment contents and workflows are collected and implemented at the partner institutions. New formats for item and exam formats are continuously developed. So far, over 6 million students were successfully assessed in 20,000 exams.
Especially with the upcoming conceptual, logistic and developmental challenges associated with the shift from knowledge to competency-based assessment, tie-ups are highly recommendable.
13 years of cooperation in a collaborative network has proven to be an efficient way to face new challenges in medical assessment.
Assessment institutions should work together in order to tackle common challenges. 13 years of successful cooperation at UCAN proves this approach to be both innovative and feasible.

3I4 (1212)
Can we use multiple choice questions to assess public health, sociology, psychology and research methods? Data from the UK Medical Schools Council Assessment Alliance question bank

Authors
Eleanor J Hothersall, University of Dundee, Dundee, UK
Sean McAleer, University of Dundee, Dundee, UK
Susie Schofield, University of Dundee, Dundee, UK
Veena Rodrigues, University of East Anglia, Norwich, UK

Presenter: Ellie Hothersall, University of Dundee, UK

Background: UK medical schools increasingly use multiple choice questions (MCQs) in summative assessment. This will probably increase with the proposed introduction of a national licencing exam in 2022. The topics of public health, sociology, psychology and research methods (PHSPRM) are often included in MCQ assessments. However, there is currently no evidence that MCQs constitute a valid method of assessment for PHSPRM topics. The Medical Schools Council Assessment Alliance (MSCAA) has a national bank of MCQs covering the UK undergraduate medical curriculum.
Method: MSCAA MCQs were identified systematically. Questions were categorised by learning outcomes, cognitive skill, topic, content and task. Questions with performance data were described as "high" performing using a cut-off of discrimination or point biserial ≥0.2.
Conclusion: 113 were identified which were "live" (either validated (10) or unvalidated (103)). 26 questions were psychology (23.0%); public health 36 (31.9%); research methods 47 (41.6%) while sociology had 4 (3.5%). 89.4% of questions assessed comprehension and application, 8.0% knowledge, and 2.7% problem-solving. Mean facility overall was 0.55 (standard deviation 0.27), mean discrimination 0.15 (0.12), and mean point biserial 0.09 (0.12). There were significant differences between learning outcomes for facility, discrimination and point biserial. Discrimination and point biserial were significantly higher in the validated compared to unvalidated questions.
High performing questions generally tested public health or research methods, and were more likely to be knowledge-based questions. Low performing questions were more likely to assess psychology or sociology. >40% of questions in both high and low performing groups contained flaws.
Conclusion: Some specific areas of PHSPRM can be validly assessed using MCQs, particularly the topics of epidemiology, infectious diseases, occupational health, screening or statistics. However, this represents only a small fraction of the required knowledge. There is a risk of over-representation of aspects of these topics, simply because they can be easily included in existing assessment methods. There is an urgent need to develop other assessment tools for PHSPRM topics.
Take-home message: There is an urgent need to develop valid assessment of PHSPRM topics, and MCQs can contribute meaningfully to this assessment.

3I5 (1344)
In between the Lines: Language Use in Medical Education

Authors
Alexandra Núñez, Institute for Communication and Assessment Research, Heidelberg, Germany
Marcus Lindner, Institute for Communication and Assessment Research, Heidelberg, Germany
Konstantin Brass, Institute for Communication and Assessment Research, Heidelberg, Germany

Presenter: Alexandra Núñez, Institute for Communication and Assessment Research, Heidelberg, Germany

Background: Which role plays the language used in MCQ-assessment in medical education? How does it shape the conceptual knowledge, the future professional behavior of physicians?
Method: In our pilot-study, we investigate quantitatively and qualitatively how language is used in german multiple choice questions and give a short critical insight in the (ir)regularities of language pattern that function as the main conceptualization anchors in MCQ-questions.
The Item-Management-System provides a huge amount of MCQ-questions from different medical schools in Germany. We strictly obey to the regulation of data protection and therefore anonymized the data. Our corpus consists of 230.000 MCQ-questions which are classified into the german medical schools and into the medical disciplines such as "Anatomy" etc. Only lexical categories were extracted such as nouns, verbs and adjectives and we analyzed them with regard to the relational use of lexical words in questions of medical schools and in combination with a discipline. Thus, we can figure out whether a medical school and/or discipline prefers a specific amount of lexical words.
Results: Although the medical schools teach the same disciplines, the results indicate a semantic variety of lexical words used in different medical schools and disciplines and thus, suggest different linguistic, furthermore cognitive styles of thought and transfer of knowledge in medical education.
Albeit there is need for further analysis, we presume that the lexical pattern and conceptualization tendencies in MCQ-questions have an impact on a) the quality of the assessment, b) on the students performance and c) their future behavior as physicians.
Conclusion: If the language use differs between medical schools, can we conclude that different medical knowledge is shaped by the language use? What about the comparability of medical education in different medical schools and thus the quality standards, if each school tests different aspects of medical knowledge?
We will present the results and discuss the meta-methodological question whether a 'language standard' or peer-reviewed questions should be taken into consideration in medical MCQ-assessment.
Take-home message: Language matters!

3I6 (3569)
Effect of frequency of functioning distractor on internal reliability of a multiple choice question based test

Authors
Muhammad Faisal Ikram, Alfaisal University, Riyadh, Saudi Arabia
Shoukat Ali Arain, Alfaisal University, Riyadh, Saudi Arabia
Sadeq Abu-Dawas, Alfaisal University, Riyadh, Saudi Arabia
Ahmed Yaqinuddin, Alfaisal University, Riyadh, Saudi Arabia
Amna Shoaib Siddiqui
Wael M. Alkattan

Presenter: Muhammad Ikram, Alfaisal University, Riyadh, Saudi Arabia

Background: Multiple choice questions (MCQs) with five or four options are routinely used in clinical and preclinical tests. At Alfaisal University, College of Medicine, a standard MCQ format with five options is in practice. These items are generated in house and reviewed through an extensive evaluation process before banking. However, despite of extensive review, questions still have a significant number of non-functioning distractors (NFD) (distractors attempted by < 5% of the student). The aim of this study was to investigate the correlation of the average NFD per item in different tests with test internal reliability index. In addition, the study will relate the average NFD per item with average time spent on it.
Method: A total of 15 preclinical tests were randomly selected. Data was evaluated using ExamSoft item analysis report. Mean NFD per item for each test was calculated. A Pearson correlation was run between mean NFD, internal reliability, mean test score and average time spent on a question.
Results: A strong correlation (0.89) was observed between NFD per item and mean scores of the test. A modrate negative correlation (R=-0.68) was observed between mean NFD per item and internal reliability of the test. No correlation was observed between mean NFD and mean time spend on each item (R=-0.16) and a weak correlation was seen between KR20 (internal reliability index) and mean time spend on each item (R=-0.22).
Conclusion: These data suggest that as the number of NFDs per item increases the test become less reliable and high scoring. However, increasing number of plausible options increases the tests' internal reliability. We also hypothesize that total time spent on each question also depends on length of the question. For more meaningful data to address this issue, correlation between total word count in a question and mean time spend need to be calculated.
Take-home message: Decreasing the number of NFDs will help is generating good quality and reliable tests.

3l7 (2018)

Assessing Competency of Subspecialty Residents in Critical Care Clinical Reasoning: Validity Evidence In Support of the Script Concordance Test

Authors

Dominique Piquette, Sunnybrook Health Sciences Centre, Toronto, Canada
Ryan Brydges, The Wilson Centre, Toronto, Canada
Alberto Goffi, University of Toronto, Toronto, Canada
Christie Lee, University of Toronto, Toronto, Canada
Briseida Mema, The Hospital for Sick Children, Toronto, Canada
Catharine Walsh, The Hospital for Sick Children, Toronto, Canada

Presenter: Dominique Piquette, Sunnybrook Health Sciences Centre, Toronto, Canada

Background: Completing 1-4 months of critical care (ICU) training is mandatory for residents enrolled in most Canadian specialty programs and represents a unique opportunity for residents to learn cognitive skills required to care competently for their sickest patients. Yet, the educational benefits of short ICU rotations are unclear. The script concordance test (SCT) is a written test designed to assess clinical reasoning in context of uncertainty. Validity inferences regarding scoring and generalization (Kane's framework) are better supported for SCTs studied in non-ICU contexts than inferences regarding extrapolation. We conducted a study to add evidence to the validity of the SCT for its use in the critical care setting for formative assessment or rotation evaluation.

Method: We developed a critical care SCT according to published guidelines. The test blueprint was based on an ICU educator survey and training objectives. Two ICU physicians wrote a bank of 70 items used to create two SCT versions, each including 35 items. Two separate ICU experts reviewed item quality. Scoring was based on comparison of residents' answers against frequency of answers of a reference panel composed of 10 ICU expert physicians. The SCT was administered to consenting specialty residents who rotated in three participating ICUs. Each resident completed the SCT on week 1 and week 4 of their ICU rotation. The test final version was obtained after item optimization.

Results: Between January and October 2017, 56 residents completed at least one SCT (mean score, 65.7 [SD 10.6]). Of those, 32 residents completed two assessments: SCT scores were significantly higher at week 4 compared to week 1 (mean difference, 4.6 [SD 10.6]; p=0.0002; effect size, 0.43). Week-1 SCT scores were significantly higher with increased previous ICU exposure (p=0.03), but not with higher level of training (p=0.09). Week-1 SCT scores also significantly differed according to baseline specialty (p=0.01).

Conclusion: This study added to the validity evidence (responsiveness and relationship to other variables) of a critical care SCT. The SCT could be used to inform educators and learners about pre-rotation learning gaps and ICU rotation effectiveness in fulfilling these gaps.

What's all the Hype? A scoping review of Entrustable Professional Activities in Undergraduate Medical Education

Authors
Eric G. Meyer, USUHS, Bethesda, MD, USA
H. Carrie Chen, Georgetown, Washington, DC, USA
Sebastian Uijtdehaage, USUHS, Bethesda, MD, USA
Steven J. Durning, USUHS, Bethesda, MD, USA
Lauren A. Maggio, USUHS, Bethesda, MD, USA

Presenter: Eric Meyer, USUHS, Bethesda, USA

Background: Entrustable professional activities (EPAs) are a hot topic in undergraduate medical education (UME). Yet, the usefulness of EPAs as an assessment framework remains unclear. The authors sought to better understand the breadth and depth of the literature on EPAs in UME.
Methods: A scoping review on EPAs in UME was conducted using PubMed, Embase, ERIC, SCOPUS, MedEdPORTAL, and Web of Science, plus hand searching gray literature. Initial results were shared with the 1,100 AAMC EPA Listserv members to identify missed content. The authors extracted key characteristics, including those mapped to the 2010 Ottawa Conference Assessment Guidelines (Norcini, 2011), from articles chosen for inclusion using a collaboratively designed data-charting tool. Results were quantified and thematically analyzed for core themes.
Results: Fifty-seven articles published from 12 countries were included. 26 (45.6%) discussed the Association of American Medical Colleges' (AAMC) 13 Core EPAs. 8 (14%) were published or funded by the AAMC. 28 (49.1%) were opinion pieces and 18 (31.6%) prospective studies. Opinion pieces discussed all of the Ottawa Criteria except reproducibility; 98.1% had positive conclusions. The prospective studies addressed all the criteria; 28.6% reporting concerns about EPAs in UME.
While much of the literature on EPAs consisted of optimistic opinion pieces, the results of prospective trials were less promising. Analysis revealed that early papers recommended EPA implementation using established assessment methods (e.g.: 360° evaluations, programmatic assessment, etc). Consequently, it seemed that authors conflated the benefits of these methods of assessment attributing them to the EPA framework itself. Other articles alluded to EPAs to advocate for other educational goals, which confused the EPA dialogue. A final theme was the large influence of the AAMC's efforts. While promising, the Core EPA study updates did not appear to reference contemporary literature in designing, assessing, or measuring EPAs.
Conclusion: Much has been published to energize the research and programmatic efforts required to implement EPAs in UME. Now is the time to move beyond opinion to generate evidence from prospective studies that carefully assess each of the Ottawa Criteria.

3J2 (1740)
Transformative but complex: exploring the educational effects of entrustment on final year medical students through the experience-based learning model

Authors
Rui Coelho, FMUP, Porto, Portugal
Pedro Grilo Diogo, FMUP, Porto, Portugal
Maria Amélia Ferreira, FMUP, Porto, Portugal

Presenter: Rui Coelho, FMUP - Faculty of Medicine - University of Porto, Portugal

Background: Entrustable Professional Activities (EPA) is a new paradigm in Medical Education bringing great promise to enact competence-based education in the workplace. However, is yet to be explored how entrustment enhances students' learning through participation in patient care and what conditions influence learning. Experience-based learning (ExBL) is a useful model to elucidate how medical students learn through experience in real-life settings.
Methods: A phenomenological approach was chosen to explore what and how final year medical students learn in the workplace through the entrustment of professional tasks. We conducted five focus groups with medical students using maximum-variation sampling until thematic saturation. Deductive thematic analysis using the ExBL model was conducted using an iterative data analysis and collection design.
Results: The entrustment of professional activities leads to outcomes predicted by ExBL: real patient, affective and practical learning. Students acquire experience with patients, gaining a new dimension to their clinical knowledge. A complex mix of positive and negative feelings emerges from entrustment and students learn how to practice Medicine in the context of a team. Gradual increase in autonomy drives the construction of own meaning for clinical reality, activates clinical and meta-cognitive reasoning and fosters self-regulation of learning. In contrast, low autonomy is destructive for learning. Learning from entrustment is promoted by feedback and psychological safety within medical teams.
Discussion/Conclusion: This study deepens our understanding about how entrustment enhances workplace-based learning through the theoretical scope of ExBL. Entrustment seems to drive learning through constructivist mechanisms and activates meta-cognitive reasoning. The impact of entrustment in learning is complex and involves a dynamic interplay of personal, interpersonal and environmental factors. Complexity needs to be embraced to develop meaningful teaching and assessment of EPA frameworks.
Experience-based learning sheds lights on the educational effect of entrusting professional activities to final year medical students. Entrustment is paramount to the transformative impact of workplace-based learning in the development of student clinical competence.

Creating a Tool to Enable "Just in Time" Entrustment-Based Assessment and Feedback for Learning

Authors
Maryellen Gusic, University of Virginia School of Medicine, Charlottesville, USA
Mark Moody, University of Virginia School of Medicine, Charlottesville, USA
Kim Holman, University of Virginia School of Medicine, Charlottesville, USA

Presenter: Maryellen Gusic, University of Virginia School of Medicine, Charlottesville, USA

Background: As schools implement Entrustable Professional Activities (EPAs) in their program of assessment, it is important to develop tools that support critical constructs related to this framework. EPA-based assessment depends on direct observation of learner performance and on the ability to collect and document information in a user-friendly format. Data should be immediately available to learners so that they are able to work with teachers to analyze the information and develop a learning plan to address gaps and optimize strengths and emerging skills.
Methods: Educators and technology staff collaborated with an internal software development team to create the web-based Interactive Clinical Assessment Navigator (iCAN) application to collect and document data from direct observations of learner performance. The team also partnered to develop data visualizations available to students, faculty coaches, the entrustment committee and educational administrative leaders.
Results: Factors critical to success included: Key stakeholders actively participated in design with regular opportunities to review early versions; A phased implementation enabled analysis of how the tool was being used, to understand how students and assessors understood the assessments, and to make adjustments; Adoption by resident and faculty physicians was successful due to an intense change management effort. Physician champions increased awareness and willingness to participate among peers.
Since July, 2017, over 430 faculty and resident have participated in training sessions. 1028 assessments have been completed by Master Assessors (16%), faculty (52%) and residents (32%) during the internal medicine (63%), obstetrics/gynecology (7%) and pediatrics (30%) clerkships. 458/1028 observations have assessed students' abilities to perform a history and physical exam. 46% of assessors stated that students were ready to perform tasks with indirect supervision.
Using Lean and Agile methodologies, we developed a highly functioning application for EPA-based assessments. Importantly, data is immediately available, allowing stakeholders to understand students' emerging competence; promoting the development of trust and the use of assessments as a learning tool.
Conclusion: Partnership with educational technologists has facilitated a process of continuous improvement and refinement of a tool that meets educational objectives, supports workplace-based assessment and learning and is responsive to the needs of end-users.

Practical Aspects of Making Summative Entrustment Decisions

Authors
Abbas Hyderi, University of Illinois College of Medicine, Chicago, Illinois, USA
William Cutrer, Vandebilt University School of Medicine, Nashville, Tennessee, USA
Vivian Obeso, Florida International University Herbert Wertheim College of Medicine, Miami, Florida, USA
Sandy Yingling, University of Illinois College of Medicine, Chicago, Illinois, USA
Kimberly Lomis, Vanderbilt University School of Medicine, Nashville, Tennessee, USA

Presenter: Abbas Hyderi, University of Illinois College of Medicine, Chicago, USA

Background: In 2014, the Association of American Medical Colleges published a list of 13 Core Entrustable Professional Activities (EPAs) for Entering Residency, articulating tasks that medical school graduates should be able to perform upon transition to residency under indirect supervision. Ten US medical schools were convened to develop best practices for implementation, with an expectation to pilot the process of summative entrustment decisions in 2019. Additionally, many other medical schools are implementing or considering how to implement an EPA framework in their UME programs. An integral part of this framework involves making summative entrustment decisions. However, determining how to make these decisions can be a challenge. Many institutions are struggling with content, process, logistics and resources especially given the larger scale of UME programs relative to GME programs. The AAMC pilot schools have discussed challenges and best practices and are ready to disseminate actual findings beyond their initial recommendations. (1)
Methods: Two participating schools in the AAMC Core EPA pilot (Vanderbilt and Florida International University) have developed and implemented entrustment committees. This short communication is designed to share lessons learned including how to solve practical problems and overcome barriers facing individuals and institutions that are trying to make these summative entrustment decisions.
Key objectives to be covered include: 1) Differentiate ad hoc formative observations/decisions and summative entrustment decisions; 2) Describe mechanisms to collate formative data for summative entrustment decisions; 3) List potential members of an entrustment committee; 4) Consider inflection points at which an entrustment committee makes summative decisions; 5) Identify innovative methods to approach particular EPAs that may be more challenging to assess in the workplace; 6) Describe faculty development needs for entrustment committee members
Providing practical aspects of making summative entrustment decisions will be important to actualize the

core EPA framework as a competency-based approach for UME programs.

1) Finding a Path to Entrustment in Undergraduate Medical Education: A Progress Report From the AAMC Core Entrustable Professional Activities for Entering Residency Entrustment Concept Group. Brown D, Warren J, Hyderi A et al. Acad Med 2017:92: 774-779.

Trainee´s learning and patient safety during final year clerkships - improvements by using EPAs

Authors
Anja Czeskleba, Charité - Universitätsmedizin Berlin, Berlin, Germany
Ylva Holzhausen,Charité - Universitätsmedizin Berlin, Berlin, Germany
Harm Peters, Charité - Universitätsmedizin Berlin, Berlin, Germany

Presenter: Anja Czeskleba, Charité - Universitätsmedizin Berlin, Germany

Background: Final year clerkships in medicine strive to find a balance between the learning of trainees and maintaining safety of patients. Entrustable Professional Activities (EPAs) have recently been introduced as a new concept to operationalize workplace participation by defining professional task and a designated level of supervision for trainees. This qualitative study explores the perspectives of supervising physicians on i) the problems they see in the relation between participation of final year clerkship students and patient safety, and ii) whether and how EPAs may improve the situation.
Methods: Supervising physicians (n=11) took part in focus group discussions. First, they discussed problems experienced in supervising final year clerkship students related to patient safety. Then, they discussed the potential benefits of implementing EPAs as outcomes in the final year clerkships. The data were analyzed qualitatively according to Kuckartz (2014): Appearing problems were examined by using the framework of contributory factors influencing clinical practice (Woloshynowych et al., 2005). To analyze the potential benefits of EPAs, a new category system was developed inductively.
Results: The physicians discussed a number of different problems related to patient safety when final year students participate in patient care. As main problems, they mentioned the lack of obligatory learning goals and of a given structure for integrating trainees and their learning in the clinical workflow. By using EPAs, training tasks and level of supervision would become more clearly defined. Therefore, EPAs could improve students' learning and thereby increase patient safety.
The experiences shared by supervising consultants point to a number of problems with patient safety in the context of students' workplace participation in their final year clerkship. The consultants expected that the risk involved can be reduced by using EPAs, i.e. by providing a better structural framework and clearer operationalization of the leaning goals to be met. This can lead to better trained physicians and safer practice now and in the long-run.

Patients' safety emerges as another important dimension in the application of EPAs.

When to trust our learners? Clinical teachers' perceptions of decision variables in the entrustment process

Authors
Chantal Duijn, Utrecht University, Utrecht, Netherlands
Lisanne Welink, University Medical Center Utrecht, Utrecht, Netherlands
Harold Bok, Utrecht University, Utrecht, Netherlands
Olle ten Cate, University Medical Center Utrecht, Utrecht, Netherlands

Presenter: Chantal Duijn, Utrecht University, Utrecht, Netherlands

Background: Clinical training programs increasingly use entrustable professional activities (EPAs) as focus of assessment. Clinical teachers struggle to find ways to assess the preparedness of learners to independently perform patient care tasks. Questions remain about which information should ground decisions to trust learners. This qualitative study aimed to identify decision variables in the workplace that clinical teachers find relevant in the elaboration of the entrustment decision processes. The findings can substantiate entrustment decision-making in the clinical workplace.
Methods: Focus groups were conducted with clinical teachers, using the structured consensus method of the Nominal Group Technique to generate decision variables. A ranking was made based on a relevance score assigned by the clinical teachers to the different decision variables. Field notes, audio recordings and flip chart lists were analyzed and subsequently translated and, as a form of axial coding, merged into one list, combining the decision variables that were similar in their meaning.
Results: The focus groups yielded 21 unique decision variables considered relevant to inform readiness to perform a clinical task on a designated level of supervision. The decision variables consisted of skills, generic qualities, characteristics or other information. We grouped the decision variables into five categories: ability, humility, integrity, reliability and breadth of information to ground entrustment.
Discussion/Conclusion: To entrust a learner to perform a task at a specific level of supervision, a supervisor needs information to support such a judgement. This trust cannot be credited on a single case at a single moment of assessment, but requires different variables and multiple sources of information. This study provides an overview of decision variables giving evidence to justify the multifactorial process of making an entrustment decision. Extensive reflection by different observers on performed tasks is highly relevant: both reviewing of actions after shifts, reflective behaviour by the learner as well as multi-source feedback were mentioned as relevant decision variables to base entrustment decisions on. Faculty development will be necessary to explain these types of entrustment decisions as being situational versus focused on certification, when introducing workplace curricula based on EPAs.

A Longitudinal Assessment of Professional Identity, Wellness, Imposter Phenomenon and Calling to Medicine among Medical Students

Authors
Valerie E. Houseknecht, Wright State University Boonshoft School of Medicine, Dayton, USA
Brenda Roman, Wright State University Boonshoft School of Medicine, Dayton, USA
Nicole J. Borges, University of Mississippi Medical Center, Jackson, USA
Adrienne Stolfi, Wright State University Boonshoft School of Medicine, Dayton, USA

Presenter: Brenda Roman, Wright State University Boonshoft School of Medicine, Dayton, USA

Background: Interpersonal communication, self-care and resilience skills are drawing attention as medical educators gain appreciation for how an individual's relationship to self, profession and patients impacts quality of patient care and physician health. Professional identity formation must cultivate development of students' emotional and spiritual dimensions by promoting self-reflection, emotional awareness, resiliency and well-being.
Method: We assessed changes over time in professional identity, wellness, imposter phenomenon and calling to medicine in a cohort of medical students from the first through third years of medical school, using 4 validated measures: Perceived Wellness Survey (PWS), Brief Calling Scale (BCS), Physician In-group Identification Scale (PID) and Clance's Imposter Phenomenon Scale (CIP). The study was exempted by the university IRB.
Results: 110 class of 2018 students returned surveys at the beginning of year 1; 58 completed surveys at the beginning and/or end of year 3 and were included in analyses. From pre to post preclinical years (n=44), there was a significant decrease in the PID, and a small but not statistically significant increase in the CIP. There were no changes in the PWS or BCS. After the third-year clerkships (n=35), the PWS and PID decreased, the CIP increased, and the BCS did not change. For students who participated at all time periods (n=21), there were no differences in the PWS, BCS, and CIP. The PID decreased from pre to post preclinical years, and remained significantly lower at the end of the clerkship year.
Discussion: Student wellness dropped significantly over 3 years, likely due to increased time demands and less control over one's schedule. The BCS did not decrease over time, which is reassuring since it's linked to decreased burnout and increased resiliency. That students lose a sense of identity as part of the physician community is concerning; future curriculum initiatives should focus on integration of professional identity into students' individual identities.
Conclusion: As medical educators seek to understand the transition of undergraduate student to medical school graduate, curricula should include a focus on development of physician identity and an emphasis on individual wellness/self-care in the clinical years.

Professional identity formation through the lens of the Social Identity Approach – self-categorization as a 'doctor' in the transition from student to medical graduate

Authors
Sjoukje van den Broek
Sophie Querido
Marjo Wijnen-Meijer
Olle ten Cate
Marijke van Dijk

Presenter: Sjoukje van den Broek, University Medical Center Utrecht, Netherlands

Background: The theory of Social Identity Approach (SIA) discusses how group memberships affect self-concepts. Self-categorization, a core concept in SIA, explains how and when people define themselves as members of a specific group rather than only as individuals. We aimed to explore through the lens of SIA which experiences during the transition from student to medical graduate affects self-categorization as a doctor.
Method: We interviewed 21 medical students in transition to medical graduate. Interviews were semi-structured and focused on factors influencing professional identity formation and career choice considerations. Transcripts were analyzed by two authors using template analysis to find cues of self-categorization and experiences of influence on it.
Results: Interviewees discussed identity formation in terms of group-membership and fit with the group based on personal characteristics and lifestyle. Experiencing physician tasks and responsibilities and the extent to which they felt competent were described as being of major influence. Next, how trainees felt treated by the professional group had a big impact. Important was the way group members showed an inviting attitude through positive commenting on fit in the team, and how the trainee felt treated as a colleague.
Conclusion: We found SIA to be a useful approach when exploring professional identity formation. Medical students seek for a fit with the professional group in terms of personal characteristics and lifestyle. In the transition to medical graduate, students experience tasks and responsibilities of a doctor not only to acquire knowledge and skills but to elaborate their identity and fit with a professional community. Feeling competent and feeling treated as a colleague by group members of the aspired group appear to be major influences on self-categorization as a doctor.
Take-home messages: Professional identity formation during transition from student to medical graduate may benefit from:

- having trainees consciously reflecting on their fit with the professional group
- having trainees experience the full tasks of a medical doctor
- stimulate the inclusion of medical trainees in teams

Fostering and evaluating Medical Professionalism through an innovative Training Program for young doctors

Authors
Graziela Moreto
Pablo Gonzalez Blasco
Marco Aurélio Janaudis
Marcelo Rozenfeld Levites
Pedro Subtil de Paula

Presenter: Graziela Moreto, UNINOVE - Universidade Nove de Julho, São Paulo, Brazil

Background: The literature points out several assessment tools related to medical knowledge, how it is applied and how it is done. However, little is known about methodologies focused on the development of professional identity - being a doctor. Medical professionalism, is located at the top of Miller's pyramid of knowledge. SOBRAMFA – Medical Education and Humanism runs an innovative training program for young doctors. This 3 years-program is based in multivariate practicing scenarios (from Complicated Inpatients to Palliative Care and Nursing Homes), regular scientific meetings, reflective workshops, and an accurate global evaluation along with strictly mentoring of each learner. During the 12 years in which this Program is set, it's possible to identify in the learners not just the improvement in technical knowledge but mainly their professional maturation. The evaluation system (360 degree feedback) -including self-assessment, peer evaluation, preceptors' guide feedback - is the cornerstone of this successful outcome.
Professional maturation, what we might call medical professionalism, is what is located at the top of Miller's well-known pyramid of knowledge, defined as "IS" doctor. The main contribution of this study is to share an educational experience where all levels of the Miller pyramid are contemplated during the training.
The training Program developed by SOBRAMFA, an innovative educational model which provides assistance to patients in different settings and establish a routine of activities with technical and philosophical exercise, all them accompanied by an individualized evaluation process that stimulates self-reflection, can contribute to improve professionalism and excellence in doctoring.
Take-home messages:
- To set a training program in a multivariate practicing scenario, brings challenges and learning opportunities for the young doctors.
- A strictly routine of regular scientific meeting, reflective workshop and an accurate face-to-face evaluation is required for the learners incorporate attitudes to develop medical professionalism and build their identity.

'Not a doctor': the professional identity formation of physician associate (PA) students

Authors
Clare Morris, IHSE, Queen Mary University London, UK.
Wendy Lowe, IHSE, Queen Mary University London, UK
Justine Strand De Oliveira, IHSE, Queen Mary University London, UK

Presenter: Clare Morris, Queen Mary University London, UK

Background: The profession of physician associate (PAs) began in the USA in 1965, emerging in the UK early this millennium. Whilst there is an agreed national curriculum and licencing exam for PAs, registration is currently voluntary.
The Department of Health (2012) defines the PA as 'a new healthcare professional who, while not a doctor works to the medical model' [our emphasis]. PAs are defined in relation to what they are not, rather than what they are. In our experience, this process of othering (positioning PAs identity in relation or opposition to doctors) is common and we believe this to be significant in relation to PA professional identity formation and their integration into healthcare teams.
Professional identity formation involves socialisation into professional communities (Cruess et al 2015). Our study explores how this newly emerging professional group self-categorise ('who I think I am') and negotiate their identity in relation to 'other' professions ('who I think you think I am') (Monrouxe 2010).
Method: This is a qualitative research enquiry, with a socio-cultural framing i.e. one where learning is understood as a social practice, involving active participation in communities (of practice) and the construction of identities in relation to that practice. Our study utilises audio-recorded interviews to trace shifts in the ways PA students talk about how learning is changing 'who they are' and shaping 'who they will be'. Data collection takes place at three points: at the start of the programme, after the first block of clinical placements and the end of the first year of their programme.
The final interview will be conducted in February 2018, with data analysis completed by the end of April. Our initial impressions support the premise that professional identity is constantly being negotiated as students seek to reconcile their self-categorisations with the ways they are positioned by other healthcare professionals. This is revealed in the ways they are introduced to patients and the types of learning opportunities they are afforded (or otherwise).
We will present findings with an emphasis on implications for curriculum design and faculty development.

Problem based learning plays a key role in facilitating the process of professional identity development in medical students. Assumption or truth?

Authors
Nicolaj Johansson, Aalborg University, Aalborg, Denmark
Diana Stentoft, Aalborg University, Aalborg, Denmark
Susanne Nøhr, Aalborg University Hospital, Aalborg, Denmark

Presenter: Nicolaj Johansson, Aalborg University, Aalborg, Denmark

Background: Professional identity development is acknowledged as a fundamental part of medical education and the topic has received much attention in the medical education literature in recent years. Despite the growing interest, only a few studies have examined the impact that problem-based learning (PBL) has on the development of professional identity.
Method: To understand how PBL influences the development of professional identity and be clear about what is known about the topic, a literature review concerning professional identity development was conducted. Using a full text search string comprising the terms identity, problem-based learning, and medical students, the following databases, were searched: Pubmed, Scopus, and Proquest.
Results: 438 articles were identified and 11 were considered relevant based on a review of their abstracts. While these articles investigated the influence of PBL on the development of such competencies as critical thinking, reflexivity, clinical problem solving, collaboration skills, and intrinsic motivation, all of which have been found to influence professional identity development, none of them were specifically concerned with how PBL impacts professional identity development.
Discussion: Rarely are the implications of the use of PBL discussed in relation to professional identity development. Even though PBL has become more common as the preferred pedagogical approach to medical education, its consequences for professional identity development are still vague. Despite, the growing interest for PBL as a pedagogy and the consensus among researchers that a strong sense of professional identity enhances the degree of preparedness to the transition from medical student to junior doctor, there is still a lack of scientific evidence supporting the idea that PBL contributes positively to the development of professional identity.
Conclusion: We believe that using PBL plays a key role in facilitating the process of professional identity development in medical students. Thus, we argue that the medical community should pay attention to the importance of using PBL as an effective way to facilitate the development of medical students' professional identity.

The Relationship Between Role and Identity in Professional Identity Formation During Residency: A Qualitative Study

Authors
Adam P. Sawatsky
Wil L. Santivasi
Hannah C. Nordhues
Brianna E. Vaa
John T. Ratelle
Frederic W. Hafferty

Presenter: Adam Sawatsky, Mayo Clinic, Rochester, MN, USA

Background: Professional identity formation (PIF) is central to medical education; current PIF conceptualization includes psychological and sociological theories. Social cognitive theory (SCT) describes the relationships between identity, behavior and context and provides a lens to examine PIF. Understanding the process may help faculty support PIF during residency, therefore we used SCT to explore PIF during residency.
Method: We used constructivist grounded theory to examine PIF during residency. Residents in the Mayo Clinic Internal Medicine Residency participated in hour-long semi-structured interviews from February-May 2017. Interviews were transcribed verbatim and de-identified prior to analysis. Data collection and analysis were conducted simultaneously. We applied open codes, wrote analytic memos and discussed themes. We identified main themes relating to PIF and explored relationships between themes. Using constant comparison, we refined our categorization of themes within a SCT framework to explain our findings. Theoretical saturation was determined by group consensus. This study was approved by the Mayo Clinic Institutional Review Board.
Results: We conducted 23 interviews; 15 (65%) participants were male. Five participants (22%) were postgraduate year (PGY) 1s, 9 (39%) were PGY-2s and 9 (39%) were PGY-3s. We identified themes describing the relationship between person, behaviors and context and their connection with PIF. Residents described a dynamic, reciprocal relationship between identity development and enacting the roles of a physician. They discussed their initial ideal of a "good doctor" at the start of residency (e.g. "knows everything about medicine"), which influenced the enactment of their doctor role. With experience, feedback, and role models, residents re-framed their idea of a "good doctor" ("use[s] the resources around you"). While residents felt the "impostor syndrome," performing the doctor role provided confidence and reinforced their identity as physicians.
Conclusion: Residents undergo PIF through interactions between person and behavior within the context of residency training, exemplifying reciprocal determinism between person, behavior and context within SCT. This framework may help educators understand the process of PIF during residency.
Take-home message: Understanding the relationship between person and behavior in the development of

professional identity may help guide the role of faculty in supporting PIF.

Professional Identity Formation: A Comparison of First-Year and Third-Year Pharmacy Students

Authors
Nicole J. Borges, University of Mississippi Medical Center, Jackson, Mississippi, USA
Kim Adcock, University of Mississippi School of Pharmacy, Jackson, Mississippi, USA
R, Stephen Manuel, University of Mississippi School of Medicine, Jackson, Mississippi, USA

Presenter: Nicole J. Borges, University of Mississippi Medical Center, Jackson, Mississippi, USA

Background: Professional identity formation has been described as one of medical education's core goals (Rabow et al., 2010). It has been referred to as the gradual process by which students assume the identity of their profession over the course of their education (White et al., 2011). While professional identity has been found to decline between the first and third years of medical school (Houseknecht et al., 2015), it is not known whether this decline occurs across other health professions. This study compares professional identity in first-year and third-year pharmacy students.

Method/Results: 216 pharmacy students (first-year = 113, third year = 103; 94% response rate) at one USA medical center were administered the In-Group Identification Scale (Leach et al., 2008) when they matriculated in 2016. This 14-item survey was modified for appropriate use with pharmacy students and used a Likert-type response scale from 1 (very strongly disagree) to 6 (very strongly agree) with total scores ranging from 14-84.

Findings using an independent samples t-test suggest no differences in professional identity between first-year pharmacy students (M = 67.26, SD = 8.5) and third-year pharmacy students (M = 64.84, SD = 10.09; t (214) = 1.913, p =.05).

Discussion: Previous research supports that for medical students professional identity formation has been shown to decline between first and third years of medical school (Houseknecht et al., 2015). For pharmacy students, however, the current study shows that professional identity remained stable. This difference in health professions students lends us to wonder why professional identity changes or remains stable in certain health professions but not others. Future studies should investigate perhaps through qualitative inquiry as to why these differences exist. Some literature has identified the curriculum and learning environment as a culprit, so this begs the question of how do medicine and pharmacy education differ throughout the first three years that might contribute to erosion of professional identity versus stability.

Conclusion: Professional identity appears to remain stable in pharmacy students between the first and third year of their education.

A New School of Thought: Six Year Review of The Integrated Practice of Medicine course: Part of an Innovative Fully Clinically Integrated New Medical School Curriculum

Authors
Thomas B. Pace

Presenter: Thomas Pace, University of South Carolina School of Medicine Greenville, Greenville, SC, USA

Background: In 2012, The University of South Carolina School of Medicine Greenville (USCSOMG) opened the doors to new four year medical school and a curriculum designed to educate physicians with a different perspective on addressing individual and public health care needs of an increasingly diverse society. This fully clinically integrated curriculum begins with enrolling all first year medical student in a standardized 6 week basic EMT course on the first day of medical school, facilitating their state certification as an EMT provider and continuing the student's participation in ongoing ambulance rides throughout their first two years of medical school. In addition to community and public health issue exposure the mandatory EMT certification experience offers, the next two years of medical school education continue to offer extensive clinical interaction with active physician educators through weekly small group structured case based learning, carefully integrated with the weekly biomedical science curriculum. This biomedical science faculty and curriculum carefully coordinated with physician and professionalization education with other related health care providers (pharmacy, nursing and EMT) has provided an excellent foundation for the USCSOMG student to gain an expanded awareness of the complex medical, social and behavioral aspects of both individual patient care and public health concerns at large that are facing an ever diversifying society which the new physicians are committed to serving. It is the belief of the USCSOMG founders that this novel fully clinically integrated educational approach will not only produce physician graduates with exceptional insight and skills in the social, behavioral and cultural needs of an increasingly diverse society, but will do so while enhancing the student's acquisition of the prerequisite medical knowledge which is crucial as the foundation for physicians' effectively understanding and treating medical health care needs of individuals and society at large. This report is the six year mark reflection on the successes, challenges and lessons learned as well as future plans from the USCSOMG "A New School of Thought" experience highlighting the longitudinal M-1 through M-4 Integrated Practice of Medicine course (IPM).

Re-examining basic science knowledge to improve preparation for clerkships: Early experiences with CRUX tests

Authors
Eugene J.F.M. Custers
Inge E.T. van den Berg
Olle Th.J. ten Cate

Presenter: Eugène Custers, University Medical Centre at Utrecht, Netherlands

Background: For many decades, the complaint has frequently been voiced that medical students have forgotten much of their basic science knowledge when they start their clerkships. Most probably, this is a consequence of students' studying the learning material only once. This situation could be improved by requiring students to revisit curriculum content before entering their clerkships. Thus, the UMC Utrecht Medical School introduced four mandatory broad re-examination (CRUX) tests in the pre-clerkship curriculum in 2016.
Methods: Each CRUX-test covers 3-5 of 14 pre-clinical courses and is administered at least six months after the course's examination. The tests consist of questions that can unequivocally be assigned to the major global learning objectives of the course; questions that lack this property are not included. Students have to pass all four CRUX tests before they can earn their Bachelor Degree; in case they fail a test, they have to redo it as often as they need. Our study analysed appreciation, test results, and consequences for individual students as well as the faculty.
Results: Faculty and students alike believe the idea behind the CRUX-tests to be sound. Initially, approximately two-third of the students passed each test at the first attempt. Recently, however, this proportion has decreased, a trend that propagates through subsequent attempts. In addition, fewer students sign up and show up at each subsequent test occasions. Though students' self-reported time investment (which ranges from 0-40 hrs) correlates positively with test scores, this time investment also appears to have decreased.
Though most students pass the tests without frequent failures, a persistent minority still did not pass a single CRUX test, partly due insufficient time investment, but probably also because of cognitive difficulties or maladaptive study behaviour.
Though the CRUX-tests largely seem to meet their aim, there is an important side effect in the form of a group of students who increasingly lag behind. This group may require focused remediation.
Conclusion: CRUX-tests stimulate most students to revisit their knowledge, but unintentionally also to block progress of others who may need remediation to prepare them for their clerkships.

Toward critical reflection for competent social practice

Authors
Stella Ng, University of Toronto, Toronto, Canada
Emilia Kangasjarvi, St. Michael's Hospital, Toronto, Canada
Sabrina Teles, University of Toronto, Canada
Shanon Phelan, University of Alberta, Canada

Presenter: Stella Ng, University of Toronto, Canada

Background: In response to patients' needs, clinicians are called to work with/in health care systems, insurance companies, schools, homecare and community organizations. To rise to this call, clinicians must advocate, collaborate and communicate effectively and with attention to systems-based practice. Teaching toward these competencies in an authentic and effective manner proves challenging. To inform education efforts, we aimed to study practices in a context particularly in need of these types of knowledge, skill, and practice.
Methods: As part of an interpretive qualitative study, we interviewed 42 participants who work at the health-education interface in support of children with disabilities/chronic conditions: parents, health-, and school-based professionals. We asked them about their work in this complex practice area. After inductively noting that some practitioners exhibited critically reflective insight, we deductively coded all instances of critical reflection, and the source of these insights. Critical reflection refers to thoughtful consideration of everyday experiences and situations, with focused attention on issues of power, privilege, and social structure. Critical reflection informs change-oriented action.
Results: Clinicians' critically reflective insights corresponded with opportunistic ways of learning about 'other' systems. For example, a physician who worked adaptively with school systems cited her sister's teaching career as a source of knowledge. A physiotherapist who collaborated respectfully with families and schools acknowledged her teenager daughter's volunteer experience in special education. With critically reflective perspectives, clinicians appreciated larger social systems at play and resisted biomedical and social norms (e.g. narrow definitions of 'disability') to best respond to the nuanced intersections of patient and practice contexts and needs.
Conclusion: Our research shows the potential for critically reflective practice to enable more compassionate, person-centered, innovative care; but points to a haphazard way of learning it. These findings build on research that found clinicians gained critical reflexivity when hospitalized, and that this reflexivity supported compassionate care (Rowland and Kuper). But we must not rely on these current ways of learning, and share possible teaching practices from critical pedagogy.

Christian Grimm, University of Zurich, Switzerland
Rainer Weber, University of Zurich, Switzerland
Jan Breckwoldt, University of Zurich, Switzerland

Presenter: Jan Breckwoldt, University of Zurich, Faculty of Medicine, Zurich, Switzerland

Background: A master thesis is mandatory within all undergraduate medical study programmes in Switzerland. The first student cohort at the University of Zurich submitted their theses in 2013. To gain first data on the potential benefits for students and institutions at a research-oriented university we analyzed the theses completed by the years' cohorts 2013-2017. As a first approach we used simple publication metrics as one measurable surrogate of academic achievement.
Methods: The databases "PubMed/Medline" and "Google Scholar" were searched for the students as authors, their supervisors as authors, and the titles of the theses. For articles listed in PubMed/Medline we identified the students' positions in the sequence of authors and the journal metrics expressed as Impact Factor (IF), 5-year IF, and the rank quartile (Q1 (highest) to Q4 (lowest)) within the subject domain in "Web of Science, InCites Journal Citation Reports" [1]. The search was performed between Jan 3rd and 26th, 2018.
Results: All 1151 theses which were handed in by the years' cohorts 2013-2017 could be analysed. At the time of the search 328 theses (28.5%) were contributions to articles listed in PubMed/Medline, the median IF of these was 2.201, 5-year-IF 2.005, the median rank quartile was Q2, and the student's position of authorship was first in 116 cases (35.4%), second in 95 cases (29.0%), and third or higher in 117 cases (35.7%). No student was listed as last author. Median IF was higher if the student's position was further back in the sequence of authors (median IF of first authorship: 1.688 vs. third or higher: 2.806, p< .0001, MWU test).
Discussion: When completing a mandatory master thesis in medicine at a research-oriented university, academic achievement as expressed by publication metrics was significant. However, the implications of these findings for the development of scholarly competencies and scientific careers remain to be investigated since publication metrics provide only a limited view on academic achievement.
Conclusion: A substantial number of master theses at a research-oriented university contribute to high-ranked peer-reviewed publications.

How to succeed in curriculum reform? – Influence of stakeholder interests and strategies in context of Bourdieu's framework

Authors
Anne Franz
Miriam Geppert
Krista Loo
Asja Maaz
Harm Peters

Presenter: Anne Franz, Charité - Universitätsmedizin Berlin, Germany

Background: Medical curriculum reform involves many different faculty stakeholders and it is shaped by distinct interests. The identification of interests and strategies of different stakeholders is crucial to understand the process of curriculum reform. Purpose of this qualitative study is to analyse the process of curriculum reform by the framework of Bourdieu (Gomes & Rego 2013), i.e. the competition over resources in social fields.
Methods: Semi-structured interviews were performed with key stakeholders in a recent major curriculum reform at Charité -Universitätsmedizin Berlin, Germany. Viewpoints of four faculty members, four students and five curriculum developers were recorded and compared between groups. Transcriptions of audio-records were qualitatively analysed by three evaluators according to Mayring (2015).
Results: The groups competed over "capital", as Bourdieu describes resources (Varpio 2013): Faculty members competed over teaching hours connected to staff positions, while students and curriculum developers competed for progressive pedagogical concepts. Strategies used by the groups highly depended on their interests. Among these, we found alliance building, holding back information, hiding interests, preparing concepts shortly before meetings and compromise proposals.
Discussion: This study shows how hidden interests influence the negotiation strategies in the process of curriculum reform. Using Bourdieu's framework, it reveals the competition over resources and positions within the field of a medical faculty. Faculty members compete over positions through teaching time, while students' interests appeal highly learning content orientated. Medical universities should take into account the consequences resulting from a curriculum reform process for all faculty stakeholders.
Conclusion: The results of a curriculum reform are not limited to pedagogical concepts. There is also a significant impact by social positions within the field of a medical faculty. Managing successfully a curriculum reform requires to involve all stakeholders and their specific interests as well as to create a breeding ground for constructive discussions during the entire process.

Reinventing Japanese medical education, a year later

Authors
Haruko Akatsu, IUHW, Narita, Japan
Motofumi Yoshida, IUHW, Narita, Japan
Kiyoshi Kitamura, IUHW, Narita, Japan
Takahiro Amano, IUHW, Narita, Japan

Presenter: Haruko Akatsu, IUHW, Narita, Japan

Background: International University of Health and Welfare (IUHW) School of Medicine opened in April 2017, 38 years after the Japanese government ban on the establishment of new medical schools in Japan. This school is vastly different from any other Japanese medical school. It strives to train internationally-minded, bilingual and highly professional physicians who could go on to serve around the globe.
Discussion: We have succeeded in creating a participatory, team-based, bilingual learning environment, where one in every seven students is international. We implemented a novel educational system, including elements such as: one-hour student entrance examination interviews conducted by six faculty and staff members; 20-minute English mock-lectures by faculty recruitment candidates; a week-long freshman orientation; intensive language courses; weekly student- and faculty-support meetings; weekly faculty development seminars; class evaluations completed after every period; and a team-based teaching (TBT) model. IUHW School of Medicine created a completely different educational framework. In addition to the efforts listed above, this success was also due to strong leadership that emphasized education first. A well-defined vision, careful selection process for students and faculty, frequent faculty development, a team-based teaching model, along with timely, thorough feedback and support systems for students and faculty, enabled us to innovate even in this conservative, traditional Japanese society.
Some challenges we have encountered in this process include encouraging the few students who do not participate in active learning, and faculty members who are not interested in considering their constructive feedback. Success of creating something unprecedented in medical education requires a well-defined vision supported by the leadership, a carefully planned process, team-based teaching, and timely and thorough feedback and support systems both for the students and faculty.
By continuing to share the establishment of our school, we hope not only to receive feedback from our international peers, but also to inspire others toward innovation in medical education.

Implementation of spiral curriculum in Medical Education: Four Loops

Authors
Khatuna Saganelidze, New Vision University, Tbilisi, Georgia
David Kereselidze, New Vision University, Tbilisi, Georgia

Presenter: David Kereselidze, New Vision University, Tbilisi, Georgia

Background: NVU Medical School has launched MD program in 2014 and after reaching the midpoint of its implementation, the school conducted an Assessment of Learning Outcomes Achievement (LOA) in 2017. As a result of a rethinking of MD curriculum, it is now described in four loops referring to knowledge, skills and values, where every consecutive loop builds on previous one and sets more complex learning objectives.

Methods: Activities were conducted in the format of group, committee and extended curriculum committee meetings. Throughout the process, the existing experience of the program implementation, approaches of other universities as well as the student surveys were analyzed. The draft amendments were discussed with the University administration and broader audience of diverse professional experiences, including potential employers/stakeholders.

Results/Discussion: As a result, knowledge and understanding, applying knowledge, communication, making judgments and learning skills as well as values were considered as linking elements in the spiral curriculum or in other words, the four loop spiral of medical competencies was outlined, in which each subsequent loop builds on the previous one, further enhancing and developing competencies.

The interconnections between the components of the program demonstrate the advantages of perceiving the curriculum in spiral model, since the goals and learning outcomes of the individual components, as well as the link between these components, are best illustrated within such an approach. Bridging components facilitate the transition from one loop of spiral curriculum to another. Special attention is paid to shape the trans-disciplinary components in the final loop of the curriculum.

Rethinking of MD curriculum core elements such as applicable knowledge, clinical and generic skills, research, values and ethical attitudes for composing elements of the spiral curriculum, enable the gradual enhancement of student competencies, where every consecutive loop elements require retrieving of already gained knowledge and competencies and are designed to set more complex learning objectives.

Take-home message: Emphasis on the importance of the acquisition of knowledge matching with the practical application of gained competencies and of thereof achievement through implementation of spiral curriculum composed of four loops referring to knowledge, skills and values.

Integration of Gender Medicine in Medical Education at Austrian Universities – the Status Quo

Authors
Ulrike Nachtschatt, Innsbruck Medical University, Innsbruck, Austria
Sandra Steinböck, Vienna Medical University, Vienna, Austria
Margarethe Hochleitner, Innsbruck Medical University, Innsbruck, Austria

Presenter: Ulrike Nachtschatt, Innsbruck Medical University, Innsbruck, Austria

Background: The implementation of Gender Medicine at Austrian universities started in 2004. As universities are independent entities and frame conditions differ, development of the new medical discipline proceeded differently depending on the university venue. The survey at hand examines the current status of the implementation of Gender Medicine in medical education at all Austrian universities. To date no systematic studies have been conducted on this subject.
Methods: The methodology was to first conduct a document analysis, followed by a questionnaire survey. The study covers public as well as private medical universities.
Results/Discussion: Analysis of the documents showed that Gender Medicine is often combined with affirmative action for women, equal treatment and/or gender studies. These subjects are frequently combined in order to meet legal requirements, which often results in unclear and vague statements of goals. The results show that, at least formally, Gender Medicine has been integrated at all the Austrian universities by being anchored in their curricula. Actual implementation in everyday university studies has been achieved very differently at the various universities and ranges from a well-established and broad offer of Gender Medicine lectures to a university with no lectures at all.
Conclusion: Legal framework conditions are necessary prerequisites. However, legal requirements in their general and vague nature are not sufficient and permit much creative leeway. Additional factors are important in order to establish Gender Medicine in medical education and research. The development of uniform standards and criteria would be a next important step for the Austrian universities.
Take-home message: Legal standards, financial resources as well as specific persons, who bring the right interest and dedication and have the necessary power to act, are necessary to implement a new medical discipline.

The relevance of the 'irrelevant': sexual and gender diversity topics in a medical curriculum

Authors
Maaike E. Muntinga
Juliët A. Beuken
Petra Verdonk

Presenter: Maaike Muntinga, VUmc School of Medical Sciences, Amsterdam, Netherlands

Background: Future doctors should be adequately trained to address the specific health care needs of sexual and gender minority patients. So far, little insight exists in to the extent to which medical schools integrate sexual and gender diversity content in their curricula. We therefore screened an undergraduate course 'Sex, sexuality and relationships' in the VUmc School of Medical Sciences (VUmc SMS) curriculum for Lesbian, Gay, Bisexual, Transgender and Intersex (LGBTI) content, with the aim to identify good practices and opportunities for improvement.
Methods: We conducted a two-phase, intersectionality-based course evaluation. Intersectionality theory assumes individual (health) experiences are influenced by intersections of identities associated with either advantage (privilege) or disadvantage (oppression). In phase one, we evaluated the formal curriculum by screening the course for content (lecture slides, assignments, course literature) and identifying gaps using Obedin-Maliver's framework for LGBTI learning objectives (Obedin-Maliver et al, 2011). In phase two, we critically analysed how LGBTI content was addressed within the course.
Results/Discussion: We identified several good practices related to content, such as a lecture on transgender surgery and an assignment on mental health and sexual orientation. However, essential LGBTI topics such as intimate partner violence, LGBTI youth & coming out, barriers to care for LGBTI patients, and social aspects of trans identity and transitioning remained unaddressed. Lesbian and bisexual health issues were not addressed. Patients and physicians in paper cases were heterosexual unless otherwise indicated (heteronormativity) 'homosexuality' was listed as a topic alongside medical syndromes and diagnoses (pathologization), and gender and sexuality were generally presented as fixed and binary constructs.
In paper cases and study material, the standard sexually diverse patient is a white male, which (inadvertently) renders other intersections of identity (e.g. ethnicity) with sexual of gender minority status invisible. This invisibility of LGBTI minority identities and institutional heteronormativity leads to white and heterosexual bias in clinical reasoning, which might cause physicians to overlook needs of both non-straight ánd straight-identified patients.
Conclusion: Addressing LGBTI-related content in a responsive way is essential to emphasize the clinical relevance of knowledge about patients' gender and sexual identities.

Women leaders in Global Health - the importance of gender equality in global health and the integration of global health issues into medical education

Authors
Sabine Ludwig
Roopa Dhatt
Ilona Kickbusch

Presenter: Sabine Ludwig, Charité-Universitätsmedizin Berlin, Germany

Background: Women represent on average 70% of the global health workforce, but only 25% are in leadership positions. In order to showcase women's leadership, improve gender equality in global health and contribute to the integration of global health in medical curricula, a list of 300 Women Leaders in Global Health was compiled and the organization Women in Global Health founded. As Germany is taking on a new leadership role in global health, the aim was to create the first national pilot chapter of the international organization for Germany as a best practice example for other national networks.
Methods: A group of women working in the field of global health in Germany from academia, the private sector, ministries and non-governmental organizations as well as medical students was established. Criteria for the nominations, work priorities and objectives were defined. Women in the network need to work in global health in Germany, being German and working in global health internationally and having a minimum of two years' work experience in this field.
Results: The first national pilot chapter of the organization Women in Global health was founded. There are 102 women from 55 different organizations and institutions women on the list and in the network. The list is ordered alphabetically by surname and is not ranked. 55% of the women on the list are in leadership positions, 83% work in Germany, 92% are German, and 8% have a different national background.
Discussion/Conclusion: The list and network will increase the visibility of the women, advocate for the integration of global health issues into the medical curriculum and contribute to more gender equality in global health. Not all women working in this field are included yet and financial resources are needed to work on the goals. The German chapter will be a best practice example for the creation of further local chapters.
Take-home message: It is important to have a core group of women from different institutions to start with a national network, to clearly define the objectives of the national chapter and keep the network flexible.

Medical students' ability to care for LGBT population in the Middle East

Authors
Nada Najem, USJ, Beirut, Lebanon
Eliane Eid, USJ, Beirut, Lebanon
Elie Nemer, USJ, Beirut, Lebanon
Sani Hlais, USJ, Beirut, Lebanon
Eliane Ayoub, USJ, Beirut, Lebanon

Presenter: Roland Tomb, Saint-Joseph University Medical School (USJ), Beirut, Lebanon

Background: Doctors are committed to care for all patients regardless of their ethnicity, race, religion and all disparities including their sexual orientation and practices. Nevertheless, during the past decade some evidence has grown about healthcare disparities towards LGBT (Lesbian, Gay, Bisexual and transgendered) population. Our aim was to assess the residents' attitude and knowledge towards LGBT Lebanese population.
Methods: We performed a cross-sectional; internet-based survey among the residents of the Saint Joseph University medical school in Lebanon, designed for completion within a 15-minute time period. A confidential online survey using Limesurvey was sent to all the 230 residents. The email included an informed consent. The residents were free to answer or not. The test was anonymous without log-in information requested. The school's ethics committee approved the study.
Results: The first part of the questionnaire assessed attitudes towards LGBT patients. The residents indicated their level of agreement with each item (13 items) according to a 5-point Likert scale. This part was adapted from a validated survey of resident and physicians' attitudes toward patients with AIDS. The second part aimed to assess knowledge and consisted of 14 knowledge-based questions pertaining to LGBT healthcare. This part was based on the health objectives presented in the Healthy People 2010. A total of 118 of the 230 students (51%) completed the online survey.
Student Attitudes: An attitude score was calculated, based on a 5-point Likert scale per item, where a score of 5 indicated the most positive attitude and a score of 1 the most negative attitude. Students had an overall attitude score of 2.93 (SD=0.40).
Knowledge score: The knowledge score was low (7.2/20) and didn't correlate to the attitude score. This score ranged from 0 to 14/20. The median is 7/20, and the maximum 14.2/20. Only 10% of residents scored more than 10/20.
Conclusion: In conclusion, this study shows that our residents have a slightly positive attitude but a lack of accurate medical knowledge relevant to the special needs of the LGBT population.
Take-home message: Based on our results, an educational intervention needs to take place.

3M5 (744)
Implementation Strategies of Gender Medicine in European Medical Universities

Authors
Sarah Hiltner, Radboud University Medical Center, Nijmegen, Netherlands
Theresa Wobbe, University of Potsdam, Potsdam, Germany
Sabine Oertelt-Prigione, Radboud University Medical Center, Nijmegen, Netherlands

Presenter: Sarah Hiltner, Radboud University Medical Center, Nijmegen, Netherlands

Background: Sex and gender sensitive medicine (SGSM) is a young discipline that is claiming its position in medical academia since the early 2000s. The European SGSM scene has increased its visibility through institutionalization and some very active national members. Nevertheless, a lack of formal structures, transnational guidelines and diverse academic environments led to significant diversity in national strategies and depth of implementation in medical curricula.

Methods: This study investigates the current state of the field of SGSM in Europe and analyzes the impact of organizational aspects on its implementation into medical curricula. The explorative set-up consists of semi-structured interviews with 20 persons from 7 countries and 12 universities. The questionnaire focused on three aspects in particular: 1. the status quo of SGSM at the particular university, 2. how did it obtain its status? 3. what was the context within the university and the state it is situated in? More than 700 minutes of interview data were collected and analyzed via directed content analysis. Results were arranged into facilitators and hurdles based on the depth of implementation of SGSM into the curriculum.

Results: The results were sorted into two groups, based on SGSM being a mandatory (6 universities) or voluntary (6 universities) part of the medical curriculum. Mandatory implementation was facilitated by the presence of a professorship filled with a pioneer of SGSM. Supportive elements were the presence of a lecture series about SGSM, possibly with the involvement of department heads from other medical disciplines.

Discussion/Conclusion: The universities that implemented SGSM as mandatory part of their medical education display institutionalized SGSM structures. Through formal structures like a chair, a lecture series or a department they have made SGSM visible, which in turn fostered the mandatory inclusion into the curriculum.

The most promising approach to raise awareness for SGSM is a lecture series, however, funding for institutionalizing SGSM structures is indispensable to force sustained inclusion of SGSM into the curriculum.

Take-home message: SGSM should become a mandatory part of medical training – the most successful start is a lecture series engaging established experts from all medical disciplines.

"Can I have your number?" – exploring undergraduate medical student boundary setting

Authors
Russell Hearn, King's College London, London, UK
Benjamin Taylor-Davies, King's College London, London, UK
David Gee, King's College London, London, UK

Presenter: Benjamin Taylor-Davies, King's College London, UK

Background: Awareness of professional boundaries is prerequisite to delivering good medical care. In undergraduate medical curricula students are not necessarily taught how to develop these boundaries and their extent may be influenced by students' social demographics or held beliefs. We undertook to examine these influences and subsequently consider how undergraduate medical curricula may be designed to ensure development of appropriate boundaries in future doctors.

Methods: Third-year undergraduate medical students participate in a primary care simulation programme. In one layered actor-based scenario, a patient with dyspepsia romantically propositions the doctor. An ethnographic observational study was conducted by CCTV exploring the gender and ethnicity of doctor/patient/group and the resultant issues around sexuality, culture, power and boundary setting. This was then triangulated using two focus groups to reflect observational results.

Results: Strong demographic themes emerged, with both gender and ethnicity appearing to strongly influence the extent of boundary setting and tolerance of unprofessional interpersonal behaviours. Female students demonstrated a lower threshold for unprofessional behaviour and more explicit boundary setting behaviour. BME students seemed more uncomfortable with explicit acknowledgments of inappropriate patient behaviour. Same-sex doctor-patient scenarios produced varying levels of challenge to students again related to sex and ethnicity of the student.

Discussion/Conclusion: Female students reported greater familiarity with unwanted sexual advances, lived experiences therefore influence the student's professional behaviour. Differing genders and/or ethnicities of patient and student may influence the dynamic of power within the consultation and thus both the student's tolerance of unprofessional behaviour and their rapidity and ease of boundary setting.

Doctors need to develop insight into their own held beliefs and then be able to operate within varied sexual, cultural and ethnic landscapes. Medical curricula must reinforce the importance of professional boundary setting and provide future doctors with the consultation skills to function optimally. We will suggest a usable toolkit for this development within undergraduate curricula.

Mainstreaming gender and diversity in a medical curriculum. Reflections from VUmc School of Medical Sciences in Amsterdam

Authors

Petra Verdonk
Maaike Muntinga
Lina Issa
Hannah Leyerzapf

Presenter: Petra Verdonk, VU University Medical Center School of Medical Sciences, Amsterdam, Netherlands

Background: Medical schools need to address the health care needs of diverse populations. We have been implementing a longitudinal cultural competence pathway, based in a social justice paradigm. Learning objectives were as follows: (1) knowledge on health differences across sex/genders, cultures, and class; (2) skill development, and; (3) reflexivity. In addition, an extracurricular, diversity-oriented student committee (D.O.C.S.) supported by a performance artist was founded.
Methods: We developed and implemented several modules including 2 hr practicals, lectures, study assignments, an elective, oral examination and a teacher training module were developed and implemented, some in collaboration with D.O.C.S. and the artist. Overall, assessment of the pathway included piloting and evaluating modules in different designs, conducting interview studies about students' experiences, and a curriculum quality assessment by the national visitation committee.
Results: Evaluation results show that most learning objectives were implemented as intended, including final objectives for the bachelor and masterprogram, and the visitation committee evaluated the implementation of diversity issues as a best practice. Despite these successes, much remains to be done. For instance, although our experiences with collaborating with the artist and students were positive, we adjusted some modules from arts-based to more traditional content and form because of poor student adoption. While acceptability of diversity issues among students, a large share of medical teachers have not been reached.
Discussion: Despite a positive climate to diversity in our school, students and staff also call for traditional, comfortable approaches to teaching, both content- and form-wise. Teacher discomfort with topics such as racism, oppression and critical reflexivity cause this content to readily disappear from the curriculum. We reached important milestones, but we also need a pause and reflect on what we have reached, and how to move forward, especially when it comes to transformation in our school and social justice issues.
Conclusion: A structured approach to implementing diversity issues in medical education is effective at the formal curriculum level. A social justice approach tells us to not be easily satisfied.

Comparing apples, oranges and dragon fruit: Integrating the BioMedical Admissions Test (BMAT) into selection at Leeds Medical School

Authors
Patrick JR Harkin, School of Medicine, University of Leeds, Leeds, UK

Presenter: Patrick Harkin, School of Medicine, University of Leeds, UK

Background: During selection, medical schools must compare applicants with different academic qualifications and diverse experiences. In 2014 Leeds Medical School introduced BMAT to facilitate comparisons of academic potential within our diverse pool of applicants, including school leavers, international and mature applicants, and those from WP backgrounds. Adoption of BMAT was carried out over a number of years, replacing use of another assessment. BMAT comprises three sections: Sections 1 and 2 measure analytical problem solving skills, and application of scientific knowledge, respectively. Section 3 is a writing task focusing on the ability to develop, organise and communicate ideas.
Methods: The context of selection at Leeds is described, including the way in which the Medical School aggregates BMAT section scores and uses them alongside other selection measures. Scores from the first cohort to take BMAT for entry were correlated with Year 1 examination marks. Analyses of relationships for different subgroups were also conducted.
Results: BMAT scores, as used in our selection process, correlate with Year 1 examination marks. The format and content of Year 1 exams at Leeds Medical School is considered in view of these correlations. Differences in performance, both in BMAT and on the course, between key subgroups were identified; however the relationship between BMAT scores and outcomes within these subgroups appear similar.
Aggregated BMAT scores, as used by Leeds Medical School, predict performance on Year 1 summative examinations. BMAT Section 2 was the strongest predictor, most likely as it is more closely related to the abilities being assessed in Leeds' first year exams. Selection processes evolve and more emphasis may be given to BMAT scores in future, with further consideration of subgroup differences in applicants.
Conclusion: Medical schools face challenges in comparing applicants with different backgrounds and experience and an admission test taken by all candidates may add value to the selection process. BMAT predicts year 1 exam performance at Leeds Medical School, which has a diverse applicant cohort. BMAT Section 2 may be useful for evaluating science ability in applicants without GSCE grades, such as international or mature applicants.

3N2 (2725)
Is selection paying off? A cost-benefit analysis of a multi-tool selection procedure into medical school contrasted with a lottery procedure

Authors
Sanne Schreurs, Department of Educational Development and Research, Maastricht University, Maastricht, Netherlands
Kitty Cleutjens, Department of Pathology, Maastricht University, Maastricht, Netherlands
Arno Muijtjens, Department of Educational Development and Research, Maastricht University, Maastricht, Netherlands
Jennifer Cleland, Centre for Healthcare Education Research and Innovation (CHERI), Institute of Education for Medical and Dental Sciences, University of Aberdeen, Foresterhill, Aberdeen, UK
Mirjam oude Egbrink, Department of Physiology, Maastricht University, Maastricht, Netherlands

Presenter: Sanne Schreurs, Department of Educational Development and Research, Maastricht University, Maastricht, Netherlands

Background: Higher education institutes are often confronted with the challenge of decreasing funding and increasing accountability demands. These factors have also led to more scrutiny of medical school finances. However, economic analyses, such as cost-value analyses, to date, are lacking in medical education, although there have been recent calls in the literature to focus more on this topic. Joining this conversation, the current study aimed to examine and compare the cost and value of two different approaches to selection into medical school: a bespoke, multi-method selection process versus a lottery procedure. Our goal was to assess the relative effectiveness of each approach, and then compare these in terms of outcomes and costs.
Methods: The study was conducted at Maastricht University Medical School (MUMS). The costs and benefits of the bespoke selection process were contrasted with those of a national weighted lottery procedure. Both selection approaches ran in parallel. The study encompassed three cohorts of students admitted through selection and through lottery (2011-2013). Outcomes included retention, remediation and examination performance over the course of the three-year bachelor of medicine.
Results: The bespoke process costed about €133,000 for a full cohort of medical students (n=316). The lottery procedure came with negligible costs for the medical school. In return, the average benefits of bespoke selection compared to lottery added up to a little over €200,000. These benefits consisted of an increased income by preventing drop-out and decreasing extra costs by preventing redoing blocks and OSCEs. Overall, the bespoke selection process was cost-beneficial.
Conclusion: This study shows that conducting a cost-benefit study is not only feasible in the context of selection for medical school but that an 'expensive' selection process is cost-beneficial over a cost-neutral alternative. Different schools have different approaches to

selection and this was one study in one setting, so we urge others to look at similar questions in their own contexts. The results in this study provide important information for the current debate about whether or not selection procedures are worth the investment in staff time and resource.

3N3 (2736)
Selecting the attributes that matter: Personal attributes at MMI interview predict clinical competence in specified domains of senior medical student OSCEs

Authors
Lyndal Parker-Newlyn, University of Wollongong, Wollongong, Australia
Kylie J Mansfield, University of Wollongong, Wollongong, Australia
Helen Rienits, University of Wollongong, Wollongong, Australia
Ian Wilson, University of Wollongong, Wollongong, Australia

Presenter: Lyndal Parker-Newlyn, University of Wollongong, Australia

Background: Previous academic performance predicts future academic performance in medicine, and is a widely used selection attribute, despite weaker correlation with clinical aptitude. Interviews are more controversial, reports of their predictive validity vary. In previous research we investigated the correlation of MMI and predict clinical skills in medical students and demonstrated that MMI interviews were useful at predicting clinical performance, especially in final year. It was unclear if both MMIs and OSCEs identify generic communication skills or if correlations exist between specific skills and clinical attributes. In this study we investigated if specific MMI selection attributes could predict clinical performance in OSCE domains in final year medicine.

Methods: MMI stations in our MD admissions process are blueprinted to selection attributes. Similarly, OSCE stations are classified according to clinical competencies identified by ACCLAIM. Attribute matched MMI stations from two cohorts of medical students (2016-2017 graduates) were correlated with their final year OSCE scores (assigned competency descriptors from the ACCLAIM collaboration) using linear regression.

Results: MMI interviews predicted final year OSCE performance with stronger correlation than previously reported ($r2=21.2\%;P<0.0001$). MMI selection attributes also showed a significant positive correlation with overall OSCE performance – specifically, stations assessing insight into medicine showed positive correlation with overall performance ($r2=12\%;P<0.0001$) and ethics/law domains ($r2=16.2\%;P<0.0001$). MMI stations assessing problem solving demonstrated positive correlation with investigation planning ($r2=11.2\%;P<0.05$) and patient centred care ($r2=12.1\%;P<0.001$). Students' performance on leadership stations correlated with overall OSCE score ($r2=12\%;P<0.008$), and Professional Discourse ($r2=15.3\%; P<0.003$).

Discussion: Predicting clinical performance is a clear goal in medical school admissions. This analysis confirms the predictive correlation of MMI interview with final year OSCE performance. Selection attributes specifically correlate with clinical performance domains, implying that MMI does not simply assess communication, but also the underpinning attributes that form foundations for clinical skill development.

Conclusion: MMI interviews can aid student selection by predicting those who will perform well in future clinical assessments. Identifying desirable personal attributes when designing admissions processes is important to select for the foundation skills that underpin future clinical competence.

3N4 (3401)
Associations between MMI scores and scores on the BioMedical Admissions Test (BMAT): Implication for selection practices

Authors
Molly Fyfe, Cambridge Assessment Admissions Testing, Cambridge University, Cambridge, UK
Patrick Harkin, Leeds University Medical School, Leeds, UK
Kevin Cheung, Cambridge Assessment Admissions Testing, Cambridge University, Cambridge, UK

Presenter: Kevin Cheung, Cambridge Assessment Admissions Testing, Cambridge University, Cambridge, UK

Background: Admissions tests and multiple-mini interviews (MMIs) are often used in medical school selection, yet little is known about how these assessments may inter-relate in the constructs they assess. While the assessment constructs of MMIs can be difficult to define clearly, those measured in standardized admissions tests tend to be well established and defined. BMAT has three sections that target constructs relevant to studying medicine. Sections 1 and 2 respectively measure analytical problem solving skills and application of scientific knowledge. Section 3 tests the ability to organize and communicate ideas effectively in writing. This study investigates the relationships between BMAT scores and MMI performance at a UK medical school.

Methods: MMI data for three years of applications were obtained; for each year, eight individual station scores and overall MMI scores were correlated against BMAT section scores. Regression analyses were conducted using BMAT section scores to predict overall MMI performances.

Results: Correlation and regression analysis showed that BMAT Section 3 is significantly associated with MMI overall scores across all years for which data was analyzed. Furthermore, Section 3 correlated with specific MMI stations consistently, suggesting that the relationships between MMI station constructs and BMAT Section 3 were stable year on year. MMIs were not consistently associated with cognitive skills in critical thinking, problem solving or scientific reasoning, as measured by BMAT Section 1 and 2.

Discussion: Communicating ideas effectively, as measured in the BMAT writing task is associated with MMI overall performance, This suggests related constructs, such as different aspects of communication, are being assessed. MMIs showed little evidence of assessing scientific reasoning however, perhaps reflecting the design of the stations and the purpose of this selection stage.

Conclusion: Shortlisting candidates using BMAT may help select applicants more likely to perform well on MMIs, although the amount of shared variance is small. There appears to be minimal redundancy in the constructs assessed through MMIs and BMAT suggesting these assessments are complementary when used together for selection.

Investigating the predictive validity of a selection instrument over time – A case study of the BioMedical Admissions Test (BMAT) at a UK university

Authors

Sarah McElwee, Cambridge Assessment Admissions Testing, University of Cambridge, Cambridge, UK
Safiatu Lopes, Cambridge Assessment Admissions Testing, University of Cambridge, Cambridge, UK
Brigita Seguis, Cambridge Assessment Admissions Testing, University of Cambridge, Cambridge, UK
Kevin YF Cheung, Cambridge Assessment Admissions Testing, University of Cambridge, Cambridge, UK

Presenter: Sarah McElwee, Cambridge Assessment Admissions Testing, University of Cambridge, UK

Background: Establishing the predictive validity of a selection assessment over time is difficult. Selection contexts and processes may change, affecting the ways in which scores are used and the impact they have on the admissions decision. BMAT is an admissions test for entry to medicine and related biomedical courses in the UK and internationally. Early analysis of pilot years of BMAT showed it predicted course performance. This analysis examines more recent data when scores were used for decision-making.

Methods: Course performance data for multiple cohorts from pre-clinical phases of medical training were linked with BMAT scores for a UK university. Correlations and regressions were used to identify theorised positive relationships between BMAT Section scores and overall grades from the first and second years of medical school. Module level data was used to examine predictive relationships at a more granular level.

Results/Discussion: BMAT scores predict overall performance in first year of the medical course, and certain sections predict performance in the second year. The relationships were weaker than those observed in pilot years of BMAT use but similar to those reported in other predictive validity studies. Issues such as greater range-restriction as a test's use in selection develops may underpin attenuation in the observed correlations. Inclusion of the module data in the analysis highlights the importance of taking a construct-driven approach to predictive validity.

Differences in score use over time are inevitable as stakeholders constantly appraise their selection procedures. If BMAT scores are used more readily to support selection decisions, predictive relationships may be present but more difficult to observe. Other issues are also important to consider, such as the impact of the students' progression through the course and the intended construct of the course assessments.

Conclusion: BMAT continues to demonstrate predictive validity using on-course performance as a criterion variable. It is important to consider alignment of constructs between the admissions tests and course examinations. Monitoring the predictive validity of an assessment is challenging due to changing selection contexts.

Does changing medical admissions practices impact on who is admitted?

Authors

Sandra Nicholson, QMUL, London UK
Shona Fielding, University of Aberdeen, Aberdeen, UK
Paul Tiffin, University of York, UK
Rachel Greatrix, UKCAT, Nottingham, UK
Fiona Patterson, Work Psychology Group, Derby, UK
Jennifer Cleland, University of Aberdeen, Aberdeen, UK

Presenter: Sandra Nicholson, QMUL, London, UK

Background: Undergraduate medical admissions must balance two potentially-conflicting missions: to select those who will be both successful medical students and competent clinicians, and increase the diversity of the medical school population and workforce. Many countries address this dilemma by reducing the heavy reliance on prior educational attainment, complementing this with the use of other selection tools. However, to what extent has this shift in practice actually widened access to medicine? Available evidence is conflicting. Our aim therefore was to examine if changes in medical school selection criteria or processes significantly impact on the composition of the student population.

Methods: An observational study of medical students from 18 UK 5-year medical programmes who took the UK Clinical Aptitude Test (UKCAT) from 2007-2014. We included candidate demographics, UKCAT (total scores) and data on admissions practices. We used an interrupted time-series framework with segmented regression to identify the impact of changes in selection practices at five case study medical schools on the demographics of four target groups (male, non-white, lower socio-economic classes, non-selective school attendance).

Results: There were no obvious changes in the proportion of admissions from each of the target groups over the eight year period, averaging at 43.8% male, 3.3% lower socio-economic group, 51.5% non-selective school and 30.5% non-white. All five example schools changed their admissions practices over the time period of the study. Yet this within-school variation made little difference locally, or overall: changes in admission practices did not lead to any discernible change in the demography of those accepted into medical school.

Discussion/Conclusion: Although our case schools changed their selection procedures, these changes did not lead to any observable differences in their student populations. Significant resource has been directed within the UK to addressing the under-representation of students from lower socio-economic groups without, on the whole, any standardised long-term evaluation. Our results

indicate that these efforts whilst well intentioned have largely failed.

Take-home message: We suggest that increasing the diversity of medical students, and hence the medical profession, may require adopting different, perhaps more radical, approaches to selection.

One day to change 3 years of learning: the gamble of few students

Authors
Camille Bac, Lyon Est Faculty of Medicine, Lyon, France

Quentin Paulik, Lyon Est Faculty of Medicine, Lyon, France
Gilles Rode, Lyon Est Faculty of Medicine, Lyon, France
Nicolas Lechopier, Lyon Est Faculty of Medicine, Lyon, France
Jérôme Etienne, Lyon Est Faculty of Medicine, Lyon, France

Presenter: Camille Bac, Lyon Est Faculty of Medicine, Lyon, France

Background: French medical studies are sanctioned by a national ranked exam (ECNi), which determine students' specialty and town of residency. The training for this contest, from the 4th year to the end of the 6th, requires for students to acquire an effective working method. But it is easier said than done… That's why some students decided in 2016 to take charge by creating themselves a time to learn how to work well. After a first successful edition in 2016, the student organizers decided to go further this year!
Methods: On September 2017, few students organizers created a special half-day at the beginning of the 4th year to give confidence to students for the ECNi training. Concretely, 308 4th year students were divided into 12 small working groups animated by a trinomina composed of one 5th year student, one junior doctor and one teacher to discuss about pedagogical methods. Then, an initiation to self-hypnosis was proposed, along with a debate with human sciences teachers about students' difficulties at hospital.
Results: In our survey of satisfaction (184 answers), 93% answered that this day met their expectations, 97% want a new session next year, and the average grade of the quality of this half-day was 8.2/10. The students particularly appreciated the presence of the trinomina to answer all their questions from different point of views.
Conclusion: This successful organisation was possible thanks to the skills of everyone implicated in this half-day: students' motivation, residents' willingness to help, teachers' expertise and support.
Faced with such an effective collaboration, the university was very favourable to this initiative as it created a positive and encouraging atmosphere for students before the start of the academic year.
Take-home message: Alone, we go faster… Together, we go further! And this is exactly what this project illustrates: students, residents and teachers, working hand by hand to allow students to start the ECNi training on a strong foundation…

The experience of the eldest, the proximity of the youngest, and the perspective of the middle… maybe we have here the ingredients of the pedagogy of tomorrow!

Student self-assessment driven by the AMEE ASPIRE programme at the Faculty of Medicine of the University of Lisbon

Authors
Madalena Patricio, Department of Medical Education/Institute of Introduction to Medicine, Faculdade de Medicina, Universidade de Lisboa, Portugal
António Pais-de-Lacerda, Department of Medical Education/Institute of Introduction to Medicine, Faculdade de Medicina, Universidade de Lisboa, Portugal
Miguel Barbosa, Department of Medical Education/Institute of Introduction to Medicine, Faculdade de Medicina, Universidade de Lisboa, Portugal
António Barbosa, Institute of Introduction to Medicine, Faculdade de Medicina, Universidade de Lisboa, Portugal

Presenter: Madalena Patricio, Department of Medical Education (DEM), Faculty of Medicine, University of Lisbon (FMUL), Lisboa, Portugal

Background: The ASPIRE-to-Excellence international initiative was created by AMEE to recognise and reward 'Excellence in teaching' at the medical schools. Criteria are now defined in five areas with 'Student Engagement in the School and in the Curriculum' being one of them. In 2018 it was decided to benchmark the school against best practices in this area putting forward an application for the ASPIRE award.
Methods: Benchmarking revealed 'self-assessment' as one of the current weakest sub-criteria. This study reports a pilot 'self-assessment' made by 334 first year students in the context of Module III-I 'The Doctor, the Person and the Patient', with students indicating the grade they expected in the written exam and portfolio. For this purpose, a question was introduced at the end of the exam namely 'What grade do you expect to get on the exam you just completed as well as in the portfolio you delivered last week? Students were also asked to rate the level of their knowledge (high/medium/low) regarding Module III-I. This pilot study was already extended to other curricular areas (e.g., Neurology and Paediatrics) and to practical exams.
Results: Considering the global sample the results indicate that students are capable of self-assessment. The average difference between 'grade' vs 'expected grade' is only .13 for portfolio and .15 for the exam. However when considering the three groups (high/medium/low knowledge) students assessing their knowledge as 'high' were more optimistic in terms of expected grade (average difference equal to .38 for portfolio and .75 for written exam).
Discussion/Conclusion: Comparing self-assessment grades of portfolios versus written exams the authors expected students to have had more difficulties when estimating their portfolio grades, because assessment criteria, although clearly defined and transparent, were probably less objective.

Although this pilot experience showed that students are capable of self-assessment in terms of theoretical knowledge and critical reflection it is important to extend this pilot experience to all curricular areas to keep them continuously aware of the need to permanently monitorise their performance. Self-assessment is a key competence to prepare future doctors to engage in Lifelong Learning.

Working in partnership with health professional students to understand their perceptions of digital identity management and to embed digital skills into the curriculum

Authors
Aileen Linn, University of Glasgow, Glasgow, UK
James Boyle, University of Glasgow, Glasgow, UK
David Gibson, University of Glasgow, Glasgow, UK
Hannah Lawler, University of Glasgow, Glasgow, UK
Sara Berent, University of Glasgow, Glasgow, UK
El Spaeth, University of Glasgow, Glasgow, UK

Presenter: Aileen Linn, University of Glasgow, UK

Background: Within the University of Glasgow's College of Medicine, Veterinary Medicine and Life Sciences (MVLS) there are several degree programmes which have associated Professional bodies that publish guidelines for social media use and misuse. But how do our students actually feel about the advice and guidance that is provided to them? Can they apply these guidelines to their own experiences in University? What are the motivators for our students to pursue their identity management and what are the challenges that they currently perceive with behaving professionally in a digital environment?
Methods: All of the undergraduate students on degree programmes within the College of MVLW were invited to participate in a needs analysis survey. This presentation will communicate the results of this study, which identified digital identity management, professionalism in an online environment, digital wellbeing, productivity skills including management of digital distractions, and communication and collaboration online as key topics that students wanted more guidance on.
Forty student partners from across the schools worked in collaboration with staff focusing on potential challenges, solutions, and opportunities for curriculum developments in these areas. Face-to-face and online teaching resources that will encourage student reflection on both their personal and professional development as they transition through their degree programme were created based on their insights.
The presentation will focus on the development of digital citizenship skills that our students have identified as key graduate attributes that will help them strive throughout their University Career and within their future work place and how to embed the development of these skills into the curriculum. The presentation will also focus on the benefits of working in partnership with students to enhance curriculum development.

Developing Effective Student-Staff Interactions to Improve the Learning Environment

Authors
Katrina West, School of Clinical Medicine (University of Cambridge), Cambridge, UK
Michelle Arora, School of Clinical Medicine (University of Cambridge), Cambridge, UK
Mark Lillicrap, School of Clinical Medicine (University of Cambridge), Cambridge, UK
Richard Davies, School of Clinical Medicine (University of Cambridge), Cambridge, UK
Mark Gurnell, School of Clinical Medicine (University of Cambridge), Cambridge, UK
Diana Wood, School of Clinical Medicine (University of Cambridge), Cambridge, UK

Presenter: Katrina West, School of Clinical Medicine, University of Cambridge, UK

Background: There is little literature describing the effect of student-staff interactions on the learning environment. Undergraduate medical education programmes are organisationally complex, requiring interaction between a range of faculty and administration staff and communication with a large number of students to deliver desired educational outcomes. Students may struggle to identify their place within the course's design and delivery, leading to disaffection and a sense that they are merely recipients of the curriculum. We have observed that, paradoxically, faced with increased and varied communication relating to the curriculum, some students have become more disengaged (Baron & Corbin, 2012).
Methods: We conducted focus groups with 28 students, a questionnaire (197 students) and interviewed 36 staff (administrators and clinicians). The data were thematically analysed to explore the quality, quantity and effectiveness of our interactions with students. The data reached thematic saturation.
Results/Discussion: Emerging themes included students' communications expectations ('there's a disparity between the emails we're getting and what we want to get emails about'), and the quality and quantity of communication students received ('the main problem is the diversity and quantity of things we are emailed about […] Receiving lengthy emails about smaller things we don't need to act on […] habituates not reading them'). Other themes included the importance of inter-staff communication to encourage cohesiveness ('students are often sent information without the rest of the School Office knowing. We need to get communications within the team working, who's doing what, where').
We developed strategic and sustainable initiatives to improve student and staff interactions. Multiple emails were replaced by a weekly newsletter delivering key messages and introducing key members of staff to students and ineffective methods of communication were replaced with more efficient and cost-effective platforms. Staff development programmes now include guidance and training for effective written communication. Preliminary results suggest improved overall student satisfaction.

Conclusion: A collaborative approach to improving student-staff interactions through effective communication improves the learning environment and reduces disaffection, thus improving the overall student experience.

3O5 (1854)
Students have great influence on decisions at University of Copenhagen – regarded as equals of the Board of Leaders

Authors
Mathilde Horn Andersen
Annarita Ghosh Andersen

Presenter: Mathilde Horn Andersen, Student, University of Copenhagen, Denmark

Background: In 2016 the Danish government presented a law amendment to get the students at the Danish University's to finish their degree faster. By 2020 the University's would have to reduce their students completion time with 5 months. They gave every University the responsibility of finding their own solutions to the new demands. The University of Copenhagen formed a committee of 6 students and 6 members of the University's board of Leaders to make a solution to accede to the governments demand.
Methods: The medical students at the University of Copenhagen participate in the hiring of professors, curriculum development, accreditation process and more. The faculty believes that a dialogue between all parties involved is expected.
The example analyzed in this case is the implementation of new guidelines for the student completion time. We have analyzed it qualitatively by regarding the overall student and faculty satisfaction with the process and result.
The faculty greatly appreciates the participation of students in many aspects of decision-making. Student involvement and engagement have a measurable effect on both the success and quality of educational changes and the student's satisfaction with the new demands.
Discussion and Conclusions: Creating and nurturing student involvement and engagement is profitable both for the faculty and the students who also benefit from the experience in their future as medical professionals. It gives a smooth implementation of decisions affecting the student body – including the difficult ones.
Students must be included in designing the rules and demands of the University. They are experts in their own and their peer's behavioral patterns and have a different insight to which changes will accede to the demands.
Take-home message: Start formalizing student involvement and engagement. This will subsequent allow for a buildup of skilled and empowered student involvement and engagement for the benefit of the single university and society as a whole.

Training Medical Students to become Great Teachers: A Longitudinal MS4 Medical Student as Teacher Elective (MST)

Authors
Elisabeth Schlegel, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Hempstead, New York, USA
Alice Fornari, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Hempstead, New York, USA
Michael Cassara, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Hempstead, New York, USA
Jeffrey B. Bird

Presenter: Elisabeth Schlegel, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Hempstead, USA

Background: As pointed out by Erlich and Shaughnessy (2014) and others, teaching is a physician core skill. However, educational skill training is oftentimes not part of the medical school curriculum. The purpose of this innovative medical student as teacher (MST) elective is preparing final year medical students (MS4s) for roles as medical educators in their post graduate training using both didactics and experiential learning.
Methods: A longitudinal MST elective for MS4s combining didactics, educational theories and strategies, curriculum design and authentic teaching expectations was developed within our School of Medicine [SOM] curriculum. Replacing a 2-week block rotation pilot, it includes educational boot camps (22 hours), opportunities as educators (25 hours), independent study (15 hours), and a summative capstone project. A visual timeline, reflective online teaching logs, faculty debriefings, and mentoring enable students to successfully meet curricular goals and objectives. MS4s develop proficiency in various pedagogies and receive 2-week elective credit.
Results/Discussion: After co-facilitating over 20 educational sessions, the inaugural MS4s have been commended for their skills by faculty and students. The self-directed learning approach is compatible with required clinical rotations and residency interviews, while allowing sufficient time to acquire teaching skills. Data will be presented from semi-structured exit interviews evaluating program structure and learning objectives, individual assessments including reflective teaching logs, debriefings, journal club presentations and a 2-station teaching OSTE. Their final capstone curriculum project including a presentation, is critiqued by peers and faculty and available as future curriculum component at the SOM. This elective providing educational content and structure, reflection, and teaching opportunities can easily be adopted by medical schools with elective time and faculty resources. Flexible timelines and enhanced communication strategies, specific to authentic teaching opportunities, are key to accommodate individual student interests and schedules. Required face to face time must be scheduled early.
Conclusion: Successful MST electives allow students taking on faculty roles and provide benefits for medical school leadership, teachers and learners. It is a win-win for all. We describe a comprehensive longitudinal MST

program preparing students for roles as proficient medical educators in their future specialties.

Tailored faculty development to support undergraduate medical curriculum renewal: An aligned approach

Authors
Jana Lazor, University of Toronto, Toronto, Ontario, Canada
Lori Innes, University of Toronto, Toronto, Ontario, Canada
Jennifer Bell, University of Toronto, Toronto, Ontario, Canada

Presenter: Jana Lazor, University of Toronto, Ontario, Canada

Background: Our challenge was to create a faculty development (FD) program that aligns faculty capacities and skills with the goals and pedagogy of a new undergraduate medical curriculum that is undergoing significant innovation and change.
Methods: To ensure alignment between FD that is offered and the new curriculum being developed, we applied a process we refer to as "Assess, Align, and Engage", which reflects a learning-centered environment, with an eight step situational analysis to understand: (1) proposed curriculum changes; (2) faculty roles/tasks; (3) core knowledge, skills and attitudes required to perform faculty teaching tasks; (4) learner (faculty) characteristics; (5) student learning needs/characteristics, that the faculty need to be prepared to incorporate into their teaching practices; (6) health care environment context in which the students will be learning and faculty will be teaching; (7) educational evidence being used to inform the curriculum renewal; and (8) potential impact that the change may have personally on faculty and that may need to be managed to support the transition.
Results: The FD team designed a comprehensive FD strategy for 12 teacher roles identified by the framework. Tailored tools, resources, and a multi-modal approach was adopted for each role. Since August 2016, the start of the new curriculum, we provided 94 workshops located close to faculty clinical practice, 10 webinars, 14 educational videos, 18 print materials, 7 e-learning modules, 167 Educafes that offer coaching in local communities of practice, and individual peer coaching. Evaluation and scholarship are embedded in the development of the FD program.
Discussion/Conclusion: FD should be iterative and responsive to ongoing curriculum changes and newly identified faculty needs. Evaluation is key, specifically different FD modalities need to be evaluated to examine what can work and when, and inform future programming. Intentional alignment between FD and curriculum development can create a continuous quality improvement loop between the two practices that inform ongoing refinement of the curriculum itself as well as the faculty resources and learning events that are developed.

Take-home message: Planning for FD needs to start early and be integrated into all stages of curriculum reform.

3P2 (3612)
Creating a Collaborative, International, Post-Doctoral Fellowship in Health Professions Education

Authors
Colleen O'Connor Grochowski, Duke University School of Medicine, Durham, North Carolina, USA
Scott Compton, Duke-NUS Medical School, Singapore
Sandy Cook, Duke-NUS Medical School, Singapore
Diana McNeill, Duke University School of Medicine, Durham, North Carolina, USA

Presenter: Sandy Cook, Duke University School of Medicine, Durham, USA

Background: With the emerging shortage of qualified basic science educators and the growing call for innovations in health professions education (HPE), Duke and Duke-NUS established a one-year post-doctoral fellowship in basic science education at each institution. The goal of the fellowships is to create rigorously trained academic basic science educators with an understanding of the challenges facing biomedical science education (e.g., information explosion, vertical integration). This abstract describes the structure of the program and presents the framework for evaluating its effectiveness.
Methods: A one-year curriculum was developed covering curriculum design; how to manage the learning environment; and, teaching, assessment, and evaluation strategies. Also included are requirements for follows to complete observed teaching activities with feedback, an educational research project, and structured mentoring.
Results/Discussion: By visiting each other's institution and ongoing collaboration, fellows learn the different methods for delivering similar curricula at each school and the associated cultural impacts on the education environment. Evaluation plans for the effectiveness of the fellowships include the fellows' reactions to the experience, other faculty members' perceptions of the value added by the fellowships, a review of the fellows' learning of content and pedagogy, their contributions to the curriculum, research outcomes, and career trajectories.
Two individuals were recruited, one at each institution, starting in summer 2017. The one-year fellowship curriculum was tailored to support individualized learning for each fellow, and to facilitate self-directed learning. Evidence resulting from the evaluation plan will be available in early Summer 2018. We expect this will become a unique global model for reducing the shortage of quality academic basic science educators, improving the quality of HPE, and contributing to the advancement of educational scholarship. In addition, we anticipate these efforts will demonstrate the value of rigorously trained basic science educators resulting in enhanced career opportunities worldwide.
Conclusion: We have created an effective method and curriculum for addressing the shortage of rigorously trained academic basic science educators.

3P3 (3148)
Effects of institutional context on lecturer agency in faculty development

Authors
Shirra Moch, University of the Witwatersrand, Johannesburg, South Africa
Patricia McInerney, University of the Witwatersrand, Johannesburg, South Africa
Sfiso Mabizela, University of the Witwatersrand, Johannesburg, South Africa

Presenter: Shirra Moch, University of the Witwatersrand, Johannesburg, South Africa

Background: Professional learning programmes in health science education seek to prepare lecturers for their teaching role and to improve the quality of pedagogical practices in order to benefit students. In 2014 we commenced a postgraduate diploma in health science education in a Faculty of Health Sciences in South Africa. This is a longitudinal programme comprising four modules including: Theories of teaching and learning; pedagogy in the health sciences; assessment and curriculum development. The purpose of this study was to obtain perceptions from the first group of participants (n=24) concerning factors which influenced development of agency in facilitating educational change following the programme.
Methods: Two focus groups were conducted with a total of ten participants. The focus groups were audio-taped then transcribed verbatim and coding of data was developed using MAXQDA (Release 12.3.1). The primary interpretive gaze of this study was Archer's social realist perspective of the interaction of structure and culture in the development of agency. The transcripts were coded to extract structure as material resources as well as roles within the system. Elements of culture included ideas, values and beliefs. This institutional context was used to explore lecturers' agency to enact self-change or to act as change agents following the diploma.
Results: Following the course, some participants did not change their own teaching performance or advocate for changed educational practices within their environments. Structural themes which indicated this agential constraint included physical learning spaces; and hierarchical silos within departments. Elements of culture which constrained agency included: value of good teaching; risk versus vulnerability; and technophobia. Factors enabling agency included identification with a community of practice; mastery of a health science education discourse; and multidisciplinarity.
Discussion: Whilst the diploma fosters epistemological and axiological insights, attention to both structural and cultural institutional constraints could improve lecturers' agency in implementation of improved educational practices. Further diplomates may also provide impetus within the community of practice to support these changes.
Conclusion: A critical realist lens can highlight programmatic and institutional factors which influence educational outcomes following a longitudinal professional learning programme.

3P4 (512)
From faculty development program to educational change in the clinical workplace: exploring the transfer of educational innovations through activity theory

Authors
Agnes Elmberger, Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden
Erik Björck, Department of Molecular Medicine and Surgery, Karolinska Institutet, Stockholm, Sweden
Matilda Liljedahl, Primary Health Care Unit, Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden
Juha Nieminen, Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden
Klara Bolander Laksov, Department of Education, Stockholm University, Stockholm, Sweden

Presenter: Agnes Elmberger, Department of Learning, Informatics, Management and Ethics, Karolinska Institutet, Stockholm, Sweden

Background: Faculty development programs (FDP) are aiming to advance the teaching practice in health professions education by equipping teachers with knowledge and skills as professional educators. Research on faculty development has focused on scope and effectiveness of FDPs, however, little is known regarding how knowledge learned in such activities is transferred and transformed into the workplace and how change may happen as a result of faculty development. Drawing on activity theory and its notion of individual action as closely connected to context, we sought to explore the transfer of educational innovations into the clinical workplace.
Methods: Five interprofessional teams of clinical teachers attended a one-year FDP where they developed and transferred educational innovations to their workplaces. Focus groups were held with fourteen of the participating teachers at the end of the program and analyzed thematically. The findings were discussed in relation to activity theory.
Results: Transfer of the educational innovation was characterized by three interacting and iterative processes: (1) the innovation process, including access to expertise and protected time during development as well as the relevance of the innovation; (2) the clinical workplace process, including interactions with the workplace acquiring mandate for change, providing information and embracing reactions; (3) the team process, including collective action, team development and adopting new roles.
Discussion/Conclusion: Understanding change and pedagogical knowledge transfer is central in developing and sustaining educational scholarship and high quality teaching in health professions education. This study suggest that transfer of educational innovations created in a FDP comprise multiple interacting processes taking place in two activity systems, the workplace and the team. Contradictions arise between these systems as they have partly differing objects. These findings are relevant for the

broader issue of knowledge transfer in faculty development, highlighting the complexities of this issue. As transfer between faculty development and teaching practices in the clinical workplace seem to be a case of interlinked processes in multiple social systems, faculty development should support participants in navigating this transfer and consider the workplace as an active part in the process.

3P5 (592)
Promoting Approaches to Teaching in the Basic Sciences that Facilitate Students' Engaging in Deep Learning: The Impact of a Certificate Program in University Teaching

Authors
Diane Salter, St. George's University, St. George's Grenada, West Indies
Shannon Rushe, St. George's University, St. George's Grenada, West Indies
Glen Jacobs, St. George's University, St. George's Grenada, West Indies

Presenter: Diane Salter, St. George's University, St. George's, Grenada, West Indies

Background: Most Basic Sciences faculty begin teaching with little prior pedagogical background. This project evaluated the impact on teaching of a learning focused, professional development certificate program for Basic Sciences faculty.
Methods: Basic Sciences faculty participated in a task-based Certificate Program in Teaching and Learning. This learning-centred program modelled strategies that create optimal environments for student learning. Change in participants' approaches to teaching, consistent with approaches that enhance learning outcomes, was measured by Attitudinal Change and Behavioural Change. Attitudinal change was measured by pre-and-post scores on the Approaches to Teaching Inventory (ATI), (Prosser & Trigwell, 1999). Behavioural change was measured by analysis of curriculum faculty developed during the program.
Results: Pre-participation ATI analysis showed faculty scored as Balanced (42%), Information Transmission/Teacher Focused (34%), Conceptual Changed Student Focused (24%). Post-participation scores are being collected and will be shared during the presentation. Behavioural change was measured by a qualitative analysis of the participants completed tasks that demonstrated revised pedagogical approaches and comments in reflection papers such as: "These sessions have changed my thinking about how to teach large classes". A qualitative analysis identified themes of Reflection, Application, and Rethinking. Participants in this program showed changes in approaches to teaching consistent with promoting a student learning environment that fosters deep learning.
Conclusion: Many professional development programs for faculty have focused on 'Instructional Skills' vs rethinking approaches to teaching in a way that results in a learning environment that facilitates deep student learning and achievement of course learning outcomes. In the design and implementation of this program, the post-workshop

activities were integral to the program and provided a concrete way for faculty to 're-think' their approaches to teaching and incorporate changes to their course design and delivery.
Findings suggest that the model of this program with a task-based approach, flexible timeline and focus on student learning can provide shifts in approaches to teaching and promote ongoing participation in professional development.
Prosser, M. & Trigwell, K. (1999). Relations between teachers' approaches to teaching and students' approaches to learning. Higher Education, 37: 57-70. Kluwer Academic Publishers.

3P6 (3223)
Developing clinical education based on medical education research - findings from a faculty development program

Authors
Klara Bolander Laksov
Matilda Liljedahl
Agnes Elmberger
Erik Björck

Presenter: Klara Bolander Laksov, Stockholm University, Stockholm, Sweden

Background: Students in health and medical education spend a great deal of their education in clinical learning environments. There is today a growing knowledge of how learning in the clinical education environment can be facilitated, as well as about existing barriers to the implementation of these skills. By studying how clinical teachers engaged in educational development work, we wanted to better understand the conditions and systems required for successful implementation. This project aimed at examining the conditions for the successful use of medical-educational research results to stimulate learning in clinical education.
Methods: Based on knowledge generated from educational research, a faculty development program was designed to enable five teams of clinical teachers from three university hospitals to participate in a faculty development program aiming to develop, implement and evaluate an educational 'tool' together. The five teams that participated in the program were interviewed in focus groups at the start and end of the program. Observational and document data were collected throughout the process.
Results: All teams managed to develop a tool aimed at students or clinical teachers, implement and evaluate it. The faculty development program and its structure as a year-long scaffolding of driving and legitimising change processes in the clinical environment was acknowledged as facilitating the implementation of the educational tools. One year after the end of the program, four of the five teams had presented their work at medical education conferences, three teams are currently working to publish their work.
Conclusion: The design of the program around building capacity for change together with workshops focusing different aspects of Mayer and Stensaker's Change process prescriptors was identified as a successful

framework for successful implementation and use of medical education research in the clinical education environment.

The invitation of teams to faculty development program, together with a design building on scaffolding educational change and leadership enabled participants to translate medical education research into their clinical teaching practice.

Presenter: Vanessa Kraege, Internal Medicine, Lausanne University Hospital, Lausanne, Switzerland

Background: Residents' roles and activities have dramatically evolved in the last decades due to following factors: population ageing and polymorbidity, use of electronic patient records, importance of interprofessional skills, increasing administrative tasks, reduction of working hours thus increasing handovers, financial restrictions and pressure on lengths of stay (LOS). While these factors play a major role in residents' work experience and patient care, the daily organisation of the ward itself has hardly changed in many hospitals, including ours.
A recent study in our Department (Ann Intern Med. 2017;166(8):579-586) highlighted the long hours spent on the computer, the high rate of disruptive task switching and the important mismatch between planned and actual activities, e.g. administration often winning over postgraduate classes.
Methods: To address these problems we set up an interprofessional project with the aim of 1) reorganising the residents' day plan to reduce task switching, improving efficiency and providing protected time for education. 2) implementing an interprofessional morning meeting to rapidly define or adapt the therapeutic project for each patient. 3) planning time to prepare patient rounds, thus optimising the quality and efficiency of physician-nurse-patient interactions. 4) recruiting new medical secretaries allowing delegation of several administrative tasks.
Results: We implemented these changes between May and November 2017. Efficiency and satisfaction of teams increased. LOS decreased from 9.53-12.93 days (December 2013 to 2016) to 7.34 days (12/2017). Given the absence of other major changes, the significant LOS reduction in 2017 probably reflects the gain in our teams' efficiency.
A detailed analysis of residents' activities on the ward and their relative added value allowed us to highlight inadequacies and successfully implement a new organisation. We now look forward to measuring

indicators such as resident, nurse and patient satisfaction, and repeating a new time-motion study.
Conclusion: The evolution of medical roles, activities and patient population necessitate re-thinking and re-organizing the residents' traditional daily schedule. Implementing interprofessional collaboration on therapeutic projects, as well as delegating some administrative tasks, has a potentially positive impact on several outcomes.

3Q2 (1543)
Training as an investment: Does early procedural training generate more productive residents?

Authors
Claus Hedebo Bisgaard, Centre for Health Sciences Education, CESU, Faculty of Health, Aarhus University, Aarhus, Denmark
Svein Aage Rodt, Department of Anaesthesiology and Intensive Care, South Section, Aarhus University Hospital, Aarhus, Denmark
Peter Musaeus, Centre for Health Sciences Education, CESU, Faculty of Health, Aarhus University, Aarhus, Denmark
Jens Aage Kølsen Petersen, Department of Anesthesiology and Intensive Care, North Section, Aarhus University Hospital, Denmark
Sune Leisgaard Mørck Rubak, Department of Paediatrics and Adolescent Medicine, Aarhus University Hospital, Denmark

Presenter: Claus Hedebo Bisgaard, Centre for Health Sciences Education, CESU, Faculty of Health, Aarhus University, Aarhus, Denmark

Background: Clinical production and postgraduate medical education both take place in the ward and can therefore be perceived as conflicting. The trainees' contribution to clinical production as the outcome measure of educational intervention has only been sparsely studied. This study examines how early procedural training influences residents' and specialists' share of clinical production for central venous catheterization, spinal and epidural anesthesia.
Methods: Residents' share of clinical production was compared between an early procedural training intervention group (n=20) and a historical control group (n=19) of first-year anesthesiology residents from three training departments. The results were compared to a contemporaneous control (n=7) and historical control group (n=7) from another department. All controls received traditional competency-based education. Additionally, residents' and specialists' share of total production were compared by year. The total procedural time spent by specialists was compared to the additional time needed for the intervention for a return on investment measure of specialist time.
Results: For all three procedures, the median residents versus specialists' share of the total production increased compared to intervention initiation year of 2015:
Spinal anesthesia 2015: 0.44 (0.26, 0.62); 2016: 0.60 (0.34, 0.85) to 2017: 0.71 (0.65, 0.76).
Epidural anesthesia: 2015: 0.21 (0.17, 0.25); 2016: 0.29 (0.25, 0.33) to 2017: 0.45 (0.37, 0.52), p=.008.

Central venous catheter, 2015: 0.30 (0.23, 0.36); 2016: 0.46 (0.35, 0.55), p=.008 to 2017; 0.64 (0.50, 0.79), p=.008. Specialists' time saved, three hours, corresponded to the three hours additional procedural training per resident. These differences could not be found in the temporal comparison for the control departments.

Discussion/Conclusion: Early procedural training had a positive effect on residents' level of production for central venous catheterization, spinal-, and epidural anesthesia. Specialists' production share decreased at the same time, thus balancing the time invested for the enhanced supervision.

Potentially, there is a positive trade-off effect of early procedural training. It generates more experienced and productive young doctors while at the same time freeing specialist time to other work functions, such as additional supervision or more advanced tasks.

Take-home message: Investing time in early training increases residents' contribution to clinical production.

How peers, supervisors and patients support reflection of residents, but also hinder it

Authors
Serge B. R. Mordang, Maastricht University, Maastricht, Netherlands

Laurents P. S. Stassen, Maastricht University, Maastricht, Netherlands
Karen D. Könings, Maastricht University, Maastricht, Netherlands

Presenter: Serge Mordang, Maastricht University, Maastricht, Netherlands

Background: Reflection on critical incidents (CI) in the workplace is crucial for residents' learning of complex skills. CI drive learning and development because they have the potential to make residents reconsider existing action repertoires and beliefs. To meaningfully support residents' reflection on CI, it is crucial to better understand why CI are perceived as critical, how residents handle CI, and what learning behavior is elicited.

Methods: This study draws on interviews with 33 medical residents exploring how they handle CI in the workplace. Questions were open-ended, building on and deepening residents' answers, aiming for 'thick descriptions' of reflection. After interviews were transcribed verbatim, we used a within-case and cross-case analysis to build a general pattern of explanation.

Results: Our analysis ran against a rather individualist perspective on reflection furthered in practice and research. It happens in interactions with peers, supervisors, and patients which can support but also hinder reflection. Residents want to meet supervisors' standards as well as standards implicitly set by peers (i.e., perform as well as they do). Moreover, high quality patient care is residents' top priority, which urges them to seek quick solutions or ask their peers or supervisor for advice, rather than reflectively dealing with an incident themselves. Quality and depth of reflection is likely to suffer. Dedicated time for peer discussions enhances deep reflection, while own supervisor involvement sometimes feels unsafe.

Discussion: CI experienced from interactions with peers and supervisors might be due to self-preservation feelings and image management in a competitive working environment. Furthermore, residents prioritize patient care over learning, which leads to more superficial reflection straightaway and limits reflection afterwards. For deeper reflection afterwards residents need more dedicated time. Moreover, psychological safety is crucial for elaborating on CI with peers and supervisors.

Conclusion: Residents' social context facilitates and hinders residents' reflection process in different ways. It is positive that colleagues keep residents sharp and focused in the workplace. However, quick solutions can discourage residents to reflect deeply on experiences. Peer discussions should be stimulated. Residents need more time and space to reflect profound on daily practice.

Multi-methods evaluation of an experiential approach to improving residents' competence and confidence in obesity management consultation

Authors

Denise Campbell-Scherer, Department of Family Medicine and Alberta Diabetes Institute Member, University of Alberta, Edmonton, Canada
Thea Luig, Department of Family Medicine, University of Alberta, Edmonton, Canada
Sonja Wicklum, Department of Family Medicine, Cumming School of Medicine, University of Calgary, Calgary, Canada
Erin Cameron, Department of Human Sciences, Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada
Doug Klein, Department of Family Medicine, University of Alberta, Edmonton, Canada
Arya M Sharma, Department of Medicine, Division of Endocrinology, and Alberta Diabetes Institute Member, University of Alberta, Edmonton, Canada

Presenter: Denise Campbell-Scherer and Sonja Wicklum, University of Calgary, Alberta, Canada

Background: Family physicians play a vital role in the prevention and management of obesity. There is a pressing need to create high quality, evidence-based training programs for family medicine residents to develop competencies in identifying complex causes, assessing interactions with comorbid diseases and mental health, counselling on person-specific management options, navigating interdisciplinary care, and providing long-term, responsive, support.
Methods: We developed and evaluated a course integrating didactic lectures with an experiential learning approach. 5AsT-MD draws on the "5As of Obesity Management™" (ASK, ASSESS, ADVISE, AGREE, ASSIST), an evidence-based framework and suite of tools. Experiential learning included wearing bariatric suit, mentored group discussions, practice with standardized and in-clinic patients, and narrative reflection.
The pilot was delivered to two cohorts (n=60) of first year family medicine residents. Multi-methods were used to determine whether residents' awareness of the complexity of obesity, attitudes towards people living with obesity, and self-efficacy for obesity counselling improved. We assessed changes in attitudes, beliefs, and confidence using two validated scales, a course-specific questionnaire, and narrative reflections, which were analyzed thematically.
Results: Residents showed positive change in their belief about obesity, increased understanding of its complexity and chronicity, improved confidence, and self-perceived success in obesity counselling practice through uptake of the 5As framework and tools. Experiential learning elements proved crucial in increasing residents' ability to empathically engage with patients. The bariatric suit experience was powerful in helping residents examine their assumptions. Learning about the complexity and chronicity of obesity encouraged residents to critically reflect on their weight counselling practice and role as a family physician

Conclusion: The 5AsT-MD approach proved promising in preparing residents for evidence-based and patient-centred obesity counselling, increasing self-efficacy, and providing practical tools to support their practice. Experiential learning, peer discussions, critical reflection, and mentorship facilitate greater awareness of how medical, biographical, and politico-social factors intersect. This innovative approach equipped learners to have more effective and constructive encounters with patients. Multi-method evaluation allowed for a better understanding of how course components impacted learners and for adjustments and improvements to be made to course content and teaching methods.

E-learning presented as "just in time training"

Authors

Rikke Kaae, Aarhus University Hospital, Aarhus, Denmark
Kasper Kyng, Aarhus University Hospital, Aarhus, Denmark
Christian A. Frederiksen, Aarhus University Hospital, Aarhus, Denmark
Jette Led Sørensen, Rigshospitalet, University of Copenhagen, Denmark
Berit Eika, Aarhus University, Aarhus, Denmark
Tine Brink Henriksen, Aarhus University Hospital, Aarhus, Denmark

Presenter: Rikke Kaae, Aarhus University, Aarhus, Denmark

Background: Studies show that ultrasonography (US), conducted by experienced examiners, can be used to detect correct umbilical catheter (UC) placement and reduce the x-ray burden(1)(2). Evidence supporting the general use of clinician performed US for UC placement is limited(3) and the minimal amount of training necessary to be competent to detect the UC tip with an acceptable accuracy has not been investigated.
Aim: To assess the improvement in theoretical knowledge and the accuracy of the practical performance following a 1.5 h e-learning introductory.
Methods: The study is a comparative observational experiment. The e-learning comprised video examples with voiceover. A 25-item multiple-choice questionnaire (MCQ) test of "one best answer" type was developed and validated. Twenty paediatricians with minimal experience in the use of US were included. After completion of the e-learning the participants performed the US task on a live animal model; newborn piglets with catheters in umbilical vessels at different positions. The participants attended 12 US scanning sessions in order to detect whether or not the UC were in a correct or misplaced position. For the practical learning outcome the sensitivity and specificity of US based detection of correct UC placement when performed by the participants was estimated. The theoretical knowledge was measured by the participants´ change in the MCQ score.
Results: The participants´ MCQ scores (mean±SD) before and after completing the e-learning were 161±30 and 234±14 points, respectively. Mean MCQ score difference was 73±30 points (P < 0.0001, two-tailed paired t-test). The sensitivity for the participants' ability to detect a correct

UC as correct by US was 0.89(CL95% 0.83 0.94) and the specificity 0.87(CL95% 0.79 0.93). From the fifth scanning onwards: sensitivity 0.98(CL95% 0.90 0.99) specificity 0.95(CL95% 0.89 0.99).

Conclusion: E-learning increased the pediatricians' theoretical knowledge in US based assessment of UC placement and we found a high accuracy in their practical performance that further improved after additional five hands-on sessions.

The perspective of our results is that further development of "just in time" video based training may improve, streamline and standardize the training of specialists in new procedure.

3Q7 (2354)
Use of Virtual Reality in the learning of patient safety in the Emergency Department: Perceptions of doctors

Authors
Shu Woan Lee
June Sim Guek Gwee
Michelle Wong
Joy Quah

Presenter: Shu Woan Lee, Changi General Hospital, Singapore

Background: The Emergency Department (ED) is a patient care setting that is prone to patient safety infringements. Reasons identified include varied training and experience of staff, high patient load, multiple transitions in care, and ED overcrowding.

Methods: Prior education in patient safety was done using online powerpoint videos (focusing on knowledge and showcasing past serious reportable events), simulation session (focusing on skills and team work) and assessment MCQs.

The investigators noted with concern the repetitive nature of safety infringements, which occurred in mainly junior doctors (Post Graduate Year 1-5) and set out to revamp the current education methodology.

Buy in was sought from the group of incoming doctors through a survey about the use of virtual reality (VR). A third party APP company was engaged to create a scenario set in the virtual ER.

Results: The department educators needed to be convinced on the willingness to adopt yet another methodology of learning.

The average age of the group of doctors were 29 years old. 62.5 % of them were moderately familiar with VR. Overwhelmingly, the doctors felt that virtual reality will aid in learning (> 90 %). 65.8 % felt that it would help them remember what they learn better.

Despite 50 % of them being unsure if the use of VR were time consuming, they were still willing to consider its use. There was no statistical difference between the perceptions of the doctors when compared between experienced (PGY > 5) versus less experienced (PGY 1-5)

Conclusion: Education efforts in the ED have focussed on knowledge and skills. Historically it has been difficult to teach "attitude". This was a survey to check perceptions and obtain buy in, aiming to increase motivation and improve learning and retention of patient safety pitfalls.

We hope this translates to better clinical outcomes as our juniors internalize the concept of patient safety.

Video-based asynchronous DOPS - assessing skill acquisition by Orthopaedic residents

Authors
Benjamin Liang, Khoo Teck Puat Hospital, Singapore,
Vaikunthan Rajaratnam, Khoo Teck Puat Hospital, Singapore

Presenter: Benjamin Liang, Khoo Teck Puat Hospital, Singapore

Abstract Text: Although surgical training is traditionally seen as an apprenticeship, it is difficult to assess when surgical trainees are able to operate independently.
We propose a modification of an existing Direct Observation of Procedural Skills (DOPS) system by utilising sequential videos of the same surgical procedure, in order to obtain a record that can be reviewed asynchronously by an assessor, and provide trainees an increased opportunity for self assessment and reflection.
We believe that the videos would be able to document a resident's progression through the Dreyfus sequence of skill acquisition.
Three Orthopaedic residents rotating through the Hand Surgery department were involved in this study. Each resident selected a surgical procedure, and performed it for assessment three times, which were all captured on video. Each was performed approximately one month apart, allowing time for reflection and improvement. All videos were reviewed by a single fellowship trained senior Hand surgeon, and graded according to a pre-existing DOPS grading form. The time taken to perform the chosen procedure was also recorded.
In addition, residents were asked to perform a self assessment of skills and confidence, graded on a Likert scale. A qualitative survey was also administered in order to obtain resident feedback on this method of assessment.
All three of the residents were able to achieve statistically significant improvements in their DOPS score and surgical time. Their level of skill and proficiency was also judged by the assessing Hand surgeon to have progressed from "advanced beginner" status to "proficient" in the Dreyfus model of skill acquisition. Resident self assessment also showed significant increases in the perception of their own skills and confidence over time. Qualitative surveys showed that residents felt that the video record was useful both during the review with the assessor, and later on during revision.
Video recording of procedural skills is useful in documenting skill acquisition by a resident, and allows for asynchronous review of the procedure by a supervising surgeon. It also helps to increase self confidence of residents, and allows for subsequent reflection and revision of the procedure.

Supervisor's summative assessments of trainees: a study of the internal structure validity evidence for the interpretation and use of the results

Authors
Darryl McGill
Cees van der Vleuten
Mike Clarke

Presenter: Darryl McGill, The Canberra Hospital, Canberra, Australia

Abstract Text: Ensuring validity of assessment results is essential for the fairness of score interpretation and use. Doing so will provide evidence of assessor capability to consistently provide valid and reliable feedback about trainee competence and adequately assess different competency-constructs, requirements fundamental for fairness for any clinical-assessment.
To determine if term-supervisor assessment results used for unconditional-registration of medical trainees in Australia have internal-structure validity as proposed by the test-developers when used in a single assessment program.
The supervisor-assessment scores were for interns training in Canberra Hospital Australia. Internal-structure validity was tested using confirmatory factor (CFA) and model fit analysis. Measurement invariance was analysed to determine if the same variable is being measured across multiple groups (eg gender). Reliability was measured using Generalisability Theory with a one facet model for unbalanced data-sets to measure score-variance due to trainees for each score, and the number of assessments for a minimum adequate reliability (NAMAR) value ≥ 0.80 for each competency item.
CFA established that a hypothesised 3-Domain model provided the best model fit ($\chi 2/df=1.49$; TLI=0.980; CFI=0.984; RMSEA=0.034; SRMR=0.025; WRMR=0.693), one different to the test-developers proposed structure which was not identified as a valid model. Dimensional invariance was measured by determining if the same latent factors still had adequate model fit within subgroups.
Score differences existed related to supervisor gender (female supervisors giving higher scores) which is likely a true difference because the dimensional invariance had acceptable 2-group model fit for males and females. No differences existed for female and male trainee results. Scores for individual competency items were not reliably measured and some were unable to be adequately measured at all. Competency-item reliability was very poor, all having 100.
The assessment method for trainees' competence proposed by the test-developers for interns was not validated, bringing into question the fairness for the interpretation and use of assessment-scores used for unconditional medical practitioner registration.
The need for routine evaluation of supervisor capabilities as assessors, validity of their feedback, and fairness of assessment-score use from assessment programs of clinical competence is reinforced.

Beyond the tick-box: A self-regulated learning lens on trainee perceptions of the mini-CEX

Authors
Eva Kipen, University of Melbourne, Melbourne, Australia
Monash University, Melbourne, Australia
Alfred Health, Melbourne, Australia
Robyn Woodward-Kron, University of Melbourne, Australia
Eleanor Flynn, University of Melbourne, Australia

Presenter: Eva Kipen, University of Melbourne, Australia

Abstract Text: Effective formative assessment should facilitate feedback to drive improvement and foster self-regulated learning. Self-regulated learning is necessary for the development of active learning skills in the clinical environment. The mini-CEX is widely used in post-graduate medical workplace-based assessment. Yet, there is little understanding of the perceived relationship between the mini-CEX and trainees' self-regulated learning. The aim of this study was to explore trainees' experiences and perceptions of the mini-CEX, using self-regulated learning as a novel interpretive lens.
The study was qualitative, utilising individual semi-structured interviews. Purposive sampling was employed to recruit geriatric medicine trainees in Melbourne, Australia. The interview schedule was informed by Zimmerman's self-regulated learning framework. After recording, the interviews were transcribed and analysed thematically.
Twelve trainees participated in the interviews. Four themes were found with a cyclical inter-relationship between three themes: namely goal setting, task translation and perceived outcome. These themes reflected the forethought, performance and self-reflection phases of the self-regulated learning framework. Each phase was influenced by the fourth theme, supervisor co-regulation. Goal setting had motivational properties that had significant impact on the later phases of the cycle. The "tick box" goal aligned with an opportunistic approach and poorer perceived educational outcomes. Participants reported that effective external feedback following assessment was critical for their self-evaluation, affective responses, and perceived outcomes.
Trainees perceived the performance of a mini-CEX as a complex, inter-related cyclical process, influenced at all stages by the supervisor. Supervisor engagement is essential to support trainees to individually regulate their learning in the clinical environment and achieve the full benefits of formative assessment. Trainees and supervisors could benefit from greater awareness of the theoretical underpinnings of self-regulated learning in order to optimise workplace-based assessment learning outcomes.
The support of a supervisor is a key factor for trainees' self-regulated learning throughout the complex stages of the performance of a mini-CEX.

Factors influencing General Practitioners in their attribution of a Global Assessment in medical training

Authors
Graham Emblen, General Practice Training Queensland, Brisbane, Australia
Marie-Louise Dick, General Practice Training Queensland, Brisbane, Australia
Scott Preston, General Practice Training Queensland, Brisbane, Australia
Gerard Ingham, Springs Medical Centre, Daylesford, Australia
Jane Smith, Bond University, Gold Coast, Australia
Joanne Fisher, General Practice Training Queensland, Brisbane, Australia

Presenter: Marisa Magiros

Abstract Text: Global Assessments (GAs) are used in Australian General Practice (GP) training during selection, in-training reviews, and within summative assessment. This project aimed to determine factors influencing assessors in their assignment of a GA score.
A modified Delphi process was used with participants recruited from GP Supervisor and Medical Educator groups nationwide. Consensus information obtained via questionnaires was reflected to the group for comment in subsequent Delphi rounds.
Demographic items collected included educator role, level of experience, and total number of doctors supervised. Participants were asked where they had performed GAs, and the factors they considered when making a GA. Participants ranked these factors independently, and in relation to training level of the doctor being observed, as well as commenting on consensus rankings. Participants rated their confidence in GAs as an accurate determinant of GP competence. Participants were asked to identify personal biases, and their approach to discrepancies in GA scores.
Of the 28 participants engaging in four Delphi rounds, most were female, aged over 40, and had roles as Medical Educators. GAs were most commonly used in direct observation of practice, formatively and summatively. Clinical knowledge, conscious incompetence, communication skills and help-seeking practices were ranked highly in considering GA. There was good agreement amongst participants regarding criteria significance across the training continuum and the robustness of GA. There was conflicting opinion about what skills and factors can be learnt versus what should be inherent characteristics of a doctor.
The factors contributing to a GA are broad and not limited to assessment of knowledge and skills, but include the non-clinical domains, namely communication, professionalism and organisational skills. Trust in the validity of GA by participants was strong, particularly when multiple assessors are involved. Personal biases do exist, and it is unknown at this stage whether or how they are overcome by assessors when making final judgment.
The strength of GA appears to be drawn from the breadth of factors considered that go beyond 'clinical' checklists by allowing for overall impressions and gut feeling, providing a 'rounded approach' to competency.

Programmatic Assessment Practice-focused Guidelines: A knowledge translation tool to support competency-based assessment at Queen's University

Authors
Laura McEwen, Queen's University, Kingston, Canada
Susan Chamberlain, Queen's University, Kingston, Canada
Damon Dagnone, Queen's University, Kingston, Canada
Jessica Rich, Queen's University, Kingston, Canada
Heather Braund, Queen's University, Kingston, Canada

Presenter: Laura McEwen, Queen's University, Kinsgton, Canada

Abstract Text: On July 1 2017, Queen's University was the first school in Canada to launch competency-based models of residency education institution-wide. Although validated frameworks to inform the development and evaluation of programmatic assessment exist, we determined these to be of limited utility to our assessment system users. Consequently, we assembled a research team to develop a practice-focused framework to guide the implementation of programmatic assessment by various stakeholder groups (e.g., residents, frontline faculty, program leaders, etc.). The draft programmatic assessment practice-focused framework was developed based on principles derived from the literature and iteratively refined by a panel of internal experts that included physicians from multiple specialties and PhDs in education. Through an iterative, collaborative process we were able to distill this work to a set of 9 guidelines. The group then drafted descriptions of associated activities for each guideline for 6 key stakeholder groups including: residents, frontline faculty, Academic Advisors, Program Directors/CBME Leads, Competence Committees, and Residency Program Committees. We then conducted focus groups with stakeholders to refine descriptions of their activities to better reflect the operationalization of programmatic assessment principles in practice and to ensure the accessibility of language used to describe these activities. These focus groups also served to underline the practical utility of this knowledge translation tool across user groups.
To-date the Programmatic Assessment Practice-focused Guidelines have been used to inform the overall structure of faculty development events and as the basis of various workshop activities. Ultimately, this knowledge translation tool has served to support the initial implementation of competency-based programmatic assessment at Queen's and we anticipate it informing refinements over time. Although our research continues to unfold with an external expert review process, we view a round table discussion at AMEE as an excellent opportunity to share this emergent work and gather input from a wider audience.

Engaging departmental stakeholders in shaping their program of assessment

Authors
Stephanie Baxter, Queen's University, Kingston, Canada
Rylan Egan, Queen's University, Kingston, Canada
Laura McEwen, Queen's University, Kingston, Canada
Nancy Dalgarno, Queen's University, Kingston, Canada
Heather Braund, Queen's University, Kingston, Canada
Mary-Anne Reid, Michigan State University, East Lansing, USA

Presenter: Nancy Dalgarno, Queen's University, Kingston, Canada

Abstract Text: Canada is adopting a competence-based medical education (CBME) model in residency education. The Royal College of Physicians and Surgeons of Canada has advocated for a programmatic approach to assessment with increased emphasis on direct observation of residents' clinical performance. This change has implications for physicians' and residents' workflow. Supporting and incorporating feedback from stakeholder groups as they pilot CBME assessment tools may increase engagement.
To what extent does involving stakeholders in the selection and modification of workplace-based assessment (WBA) tools for use in Ophthalmology assist in shaping their program of assessment?
The qualitative case study was conducted in an Ophthalmology Emergency Eye Clinic at a teaching hospital in Eastern Ontario prior to the July 1, 2017 CBME implementation. Phase 1 consisted of faculty piloting four WBAs over a three-month period by documenting perceptions of the tools. Phase 2 involved two focus groups, one for residents (n=9) and one for faculty (n=6), which explored qualities of effective feedback, feasibility, usability, value, challenges, and recommendations for the tools. Data were analyzed using a thematic design.
All participants discussed the need for a shift in the departmental assessment culture to support the transition to CBME and improve buy-in among stakeholders. The WBAs tools were generally viewed as formal evaluations and faculty were concerned about 'formalizing' feedback. Residents stated the need for more timely feedback given in a safe location. Generally, residents preferred written performance indicators rather than numerical. Residents and faculty valued verbal feedback more than written. These results provide insight into faculty and resident perspectives about assessment processes. An ongoing challenge is integrating feedback processes in the assessment culture and promoting WBAs as low-stakes coaching tools. Future research will examine the extent to which these perspectives about the program of assessment change following CBME implementation.

Exploring how the new entrustable professional activity assessment tools affect the quality of feedback given to Medical Oncology residents

Authors

Anna Tomiak, Queen's University, Kingston, Canada
Nazik Hammad, Queen's University, Kingston, Canada
Rylan Egan, Queen's University, Kingston, Canada
Nancy Dalgarno, Queen's University, Kingston, Canada
Heather Braund,Queen's University, Kingston, Canada
Jeffrey Emack, Queen's University, Kingston, Canada

Presenter: Nazik Hammad, Queen's University, Kingston, Canada

Abstract Text: Competency-based medical education (CBME) assessment tools are designed to support residents' development. Our Medical Oncology training program completed a pilot study of six competency-based assessment tools in preparation for July 1, 2017 CBME implementation.

To what extent are the entrustable professional activity (EPA) assessment tools effective in providing quality feedback to Medical Oncology residents?

Using a sequential explanatory mixed-method design, data was collected from four of six workplace-based assessment tools (WBA) (n=17), a resident focus group (n=4) and physician interviews (n=5). Data was analyzed using a quality feedback framework developed by the research team and thematic design.

WBA data indicated that the overall rating of EPA achievement was 71% "Achieved" and 29% "In progress". Quantifiable written feedback was included in 88% of assessments, 33% providing actionable feedback and 20% offering next steps. Two overarching themes were identified: 1) despite a shared understanding of quality feedback, delivery and quality of feedback was an ongoing concern; 2) faculty and residents had concerns about implementation of WBA tools. All participants indicated a preference towards verbal feedback delivery methods, but acknowledged the importance of written feedback. Both groups were concerned about time taken to complete the tools and questioned the feasibility within clinical contexts. There remained a lack of clarity surrounding the purpose(s) of WBA tools and processes for initiating, completing, and submitting tools. Lack of buy-in from faculty was also acknowledged by residents.

Greater emphasis is needed to ensure documentation of actionable feedback that encourages professional growth. Faculty development and quality improvement are critical for stakeholder's explicit understanding of using assessment tools, and how they will be applied to document overall competency development and achievement. Adopting WBAs is supported with the belief that specific adjustments will be required, but not known until full implementation has occurred.

3S: Conference Workshop: The World Federation for Medical Education (WFME) Recognition Program for Accrediting Agencies: Purpose, processes, and criteria (25)

Location: Wettstein, 2nd Floor, Swissotel
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
David Gordon, WFME, Ferney-Voltaire, France
John Norcini, FAIMER, Philadelphia, USA
Marta van Zanten, FAIMER, Philadelphia, USA

Background: While the purposes of accreditation of basic medical education are to evaluate and ensure the quality of medical education programmes and encourage improvement, accreditation practices vary considerably worldwide. Consequently, the World Federation for Medical Education (WFME) has developed and implemented a global programme aimed at recognising agencies that accredit medical schools at an international standard. This workshop will provide an overview of the WFME recognition programme and an in-depth understanding of its purpose, processes, and criteria.
Who should attend: Anyone with an interest in the accreditation of basic medical education is invited to participate. Individuals involved with accreditation agencies or regulatory organisations are especially encouraged to attend.
Structure of workshop: The workshop will include presentations on the WFME Recognition Programme, followed by group activities aimed at increasing participants' overall understanding of the programme, including potential strategies for setting up an accreditation system and enhancing current systems to better comply with WFME criteria. Associated challenges and how an agency can move towards fulfilment of the elements will also be addressed. The workshop will conclude with a discussion of the important themes that have emerged.
Intended outcomes: At the conclusion of this workshop, participants will have gained an in-depth understanding of the WFME Recognition Programme, the process of recognition, and the specific criteria used in evaluating accrediting agencies. This information will be useful for individuals to help ensure that medical education, and specifically the accreditation of medical programmes, in their home settings is operating at a global level.
Level: Introductory / Intermediate

3U: Conference Workshop: Planning and orchestrating change: From change management to change stewardship (310)

Location: Helvetia 4, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters
Glen Bandiera, University of Toronto, Canada
Rhonda St. Croix, Royal College of Physicians and Surgeons of Canada, Ottawa, Canada
Ming-Ka Chan, University of Manitoba, Winnipeg Manitoba, Canada
Anne Matlow, University of Toronto, Canada

Background: Education leaders are called upon to design and orchestrate major changes in the current educational milieu. Embedded in both academic and administrative environments, education leaders must oversee change initiatives that arise from scholarly inquiry, institutional requirements, or external forces. Regardless of the nature of the change, success hinges on having a solid approach to change that is rooted in theory and practically tested in real world environments. We are not starved for good models of change management; in fact many appropriate models exist that may help in any given context. The challenge for education leaders is recognizing when change is afoot, articulating the nature and rationale for the change, and selecting the best approach for the given circumstances. Given these challenges, we have developed a workshop that has been delivered locally and that focuses on the unique aspects of change in education. We draw on multiple theories and practical experience to help education leaders design an effective approach to change while avoiding common pitfalls and frustrations. We include a process that maps multiple well-known models to one common framework to help leaders select the approach most likely to lead to success.
Who should attend: Anyone who is called upon to design or lead change initiatives in the education environment.
Structure of workshop: The presenters will conduct a small group interactive exercise designed to attune participants to the challenges of change in education. There will then be a large group discussion of some case examples brought by the presenters from their own experience in addressing challenging change initiatives. Two further large and small group exercises will allow participants to apply the concepts to an individual change initiative relevant to them.
Intended outcomes: Participants will be able to identify key elements in understanding he impact of change, describe an approach to designing an effective change initiative, and outline common pitfalls and avoidance strategies.
Level: Intermediate

3V: Conference Workshop: Preparing Faculty to Conduct GT-RR Reflection Rounds: A Space for Students to Explore the Meaning of their Interactions with Patients (157)

Location: Helvetia 5, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Christina Puchalski, George Washington Univeristy, Washington, DC USA
Benjamin (Jim) Blatt, George Washington Univeristy, Washington, DC USA
Malgorzata Kranik, NIcolaus Copernicus University, Bydgoscz, Poland
Phillip Larkin, Our Lady's Hospice, Harold's Cross, Dublin, Ireland

Background: Medical education provides little opportunity for student reflection on the meaning of their patient interactions. Experiences like the death of a patient can be profoundly disturbing. Reflection is vital for students to grow from such experiences and develop their own inner resources to address patient suffering and buffer against burnout. Reflection Rounds, conducted in small groups by pairs of specially trained faculty, provides students with a safe space to explore the emotional and humanistic and/or spiritual aspects of their patient interactions.

Who should attend: This workshop will provide faculty the initial preparation necessary to conduct Reflection Rounds--distilled from the faculty training program developed for the Reflection Rounds initiative piloted in 17 North American medical schools. The faculty Train-the-Trainer program and Reflection Rounds itself were developed by the George Washington University Institute for Spirituality and Health (GWish) with funding from the Templeton Foundation—thus designated GT-RR. This workshop is designed for clinical teachers and medical educators from medicine, nursing and from all other health care professions.

Structure of Workshop:
15 min Introduction: Brief overview of structure, theory and objectives of GT-RR Reflection Rounds and the Spirituality and Health Competencies that inform them.
20 min Video Presentation/Discussion: Video of an actual Reflection Rounds with 4 medical students
50 min Practice: Participants in small groups experience reflection rounds: share personal stories guided by workshop leaders.
20 min Discussion: Participants share their reactions and outline how they might implement Reflection Rounds in their home institutions

Intended Outcomes: Participants will be able to:
1. Describe the theory and structure of GT-RR Reflection Rounds and its role in health care students' personal and professional formation
2. Employ the G-TRR structured format to conduct Reflective Rounds.

(A complete set of materials about GT-RR will be provided for each participant)
Level: Basic

3W: Conference Workshop: Golden standards for medical specialist training in Europe (1790)

Location: Helvetia 7, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Hannu Halila, Finnish Medical Association, Helsinki, Finland
Hans Hjelmqvist, University of Örebro, Sweden
Bernard Maillet, UEMS, European Union of Medical Specialists, Brussels, Belgium

Background: Medical specialist training in the European Union is regulated by the Professional Recognition Directive. The Directive was last revised in 2013. The main purpose of the Directive is to ensure free movement of doctors within the EU/EEA area. This Directive does not regulate the content of specialist training, only the minimum lengts of training (3-5 years) within 54 specialities listed in the Annex V of the Directive.
UEMS, European Union of Medical Specialists, is the oldest of the European Medical Organisation, founded in 1958. The main goal of UEMS througout its now 60 years has been to ensure the quality of medical specialist training in Europe. This work has been done within the now 43 Specialist Sections. They have created European Boards as subgroups, in conjunction with the relevant European Society, with a view to defining European standards of medical specialist education and training. These European Training Requirements are widely acknowledged as golden standards throughout Europe.
Furthermore, UEMS has developed different means of quality assurance in specialist training. They include Visitation of Training Centers and European Specialist Exams.
UEMS has already during the revision of the Directive suggested that specialist training should shift from time-based to competency-based training.

Who should attend: All those interested in specialist training : educators, doctors in training, university teachers, clinicians.

Structure of workshop: The workshop will begin with an introduction to the European Union regulations and activities of UEMS in the field of postgraduate medical education. Through interactive group discussions the workshop will develop ideas for new methods to assess specialist training as well as elements for future competency based education : what should the newly trained medical specialist be able to do and know in the future.

Intended Outcomes: Participants will be familiar with the present system of postgraduate training in Europe and the methods of quality assurance. They will also through discussions have a vision of how training in the future should be developed.
Level: All

3X: Conference Workshop: Simulation, Entrustable Professional Activities and the medical school clinical clerkship (16)

Location: Osaka, 3rd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Lisa Buckley, Ross University School of Medicine, Far Rockaway, USA
Dave Pederson, Ross University School of Medicine, Miramar, USA
Reid Adams, Ross University School of Medicine, Pontiac, USA
Sean Gnecco, Ross University School of Medicine, Miramar, USA
Joseph Crutcher, St. John's Providence Southfield, USA

Background: Over the past several years, program directors have increasingly expressed concern that some medical school graduates are not prepared for residency (Lyss-Lerman et al., 2009). At the same time, there has been an international paradigm shift (Association of American Medical Colleges (AAMC), 2008; The Association of Faculties of Medicine of Canada, 2010) to better define educational outcomes and assess competency in health professions (Carraccio et al., 2016; Englander et al., 2013). In order to address these issues, efforts are under way to examine the requirements at key transition points in the formation of physicians (college to medical school, medical school to residency, and residency to practice or fellowship). In 2014, the Association of American Medical Colleges (AAMC) published a list of thirteen core entrustable professional activities (EPAs) for entering residency, which outline the knowledge, skills and behaviors of a graduating medical student (Association of American Medical Colleges, 2014). The publication includes items student should be capable of achieving without direct supervision on their first day of residency (Association of American Medical Colleges, 2014). Since the AAMC publication, there has been an increased focus on EPAs in medical education and research, although many question remain unanswered.
Intended Outcomes: Using the AAMC's EPAs as a guide to clinical clerkship education, we will present and discuss the various ways hospitals have added simulation curriculum to the clerkship rotations with the goal of addressing these EPAs. This course will focus on how we have integrated EPAs 1: Gather a history and perform a physical examination, 2: Prioritize a differential diagnosis following a clinical encounter, 3: Recommend and interpret common diagnostic and screening tests and 12: Perform general procedures of a physician, into the clinical medical school education and hope this information will be useful to schools who are looking to implement similar programs.
Who should Attend: Medical schools educators that are interested in incorporating EPAs into their clinical education curriculum.
Structure of Workshop: Lecture style information session followed by questions and answers and then a small group discussion activity to assist participants in thinking about how to apply the information.
Level: Intermediate

3Y: Conference Workshop: Are you ready for smart patients? Are your digital capabilities up to speed in a digitised and democratised world? (3161)

Location: Samarkand, 3rd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Susan Kennedy, Health Education England, London, UK
Richard Price, Health Education England, London, UK
Phil Southworth, Imperial College Healthcare NHS Trust, UK

Background: The smart patient is with us and, as Eric Topol says in 'The Patient Will See You Now', the relationship (between doctor and patient) 'is changing and must change' in a digital world.
Essential to any doctor in our complex and ever-changing digital world are those digital capabilities that enable them to exploit technology in the better care of patients, to embrace the democratisation of medicine and to ensure they can thrive in this brave new world.
Health Education England's Technology Enhanced Learning (TEL) Programme plus the UK's National Information Board's (NIB) Building a Digital Ready Workforce (BDRW) Programme have developed a digital capabilities framework for use by all health and care professionals across the country.
Doctors can use the framework for self-assessment, identifying learning and development needs, informing personal and professional development plans, directing learning, reflecting and evaluating on progress and performance.
Who should attend: Anyone unsure of their own digital capabilities and wanting to self-assess against the framework. The workshop will provide guidance in identifying areas for continuing professional development in specific digital capabilities.
Structure of workshop:
• Icebreaker – what digital capabilities do you already have? (Different ways this might be done but will involve standing, moving, handraising)
• What does digital literacy mean to you? Paired work with post-its
• What does digital literacy mean to doctors and patients? Table work
• The HEE Digital Capabilities Framework. Slides from presenters
• Self-assessment. Individual work with the framework
• Digital journeys. Group or paired work looking at the digital learning and transformation journeys that they as individuals and/or their teams/departments/organisations are on. Illustrated group responses.
• Plenary/discussion.

Intended Outcomes:
• Participants will have a clear understanding of what digital literacy is
• Participants will have been able to assess their own level of digital literacy
• Participants will have begun to identify their own and their colleague's learning and development needs in relation to digital capabilities
• Participants will have identified at least 4 key areas on which to work in the coming year
• Participants will be signposted to existing education and training resources that support the development of digital capabilities.
Level: Introduction/Intermediate

3Z: Conference Workshop: Creating your personal learning network: 10 tips from a systems lens (2385)

Location: Guangzhou, 2nd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Felix Ankel, HealthPartners Institute, Bloomington MN, USA
Sally Santen, Virginia Commonwealth University, Richmond VA, USA
Robin Hemphill, Virginia Commonwealth University, Richmond VA, USA

Background: Health professions education is at a crossroads. We are living in exponential times using linear methods to manage educational programs, transition from time based to competency based medical education, and navigate hierarchical organizations to maintain sustainable financial models. Educational theories are moving from cognitive and constructionist models to connectivist models http://eprints.gla.ac.uk/118043/9/118043.pdf allowing learners and educators to thrive in a digital age. Future health professions educations leaders will develop and nurture robust personal learning networks to help them adapt to complex systems. This workshop will introduce participants to 10 elements of a healthy system and challenge them to identify a local person with perceived competency in each area.
Participants will leave the session with a draft PLN and action plan when they return to their home institution.
Level of the target audience: Advanced
This session is designed for health professions educational leaders
Learning Objectives: Upon completion of this session, participants will be able to...
1. Share an outline of their personal learning network
2. List 10 disciplines in the domains of autonomy, complexity, and context management to create a healthy learning program.
3. Articulate a systems approach to their learning environment
Organization and method of presentation: Introduction to PLN Identification of three top people in current PLN, Think--pair--share (T-P-S)
Discussion of system resilience (T-P-S)

Discussion of complexity management (T-P-S)
Discussion of context management (TPS
General Q and A and next steps

3AA: Conference Workshop: Experiences with Entrustment Decision Making in EPA-based medical training. Practical insights from the Netherlands and Germany (1354)

Location: Nairobi, 2nd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:
Jacqueline de Graaf Department of General Internal Medicine at Radboudumc Nijmegen, Netherlands
Harm Peters, Dieter Scheffner Centre for Medical Education and Educational Research, Charité – Universitätsmedizin Berlin, Germany
Marieke Bolk, Dutch Association of Medical Specialists, Utrecht, Netherlands
Auk Dijkstra, Dutch Association of Medical Specialists, Utrecht, Netherlands
Marieke van der Horst, Dutch Association of Medical Specialists, Utrecht, Netherlands
Ylva Holzhausen, Dieter Scheffner Centre for Medical Education and Educational Research, Charité – Universitätsmedizin Berlin, Germany

Background: The concept of EPA-based medical training is implemented in more and more countries. What are experiences we can share and how can we work together to empower and accelerate implementation? The focus of this workshop will be on the main goal of medical training to guide and monitor the professional development of trainees towards independent practice as a physician. Entrustment decisions are an important hallmark in this process. In daily entrustment decisions (ad hoc entrustment) supervising physicians decide under how much supervision a trainee can perform certain professional activities under the given circumstances. Additionally, a summative entrustment decision can be made, which gives a trainee the generalized permission to perform a professional activity under a certain level of supervision. But what exactly does this mean? And how do you do that in the right way? We'll guide the participants through the approaches and experiences made in a Dutch postgraduate and a German undergraduate medical curriculum regarding EPA-based training and assessment.
Structure of the workshop: The workshop will start with a focussed introduction on the practice of Summative Entrustment Decision Making in resident training in the Netherlands. We explain the procedure with animated video and demonstrate experiences of residents and medical teachers in a video registration. In a second step, we will discuss how the concept of entrustment decision making was adapted and implemented in an undergraduate curriculum in Germany. In small groups

participants will reflect on the entrustment decision making concept, discuss about needs, advantages and pitfalls and share experiences. All participants may use the demonstrated tools and materials.

3BB: Conference Workshop: Assessing Cultural Competence in OSCEs (567)

Location: Mexico, 2nd Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

Presenters:

Costas Constantinou
Alexia Papageorgiou
Peter McCrorie

Background: Cultural competence has been acknowledged as an important skill doctors should have in order to achieve better health outcomes. There is evidence to show that cultural competence is associated with patient satisfaction, better doctor-patient relations and adherence to therapy. However, integrating and assessing cultural competence in medical curricula has been patchy. This workshop aims to make participants aware of the importance of cultural competence in medical practice and its integration in medical curricula, and train them in how to assess cultural competence through an OSCE station.

Who should attend: Clinical communication teachers, social scientists, experts in medical education.

Structure of workshop: The session will be very interactive and will employ brainstorming, discussion and hand-on training in order to achieve its aims:

• Brainstorming discussion on the importance of cultural competence in medical practice.

• Discuss evidence from the literature with regards to the importance of cultural competence and how it can be integrated and assessed in medical curricula.

• Simulate an OSCE station: One participant will play the doctor. The participant will be given time and information to prepare for the medical consultation. The information will include cultural competence skills. One of the presenters will play the actor and another presenter will be the examiner. The rest of the participants will observe and give feedback to the doctor. The scenario will be about a migrant patient who comes to the consultation with a perspective very different from that of the doctor. The doctor will have to communicate with this patient effectively.

• Feedback and reflection: The participant who plays the doctor will be invited to do self-reflection. Then the observers will give feedback to the doctor and then the patient and presenters. All participants will be invited to give feedback on the station and the workshop before concluding.

Intended outcomes: After the workshop, the participants will be able to:

• Understand the importance of cultural competence in medical practice.

• Appreciate the need to integrate cultural competence in medical curricula.

• Become aware of and confident in how to assess cultural competence in a medical curriculum through an OSCE station.

Level: Intermediate

3CC: ePosters: Technology Enhanced Learning & Flipped Classrooms

Location: Kairo 2, Ground Floor, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

3CC1 (3354)
Accessible 3D Scanning Technology for 3D Printing in Your Classroom

Authors
Charles Wesley Price, St. George's University, St. George's, Grenada
Xochitl Vinaja, St. George's University, St. George's, Grenada
Jessica Holland, St. George's University, St. George's, Grenada
Katie Yost, St. George's University, St. George's, Grenada
Brandon Holt, St. George's University, St. George's, Grenada
David Nahabedian, St. George's University, St. George's, Grenada

Presenter: David Nahabedian, St. George's University, St. George's, Grenada

Background: By blending art and science with the mission of education, medical illustrators bring innovation to the classroom bridging gaps that usually isolate departments. The medical illustration team at St. George's University is experimenting with three desktop 3D printers to create, modify and print anatomical models captured through a variety of methods, from photogrammetry to high-end 3D scanning. A collaboration with the School of Medicine and Veterinary Medicine has been forged to establish the most accessible technology and technique to replicate specimens for student hands-on learning.
Several 3D data capture methods are in use in our lab therefore a comparison of results has been made using bone specimens on loan from both the SOM and SVM departments. The quality of 3D prints created from these capture methods were assessed using the following criteria: accuracy, detail, quality of texture map and amount of post-scan processing required. Two common types of 3D printing were compared, Fused-Deposition Modeling and Stereolithography as well as prints derived from the same sets of photographs, but generated by separate software solutions.
Preliminary findings show that an economical photogrammetry station can be perfected to produce 3D prints with comparable quality to that of 3D scans. This may prove useful for departments with limited budgets who have a need for rare and fragile anatomical specimens but not the budget for expensive 3D scanning equipment. As the price of 3D printers continues to fall, they will become a staple on medical campuses worldwide. An increase in demand for 3D printed anatomical specimens reveals a need for affordable 3D data capture methods. Photogrammetry is a solution that uses common photography techniques and equipment. Currently, educational licenses to online software are available which allow educators to upload and process their photographs into a printable object for free.
Photogrammetry is accessible and reliable for 3D printing on a modest budget.

Redesign the professionalism teaching and learning : flipped the classrooms for better understanding, another role of medical teacher.

Authors
Kalyanee Asanasak
Patcharee puttichart
Cheerawan Chootip
Cherabat Techato

Presenter: Kalyanee Asanasak, MEC Songkhla hospital, Songkhla, Thailand

Background: Training medical professionalism is one of the most important role of the medical teacher and it is also one of the responsibiles for graduated medical doctors.
" Role model " was claimed to be one of the best way in teaching medical professionalism. What about classroom teaching? It is always a boring and difficult issue to everyone to begin the class. At Songkhla medical education center,we used flip-classroom techinque, for teaching professionalism.
All the medical students were divided into small groups each consist of different members from each year. The professionalism and ethics team teachers, consist of various medical practitioners include mainly doctors and nurses select the topic for discussion. Each group was chosen in-turned to be a leading team and worked on the assign topic with the consultant teacher. Then at the professionalism session, the third wednesday every three months month, they present the topic and lead the whole class learned by various methods for example role-play, debating, game, video-clip, dramatic play, and opened discussion. At the end of class,the consultants teachers, 2-4 teachers selected from various medical specialized and other medical partners for examples nurses, pharmacy etc.will wrapped up the sessions and made sure the students have the correct understanding by reflection and debriefing techniques.
At the beginning, the leading team were reluctant and in-confidence. After a few class with some guidance, the leader students are more capable and use various techniques in order to make the topic more interesting and easier to understanding. They even competed with each other to make their class better. Resulting in better understanding and more participation in the class. The appreciation scores from the attending students were high, have fun and thoroughly understand their medical professionalism behavior.
The flipp-classroom techniques together with peer to peer teaching governed by IPE modulators were used to make teaching professionalism more interesting. And assessing their knowledge and attitudes by debriefing and reflection techniques.

No matter how difficult in disciplined the medical students professionalism it's the medical teacher role to implant it to their students.

The Effects of the Flipped Classroom in Teaching Evidence Based Nursing : Using Team Based Learning and Mobile Application

Authors
Yueh-E Lin, Linkou Chang Gung Memorial Hospital National Taipei University of Nursing and Health Sciences. Chang Gung University of Science& Technology, Taiwan
Tsung-Chu Lan, Taoyuan Chang Gung Memorial Hospital & Chang Gung University of Science, Taiwan
Jeng Wang, Chang Gung University of Science & Technology, Taiwan
Chen-Li Kuo, Chang Gung University, Taiwan
Hui-Ling Lin, Linkou Chang Gung Memorial Hospital, Taiwan
Shu-Fang Vivienne WU, National Taipei University of Nursing and Health Sciences, Taiwan

Presenter: Hui-Ling Lin, Linkou Chang Gung Memorial Hospital, Taoyuan, Taiwan

Background: The evidence based nursing has become one of essential components to improve quality of care at clinical. The e-learning will be also critical to the future learning/teaching environment. It's not only be benefited through the method of team learning, but also actively learn with flexibility of time. Therefore, flipped classroom with an e-learning program and team based learning method will be developed for nurses.

This is a quasi-experimental study. The control group received nurses' traditional nursing classroom teaching, while the experimental group received flip teaching methods. A total of 75 patients in the control group and 76 patients in the experimental group. They were arranged survey about the nursing knowledge scale and Self-efficacy scale. The datas collected from pre-test, post-test, and one month 3 time points.

Overall, the experimental group performed better than the control group after the flipped program. The experimental nursing knowledge and practical self-efficacy after the test of the three time points, both groups received empirical nursing teaching courses and enhanced the knowledge (control group 75.07 ± 14.55 VS experimental group 80.92 ± 14.62), especially in the experimental group progress more significantly than the control group (t = 2.47, p = .015 *****); the other in practical self-efficacy, both groups can effectively improve (control group 82.15 ± 17.52 VS experimental group 89.03 ± 15.19), and the experimental group progress more significantly than the control group (t = 2.58, p = .011 *****). However, there was no significant difference between the two groups in the knowledge of post-mortem nursing and practical self-efficacy, but overall the experimental group was still more effective than the control group.

From the above, it can be understood that the use of flip teaching combined with team-oriented learning can effectively enhance the effectiveness of knowledge and self-efficacy. The findings can be used as an important reference for future demonstration teaching in order to improve teaching quality.

Learning Outcomes of Prenatal Counseling by Simulation-based Flipped Classrooms Compared to Conventional Lectures

Authors
Ching-Ju Shen, Department of Gynecology and Obstetrics, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Chin-Ru Ker, Department of Gynecology and Obstetrics, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Cheng-Yuan Tsao, Department of Clinical Education and Training, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Jong-Rung Tsai, Department of Respiratory Department, Kaohsiung Medical University, Kaohsiung, Taiwan

Presenter: Ching-Ju Shen, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Flipped classroom is a blended learning strategy that enhances students' abilities and achievements. This pedagogy reverses the teacher-centered teaching styles to student-centered learning environment. We implemented a flipped classroom curriculum of obstetric topics for senior medical students, with their learning outcomes measured by Objective Structured Clinical Examinations (OSCE).

200 participants were included in this study. Prenatal counseling topics were selected according to suggestions and feedbacks from previous students. Students were randomly assigned to the lecture group or to the flipped group. Prior to the class, students in the study group were instructed to read assigned materials, based on which they would utilize in interactions with standardized patients and performance of ultrasound-guided amniocentesis in the class session.

Compared to those in the conventional lecture group, students in the flipped group score significantly higher on average for Obstetrics in OSCE. Lower failure rates in the study group in the Obstetric station were observed, with cut-off scores determined by borderline regression methods.

The flipped classroom approach has been applied to medical education for many years to improve learning outcomes. Hybrid models that include simulation materials ensure learners to explore relevant subjects more thoroughly.

Simulation-based flipped classroom is an effective learning style for prenatal counseling. The novel learning method leads to reflective observation, abstract conceptualization and active experimentation. It could also be adopted in clerkship rotations, where a clinical setting is simulated to enhance students' learning experiences.

'Pass the Papers': Designing an exam preparation module that meets the diverse needs of Core Psychiatry trainees

Authors

Naomi Hampton, Southern Health NHS Foundation Trust, Southampton, UK

Anna Evans, Southern Health NHS Foundation Trust, Southampton, UK

Presenter: Naomi Hampton, Southern Health NHS Foundation Trust, Southampton, UK

Background: UK trainees in Psychiatry are required to pass three examinations in their first three years with high standards expected. These exams have a low pass rate, can cause a great deal of stress and contribute to difficulties in retention of trainees. Wessex Deanery trainees have protected time allotted to group exam preparation. However, historically engagement and attendance at these sessions has been difficult. Therefore opportunities are lost for shared practice and mutual support.

We have designed a course running for the first time October 2017 - June 2018, aimed at supporting trainees preparing for MRCPsych Paper A. The course is run by more senior trainees who have recently passed the exams and can focus on relevance and effectiveness. A blended learning approach is used, incorporating e-resources produced by the Royal College of Psychiatrists. We have encouraged a flipped classroom model: trainees present to each other in a style inspired by the 'Pechu-Kuchu¬TM' model. Succinct presentations are given in consecutive 90 second slots, creating a lively and engaging environment, as well as allowing for a large volume of material to be covered in a short time.

Select participants of the current course (n=11) and previous two years (n=8) were surveyed. The current group felt the course "suited my learning style" rated as 3.8/5 compared with 2.1/5. The current group's perception that the course would improve their chance of passing was 4.0/5 compared with 2.0/5.

Results for the Paper A examination (June 2018) will be compared with previous Wessex trainee performances.

Our work suggests that trainees find a 'flipped classroom', fast-paced course relevant and effective. Involving senior trainees ensures an up-to-date course while allowing course participants to lead maximises their learning opportunities. The lively concise presentations have proved a popular method to improve engagement and explore different approaches to fact-based learning.

The challenges of providing a relevant course to a diverse group have been met with a trainee-led, lively, 'flipped classroom' course which fosters a supportive environment for trainees preparing for exams.

Using OSCE to assess learning outcome of the flipped respiratory therapy course

Authors

Yun-Ting, Tseng, National Taiwan University Hospital, Taipei, Taiwan

Kun-Ta Lee, Taipei Medical University Shuang-Ho Hospital, New Taipei, Taiwan

Ling-ling, Chiang, Taipei Medical University School of Respiratory Therapy, Taipei, Taiwan

Kung-Pei Tang, Department of Education and Humanities in Medicine, School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan

Chien-Ling, Su, Taipei Medical University Shuang-Ho Hospital, New Taipei City, Taiwan

Po-Fang Tsai, Graduate Institute of Humanities in Medicine, College of Humanities and Social Sciences, Taipei Medical University, Taipei, Taiwan

Presenter: Yun-Ting Tseng, National Taiwan University Hospital, New Taipei City, Taiwan

Background: In Taiwan, the respiratory therapy specialized education has been continued for 16 years. As most of students aim for the certification of respiratory therapist that needed to pass the national examinations, they spent lots of time in field of "memorization". Nevertheless, clinical skills are still important and the practice depends on laboratory class. Due to different kinds of equipment needed to explain, clinical lecturers must be employed in the laboratory class. Additionally, students in varying degrees result in the process delayed and reduction of the practice time. Accordingly, draw up the completely new way for respiratory education urgently.

Due to comparable complexity, the sections "oxygen therapy" and "aerosol drug therapy" were chosen for control and experiment group. The section "oxygen therapy" was taught by traditional lecture and the "aerosol drug therapy" by flipped instruction. In terms of the flipped instruction, students had to perform online learning for aerosol drug therapy and were engaged in team-based learning during the class. Every student received pretest and posttest respectively at begin and the end of each class. The Objective Structured Clinical Examination (OSCE) was also implemented to assess students" learning retention for oxygen therapy and aerosol drug therapy.

According to results of paired sample t test, students' posttest scores after flipped classroom are significantly improved (T=-9.064; p=.000). Students performed also better in aerosol drug therapy than in oxygen therapy during OSCE (T=-4.269; p=.000).

Students performed better in the flipped section. Our flipped instruction is consisted of online learning before class and team-based learning in the class. This study could not clarify which part effected more on students' learning outcome.

Comparing the spoon-feeding memorizing of operation steps, the flipped instruction is more proficient to teach respiratory therapy.

MOOC (Massive Open Online Course) to improve clinical assessment skills and interdisciplinary collaboration in primary care

Authors
Lene Lunde, Department of Nursing Science, Institute of Health and Society, University of Oslo, Oslo, Norway
Anne Moen, Department of Nursing Science, Institute of Health and Society, University of Oslo, Oslo, Norway
Elin Olaug Rosvold, Department of General Practice, Institute of Health and Society, University of Oslo, Oslo, Norway

Presenter: Lene Lunde, Department of Nursing Science, Institute of Health and Society, University of Oslo, Norway

Background: Responsibility for increasingly complex patient care are migrating to primary care, requiring capacity building and competence development to strengthen interdisciplinary team collaboration, and clinical skills for better decision making and patient safety.
We have developed a MOOC to improve staffs' clinical skills in systematic health assessment and prepare students for clinical rotation in primary care.
The MOOC is a module-based digital learning resource, developed in close collaboration with healthcare practitioners in primary care. The learning objectives are to gain experience, knowledge and skills in a) systematic observation of vital signs; b) triage with relevant observations and assessments to determine severity and urgency; c) physical examination and comprehensive physical assessment; and d) in depth focus on heart and lungs.
We recruited healthcare professionals and students for a pre-pilot test of the MOOC in November 2017. A full scale 6-week course pilot test will be performed in Spring 2018 to provide information about 1) usefulness of the modules, 2) ease of use, 3) advantages and disadvantages of MOOC for learning, and 4) potential for team training.
Results from the pre-pilot test supported that topics in each module were relevant and highly useful for the participants and their collaborators. Assignments were rated as useful and appropriate, coming with huge potential for interdisciplinary collaboration. We will present results from the full-scale pilot of the MOOC, focusing on healthcare practitioners and students' perspectives, usefulness, ease of use, suggestions for improvements, and use of the MOOC in workplace and education settings.
Health assessment skills can increase staffs' capacity to differentiate common clinical issues in primary health care and stimulate interdisciplinary collaboration to prevent deterioration of the patient's condition. The MOOC is a promising platform for distributed learning and competency development in primary care.
The MOOC has potential to enhance healthcare practitioners' capacity to evaluate patient's complex condition and engage in interdisciplinary collaboration to prevent further deterioration.

Use and Content Selection Among Medical Students Utilizing an Online Educational Blog During an Obstetrics and Gynecology Rotation

Authors
Alan Rosenbaum, The Ohio State University, Columbus, USA

Presenter: Alan Rosenbaum, The Ohio State University, Columbus, USA

Background: Blogs and podcasts are increasing in popularity in medical education due to their convenience, portability, and flexibility. The goal of this study was to describe the use and content selections among medical students utilizing an online educational blog during an Obstetrics and Gynecology rotation.
The data for this is educational case report was collected during the fall semester of 2017, when senior medical students were invited to view an online educational blog during their orientation to the obstetrics and gynecology clinical rotation. The blog posts included a written outline and audio podcasts that could be viewed or heard online as well as downloaded for later use. Additional blog posts were added throughout the study time period covering topics requested by the medical students. Multiple groups of students rotated through the obstetrics and gynecology service during the semester, at the conclusion of which the page views for each blog post were assessed. Page views were adjusted for the number of students on service and if a post was created when a rotation was in progress, the page views were adjusted for the number of days the Thirteen educational posts, covering 7 obstetrical and 6 gynecologic topics, were presented on the online blog. In one semester, 125 students rotated through the obstetrics and gynecology rotation during which the online blog had a total of 206 page views among the 13 posts. The posts covering Group B Streptococcus Infection Prevention (43 views), Induction of Labor (26 views), and Fetal Heart Rate Monitoring on Labor and Delivery (21 views) were the topics with the greatest page views. When adjusted for post availability and the number of students on service, the posts with the top page views were Shoulder Dystocia, Group B Streptococcus Infection Prevention, and Induction of Labor. As a group, obstetric topics garnered greater page views than gynecologic posts ($p < 0.01$).
Discussion and Conclusion: Students on an obstetrics and gynecology rotation were willing to utilize an educational blog that contained downloadable outlines and audio podcasts. Obstetrical topics had greater viewership compared to gynecologic topics.

3CC11 (436)
Case Based Blended Learning (CBBL) – a strategy to foster the transfer of declarative to procedural knowledge or more?

Authors
Henriette Löffler-Stastka, Medical University Vienna, Austria
Bela R. Turk, Medical University Vienna, Austria and Johns Hopkins University, Baltimore, USA
Sebastian Ertl, Medical University Vienna, Austria
Tamara Seitz, Dept. for Internal Medicine, General Hospital Vienna, Austria

Presenter: Sebastian Ertl, Medical University Vienna, Austria

Background: An increasing number of patients to treat, combined with a rapidly growing amount of knowledge, is supposed to be very challenging for doctors in the future. The time needed for a decision, whether to come to a diagnosis or to send the patient to an expert, should be as short as possible. Investigating the cognitive actions of medical students solving a patient's case, lead to the conclusion that educators should focus on a higher level of reasoning. Developments in information technology in medical education offer a large variety of tools for educators. The most challenging part for medical students is to handle the huge amount of clinical information. Case based learning could be a promising approach to teach students how to investigate for the important information.

To show how e-learning influences the clinical reasoning, the diagnostic efficiency and the grades among medical students.

Prospective cohort - study. Methods: A questionnaire as well as a semantic differential will be used to measure the support of e-Learning, the attitude of medical students towards eLearning and new learning concepts. This study was designed to measure and quantify the potential of e-learning as a new teaching technique. Effects on OSCE grades are measured at different time points.

Objective Structured Clinical Examination (OSCE) results from (n=619) medical students in 2013 before CBBL implementation, and after CBBL implementation in 2015 (n=624) and 2016 (n=643) were analyzed. A significant improvement (adjusted p=0.002) of the mean OSCE score by 1.02 points was seen between 2013 and 2015 (min=0, max=25).

E-Case Based Learning is an effective tool in increasing student mobility, satisfaction, improving performance outcomes and may provide a sustainable learning platform for many fields of medicine in future. The students' satisfaction and acceptance of the implemented case based eLearning program in the fields of psychiatry, microbiology and laboratory medicine and orthopedic surgery point at the value of autonomous motivation and affective involvement fostering efficient learning styles.

Developing Our Baby: SingHealth Obstetrics and Gynaecology (OBGYN) Junior Doctors' Handbook App

Authors
Zhun Wei Mok, Division of Obstetrics and Gynaecology, KK Women's and Children's Hospital, Singapore
JCS Lee, Division of Obstetrics and Gynaecology, KK Women's and Children's Hospital, Singapore
ADH Lu, Centre for Resident And Faculty Development (CRAFD), Singhealth
CHC Tan, Centre for Resident And Faculty Development (CRAFD), Singhealth, Singapore
WS Tey, Division of O&G, OBGYN Academic Clinical Program (ACP), Singhealth, Singapore
M Mathur, Division of Obstetrics and Gynaecology, KK Women's and Children's Hospital, Singapore

Presenter: Zhun Wei Mok, Division of Obstetrics and Gynaecology, KK Women's and Children's Hospital, Singapore

Background: At the Department of OBGYN, KK Women's and Children's Hospital (KKWCH), Singapore, a physical handbook of departmental guidelines exists to guide safe practice. Guidelines change when new evidence is published, presenting a challenge in ensuring continued content upkeeping. Mobile applications (apps) provide a 'just-in-time' resource which is especially useful for junior doctors balancing newly increased responsibilities with relative inexperience.

A pilot study on the use of an app to replace the existing handbook was conducted amongst junior OBGYN doctors. Preliminary discussions were undertaken with the Program Director, Academic Chair and faculty, to identify relevant areas for the alpha-version. The app was developed in-house with SingHealth Residency's EduTech Office with preliminary funding from the Academic Clinical Program (ACP). The alpha-version launched in August 2017. Junior doctors were recruited to trial this app. Data on usefulness and weaknesses were collected through serial focus groups and analysed using grounded theory.

Consultative discussions recommended these initial key areas for inclusion:

i. Procedural and consent information
ii. Risk calculators for ambulatory counseling
iii. Clinical pathways and algorithms for inpatient and ambulatory management.

All participants had experience using apps. Focus groups reported that apps would be useful resources in ambulatory and inpatient settings.

There were differing views on app appearance and presentation between IOS and Android users. Topics of commonest reference amongst OBGYN junior doctors were identified. Practice guidelines unique to the department were deemed most pertinent. These findings were incorporated promptly into the beta-version. Beta-testing is currently underway with ongoing qualitative data collection.

Following the App's Beta trial, a seamless uptake is expected in view of the ubiquitous use of smartphones, which is scalable for use in other departments within our sponsoring institution.

App development is feasible through engagement of stakeholders within the residency sponsoring institution. Following the proof–of-concept through the alpha-version and focus group data, continued funding for this project has been promised by the ACP.

Apps are easily developed using existing resources. Showing proof of utility following new educational interventions helps engage future funding for project longevity.

3CC13 (471)
Technological pedagogical content knowledge (TPCK) in medical education: Taiwan medical teachers' perceptions of and preparedness to use technology-enhanced learning in curriculum design.

Authors
Chang Li Chun
Lin Hui Ling

Presenter: Li-Chun Chang, Chang Gung University of Science Technology, Tao-yuan, Taiwan

Background: Supporting successful transition to practice is key to retaining new graduate nurses in the workforce and to meeting the requirement for cultural diversity in healthcare services.

The result is a part of a three-year program that aims to explore the experience of technological pedagogical content knowledge (TPCK) among medical educators in Taiwan. There were three stages in this study: interviews of medical educators, analyses of medical education programs, and surveys of TPCK for medical teachers. We found 565 copies of medical-education–related teaching materials with 109 full texts for analysis. Eleven technological methods were identified. Simulations were the most popular method among the technological methods used in medical education programs. We interviewed 15 medical teachers on their five years of teaching experience. It was found that 60.7% of the teachers used technological methods in their curricula. For some teachers, the tendency of technology was another reason to use technology. We adopted random sampling to obtain participation from 319 medical teachers and received a 32.3% response rate. The content knowledge and technological content knowledge were the highest in TPCK. We found that the female sex, doctoral degree education level, full time work, nursing educators, and learned technological method were influence factors for the TPCK scores.

Technology is likely to become more ubiquitous in the education sector (Masters et al., 2016). Although educators are aware of the popular demand for technology products, it is clear that they are also aware of role of technology in the daily lives of students. Thus, educators expect to increase student interest by connecting with students through technology (Stoilescu, 2015). The present study found that in the experience of 15 educators, TK, TPK, and TPCK accounted for one-third each, which was the same as the results of Mouza et al. (2014). TK, TPK, and TPACK constitute important areas of knowledge for preprofessional educators in the ntegration

of ICT in the classroom and development TPACK after technology training.

Interdisciplinary team learning can be an effective strategy to develop TPCK for medical teachers.

3CC14 (1911)
iExaminer system: An effective teaching method to improve funduscopic examination skills

Authors
Kiyoshi Shikino, Chiba University Hospital, Department of General Medicine, Chiba, Japan
Shingo Suzuki, Chiba University Hospital, Department of General Medicine, Chiba, Japan
Yusuke Hirota, Chiba University Hospital, Department of General Medicine, Chiba, Japan
Daniel Salcedo, Chiba University Hospital, Health Professional Development Centre, Chiba, Japan
Makoto Kikukawa, Kyushu University, Department of Medical Education, Fukuoka, Japan
Masatomi Ikusaka, Chiba University Hospital, Department of General Medicine, Chiba, Japan

Presenter: Kiyoshi Shikino, Chiba University Hospital, Chiba-city, Japan

Background: Funduscopic examination is an essential skill for primary care physicians as an aid in the diagnosis of several conditions. However, providing adequate training in this skill is challenging to both learners and instructors since it is not possible to share what is observed during the examination. The Welch-Allyn iExaminer system enables the capture of images from the ophthalmoscope using a mobile phone's digital camera. We investigated whether this methodology is superior to our previous traditional method for funduscopic examination.

A controlled trial was designed to compare the effects of the two practical guidance methods on student performance during fundus examinations. The study population was comprised of 56 undergraduate medical students participating in a general medicine clinical clerkship rotation. The participants examined the fundus on an eye simulator (EYE®, Kyoto Kagaku Co, Kyoto, Japan) before and after clinical skills training and presented their findings (3 findings each before and after the training session). Participants were randomly assigned to either a practical guidance method with the Welch-Allyn iExaminer System (intervention group: n=29) or a practical guidance method without the iExaminer System （control group: n=27). The training time was restricted to 30 minutes in both the intervention and control groups. Major outcome measures were the diagnostic accuracy of funduscopic findings and duration of examination in both groups.

Diagnostic accuracy was significantly higher using the iExaminer System (intervention group: $19.5 \pm 0.45\%$ to $46.0 \pm 0.49\%$, control group: $24.7 \pm 0.46\%$ to $27.2 \pm 0.53\%$, $F_{(1,166)} = 8.91$, $p = .003$). The duration of funduscopic examination was significantly shorter using the iExaminer System (intervention group: 82.6 ± 14.4 s to 62.1 ± 22.5 s, control group: 81.7 ± 14.9 s to 73.1 ± 23.3 s, $F_{(1,166)} = 13.18$, $p < .001$).

Teaching the funduscopic examination using the Welch-Allyn iExaminer system leads to improved diagnostic accuracy while reducing total examination time. Teaching the fundus examination method based on the iExaminer system is an effective and efficient method to improve the clinical performance of funduscopic examinations in medical students.

3CC15 (2197)
Evaluation of an eLearning program for GPs in health and developmental surveillance in children. Lessons learnt

Authors
Jonathon Nguyen
Anne Eastwood
Natalie Ong

Presenter: Natalie Ong, Child Development Unit, Children's Hospital Westmead, Sydney, Australia

Background: Child health and development is conducted by Child and Family Health nurses in Australia. However there is a high drop off in visits by infancy and many developmental diagnoses eg. autism are still diagnosed late. GPs are well placed to participate in this surveillance strategy and have indicated a high interest in training in this field. Whilst face to face workshops have been run successfully, an eLearning platform was also developed to provide a blended learning platform to consolidate learning.
GP registrars attending a face to face workshop were invited to participate in the pilot project. The program consists of 5 Modules and pre and post course assessments and a 3 month post course survey to identify translation to practice behaviours. The workshop consisted of 3 practical stations addressing skills in physical examination, developmental screening and anticipatory guidance. A survey was administered to obtain feedback about the face to face and eLearning program.
A total of 68 registrars who attended the workshop commenced the eLearning program. Twenty one participants completed the program with 10 partially completed and 37 not completed. The registrars enjoyed the workshop and found it helpful in increasing their knowledge and confidence about the use of the child Personal Health Record as a surveillance tool and increased the likelihood their skills learnt to be put into practice. Of those who completed the eLearning, most found it informative, engaging, useful and practical. The blended program was ranked as most preferred whilst face to face sessions alone and eLearning alone ranked second and third. There were some participants who found that systems issues interfered with their completing the eLearning and that more refinements to resolve these issues are important to reduce the rate of non-completers.
This project demonstrates the successful delivery of a blended eLearning program for GPs in health and developmental surveillance. Of those completing the program, feedback was very positive. This also highlights the importance of sound elearning platforms to reduce participant drop off. There is the potential for the elearning program to be combined with local supervision through the use of clinical competency checklists.

Audiovisual resources in virtual campus to refresh radiological anatomy

Authors
Mario Pages, Facultat de Medicina. Universitat de Barcelona, Spain
Javier Clavero, Servei de Audiovisuals. Universitat de Barcelona, Spain,
Marcelo Sánchez, Facultat de Medicina, Universitat de Barcelona, Spain
M Angeles García-Criado, Facultat de Medicina, Universitat de Barcelona, Spain
Laura Oleaga, Facultat de Medicina, Universitat de Barcelona, Spain
M Carmen Ayuso, Facultat de Medicina, Universitat de Barcelona, Spain

Presenter: Mario Pages, Universitat de Barcelona, Spain

Background: Radiology learning requires a solid anatomic knowledge base. We realize that students in the third year of medicine degree -when general radiology is taught at our University- need some anatomical refreshing before recognizing pathology by imaging, in order to better understand the radiological signs. However, the number of face-to-face classes is limited and any anatomy class would come at the expense of some other important radiological aspects.
Our team in the radiology department decided to record the basics of normal anatomy in several short videos based on imaging (CT, MR, US) that were uploaded on the Virtual Campus. Anatomic radiology was divided into the following topics: "Anatomic bases of chest X-ray", "Normal abdominal ultrasonography", "Normal abdominal CT, "Radiology of the Central Nervous System", "A review of radiological skeletical-muscle anatomy" and "Bases of a normal Angiography" (the latter in preparation).
Videos were recorded by a professional audiovisual team in our University. All the recordings were made by shooting only radiological images with radiologist's voice, except the "Normal abdominal ultrasonography" where the radiologist's hand position is also shown. The duration of the videos is between 9 and 27 minutes. The incorporation of this educational material was done in phases –two videos every year- in order to evaluate the students' response. The videos, uploaded from 2015-16 course until now, have already accumulated 2.872 visits, which is considerable bearing in mind that is not broadcast on an open channel.
The combination of audiovisual resources and virtual campus is an ideal environment for teaching. Students can access the educational videos at any time and refresh anatomical aspects. We recommend the online viewing of each video prior to the corresponding pathology face-to-face class. This tool improves student knowledge before classes, favours interaction with the teacher and saves time, allowing the introduction and discussion of new complementary aspects of clinical radiology.

Recorded audiovisual resources are a perfect choice to refresh and understand imaging-based anatomy.

3DD: Posters: Surgical Education

Location: Hall 4.1, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

3DD1 (1707)
Evaluation of Hospital-based Clinical Training Modules for Operating Room Personnel

Authors
Pauline Johnston, Norfolk and Norwich University Hospital, Norwich, UK
Alan Norrish, Cambridge University Hospitals, Cambridge, UK
Isabel Van Rie Richards, AO Foundation, Davos, Switzerland
Kathrin Lüssi Straub, AO Foundation, Davos, Switzerland

Presenter: Isabel Van Rie Richards, AO Foundation, Davos, Switzerland

Background: Finding time away from work for educational courses is increasingly difficult for operating room personnel (ORP). The AOTrauma ORP Educational Taskforce has thus developed a new format of hospital-based education. These 2 to 4-hour Clinical Training Modules (CTMs), each covering well defined content on a specific topic, aim to teach principles of fracture fixation in the context of local needs and local hospital policy.
Method: The production of CTMs started in 2013. All modules are created by established AOTrauma ORP and surgeon faculty and were reviewed by global experts. In 2015, the first CTMs were conducted, with topics such as introduction to fracture fixation and osteosynthesis with plates and screws. Today, 5 modules are available. Translation into Spanish, French, Dutch and Russian has started. To evaluate the format and impact of the CTMs, the Taskforce prepared an online survey with 13 questions about the educational impact, content, faculty performance and logistics.
125 participants of CTMs held in 4 countries and 3 regions (Asia Pacific, Middle East and Europe) completed the anonymous evaluation (response rate: 65%) via SurveyMonkey.
Results: 81% of the participants found the content of the modules very useful or extremely useful. 66% said they have learned something new and plan to use this in their practice. 30% stated that the CTM confirmed their current practice. All educational objectives of the respective CTMs scored between 4.51 and 4.85 on a scale of 5 (with 5 being objectives fully met). 100% would recommend this training to their colleagues.
Discussion: The increasing number of CTMs run every year (27 in 2016, 38 in 2017, 21 in Q1 2018) and the evaluation results suggest they are well-received, useful and effective educational activities. Further inquiry will be done to identify and promote best practice in adjusting CTM content to the level of the local participants to further increase educational impact.
Conclusion: CTMs allow hospitals to organize training and education internally. The organization is easy, flexible and affordable. The competency-based content completes the educational portfolio of ORP worldwide who are involved in fracture fixation and care.

3DD2 (2131)
Differences in shared decision making behaviour between residents in training and orthopaedic surgeons: survey study explaining shared decision making behaviour in the care of hip- and knee osteoarthritis

Authors
Jeroen K.J. Bossen, School of Health Education, Maastricht, Netherlands
Erik W. Driessen, School of Health Education, Maastricht, Netherlands
Ide C. Heyligers, School of Health Education, Maastricht, Netherlands

Presenter: Jeroen Bossen, School of Health Education, Maastricht, Netherlands

Background: In orthopaedic surgery the focus in shared decision making (SDM) mainly goes to decision aids. Little is known about SDM behaviour of physicians and how to improve this. Behaviour can be explained by the theory of planned behaviour, which states that behaviour is directly related to intention. Intention is determined by attitude, subjective norm and perceive behaviour control. The aim of our study was to explain SDM behaviour of orthopaedic surgeons and residents in the care of hip and knee osteoarthritis.
Method: A survey was done among staff physicians and residents in training for orthopaedic surgery. We addressed physicians working with hip and knee osteoarthritis patients in the Netherlands. We developed a questionnaire to measure intention and the determinants of intention for SDM behaviour. A 7-point Likert scale was used, with high scores representing high scores on the items.
Results: Of the 385 addressed physicians, 135 (34%) responded. For intention of SDM behaviour, 47% of the physicians scored 6 points (range 1-7). A mean score of 5 (range 1-7) was seen for attitude and staff physicians scored higher compared to residents. For subjective norm, staff residents were stronger influenced by external parties like insurers and health policy makers. Residents found themselves less in control of SDM behaviour and scored lower on perceived behaviour control. In the bivariate analysis attitude, subjective norm and perceived behaviour control were correlated with intention for SDM behaviour. Perceived behaviour control was associated the strongest with an R of 0,54 (p <0,001).
Physicians express high intention and attitude on SDM behaviour and ascribe restrictions in SDM to external factors. Physicians mention issues like time constrain and poor patient understanding important in this. The found differences between residents and staff physicians are striking. This underpins the need for education for residents and results could be used for designing SDM training.
Conclusion: Physicians report high intention and attitude on SDM. Scores were lower for residents compared to staff physicians. Perceived behaviour control is the most important determinant of SDM behaviour for physicians working with hip- and knee osteoarthritis patients.

3DD3 (3225)

Exploring the training experiences of residents in the new direct-entry vascular surgery program format

Authors

Faysal Naji, McMaster University, Hamilton, Canada
Arshia Javidan, McMaster University, Hamilton, Canada
Jen Hoogenes, McMaster University, Hamilton, Canada
Mina Guirgis, McMaster University, Hamilton, Canada
David Szalay, McMaster University, Hamilton, Canada
John Harlock, McMaster University, Hamilton, Canada

Presenter: Arshia Javidan, University of Toronto, Canada

Background: Training in vascular surgery is currently undergoing a transition from a 5+2 fellowship model (vascular fellowship following completion of general surgery residency) to a direct-entry pathway immediately following medical school (0+5). This paradigm shift is in part due to the declining numbers of applicants to vascular surgery programs. Residents in the 0+5 model are provided a more focused route of vascular surgery training. Few data exist that describe residents' experiences with the 0+5 pathway.

Method: Using focus groups (FGs), we explored the experiences of junior and senior vascular residents currently in 0+5 programs in Canada.

Nine FGs were comprised of 3-5 residents each (N=27) and were facilitated by a resident (FN), with field notes taken by a research assistant. Due to geographical location, some were conducted via Skype. A piloted 15-item facilitator guide was used, and FGs were recorded and transcribed for analysis. The qualitative framework method was utilized for thematic analysis.

Results: The following broad themes emerged: diversity in teaching styles of staff and fellows; the roles that residents play in research and how programs contribute to research development; the importance of feedback and how it's used; the benefits and disadvantages of the resident-fellow mix; resident versus fellow operative and clinic exposure and experience; the impact of different rotations; increasing levels of responsibility; time constraints in the operating room; academic structure; communication routes; and integration of residency within existing fellowship programs. Multiple concepts within each theme provided rich data on residents' experiences.

Discussion: Conducting FGs provided important insight into vascular surgery resident perspectives, program performance, and overall reception of the new direct-entry pathway. The data highlight the major strengths and weaknesses of current training programs, informing a framework for future program development and potential valuable information for other residency specialties.

Conclusion: Vascular surgery residents in the direct-entry (0+5) pathway provided a wealth of information regarding their experiences. The themes of teaching, research, feedback, resident-fellow mix, operative and clinic exposure, and off-service rotations can inform vascular surgery residency program directors and aid in curricula development as the specialty continues to evolve.

3DD4 (3433)

AO Surgery Reference usage data for assessing educational needs

Authors

Lars Veum, AO Foundation, AO Education Institute, Duebendorf, Switzerland
Jane Thorley Wiedler, AO Foundation, AO Education Institute, Duebendorf, Switzerland
Fergal Monsell, Bristol Children's Hospital, Bristol, UK

Presenter: Lars Veum, AO Foundation, AO Education Institute, Duebendorf, Switzerland

Background: AO Surgery Reference (AOSR) is an internet-based resource for the management of fractures. It describes the complete surgical management process from diagnosis to aftercare for all fracture patterns described in the AO/OTA classification in a given anatomical region. The usage data (360 thousand sessions and 2.8 million pageviews per month) provide information on the knowledge gaps AOSR users are seeking to address. The analysis of these data could offer valuable insights for the development of educational opportunities and resources related to existing or emerging curricula.

Method: For selected anatomical regions, the pageviews of all provided treatment options and approaches are collected and analyzed, e.g. for differences across geographical regions and comparison with effective fracture frequency (TBD). Currently the focus is on the pediatric AOSR procedures, for which total 70,000+ pages have been viewed since it was launched in 2016.

Results: The ongoing analysis shows differences in how often fracture patterns are accessed and how often each treatment option or surgical approach for a specific fracture pattern is accessed. For example, in the case of pediatric distal humeral fractures, the Elastic Stable Intramedullary Nailing (ESIN) technique has been accessed 1300 times with a varied geographical distribution, showing much higher relevance throughout Europe and Asia compared with North America and Latin America. In the next phase of the analysis, the effective fracture frequency in the different geographical regions will be collected and compared to the AOSR data.

Conclusion: The differences in pageview frequency and distribution could be attributable to the complexity of the given problem, frequency of a fracture, or geographical treatment preferences. To contribute to educational needs assessment of globally applied curricula, this data will enable a more granular approach to curriculum design. Usage data from the AO Surgery Reference can be a valuable tool in the assessment of educational needs for curriculum development both globally and regionally.

3DD5 (717)
Learning Needs Analysis: A tool to motivate surgical faculty and stimulate reflection and self-directed learning

Authors
See Yin Liew, National Healthcare Group, Singapore
Kaushal Amit Sanghvi, Tan Tock Seng Hospital, Singapore
Cheong Wei Terence Huey, Tan Tock Seng Hospital, Singapore
Qinghui Sarah Lu, Tan Tock Seng Hospital, Singapore

Presenter: See Yin Liew, National Healthcare Group, Singapore

Background: With advances in medical education, it is essential that faculty continuously update their knowledge and skills to keep abreast with the evolving, multiple roles of medical teachers. However, surgical faculty find it challenging to do so amidst their busy schedule. The yearly participation rates in teaching-related development programs are less than 25%. This abstract describes our program's initiative to motivate participation through learning needs analysis and individualised faculty development plans, using an adult learning approach.
Method: Program faculty, ranging from senior residents to senior consultants, were invited to complete a self-assessment of their current and ideal levels of competencies in 33 teaching activities. The competency levels were rated according to the 5 levels of Dreyfus Skills Acquisition Model and the teaching activities were categorised into 6 areas defined in The Good Teacher, Harden and Crosby.
Results: Response rate was 61% (n=56). The mean rating for each area of teaching activities ranged from 2.6 to 3.1 (between Advanced Beginner and Competent) for current level of competencies, and from 4.3 to 4.5 (between Proficient and Expert) for the ideal level of competencies. All except one faculty had identified a gap between their current and ideal levels of competency in at least one area of teaching activity.
Discussion: The survey result revealed that faculty had learning needs, regardless of seniority, clinical experience and education responsibilities. However, the needs differ according to individual self-assessments. The survey data enabled the program to provide each faculty with an individualised learning needs analysis and a personalised faculty development plan with a list of relevant courses. To ensure accessibility, only locally-organised courses were recommended and fee sponsorships were budgeted for. The program also initiated quarterly surgical education journal clubs within the department schedule; which boasted close to 50% attendance.
Conclusion: A learning needs analysis can be useful to target faculty development efforts and serves as a tool for faculty to reflect and enhance their awareness regarding their multiple roles and areas for improvement. This is the first of many steps towards motivating our faculty towards self-directed, life-long learning in education.

3DD6 (1020)
A Study of Medical Students' Satisfaction with Clinical Education in Surgery Section comparing with Medicine Section: Why do they prefer Medicine Section?

Authors
Titima Nasomtrug, Udon Thani Hospital, Udon Thani, Thailand

Presenter: Titima Nasomtrug, Udon Thani Hospital, Udon Thani, Thailand

Background: The surgery and medicine sections are the major subjects for the medical students. At the end of each section, the students were required to complete an evaluation form to rate their satisfaction. Initial investigation suggested that the majority of students preferred practicing in medicine than surgery section despite similar workload. This study was conducted to evaluate the issues that led the decline of students' satisfaction with the practice in surgery section.
Method: The method of data collection was questionnaire, including the areas of medical teachers, learning system, related personnel, patient building as well as the open-ended questions for additional opinion.
Results: The questionnaire respondents included 84/91(92.31%) and 69/82(84.15%) medical students from medicine section and surgery section respectively. The students' average satisfaction for each unit in 2014, 2015 and 2016 was 4.09, 3.67 and 3.79 for surgery and was 3.99, 4.07 and 4.14 for medicine respectively. The average 3-year satisfaction for each unit regarding medical teachers, learning system, related personnel and patient building was 3.72(74.4%), 3.69(73.8%), 4.17(83.4%) and 3.68(73.6%) for surgery; and was 4.22(84.4%), 3.94(78.8%), 4.18(83.6%) and 3.94(78.8%) for medicine respectively. The medical students preferred medicine section because medical teachers appeared to spend more teaching time with them, arrange tutorials regularly and provide more lectures and discussion sessions.
Discussion: Medical students had strong desire for learning and practice medical procedures. Nevertheless, the students tended to prefer the surgical teachers because of their less strictness. In both sections, their satisfaction included the areas of working with medical internships residents and attentive academicians, having complete course orientation, clear informative course outlines and handouts, and having discussion sessions. Moreover, the students suggested reducing the amount of medical report writing and the hours of being on duty. Medical students preferred medicine than surgery section because of more tutorials especially case discussion as well as examination preparation provided by the medical teachers.
Conclusion: Time dedication by medical teachers is the most important factor for medical students' satisfaction since case discussion and medical procedural training is vital. Well-organized course orientation could provide benefits for students' further education.

Enhancing nurses' willingness to participate in robotic surgery by simulation and real situation training program

Authors
Tzu-Sang Chen
Chien-Chien Tung
Ching-Shiang Chi
Meng-Ling Chong
Jui-Fen Huang

Presenter: Tzu-Sang Chen, Tungs'Taichung MetroHarbor Hospital, Taichung, Taiwan

Background: Robotic surgery has been introduced since 2013 and nurses experience more stress with increasing applicant operations. What is worse, the total operation time is prolonged that might threaten patients' condition under anesthesia. Study showed that nurses would be reluctant to assist with the innovative procedure under sense of unpreparedness. So, a training program is mandatory. The aim of the study was to enhance nurses' willingness to participate and improve skills and knowledge.
Method: One-year study took place at a teaching hospital and purposive sampling used in 2016. 58 working at operation room (OR) nurses met the criteria, who were more than 1 year of working experience without prior robotic surgery participation. Training program consisted of basic and advanced session. Basic session included 10 times simulation training and 2 times class course. Advanced session was reality training in OR 10 times, Objective Structured Clinical Examination (OSCE) and actual practice supervised by senior nurses based on a structured checklist.
Results: 52 nurses completed basic session and 6 nurses the advanced one. On a satisfaction survey, 96.7 and 95.4 points were rated. In 2017, the numbers of robotic-assist nurses expanded to 34 from 28. Shortened 13.6 minutes were calculated on average for surgical supplies preparation. And, the volumes of operations raised up to 55.3% compared to last year.
Discussion: Being a skillful OR nurse to assist in robotic surgery takes one year to achieve. Participant simulation and real situation training course were helpful to shape comprehensive and in-depth knowledge. OSCE evaluation provided a positive idea to modify individual's learning experience. Consequently, OR nurses felt confident and were willing to work on surgery.
Conclusion: Robotic surgery would be the choice of treatment in the future and it is still controlled by a human. Simulation and real situation training can help OR nurses to overcome fear and anxiety of using the high-tech machine.
Take-home message: Simulation based and real situation training are necessary for nurses to master the cutting edge of technology.

Establishing validity of a novel competency based orthopaedic objective skills and clinical examination (OSCE) using convergent and divergent comparators

Authors
Alexandra Bishop, Dalhousie University, Halifax, Canada
Megan Gillis, Dalhousie University, Halifax, Canada
Glen Richardson, Dalhousie University, Halifax, Canada
Bill Oxner, Dalhousie University, Halifax, Canada
Joel Morash, Dalhousie University, Halifax, Canada
Luke Gautier, Dalhousie University, Halifax, Canada

Presenter: Alexandra Bishop, Dalhousie University, Halifax, NS, Canada

Background: Objective evaluations of resident surgical performance can be difficult to simulate. Observing a resident trainee perform an entire clinical exam and surgical procedure in routine clinical practice is challenging and occasionally impractical. A novel competency based surgical OSCE was developed to evaluate independent surgical decision making and skill. The goal of this study was to test the construct validity comparing previously validated Ottawa scores (O-scores) and Orthopedic in-training evaluation scores.
Method: An OSCE designed to simulate typical surgical cases treated by a general orthopedic surgeon was developed to evaluate resident surgical performance. Post-graduate year (PGY) 3-5 trainees interview a standardized patient, perform a physical exam, ask for investigations, and perform a surgical procedure on a cadaver that has a fracture or disorder simulated. Examiners evaluate all components of the treatment plan and provide an overall score on the OSCE and also provide an O-score on overall performance for each surgery. Convergent and divergent validity was assessed comparing OSCE scores to O-scores and OITE scores. SPSS was used for statistical analysis. Analysis of variance (ANOVA) was used to compare post graduate year averages and Pearson correlation coefficients were calculated to compare OSCE versus O-score and OITE scores.
Results: A total of 96 simulated surgical cases were evaluated over a three year period for 24 surgical trainees during 3 independent simulations. There was a significant difference in OSCE scores based on year of training. (PGY3 - 6.06/15, PGY4 - 8.16/15 and PGY5 - 11.14/15, $p<0.001$). OSCE and O-scores demonstrated a strong positive correlation of +0.89 while OSCE and OITE scores demonstrated a moderate positive correlation of 0.68.
Discussion: OSCE scores demonstrated strong convergent and moderate divergent correlation. A positive trajectory based on level of training and stronger correlations with established, validated scores supports the construct validity of the novel surgical OSCE. Future efforts should focus further on incorporating OSCE scores into high stakes decision making about resident promotion.
Conclusion: Construct validity of the novel surgical OSCE has been investigated and is supported by our study showing that the OSCE is a valid assessment tool.

3DD9 (2016)
From nobody to somebody by a surgical safety checklist ward round

Authors
Smith Soimadee

Presenter: Smith Soimadee, VachiraPhuket Hospital, Phuket, Thailand

Background: Senior staff usually lead ward round activities only one or two times a week. Mostly daily surgical ward rounds activities were led by junior doctors with the team comprising of one exturn and four 4th year medical students. The 4th year medical students learned by observing a junior doctor working with exturn. They have no roles but only stay on the sidelines. We tried to use surgical safety checklist ward round to draw them into ward rounds activities and become part of the team.
Method: A senior surgeon designed a surgical safety checklist ward round that comprises key activities such as patient identification and interaction, intravenous fluid prescription, nutritional assessment and orders, drug chart review, venous thromboembolism risk assessment, line tube and catheters safety. The 4th year medical students were trained to use it in a ward round led by a senior surgical staff following which they were assigned in 3 teams to use these tools helping junior doctors during ward rounds activities. Outcomes were observed from medical records audit and patient interviews.
Results: Patient identification in every steps of care was done completely only 53%. Giving patients information and opportunities to ask questions were improved from 50% to 77%. Loss of patient interaction process was decreased from 40% to 7.6%. Nutritional assessment and orders were improved from 40% to 70%. Venous thromboembolism risk assessment was improved from 0% to 47.5%. Many aspects of care were improved compared to previous outcomes from medical record audit and patient survey. Some processes were skipped due to time limitations and the team leaders think that processes were not important. Surgical safety checklist ward round can be used as a tool to engage 4th year medical students in the ward rounds activities. We use it as a framework for communication. It may be more effective if we set this topics in our curriculum to train our students and change them from nobody to somebody which can improve our patient safety.
Conclusion: Surgical safety checklist ward round can be used to draw medical students into ward round activities and can change them from nobody to somebody which improves patient safety.

3DD10 (2723)
High definition Video Recording With a GoPro Hero 5 Black in the operating room: A novel technique to improve learning in general surgery

Authors
Thawatchai Tullavardhana

Presenter: Thawatchai Tullavardhana, Department of Surgery, Faculty of Medicine, Srinakharinwirot University, Ongkharak, Nakhon Nayok, Thailand

Background: Video-recording procedures in the operating room is helpful for surgical technique analysis, teaching and training medical students. The video recording system proves expensive for many hospitals. The GoPro Hero 5 black provides high-quality surgical recordings with economical expenditure.
Method: The surgical procedures were recorded by a GoPro Hero 5 Black camera, which can provide 4K video qualities. The camera was fixed to the GoPro head strap on the surgeon's forehead. The camera setting was in standard GoPro color with 2.7 K resolution (2688x1520p), 60 frames per second, narrow field and exposure value (EV) at -0.5 - 1.0. The recorded videos were checked, reviewed, and edited for production.
The retrospective, non-comparative study was conducted at Department of Surgery, Faculty of Medicine, Srinakharinwirot University between January to December 2017.
Results: A total of 110 surgical procedures were recorded included 55 procedures in general surgery (e.g. appendectomy, herniorrhaphy and excision biopsy), 20 procedures in colorectal surgery, 10 procedures in vascular surgery, 15 procedures in Upper GI surgery (e.g. Sengstaken-Blakemore tube insertion, gastrostomy) and 10 trauma care procedures (e.g. chest tube insertion, pelvic wrap). The recorded videos demonstrated a high quality for teaching a stepwise and surgical anatomy.
A GoPro recording camera has a great advantage in surgical education including 1) Small, portable and commercially available with a reasonable price 2) Preserves the opportunity for the medical student to learn from basic to rare surgical procedures 3). Broadcasting the live procedure to the smart phone or tablet (e.g. iPad) via the GoPro application 4) Easy to transfer and imported into video editing program 5) Encourages self-reflection and teaching with academic prospect (e.g. medical conference and publication). However, the limitation of usage GoPro in the operating theater was a lack of battery capacity consequential to limitation of recording time to 50-60 minutes. Nevertheless, changing the internal backup battery can solve the problem.
Conclusion: We found that the using of GoPro produces high quality recordings which are an excellent tool in education towards the encouragement of self-reflection and enhancing the teaching quality of surgical procedures.

3DD11 (2793)
Cross-institutional collaboration through social media in helping and auditing pediatric surgical training in Taiwan

Authors
Yun Chen
Pei-Chun Lin

Presenter: Yun Chen, Far Eastern Memorial Hospital, New Taipei City, Taiwan

Background: Due to the progress of prenatal diagnosis coupled with a declining birth rate, many rare congenital surgical diseases are even rarer. Thus pediatric surgical trainees may not have sufficient clinical experiences and adequate training quality. A cross-institutional collaboration through social media was emerged to strengthen pediatric surgical training in Taiwan.
Method: At first, we defined the core surgical competences that meets the qualification of the specialty. Then we setup an online network through social media, LINE, to let all the trainers and trainees from different institutions shared and gathered the information about the defined index surgical cases. The trainees could participate the operations at different centers thus enriched their training. A questionnaire designed to approach participants' perception of this cross-institutional collaboration network were collected and analyzed.
Results: 31 questionnaires were returned (response rate 53.4%) and all of them used LINE as major social media tool. 100% of them agreed that this LINE group help establish training partnership with other centers. 96.8% agreed this can facilitate the cross-institutional resources sharing and complementarity, and build the training consensus among different institutions. 87.1% agree that through social media can motivate the sharing of index surgeries as well as help and audit trainees to fulfill the training requirements.
Conclusion: Cross-institutional collaboration through social media is beneficial for pediatric surgical training. By providing the information of index surgery and cross institutional training can help trainees' qualification in Taiwan. This collaboration platform can be applied on the training of other surgical subspecialties with limited resources.
Take-home message: Cross-institutional collaboration through LINE is an effective tool for pediatric surgery institutions to cope with the shortage of index surgeries and enhance the training quality through sharing the cases, having the training partnerships and establishing the trust both from trainers and trainees in Taiwan.

Application of FACETS Program for OSCE Pass score in Surgical Clerkship

Authors
Kyung Sik Kim
Sang Young Bae
Dan Bee Lee
Jae Gil Lee
Dong Sup Yoon
Duck Sun Ahn

Presenter: Kyung Sik Kim, Dept. of Surgery, Yonsei University College of Medicine, Seoul, South Korea

Background: The FACETS program, which is based on the item response theory model, the Rasch model, is a multiphasic model that is designed to evaluate the reliability of the task, evaluation area, and rater.
The purpose of this study is to evaluate the usefulness of the FACETS program for the evaluation of surgical clerkship.
Method: In 2016, 119 third-year medical students in the Surgery Clinic were randomly assigned to six items (local anesthesia, abscess drainage, suture disinfection, sewing, breast examination, and image dressing) and were evaluated by twenty professors. The mean and standard deviation of test items and rater scores were calculated using the SPSS program, and the multiphasic aspect of scores were analyzed with the FACETS program.
Results: The difference of the grades by each item was different according to statistical analysis method (Welch method ($p = 0.37$), and Brown-Forsythe method ($p = 0.75$)). Thirteen different combinations were made ($F = 3.206$, $p = 0.01$). The score of the repair-local anesthesia combination was the lowest with 79.6 ± 48.2 points, and the score of the image dressing-breast examination combination was the highest with 164.9 ± 17.5 points. The difference between the grades according to the rater was statistically significant ($p = 0.00$). The students' fit, external fit, reliability, internal fit, external fit were 0.89, 1.00, 0.79, 0.91, 1.07, and 0.93 respectively. There was a fit of 0.86 for the rater, 0.96 for the fit, and 0.960 for reliability. However, some raters lacked consistency. When a score of 70 is applied as a reference score, 22 out of the 78 students who initially received a passing score the acquisition score did not meet the criteria with the corrected score. On the other hand, 10 out of 41 students who received a non-passing grade in the acquisition score were adjusted to the passing grade in the corrected score.
Conclusion: The FACETS program confirmed the deviation between the OSCE checklists and raters. In conclusion, the determination of standard setting with the criterion based on the corrected score, not the raw score is more optimal.

The Five-Step Teaching Method in Laparoscopic Camera Manipulation on Medical Students: A Randomized Controlled Trial in a Philippine Medical School Curriculum

Authors
Gwendolyn Tattao, DLSHSI, Cavite, Philippines
Michael Lawenko, DLSHSI, Cavite, Philippines
Cherrie Ann Angon, DLSHSI, Cavite, Philippines
Warren Roraldo, DLSHSI, Cavite, Philippines

Presenter: Gwendolyn Tattao, De La Salle Health Sciences Institute, Dasmarinas, Philippines

Background: Although much attention is focused on teaching skills during residency, only few efforts are made for medical students. In the Philippines, no standardized camera navigation curriculum is currently available. This study aims to examine if laparoscopic camera manipulation, simulated on a box trainer, using the five-step teaching method, is more effective than the traditional feedback and return-feedback method in developing psychomotor and visuospatial skills in 4th year medical students.

Method: Through randomization, two groups were created (N = 129). One group received training using the five step method: (1) conceptualization – learner understands need for the skill, (2) visualization – preceptor demonstrates the skill exactly as it should be done without talking, (3) verbalization by the preceptor – preceptor describes each step while repeating the procedure, (4) verbalization by the student – student commits the process to memory by talking through the skill, (5) practice – student performs the skill. The other group did not talk through the skill, instead, proceeded immediately to performing the skill. The students were then assessed using a rubric that included proper handling of the camera head and the light cable, and performing image gathering accurately. The subjective comfort level of each participant in performing the psychomotor skill was also assessed using the 5-point Likert scale.

Results: Mann-Whitney-Wilcoxon test demonstrated that verbalization by the student through a skill translated into a greater ability in handling the camera head properly (p=0.021) and in gathering image more accurately (p=0.008). There was no significant difference in handling the light cable between the two groups (p=0.205). Generally, however, a higher overall proficiency level was noted among students who talked through the skill (p=0.001). Moreover, the overall comfort level in performing the skill was higher in those who articulated the steps while doing the skill (p=0.026).

Conclusion: The five-point method is an effective technique in teaching laparoscopic camera manipulation in that it produced a satisfactory learning experience for the student in a desired amount of time. In the advent of laparoscopy, it becomes imperative to include such skill in the medical students' curriculum.

The Development and Validation of an Assessment Tool for Training in Percutaneous Nephrolithotomy

Authors
Kate Quirke, MRC for Transplantation, King's College London, London, UK
Adbullatif Aydin, MRC for Transplantation, King's College London, London, UK
Matthew Bultitude, Department of Urology, Guy's and St. Thomas' Hospitals, London, UK
Catherine Lovegrove, MRC for Transplantation, King's College London, London, UK
Prokar Dasgupta, MRC for Transplantation, King's College London, London, UK
Kamran Ahmed, MRC for Transplantation, King's College London, London, UK

Presenter: Kate Quirke, MRC for Transplantation, King's College London, UK

Background: Percutaneous nephrolithotomy (PCNL) remains the first line treatment for large renal calculi and is considered a technically challenging procedure with multiple steps for urological trainees to learn. To ensure good patient outcomes and decrease the number of adverse events, it is important to standardise training through the creation of a procedure-specific curriculum. The aim of this study is to develop, and content validate an assessment tool for PCNL taking into consideration the procedure specific risks.

Method: An observational, multi-institutional prospective study applying healthcare failure mode and effect analysis (HFMEA) to the procedural steps of PCNL to identify potential risks. Development of the assessment tool followed the five steps of HFMEA; defining a topic, assembling a multidisciplinary team, systematically mapping the procedure, considering failure modes and effects to identify any areas of weakness and producing a final assessment tool containing interventions to reduce risk. The tool was content validated and revised throughout the entire design process via multi-institutional, multi-disciplinary discussion.

Results: The PCNL assessment tool was developed, containing 26 processes and 62 sub-processes. Application of HFMEA identified 101 failure modes and 24 modes with a hazard score ≥ 8; measures were implemented to minimise the occurrence and impact of these.

Conclusion: The development and validation of an intraoperative PCNL assessment tool means it can now be used in conjunction with other modules such as e-learning and non-technical surgical skills in a complete PCNL curriculum for urological trainees. The end goal being the development of accomplished surgeons competent in PCNL, a keystone in the delivery of gold-standard healthcare. In the future, this assessment tool can be utilised to assess the learning curve of the procedure.

Take-home message: The PCNL assessment tool based on HFMEA scoring identified key stages of the procedure and can aid objective assessment in urological training.

Are there still barriers for residents in putting externally acquired surgical skills into practice?

Authors
Roger Simmermacher, Dept. of Surgery, University Medical Center, Utrecht, Netherlands
Kathrin Luessi, AO Education Institute, Duebendorf, Switzerland
Olle ten Cate, Center for Research and Education University Medical Center, Utrecht, Netherlands

Presenter: Roger Simmermacher, Dept. of Surgery, University Medical Center Utrecht, Netherlands

Background: For decades teaching surgery happened "in-service", conducted by local surgeons. Skills learned elsewhere often met with barriers: authority of the chief surgeon, local habits and protocols. Over time, surgical education has changed and we aim to see whether barriers still exist for surgical residents.
Method: During two consecutive years residents attending an internationally accredited 4-day course at a central European location on osteosynthesis took a pre-course and two post-course knowledge tests. The delayed post-course test included a questionnaire related to possible barriers participants might have met when trying to merge knowledge and skills acquired during this course with local practice.
Results: Two groups of 60 PGY1 or PGY2 surgical (60%) and orthopedic (40%) residents each participated either in 2014 (group A) or 2015 (group B) in the same AO-Trauma Basic Principles of Fracture Management course held in the Netherlands. Pre-course assessment response rate was 94-97%. First post-course (voluntary) assessment response rates (within one week) were 58% and 72%; the delayed (after 5 months) post-course assessment 38% (group A) and 72% (group B); on average 56%. In group A, 45% and in B 50% were not able to implement course knowledge or skills because of a lack of patients, mainly due to a rotation-scheme excluding trauma management in that period. Dominance or resistance of a chief surgeon, hospital management, or existing protocols were never reported as factors preventing implementation of newly acquired knowledge.
Discussion: Authority and fixed protocols no longer seem barriers for surgical residents to apply externally acquired knowledge. Lack of suitable patients within 5 months after attending an osteosynthesis course, instead, is the barrier to apply new knowledge. Apparently, current, prefixed, clinical rotation schemes do not align well with (externally) provided educational programs.
Conclusion: Clinical rotation schemes for surgical residents should be better timed or be flexible to be adjusted to (externally) provided educational programs, or vice versa, to allow for timely application of newly acquired skills to retain what was learned.

3DD16 (2673)
The Neural Implementation of Surgical Expertise within the Mirror-Neuron System: An fMRI Study

Authors
Ellen Kok, School of Health Professions Education, Maastricht University, Netherlands.
Anique de Bruin, School of Health Professions Education, Maastricht University, Netherlands
Koos van Geel, School of Health Professions Education, Maastricht University, Netherlands
Andreas Gegenfurtner, School of Health Professions Education, Maastricht University, Netherlands
Ide Heyligers, School of Health Professions Education, Maastricht University, the Netherlands, Department of Orthopedic Surgery, Zuyderland MC, Heerlen, Netherlands
Bettina Sorger, Department of Cognitive Neuroscience, Maastricht University, Maastricht, Netherlands

Presenter: Ide Heyligers, School of Health Professions Education, Maastricht University, Maastricht, Netherlands

Background: Motor expertise is an important aspect of high-level performance in professional tasks such as surgery. While recently it has been shown that brain activation as measured by functional magnetic resonance imaging (fMRI) within the mirror-neuron system (MNS) is modulated by expertise in sports and music, little is known about the neural underpinnings of professional, e.g., surgical expertise. Here, we investigated whether and (if yes) how surgical expertise is implemented in the MNS in medical professionals across three levels of surgical qualification. In order to answer the more specific research question, namely whether the neural implementation of motor expertise develops in a linear or non-linear fashion, the study compares not only brain activation within the MNS related to action observation of novices and experts, but also intermediates.
Summary of Work: Ten novices (medical students), ten intermediates (residents in orthopedic surgery) and ten experts (orthopedic surgeons) watched 60 5-s video clips of daily-life activities and surgical procedures each while their brain activation was measured using a 3-T fMRI scanner. An established localization procedure was followed to functionally define the MNS for each participant individually. A 2 (video type: daily-life activities, surgical procedures) x 3 (expertise level: novice, intermediate, expert) ANOVA yielded a non-significant interaction.
Summary of Results: However, post-hoc comparisons showed that intermediates displayed marginally significantly lower brain activation in response to surgery-related videos within the MNS than novices. No other significance differences were found.
Discussion & Conclusion: The results suggest a non-linear relationship of expertise level and MNS-activation level in a domain-specific action-observation task.
Take-home Message: The relationship between expertise level and MNS-activation level in a domain-specific action-observation task seems to be non-lineair.

3EE: Posters: OSCE and Work Based Assessment

Audio-feedback in the summative OSCE - technical realization and process implementation. First results of a pilot project at the University of Basel, Switzerland

Authors
Jördis Tielsch, Deanery of Student Affairs, Faculty of Medicine, University of Basel, Basel, Switzerland
Friederike Stoller, Deanery of Student Affairs, Faculty of Medicine, University of Basel, Basel, Switzerland
David Böhler, Deanery of Student Affairs, Faculty of Medicine, University of Basel, Basel, Switzerland
Martin Imobersteg, Deanery of Student Affairs, Faculty of Medicine, University of Basel, Basel, Switzerland
Silke Biller, Deanery of Student Affairs, Faculty of Medicine, University of Basel, Basel, Switzerland

Presenter: Jördis Tielsch, Deanery of Student Affairs, Faculty of Medicine, University of Basel, Basel, Switzerland

Background: During an OSCE, many observations of the candidates are gathered, representing valuable information for the further education of the students. However, in summative exams these are usually not handed out to the students.
The aim of this project was to realize a technological solution for and to implement a process for examiners and candidates reaching from the recording to the retrieving of feedbacks regarding the before mentioned observations.
Method: Presentation and strength and weakness analysis of: the technological solution from recording to retrieving; the integration of the recordings as a task for the examiner.
Since 2017 examiners were supposed to give an immediate audiotaped feedback regarding the performance of the candidate right after the station, during a two minutes candidates rotation time. For this purpose an audiotape function was implemented into the electronic checklist of the Basel developed iPad based program iOSCE. The examiners were instructed to the new tool only during the regular briefing.
After the OSCE, the candidates had the option to play back their personal feedback on an internet platform via an emailed link and their university acess data.
Examiners and candidates were asked to evaluate the technical aspects and quality of the process by a questionnaire.
Results: The audio feedback function was used in 3 OSCEs with a total of 200 examiners and 481 candidates. A total of 1469 audiotapes were recorded, which is 42.7% of the cases. The recordings had an increase from 34% in the first to 50% in the third exam. Some of the examiners recorded a feedback for almost every student, some expressed a lack of time to do so, a few would have preferred a written format or did not record feedbacks due to other concerns.

82% of the candidates played back their audio data, the technical procedure was considered flawless.
Conclusion: The 3 exam cycles did not encounter any technical problems as confirmed by the organizers, the examiners and the candidates. The tested technology proved to be reliable. For all user (organizers, examiners and candidates) the tool was easy, intuitive and effective to use.

3EE2 (1496)
A Qualitative Study Exploring Student Perceptions of Corralling before Objective Structured Clinical Examinations

Authors
Louise Cox Thomsen, University of Dundee, Dundee, UK
Ellie Hothersall, University of Dundee, Dundee, UK
Jonathan Dowell, University of Dundee, Dundee, UK

Presenter: Louise Cox Thomsen, University of Dundee, UK

Background: Universities across the world use OSCEs as a method of assessing clinical competence in medical students. OSCEs are time-consuming assessments and not all students can be assessed simultaneously, allowing for potential collusion between different cohorts of students. Security measures, like corralling, have been designed to prevent this. Some studies have investigated the impact of collusion on grades, but few the frequency of collusion and its impact on professional development.
Method: An explorative case study was done to investigate student perceptions of corralling and the impact collusion has on exam performance and professional development. The data was collected through semi-structured interviews of students who had been both corralled and not.
Results: The results revealed varying opinions of corralling ranging from appreciated to psychological torture. It was highlighted that corralling is stressful and unpleasant but ensures a level playing field. Collusion was perceived to be common and unprofessional, but shouldn't influence future behaviour. Despite it being perceived as unprofessional behaviour, the reasons behind it weren't regarded as such, with camaraderie and peace of mind being the main influencers.
Discussion: Students recognized that corralling was fair, and without it, some students were at a disadvantage. Despite this, the stress and anxiety was indicated to be severe enough to impact performance in the examination. Therefore, students proposed bringing back corralling more 'pleasantly'. There was a clear indication that collusion is common, but no clear answer as to whether it impacts grades positively or negatively. Most students considered collusion unprofessional, but did not think it promotes future unprofessionalism. The study emphasised areas for future research, and highlighted that a change in practice at Dundee Medical School, who do not corral their students, should be considered.
Conclusion: The corralling process is stressful and anxiety provoking and can affect performance negatively.
It is believed that sharing information before OSCEs is widespread, but it is not clear as to whether it impacts performance positively or negatively. Collusion is regarded

as unprofessional, but it is not believed by students to impact future professionalism.

3EE3 (1122)
Comparison of OSCE Checklist Items, Global Rating and Entrustable Scale during OSCE Assessments of the Pharmaceutical Profession

Authors
Chih-Ming Hsu
Chih-Cheng Hsieh
Cheng-Ting Hsiao

Presenter: Chih-Ming Hsu, Chiayi Chang Gung Memorial Hospital, Taiwan

Background: Objective structured clinical examinations (OSCEs) are highly reliable and valid tools for assessing clinical skills. Entrustable professional activities (EPAs) are now used in supervisor-student relationships to evaluate how trustable a clinical event is for the particular student-to-practice transition. Scenario-based simulation and workplace-based simulation are currently high priority areas in pharmaceutical education. This study analysed OSCE scores to explore the relationships among the OSCE checklist items, global rating, and entrustable scale in pharmaceutical education.
Method: Fifteen pharmaceutical PGYs undertook the OSCE (n=84 stations) during 2016 to 2017. The exam comprised four major types of themes, and each theme includes four to six stations. The four major themes are: 1) patient evaluation and prescription; 2) patient education; 3) medication admission skills; and 4) responses to an abnormal event. Pearson's Correlation and regression were used to examine associations between OSCE checklist items, global rating, and entrustable scale .
Results: The following correlations among the three assessments (checklist / global rating /entrustable scale) were found: patient evaluation and prescription (checklist-global rating r=.491*/ checklist-entrustable scale r=.509*/global rating- entrustable scale r=.707**), patient education (r=.850**/.743**/.866**), medication admission skills (r=.920**/.864**/.961**), and response to an abnormal event (r=.725**/.740**/.904**).There were significant in the 4 types of questions.
Discussion: Our study suggests that the entrustable scale performs the same function as global ratings. In comparison with the pass criteria of the global rating, the pass criteria of entrustable scale can more fully reflect the trainees' performance and the teachers' expectations. The entrustable scale extends the function of global rating scores, comprehensively assessing examinees' entrustable competencies. It appears that examiners do not make assessments purely on test questions; they also pay attention professional competencies, attitudes, and other aspects. The entrustable scale provides clearer descriptions about the expected clinical performance, enabling examiners to focus on core competencies and clinical performance.
Conclusion: Entrustable scale are more suitable for pharmaceutical examinees in OSCE. Future research should examine its applicability for other healthcare professions.

3EE4 (2619)
Co-designing a smoking cessation station within a clinical examination with adolescent smokers

Authors
Ioannis Peppas, Whittington Health, London, UK
Elizabeth JA Fitchett, UCL Great Ormond Street Institute of Child Health, London UK
Parisut Kimkool, Whittington Health, London, UK
William Kenworthy, Whittington Health, London, UK
Nabil George, Whittington Health, London, UK
Caroline Fertleman, Whittington Health, London, UK

Presenter: Ioannis Peppas, Whittington Health, London, UK

Background: Translational science relies on the dynamic interaction between researchers, clinicians, policy makers and patients to facilitate innovation that can improve the health of the population. The aim of medical education as translational science is to train doctors that can respond to the needs of their patients and tailor evidence-based methods to address crucial problems in health outcomes.It is well established that lifestyle factors such as smoking account for a significant proportion of premature deaths worldwide. Supporting patients to change their health-related behaviour, nonetheless, can be a challenging task for healthcare professionals. An optimal opportunity for intervention is found during adolescence, a period of intense neuropsychological plasticity that greatly shapes adult health patterns.
Method: Medical educators and adolescent smokers were brought together in a workshop to co-produce a smoking cessation station for the objective structured clinical examination (OSCE) that assessed the ability of medical students to practice motivational interviewing.Following ethical approval,the OSCE station was included in the summative assessment of 364 students in their penultimate at UCL medical school.12 examiners and six adolescent actors were recruited for this purpose.The students were fully informed about the study and given the opportunity to opt-out (none did).
Results: Most students (85%) were successful in building rapport with adolescents and in employing motivational interviewing techniques. However, only 181 (50%) students managed to gather sufficient information about the adolescent's personal circumstances.Qualitative data analysis showed that 86 (24%) students did not take a detailed smoking history and 68 (19%) did not enquire about associated health-related behaviours.In addition, 104 (29%) students failed to acknowledge precipitating factors associated with the adolescent's smoking habit. Active listening and a non-judgemental approach are of utmost importance in every patient consultation.To empower adolescents to modify their lifestyle choices, medical students must be equipped with specific communication skills in order to adaptively respond to how young people perceive risk, how their perceptions are influenced by their psychosocial circumstances and how they ultimately act upon lifestyle advice.
Conclusion: Medical education research must incorporate indispensable feedback loops between all stakeholders in

order to advance training and effectively change health outcomes at the population level.

Utilize group OSCE to instruct and evaluate clinical skills and medical record writing in the fourth year medical students

Authors
Ching-Chung Lin. MacKay Memorial Hospital, Taipei, Taiwan
Jiun-Lu Lin. MacKay Memorial Hospital, Taipei, Taiwan
Chiu-Ping Kuo. MacKay Memorial Hospital, Taipei, Taiwan
Yen-Yu Liu. MacKay Memorial Hospital, Taipei, Taiwan.
Yih-Jer Wu. MacKay Memorial Hospital, Taipei, Taiwan
Hung-I Yeh. MacKay Memorial Hospital, Taipei, Taiwan

Presenter: Ching-Chung Lin, MacKay Memorial Hospital, Taipei, Taiwan

Background: Clinical skills and medical record writing are core competencies before internship, but it is difficult for all students to possess these abilities before clinical training. If these two subjects can be seamlessly integrated, it may minimize the fourth year students' academic stress.

Method: We utilized group objective structured clinical examination (GOSCE) to evaluate students' abilities vis-à-vis history taking, physical examination, and medical record writing. We also created a checklist for medical record writing and analyzed their competence. A questionnaire was employed to evaluate their satisfaction with the curriculum.

Results: Altogether 47 students, two teachers, and two standardized patients participated in the group OSCE. The average history taking score was 69(%), but medical record writing was only (53%). The lowest scores were for present illness (37%) and clinical reasoning (65%). The average physical examination score was (89%), and its record writing was (97%).

The fourth year medical students can learn history taking and physical examination during class, and we provided immediate feedback on GOSCE, allowing everyone to practice medical record writing. We evaluated and trained these students and intend to repeat this practice.

The questionnaire results indicated significant satisfaction towards standardized patient professions (4.7/5), class content (4.4/5), teamwork improvement (4.2/5), but not GOSCE grouping methods (3.9/5). It is important to integrate clinical skills training and medical record writing in group OSCE. We can utilize them to create simulations to train medical students repeatedly.

Conclusion: The students considered medical record writing and history taking more difficult than visiting; present illness and clinical reasoning scored the least. Group OSCE may be an excellent instrument to provide clinical skills and medical record writing capabilities.

A Method to Assess the Scoring Quality of The OSCE Examiners

Authors
Chuhsien Wang, Changhua Christian Hospital, Changhua, Taiwan
Hung-Che Huang, Changhua Christian Hospital, Changhua, Taiwan
Wei-Tin Lin, Changhua Christian Hospital, Changhua, Taiwan
Yi-Ju Lin,Changhua Christian Hospital, Changhua, Taiwan
Yi-Chun Kao, Changhua Christian Hospital, Changhua, Taiwan

Presenter: Chuhsien Wang, Changhua Christian Hospital, Changhua, Taiwan

Background: The correct scoring of OSCE examiners is pivotal for the high-stake OSCE. How can we assure and monitor the scoring quality of our OSCE examiner? In 2015, we developed a method to monitor the scoring quality for our OSCE examiners.

Method: Since January 2016, we started to assess the OSCE examiners' scoring quality In Chang Christian Hospital (CCH). We assessed the scoring quality of the OSCE examiners among PGY OSCEs and UGY OSCEs. After completion of a PGY or UGY OSCE, we would choose which examiners to be monitored and assessed. If one OSCE examiner was the examiner to be assessed for scoring quality, we would randomly choose two candidates' video clips that the OSCE examiner scored. The station developer would rescore the video clips of two candidates. We regarded the marked checklist by the station developer as correct answer for the performance of the two candidates at that station. Then we compared the standard answer with the marked checklist by OSCE examiner to be assessed.

We set up two scoring system and arbitrary judgement rules:

(1) OSCE Examiners Scoring Quality Score: focus on scoring accuracy only

(2) OSCE Examiners Performance Score: focus on scoring accuracy and also on abiding by the OSCE general rules Since 2016, we have monitored and assessed up to 100 OSCE examiners.

Results: According to [the OSCE Examiner Performance Score]: 30 examiners (30%) as good to excellent; 52 examiners (52%) as average; 18 examiners (18%) as fair to poor. According to [the OSCE examiners scoring accuracy rate]: 32 examiners (32%) as good to excellent; 52 examiners (52%) as average;16 examiners (16%) as fair to poor.

Among our 100 monitored OSCE examiners, 30 examiners were judged as "Dove" and two examiner was judged as "Hawk".

Conclusion: Our method could assess the OSCE examiners' scoring quality and performance status, and furthermore the "hawks" and "doves" OSCE examiners could be picked out easily.

Take-home message: We designed a method to assess the scoring quality of OSCE examiners.

Mina Morimura, Osaka City University Graduate School of Medicine, Osaka, Japan
Taichi Shuto, Osaka City University Graduate School of Medicine, Osaka, Japan

Presenter: Ayako Makuuchi, Osaka City University Graduate School of Medicine, Osaka, Japan

Background: Variations in assessments of medical students by faculty staff and standardized patients (SPs) have not been clarified by previous studies in Japan. We examined the concurrences and differences between and among these evaluators for medical students sitting the Post-Clinical Clerkship Objective Structured Clinical Examination (Post-CC OSCE).
Method: The participants were 94 sixth-year Osaka City University Medical School students who participated in the Post-CC OSCE. They were each examined by three faculty staff and one or two SPs using a global assessment and six classified assessments. We analysed the global and classified assessment scores for all 94 students, the classified assessment scores for the students for whom differences exceeding 2 points between the global assessment scores by the faculty staff and those by the SPs were not found, and those for the students for whom such differences were found using the Mann-Whitney U test.
Results: No significant differences were found regarding the global and classified assessment scores between the faculty staff and SPs. However, for six students, a difference exceeding 2 points was found between the global assessments by the faculty staff and those by the SPs. Five of these six students received ratings from faculty staff that were more than 2 points higher than those given by the SPs. For these five students, five out of six classified assessment scores significantly differed between the faculty staff and the SPs.
Conclusion: No significant differences were found between the assessment scores by the faculty staff and those by the SPs for all 94 students. However, the SPs might have provided multilateral assessments from different standpoints than the faculty staff for a minority of the participating students. Further investigations are warranted to clarify the diversity of the faculty staff and the SPs.

Models as assessors at OSCE?

Authors

Matic Mihevc, Faculty of Medicine University of Maribor, Maribor, Slovenia
Klara Masnik, Faculty of Medicine University of Maribor, Maribor, Slovenia
Tadej Petreski, Faculty of Medicine University of Maribor, Maribor, Slovenia
Nejc Pulko, Faculty of Medicine University of Maribor, Maribor, Slovenia
Sebastjan Bevc, Faculty of Medicine University of Maribor and University Medical Centre Maribor, Maribor, Slovenia

Presenter: Matic Mihevc, Medical Faculty University of Maribor, Slovenia

Background: Objective Structured Clinical Examinations (OSCEs) have become a commonly used method for assessing clinical skills. Performance is evaluated using checklists, either alone or in combination with global rating scales (GRSs). The patient-doctor (model-student) interaction is vital for successful examination. Why do models only have a passive role in the examination?
Method: The study was carried out during OSCE in November 2017. Fifty-five 3rd year medical students, 10 assessors and 13 models from 4th to 6th year were included. Examination of the cardiovascular system was evaluated with checklist and GRSs simultaneously. GRSs were divided into four categories, graded on a numerical scale from 5 to 10.
Results: The difference in average global score between models and assessors was not significant (p=0.748). Models achieved better correlation between global and checklist score than assessors (r=0.607, p<0.001 vs. r=0.440, p=0.001). Models were prone to leniency effect after 10 students (p=0.042 vs. p=0.540). Both were prone to stringency effect when less than 3 students were assessed (p=0.005 vs. p=0.041).
The results showed that model's opinion should be taken into consideration when assessing OSCE. Their results correlated better with checklist scores compared to assessor's. Bias could be eliminated with prior simulated OSCE or video assessing with discussion of the most common mistakes, and lower number of assessed students per day.
Prior studies showed that models can grade reliably using OSCE checklists. In our study, it was proven that well-educated models can also provide a reliable and valid global score and should therefore be considered as scoring partners at OSCEs.
Conclusion: With the increasing use of OSCEs it is important to maintain and improve their quality. Model's global scores were shown to be a valuable contribution to the OSCE and could represent, in the right context, a gold standard for the evaluation of the model-student interaction.

Objective Structured Assessment Of Technical Skills (OSATS) in Pathology For Medical Students: Design and Pilot Testing

Authors

Eduardo Alcaraz-Mateos, Department of Pathology, Morales Meseguer University Hospital, Murcia, Spain
Iva Turic, Faculty of Medicine, University of Split, Croatia
Fuensanta Caballero-Aleman, Intensive Care Unit, Morales Meseguer University Hospital, Murcia, Spain
Manuel Parraga-Ramirez, Intensive Care Unit, Morales Meseguer University Hospital & UCAM University, Murcia, Spain
Enrique Poblet, Department of Pathology, Reina Sofia University Hospital & Faculty of Medicine, University of Murcia, Spain

Presenter: Eduardo Alcaraz-Mateos, Department of Pathology, Morales Meseguer University Hospital, Murcia, Spain

Background: Objective Structured Assessment of Technical Skills (OSATS) is an examination for evaluating acquired medical skills and was firstly introduced in Toronto University in 1990. Despite the benefits of OSATS, there are no previous reported experiences in Pathology. The aim of this study was to design and test stations and their OSATS in two pathology procedures: gross dissection (GD) and fine needle aspiration (FNA).

Method: Training models in gross dissection (silicone handmade specimens) and fine needle aspiration skills (patented models WO2016185077 and WO2017109241), previously developed and tested by undergraduate students, were used. A 10-item 5-point Likert-like modified OSATS with a maximum score of 50 points, including not only technical skill tasks, but also other competences such as communication, clinical correlation, asepsis-antisepsis, patient safety, etc. was elaborated. Medical students (5) from 5 different universities and countries were scored by a practicing pathologist after individual workshops.

Results: Mean score of the students was 40.2 (range 35-43) for the GD training and 30.4 (range 23-43) for the FNA training. Average time for GD and FNA stations were 5'11 (range 4'06''-5'31'') and 10'47'' (range 8'03''-14'10''), respectively. Scalpel blade mounting, patient information, informed consent form filling out and compression after FNA procedure were the weakest points obtained.

Conclusion:

- Utilization of OSATS, one of the most widely used metrics for technical skills evaluation, is possible in Pathology (P-OSATS), making it feasible its adaptation to the new requirements in medical education, enhancing patient safety.

- Checklists provide trainees with structured formative feedback, although further studies are necessary to certify the improving learning curve of this methodology in simulation.

- P-OSATS, could represent a way to introduce pathologists´ tasks as stations of the Objective Structured Clinical Evaluation (OSCE) formats, expanding our visibility among medical students.

Simulation Based Testing in Taiwan Board Examination in Anesthesiology

Authors

Pin-Tarng Chen
Hung-Wei Cheng
Chien-Kun Ting
Ling-Chih Hsu
Wei-Nung Teng
Mei-Yung Tsou

Presenter: Pin-Tarng Chen, Department of Anesthesiology, Taipei Veterans General Hospital and National Yang-Ming University, Taipei, Taiwan

Background: In spite of conventional written and oral tests, simulation based testing (SBT) had now been incorporated into the board examination of Taiwan Society of Anesthesiology for several years. Here we report the process and preliminary results of SBT.

Method: A Medical Simulation Committee was set up by experts from accredited anesthesiologist training hospital. They involved in the process and development of SBT and testing.

1. Examination qualification: residences after 30 months training.
2. Designed structured scenario format.
3. Designed new scoring system, including performance checklist, global rating, non-technical skills. Each category and item were weighed according to the objectives of each scenario.
4. Enrolled raters, conducted train-the-rater workshop, set up, renewing and maintaining certification criteria.
5. Audit system for scenario and checklist validity and variability
6. Four simulation stations on each examination day
7. Scoring section: Determine the passing score after linear regression (borderline regression) of each scenario (sectional passing mark) and, keep at least 2 from 4 stations total score were above the passing mark

Results: The SBT was conducted 3 times per year since 2011. In the constructive stage, from 2011 to 2015, the SBT played the role of training and mock examination while the examinees were not familiar with the simulation. Since 2016, the Examinees must pass the SBT before becoming the written and oral testing.

For example, the pass rate ranged from 89%, 96%, 100% in 3 SBTs in 2017. According to the feedback questionnaire, most raters and participants found the SBT is reasonable for the board examination.

Conclusion: Medical simulation has taken a central role in the education and assessment. SBT should be performed by systematic approach related to the culture, requirements and resources including developing, scoring, and validating. The incorporation of SBT in the certification of anesthesiologists in Taiwan is a continuing process of evaluation and assessment. Further efforts are needed to improve newly checklist for SBT, training the raters, using mobile scoring system.

Take-home message: SBT could be one of several standardized tests to evaluate the preparedness of individuals for the practice of anesthesiology.

Usability and feedback quality of Responso - a generic electronic platform for workplace-based assessments

Authors

Sabine Berger, Medical Faculty - University of Basel, Basel, Switzerland

Matthias Hepprich, Department of Endocrinology, Diabetology and Metabolism - University Hospital Basel, Basel, Switzerland

Daniel Kohler, Dean's Office Faculty of Medicine - University of Basel, Basel, Switzerland

Jens Eckstein, Department of Internal Medicine - University of Basel, Basel, Switzerland

Stephan Marsch, Dean's Office Faculty of Medicine - University of Basel, Medical Intensive Care Unit - University Hospital Basel, Basel, Switzerland

Gianmarco Balestra, Dean's Office Faculty of Medicine - University of Basel, Medical Intensive Care Unit - University Hospital Basel, Basel, Switzerland

Presenter: Sabine Berger, Medical Faculty - University of Basel, Switzerland

Background: Workplace-based assessments (WPBA) are formative performance assessment tools implemented in postgraduate medical specialist-training in Switzerland in 2014 to improve feedback culture and optimize the attainment and quality of medical competencies of the trainees. The present paper-based format, however, has numerous limitations such as time consumption, low familiarity and guidance and very limited added value for progress evaluation.
Method: With Responso, we developed an easy-to-use electronic app for iOS, that not only addresses the above mentioned criticism, but provides structure and guidance for the execution with the help of operationalized custom-made checklists and synchronization of coach's and trainee's evaluation. It also allows archiving, retrieval, analysis and reporting of WPBA.
We investigated the usability of the app with an online questionnaire (Limesurvey®) and performed a prospective, cross-sectional randomized study in which supervising residents were compared on the basis of the direct observed clinical skills (DOCS) feedback scale concerning the quality of their feedback-giving with the paper- and app-based format after watching a standardized clinical video-scenario with a trainee.
Results: We present data of the overall good usability of the app. The feedback quality of the app had the same mean performance on the DOCS feedback scale compared to the paper-based format but with lower variance. Digital documentation and narrative feedback allow enhanced intra-individual follow-up and inter-individual comparison in mid- and long-term.
Conclusion: With Responso, we developed an easy-to-use app for WPBA and expect an improved applicability and acceptance in everyday clinical practice by a simplified assessment process, reduced administrative effort, and guidance on differentiated feedback.
Take-home message: The electronic app Responso could present a simplification for WPBA by reduced administrational effort and guidance on differentiated feedback.

Placement Supervision Group Tool: add granularity to your trainer reports

Authors

Clare van Hamel, UKFPO, Bristol, UK
Ross Meikle, NES, Edinburgh, UK
Angela Burton, HEE, Newcastle, UK
Kata Varnai, HEE, London, UK
Andrew Davies, HEE, Sunderland, UK

Presenter: Clare van Hamel, UKFPO, Bristol, UK

Background: Clinical supervisors are required to assess foundation doctors at the completion of each four month placement. Increasingly with shift work the contact between a trainee and their supervisor may be limited. The multisource feedback tool 'TAB' has been shown to be useful in identifying trainees needing additional support (1). However, supervisors indicated that colleagues were providing informal feedback about trainees but there was no consistent way to record any concerns raised.
Method: The Placement supervision group tool (PSG) was introduced into the UK Foundation Programme in 2012 allowing clinical supervisors to identify senior colleagues to provide feedback about a trainee. The tool is part of the e-portfolio options but is not mandated as core content. We explored utilisation of PSG for 2016/17 cohort and whether it had independently identified trainees needing support or just validated identified concerns. NES reviewed the PSG form completion for the cohort and compared which tools had identified concerns
Results: In total 6657 PSG forms had been completed, with 15 trainees having one or more area identified as being of major concern. 7 of these trainees also had at least one major concern raised within one, or more, of the following forms.
1. Educational supervisor report
2. Clinical supervisor report
3. TAB (Team Assessment of Behaviour)
However, 8 of the trainees with major concerns raised via PSG did not have major concerns raised via the other tools.
Discussion and Conclusion: The usage of the PSG tool has been variable across the UK we have demonstrated that it can independently identify trainees needing additional support. Encouragement of its wider use would help trainers to add granularity to the evidence they document in their reports. Use of the PSG should probably be encouraged for a greater number of trainees.
Conclusion: The PSG is a useful, independent tool in the identification of trainees needing additional support.

Medical students' and teachers' perceptions of the Mini-CEX in a paediatric rotation.

Authors
Tipaporn Thongmak
Mandy Moffat

Presenter: Tipaporn Thongmak, Hatyai Hospital, Songkhla, Thailand

Background: The Mini-CEX was implemented to assess the clinical performance of the 5th-year medical students in the paediatric rotation over the five years. The study aimed to determine how staff and students experienced its application and how its use can be optimised in the department.
Method: This was a qualitative study using individual interviews and focus groups to collect participants' experiences of forty-four staff and students. Paediatric staff, 6th-year students, and interns were invited to attend individual interviews. Fifth-year and 6th- year students were invited to take part in a focus group. The data was analysed by using the thematic analysis.
Results: Thirteen staff, two 6th-year students and seven interns participated in individual interviews. Nineteen 5th-year and five 6th-year students took part in three focus groups. All participants claimed to have a good understanding of why and how the Mini-CEX was applied to assess the students' clinical skills in the department. Staff and student participants felt that feedback given within the Mini-CEX helped to identify the learners' weaknesses and helped to improve subsequent clinical performance. Timing of the assessment and perceived differences in judgments between assessors were highlighted as negative aspects from some students. Participants (staff and students) suggested providing an induction session, ongoing staff training, a planned schedule of examination, and guidance on the outlines of the topic for improving the Mini-CEX.
Conclusion: Staff and students felt positive towards the use of the Mini-CEX in the department. The staff felt it was a suitable method for a formative assessment and that it has been successfully implemented in the paediatric department. However, several areas were identified to improve further the process within which the Mini-CEX is applied and to enhance feedback associated with the Mini-CEX.
Take-home messages:
- The Mini-CEX is a suitable method for assessing the students' clinical performance in a real-life setting.
- The feedback plays an important role to improve the students' performance in the assessment.
- The stakeholders' experience evaluation helps to improve the process and quality of the assessment method.

3EE14 (2594)
Impact of setting up check-items of mini-CEX to increase the specify of assessment

Authors
Yi-Chen Chen, Department of Respiratory Therapy, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan
Yi-Ling Kuo, Department of Respiratory Therapy, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan
Tuan-Jung Hsu, Department of Respiratory Therapy Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan
Jong-Rung Tsai, Department of Respiratory Therapy Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan
Chi-Jung Wu, Department of Respiratory Therapy Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan

Presenter: Yi-Chen Chen, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan

Background: Mini-CEX is used to test learning effectiveness in the clinical environment. Differentconcepts of appraisal items between the appraisers and students will affect the test fairness. This study sets out the check-items of mini-CEX and discusses the effectiveness of learning.
Method: The original mini-CEX from ABIM version of the rating scale put forward was revised to add the details of each items for assessment. Take action video was created for rater training. The test is done during clinical practice by internship students of Department of Respiratory Therapy 4th grade. Content Validity Index value is 0.9; reliability test Cronbach alpha value is 0.8. The tests were done before and after teaching. The data was collected from July 13, 2013 until January 31, 2017. A total of 82 non check-items and 77 check-items were evaluated. Paired sample T test, one-way analysis of variance (ANOVA) and post-test (Scheffe) and other methods were used to analyze.
Results: The average was 3.31 before assessment and 5.56 after the test, and the difference was 2.45 between before and after testing which had statistical differences ($p < 0.001$). There were significant differences ($P < 0.001$, $p < 0.001$, $p < 0.001$, $p = 0.018$, $p < 0.001$, respectively) for the scores of face-care items such as medical consultations, medical examinations, physical exams, operative skills . Consultative health education and its check-items also have significant differences ($p < 0.001$).
Conclusion: The scores from assessment with check-items are higher then without check-items. Adding check-items to dimension of mini-CEX would help to increase the ability of identifying student`s real performance in clinical practice. Such change would also help students to know more about what they should focus in their learning.

3EE16 (2382)
Using "Independence Ratios" to develop clinical competence under supervision

Authors
Karl-Heinz Merbold, University of Pretoria, Pretoria, South Africa
Thomas Corné Postma, University of Pretoria, Pretoria, South Africa

Presenter: Karl-Heinz Merbold, University of Pretoria, South Africa

Background: Universities have a societal obligation to ensure that health professions graduates possess the necessary skill to render effective and safe treatment. Unfortunately the measurement of competence development remains largely undefined, especially at undergraduate level.

Summary of work: This study entails the design and implementation of a new workplace-based assessment system in the Module: Oro-facial Surgery, School of Dentistry, University of Pretoria. The system aims to develop independent clinical practice in undergraduate students under supervision. This study involves the assessment of 28280 tooth extractions completed by fourth and fifth year dental students (2014-2016). The system provided periodic task-level feedback to students on their ability to independently perform tooth extractions using "Independence ratios" (IR=extractions performed without assistance/total number of extractions) as key performance indicator. Level of difficulty (LOD) was controlled for using a customised index with the following interpretation scale: 2=more difficult than standard). Thirteen trained clinical supervisors performed the assessments under guidance of the primary researcher/assessor (gold standard). Students were exposed to virtually all supervisors throughout the year.

Summary of results: The 2014 BChD IV cohort (n=42) eventually achieved a mean IR of 85% (SD:6%) (Ranges: IR=73-95%; LODI=1.9-3.3; extraction count (EC)=57-232). The 2015 and 2016 BChD IV cohorts (n=51 and n=62), respectively achieved mean IRs of 85% (SD:5%) (Ranges: IR=71- 97%; LODI=1.8-3.1; EC=65-261) and 88% (SD:4%) (Ranges: IR=74-94%; LODI=1.6-3.9; EC=55-140). The 2014 BChD V cohort (n=58) eventually achieved a mean IR of 90% (SD:5%) (Ranges: IR=79-100%; LODI=2.2-4.4; EC=27-168). The 2015 and 2016 BChD V cohorts (n=37 and n=51), respectively achieved mean IRs of 92% (SD:4%) (Ranges: IR=78-98%; LODI=1.8-4.7; EC=65-219) and 94% (SD:3%) (Ranges: IR=86-100%; LODI=1.6-4.3; EC=65-150). Assessment differences between the supervisors and the gold standard were generally small and could mostly be explained by differences in operational circumstances.

Discussion & Conclusions: Gradients of increased independence (under supervision) could be illustrated over time. IR measurement was sensitive enough to distinguish between low and high performing students.

Take-home Messages: IR appears to be a useful performance indicator of clinical competence in a busy undergraduate training environment. These methods may be transferrable to other specific skills that are frequently assessed.

3FF: Posters: Simulation 1, including Standardised Patients

3FF1 (2225)
Improving high fidelity simulation experience and performance by using low cost augmented reality technology

Authors
Edgar Herrera, FCS U Anahuac, Mexico
Montserrat Urban, FCS U Anahuac, Mexico
Diana Jiménez, FCS U Anahuac, Mexico

Presenter: Edgar Israel Herrera Bastida, Facultad de Ciencias de la Salud - Universidad Anáhuac México, Mexico

Background: Augmented reality (AR) is a live direct or indirect view of a physical, real-world environment whose elements are "augmented" by computer-generated perceptual information across multiple sensory modalities, including visual and auditory, its primary value is that it brings components of the digital world into a person's perception of the real world.

Method/Results: High fidelity simulation for large groups of participants is difficult and unfortunately limited to short periods of time, in order to find alternatives to improve participants experience and performance during high fidelity scenarios, AR clinical scenarios were developed so students can access from their smartphones. We compare the performance and satisfaction survey over high-fidelity sim scenario with 125 medical students who use the AR tool (n:125) vs 137 medical students who don't use the AR tool (n:125). A free augmented reality development platform was used to develop clinical scenarios, the students had to scan a QR code in order to download the instructions and a PDF document with the QR codes required and the instructions to place them in a sim scenario they can build at their house or any place. They use their smartphones to access videos, sounds, quizzes, 360 views and other information when they scan QR codes over their "homemade scenario", so they can prepare the high-fidelity scenarios before the lesson. Students have to run this scenarios previous to sim practice, and after the sim practice they filled out a satisfaction survey of the sim experience. A logistic regression analysis was performed and a highly significant relationship between the better performance scores at sim scenarios using previous AR VS not using AR (p:0.01).

Conclusion: The satisfaction surveys show that AR exposed students find this methodology more exciting and It helped to understand better the scenarios before facing them. AR requires time for its programming and preparation of the participants, however it is a worthy alternative to help improve the performance and user experience in high fidelity simulation. AR is an inexpensive complementary and exciting tool to improve high-fidelity simulation scenarios experience with undergraduate students.

3FF2 (1297)
The Effectiveness of Simulation-Based Training in Management of Acute Asthmatic Attack for Internal Medicine Residents: 1-Year Follow-Up

Authors
Tirachat Sewatanon, Maharat Nakhonratchasima Hospital, Nakhonratchasima, Thailand
Ruttanakorn Keeratiphaiboon, Maharat Nakhonratchasima Hospital, Nakhonratchasima, Thailand

Presenter: Tirachat Sewatanon, Maharat Nakhonratchasima Hospital, Nakhonratchasima, Thailand

Background: Acute asthmatic attack is a common life-threatening problem. However, many residents under training program provide inaccuracy of assessment, treatment and discharge planning. Simulation-based training may increase the quality of training in managing emergency condition without risks and provide the opportunity for immediate feedback. The aim was to determine the effectiveness of simulation-based training for improvement and long-term retention of knowledge and skills in managing acute asthmatic attack compare with clinical training alone.

Method: Ten first-year residents in internal medicine participated in one-day simulation-based training in the management of acute asthmatic attack. The prospective evaluation was conducted by performance observation in the simulated situation. The first-year residents were evaluated with the identical simulated scenario before simulation-based training, immediately after the training and three months later. They were also re-evaluated with the different scenario of acute asthmatic attack in nine months later. Additionally, this evaluation was compared with fifteen third-year residents who had not been participated simulation-based training in the management of acute asthmatic attack

Results: The findings showed the median of pre-test, immediate post-test, 3-month post-test, and 1-year post-test scores were 17.31, 49.04, 54.81 and 63.75, respectively. The statistically significant improvement in performance scores was observed immediately after training compared with 1-year post-training ($p<0.05$) and the residents trained with simulation tended to have higher performance scores than the third-year medical residents at 1-year follow-up (63.75 vs 56.25, $p=0.066$)

Conclusion: Simulation-based training improves knowledge and clinical skills of the residents in managing the acute asthmatic attack. Furthermore, the potential effects of this training can maintain residents' performances in the long period of term. Their competency is equivalent to third-year residents, therefore simulation-based training is systematic learning method which accelerates residents to achieve their performance and assists them to transfer knowledge into practice

Take-home message: Simulation-based training in the management of acute asthmatic attack is the effective method to enhance internal medicine residents' knowledge and skills following one-year training added on the clinical training program.

3FF3 (742)
Foundation Year 1 Simulation Programme at Northwick Park: A 4 year review

Authors
Jasleen Arora, LNWH Trust, London, UK
Amardeep Riyat, LNWH Trust, London, UK

Presenter: Jasleen Arora, London North West Healthcare (LNWH) Trust, London, UK

Background: 211 doctors attended the programme between 2011 and 2015. Each was given an emergency scenario followed by a debrief.
Method: Learners completed pre-course (examining previous experience and course expectations) and post-course questionnaires (focused on perceived learning and impact on future practice) consisting of numerical scale and 'free-text' questions. 211 pre- and 209 post-course questionnaires were reviewed. Qualitative data were analysed using thematic analysis by two independent investigators.
Results: Pre-course expectation themes included improvement in overall confidence and competence in managing emergencies, to gain practical advice on crisis management, clinical prioritisation, and to improve knowledge, communication skills and confidence in clinical decision making.
Following the course, learners felt they had developed a more systematic approach to patient management and a perceived increase in knowledge of medical emergencies. The SBAR communication model was highly valued, particularly in "stressful scenarios". Knowing when to escalate and involve the "most appropriate" senior clinician was also appreciated. 75% of doctors rated the course as "very good", 23% "good" and 2% as "adequate". The majority felt that it enhanced clinical practice, in terms of patient care (99%) and safety (98%). 95% felt that the course improved their communication skills and enhanced "multidisciplinary working".
97% felt that the faculty's style of facilitating was "very good" or "good", but suggested standardising feedback methods. A faculty demonstration at the beginning of the day was also suggested, whilst scenarios could be made more "realistic" by using hospital-specific charts/guidelines.
Conclusion: High-fidelity simulation facilitates learning when certain features are incorporated (Issenberg, 2005). Our study is in keeping with this and includes many of the key conditions (feedback, clinical variance, controlled environment, individualised learning). The same BEME systematic review also calls for better research and scholarship in the study of medical simulation, and our retrospective evaluation adds weight in that its strength lies in the relatively large number of learners, studied over a 4-year period, longer than many other studies in this field.

Can paper-based simulation substitute resource intensive high-fidelity teaching?

Authors
Kathryn Biddle
Ruth Pollard
Kevin Dave
Elen Hughes
John Bassett

Presenter: Kathryn Biddle, Countess of Chester Hospital, Chester, UK

Background: The prospect of starting on-calls remains a source of anxiety for many final year medical students. Simulated sessions have been developed to increase preparedness and improve confidence surrounding on-call duties. Many of these programmes involve high-cost, resource-rich simulation mannequins. Whilst the use of high-fidelity simulation carries many advantages, its cost precludes its utilisation for many students. Paper-based simulation sessions have been developed as a cheaper alternative and studies have found them to be useful despite lacking the element of stress surrounding patient contact and assessment. Our study investigates whether low-cost, paper-based simulation represents an effective method to prepare medical students for on-call duties.
Method: All final year medical students undertaking a ward shadow rotation at the Countess of Chester Hospital from September 2017 are being invited to participate in the programme. Each week, two-hour sessions are facilitated by two doctors with two students participating simultaneously. The sessions start with a briefing and a mock handover of clinical tasks. Students subsequently undergo an hour "on-call" when they are bleeped about unwell patients in addition to routine jobs. All cases are paper-based and involve the interpretation of mock notes including observation charts, blood results and imaging studies. Participants are instructed to document a diagnosis and management plan and discuss this with a "nurse" (a facilitator). Students also have the opportunity to bleep a senior for advice. Following the hour on-call, students handover remaining tasks and are debriefed. Students complete questionnaires including a 5 point Likert scale assessment related to pre- and post- session confidence in six areas: the use of bleeps, the management of acutely unwell patients, clinical prescribing, the use of guidelines, handover with colleagues and prioritisation skills. Students also have the opportunity to give free text feedback.
Analysis of pre- and post-session confidence ratings will be presented at the conference in addition to student feedback.
Our results will demonstrate whether paper-based simulation provides an effective alternative to high-fidelity simulated on-call sessions.
Conclusion: Paper-based simulated sessions represent a low-cost form of teaching to prepare medical students for starting clinical on-call duties.

3FF5 (2143)
Simulation-based education for undergraduates: The effect of task complexity on learning

Authors
Marie-Laurence Tremblay, Laval University, Quebec, Canada
Jimmie Leppink, Maastricht University, Maastricht, The Netherlands
Gilles Leclerc, University of Montreal, Montreal, Canada
Jan-Joost Rethans, Maastricht University, Maastricht, The Netherlands
Diana Dolmans, Maastricht University, Maastricht, The Netherlands

Presenter: Marie-Laurence Tremblay, Laval University, Quebec City, Canada

Background: Simulated Clinical Immersion (SCI), which simulates real-life situations in a realistic clinical environment, seems safe and appropriate to gradually expose novices to complex problems. When learning complex tasks, novices can engage in strategies to prevent cognitive overload and thus continue to gain some learning benefits. However, the resulting learning outcomes may differ from the initial learning goals. Designing adapted SCI learning tasks for undergraduate students requires a thorough understanding of the effect of task complexity on learning.
Method: The purpose of this mixed-method study was to understand the effect of task complexity on undergraduate pharmacy students' cognitive load, performance, and perception of learning in SCI. One hundred-sixty-seven second-year pharmacy students experienced one simple and one complex learning task in SCI. Participants' cognitive load was measured after each task and debriefing. Task performance and time-on-task were also assessed. As part of a sequential explanatory design, semi-structured interviews were conducted with students showing maximal variations in intrinsic cognitive load to understand their perception of learning when dealing with complexity.
Results: The complex task generated significantly higher cognitive load than the simpler task, although performance was high for both tasks. Time-on-task was significantly higher for the complex task. Qualitative results revealed that a lack of clinical experience, an unfamiliar environment, and the educational setting of SCI seemed to affect many steps in the clinical reasoning process, from data interpretation to decision-making through tasks prioritization. Although simpler tasks helped students gain more self-confidence, complex tasks further encouraged reflective practice during the debriefings.
Conclusion: Although complex tasks in SCI were more cognitively demanding and took longer to execute, students indicated that they learned more from them. Complex tasks constitute an additional challenge in terms of clinical reasoning, thus providing a more valuable learning experience from students' perspective.

The use of simulation techniques in public health care procurement procedures

Authors
Ioannis Fountoukidis, School of Economics, Aristotle University of Thessaloniki, Thessaloniki, Greece
Eleni Dafli, School of Medicine, Aristotle University of Thessaloniki, Thessaloniki, Greece
Panagiotis Bamidis, School of Medicine, Aristotle University of Thessaloniki, Thessaloniki, Greece

Presenter: Panagiotis Bamidis, School of Medicine, Aristotle University of Thessaloniki, Thessaloniki, Greece

Background: In current medical education medical doctors need to be trained in a wide range of skills. Participation in working groups for the evaluation and selection of health care goods and services for the health care provider they work for is one of them. Simulation techniques of competition processes can be used for medical doctors' training and evaluation purposes.
Method: A virtual training scenario simulating the public procurement process to purchase coronary artery stents was created. The simulation was based on virtual patient technology. Trainees followed a step-by-step workflow of a competition and had to choose from a network of 122 decisions that included both correct and incorrect ones. The scenario was based on the European Commission guidelines and directives and includes the most common mistakes in the procurement procedures.
A team of experts was asked to evaluate the tool's usability and efficacy. Trainees who run the scenario were able to handle a bidding process better than those who attended a traditional education seminar. Additionally, the interactivity and the personalized learning increased the trainees' engagement.
Results: The results from the use of the virtual training platform were very positive and encouraging. Experiencing the consequences of the wrong choices through the digitization of the procurement process seemed to be an effective way of learning. Moreover, most trainees did not encounter any difficulty in using the app and mentioned they enjoyed their learning experience.
Conclusion: Nowadays, medical professionals need to be trained in a wide range of clinical and non-clinical skills. The use of simulation techniques for the training of medical doctors in public procurement procedures seems to be an effective tool that can be integrated into lifelong learning programs.
Take-home message: The use of simulation techniques seems to enhance the training in public procurement, since trainees seem to better understand the procurement processes this way, while learning through others' mistakes is safer than learning through their own mistakes.

3FF7 (3446)

Exploring how to provide feedback for learning in virtual reality simulation for clinical decision-making

Authors
Jenny Zhou, University College London, Institute of Education, London, UK

Presenter: Jenny Zhou, University College London, Institute of Education, London, UK

Background: There has been an increased focus on the development of immersive virtual reality (VR) learning experiences, including VR simulations emphasizing clinical decision-making and crisis resource management. Recognizing the importance of feedback in face-to-face simulation education, this study aimed to understand the learner perspective on feedback for a VR-enabled simulation experience using a design-oriented approach.
Method: Fifteen participants, spanning different stages of medical school and foundation years training, took part in a VR-enabled emergency department simulation experience, developed by Oxford Medical Simulation. The simulation experience included prototyped "on-screen" pre-briefing, "on-screen" guided verbal self-reflection, "on-screen" action-oriented objective feedback based on decisions made in the VR simulator, and a score. All participants were invited to go through the simulation experience twice. Structured observations, 7-point Likert-scale ratings, and interviews were used to gather rich descriptions of the VR simulation experience focused on feedback components.
Results: Thematic analysis of interviews identified that participants, regardless of experience level, adapted the simulation to suit personal learning needs, including shifting focus between repeats of the simulation. Having a mixture of post-simulator self-reflection, action-oriented objective feedback, and a score was synergistic, providing multiple ways for the learner to evaluate what happened in the simulator and the flexibility to adapt simulation sessions to personal goals. Likert-scale ratings on the post-VR simulator components were generally positive.
The study found that the prototyped VR simulation experience as a whole, including mixed device delivery, has viability and was well-received. The self-reflection and feedback components in combination are able to help foster deliberate practice. However, the VR simulation can still be fine-tuned to differentiate between the needs of learners with different levels of experience with medical education practices.
Conclusion: Continued re-design of VR-enabled simulation should aim to fit the needs of the medical education community, which has established general best practices and features for simulation that inform learner expectations. Learners are capable of adapting feedback in different forms to suit the needs of their experience level; however, additional supports may be needed for learners who have not been fully initiated into all medical education practices.

Level of Acceptance of De La Salle Health Sciences Institute- College of Medicine Faculty in Simulation as a Teaching Learning Strategy

Authors
Alex P Bello

Presenter: Alex Bello, De La Salle Health Sciences Institute, Dasmarinas Cavite, Philippines

Background: Simulation in healthcare in the Philippines is becoming a popular method as a new teaching learning activity. In the DLSHSI, the College Medicine has been using simulation for our Physical Diagnosis subject for second year medical students In the physical diagnosis activity basically the faculty will demonstrate the skills to be followed by return demonstration of a student. This has lead to low quality of learning and retention of skills performed by the students. The introduction of simulation as an additional teaching learning tool to be use by the faculty created resistance and conflicting responses. We have invited some faculty interested in doing simulation for workshop and eventually they themselves will conduct simulation session with our students.
Aside from doing simulation sessions for the students it is our aim to know the level of acceptance of faculty members that simulation is not just an alternative tool but an additional tool as a teaching learning strategy for first year medical students.
Method: After each skills laboratory/ simulation activity the faculty were asked to answer the skills effectiveness assessment tool and to make comment on how we can improve the activity.
Results: There were 31 respondents from the faculty. Majority of them agreed that conducting a simulation activity is an important, high yield, not an alternative but an additional tool for teaching learning activity of the students.
Conclusion: Most of the faculty participated in the activity realized that conducting simulation as early as in their first year in medical school will help the students understand the concepts and will have an actually "feel" of the future situation. It will also allows students to clinically correlate the knowledge they learn in the classroom and be more confident in doing procedures they learned during the activity.
Take-home messages: We recommend to train and teach more faculty in conducting simulation.
Provide more simulation sessions as this will contribute to their clinical competence and this will also prepare them to be more confident in seeing real patients during their clinical practice.

Can Simulation Do It All? A Critical Care Simulation Model For Senior Medical Students to Instruct Pathophysiology, Clinical Management and Teamwork/Communication Skills

Authors
Brendan Munzer, University of Michigan Health System, Ann Arbor, Michigan USA
Deborah Rooney, University of Michigan Health System, Ann Arbor, Michigan USA
Matthew Stull, University Hospital/Cleveland Medical Center, Cleveland, Ohio, USA
Michael Cole, University of Michigan Medical School, Ann Arbor, Michigan USA

Presenter: Matthew Stull, University of Michigan Health System, Ann Arbor, USA

Background: Commonly, simulation experiences during medical school do not effectively provide students the autonomy, realism or feedback needed to optimize their learning. In addition, simulation sessions rarely integrate instruction of numerous EPAs (entrustable professional activities) and competencies used in clinical practice.
Method: Informed by cognitive theory, instructional design theory and nontechnical skills models, simulation protocols were developed to allow formative assessment of teamwork/communication skills (T/C), clinical management (CM), and pathophysiology (PP). Developed content addressed 4 out of 8 competency domains and 7 out of 13 EPAs.
Senior medical students on their critical care rotation participated in two video-recorded simulation cases. Sessions occurred within the critical care unit to improve realism and involved one student and two nurses to enhance student autonomy and interprofessional interactions. Each case was followed by video self-review with written reflection and structured faculty debrief. Debrief was guided by written reflection, structured faculty observations and detailed learning points. Simulation protocols defined: a) critical actions; b) essential behavior and communication; c) "adaptive" simulator responses that change complexity depending on student actions; and d) "adaptive" learning points ranging from basic to challenging. These "adaptive" elements scaffold learning and keep students in their zone of proximal development (ZPD).
Results: Based on post-simulation surveys (n = 31), T/C and CM were the "most important aspects of this exercise" with PP having the lowest importance (p<0.05). Additionally, 82-95% of participants reported the "right amount" of instruction involving T/C, CM, and PP and 78-95% rated instruction of these domains as "high quality". Lastly, 82% of participants felt the reflective self-review was "very" or "extremely" important for their learning. This project combines: i) cognitive and nontechnical skills principles, ii) protocols and learning points that are structured and adaptive to learners' ability, iii) reflective self-review and iv) structured debrief. By integrating these elements, a simulation model has been developed to instruct multiple domains and efficiently address numerous EPAs.

Conclusion: With thoughtful planning, a critical care simulation model can be developed that effectively instructs senior medical students on pathophysiology, clinical management and teamwork/communication skills in an integrated fashion.

A Microsurgical Simulation Course for Nurses

Authors
Mala Satku, Tan Tock Seng Hospital, Singapore
Jen Ming Lai, Tan Tock Seng Hospital, Singapore
Puay Ling Tan, Tan Tock Seng Hospital, Singapore
Sreedharan Sechachalam, Tan Tock Seng Hospital, Singapore

Presenter: Mala Satku, Tan Tock Seng Hospital, Singapore

Background: Microsurgical procedures can take considerable time and fatigue can set in. The importance of a good assistant and scrub nurse can make the surgery smoother and faster.
Method: Three microsurgical simulation courses were held for nurses in our institution. Each course was structured in the same manner, consisting of two lectures and two practical sessions. The lectures contained information about how to use the surgical microscope, as well as handling microsurgical instruments and sutures. The practical sessions allowed the nurses to practice microsurgical suturing on a glove and then on a non-living femoral artery of a chicken thigh. The course was evaluated with a post-course evaluation survey.
Results: A total of 30 operating theatre nurses attended the courses. The response rate was 96.7%. All the respondents felt that their knowledge of microsurgical instruments, sutures, microscope set up as well as microsurgery skills had improved after the course. More than 80% felt they could better predict what the surgeon would ask for during a microsurgical case and that they could handle instruments and sutures better after the course.
Conclusion: Our results show an improvement in the understanding of nurses in assisting microsurgical cases. With this understanding, they also report an improvement in their confidence in assisting microsurgical cases and an improvement in tolerance of the long operative requirements of certain microsurgical cases.
In our experience, a basic microsurgery course for nurses can play a significant role in developing a well-trained microsurgical scrub nurse.

Simulated ward rounds: A useful tool in building medical students' confidence

Authors
Timothy Lloyd
Andrew Greenhalgh
Pratik Solanki

Presenter: Timothy Lloyd, Princess Alexandra Hospital, Harlow, UK

Background: Medical students in the U.K. receive very little formal teaching focused on ward rounds. This can lead to medical students feeling isolated and unprepared during ward rounds and therefore it can be a struggle for students to actively engage and learn.
Method: 90 minute sessions for third year medical students were created focused on accurately simulating a three patient ward round. Two junior doctors acted as the consultant and registrar and a more senior medical student acted as the patient in each case.
The students were tasked with writing ward round entries for each patient seen including a plan as described by the consultant. Nineteen students took part in five sessions. A tutorial took place between the second and third case that focused on good practice in medical documentation as described in the General Medical Council's (GMC) guidance. The quality of their ward-round entries was assessed against the five key points listed in the GMC's guidance. Pre- and post-session questionnaires regarding their confidence in writing ward round entries and constructing jobs lists were requested.
Results: The sessions were highly rated by the participants with an overall evaluation score of 4.89 out of 5. Analysis of the students' pre- and post-course feedback forms demonstrated that confidence in note writing during a ward round increased by 22.2% ($p<0.0001$) and confidence in constructing a jobs list increased by 34.8% ($p<0.0001$). Finally comparison of the students ward round entries before and after the tutorial showed an improvement of 50% ($p<0.0001$) when scored against a GMC guideline mark scheme.
Conclusion: The data collected from these teaching sessions suggests that medical students benefit greatly from formal teaching regarding ward rounds. There was a statistically significant improvement in their confidence and the objective quality of their entries. The teaching sessions were well received and in particular the students commented on its great relevance to their clinical placements.
Take-home message: Simulated ward round sessions can increase students' confidence in writing in the patient notes and objectively increase the quality of their entries.

3FF12 (1083)
Use of Video and Simulation to Enhance Students' Confidence to Participate in Resuscitation Room

Authors
Phei Wei Goh, Tan Tock Seng Hospital, Singapore
Pick Fong Chee, Tan Tock Seng Hospital, Singapore

Presenter: Phei Wei Goh, Tan Tock Seng Hospital, Singapore

Background: Nursing students often experience incompetency due to lack of clinical exposure and unfamiliar areas during clinical attachment (Jamshidi, Molazem, Sharif & Kalyani, 2016). Lack of staffs' guidance hinders their learning as students have to cope by themselves. As a result, students are concern of harming a patient and are not confident to participate in nursing skills (Lakshmi, 2016). Aim of this study is to evaluate if conducting a simulation prior to resuscitation room attachment can enhance student's confidence to participate.
Method: A total of 100 final year nursing students completed their specialized one-week clinical attachment to Emergency Department over a period of two months. They attended a simulation prior to resuscitation room attachment. A video was developed to orientate them to the layout of the resuscitation room followed by a simulation. A survey was conducted pre and post-simulation and after their resuscitation room attachment.
Results: 75% of them are diploma students and 25% are degree undergraduates. Only 7% of them are aware of what they can participate in resuscitation room as students prior to simulation. Post simulation survey showed 95% gave positive feedback that they were able to identify skills that a student can participate. 76% rated Strongly Agree that the video was effective in orientating them and understand the roles of the resuscitation nurse. 93% reported feeling more confident in what they can participate when assigned to resuscitation room.
Conclusion: Conducting simulation in combination with the use of media was found to be effective in engaging students for reinforcement of skills, retaining knowledge and building on confidence. Through simulation, students were able to relate to the realistic environment and bridge the theory-practice gap. Hence, students were able to adapt faster in the resuscitation area and participate more actively during their one-day attachment.
Use of video and simulation prior to student's resuscitation attachment has a positive impact on their confidence to participate on the actual day. It is an effective way for them to comprehend the real clinical area especially when time and level of guidance is a challenge.

3FF13 (1047)
Pre-briefing in Simulation - How much is enough?

Authors
Grace McKay
Rebecca Robertson
Lewis Bates

Presenter: Grace McKay, Medical Education and Simulation Hub, Pinderfields General Hospital, Mid Yorkshire Hospitals Trust, Leeds, UK

Background: Pre-briefing is considered a cardinal feature of effective simulation learning, and is described as the communication between faculty and learners preceding a simulation course.
Dieckmann posits that pre-briefing should prepare learners for an upcoming session by clarifying expectations, logistics and learning objectives. Fanning and Gaba add that facilitators can use pre-briefing to create a supportive learning environment.
Method: We reviewed a cohort of 18 final year medical students partaking in simulated scenarios, managing acute patients. We aimed to explore student's engagement with pre-briefing material.
Prior to the simulation, we emailed students the learning objectives, recommended reading and clinical guidelines for half of the scenarios.
We explored student's engagement with the pre-briefing material via a survey and group discussion following the session.
Results: The survey revealed that 61% (11) of students did not read the pre-briefing material and 66% (12) did not prepare in any way for the simulation. 10 (55%) students reported that they preferred simulation to be a 'complete surprise'. Discussion with students reinforced these findings, and learners commented that they preferred to be 'unprepared' for scenarios because it better replicated clinical practice.
Many educationalists advocate pre-briefing because it can empower students to optimise their simulation learning experience.
It was therefore interesting to discover that the majority of our students did not engage with pre-briefing material and preferred to be 'surprised' by simulation content. Perhaps our findings are due to the seniority of medical student, it is possible that learners were not threatened by the 'unknown' and instead required high-fidelity experiences to prepare them for clinical practice. Alternatively, perhaps our students are not motivated to take full responsibility for their learning and instead want to be 'spoon-fed'. Some learners may feel that attendance at simulation sessions is sufficient to achieve the learning objectives.
Conclusion: In sum, we suggest that facilitators consider student perceptions prior to forming presumptions for pre-briefing material. Clearly there is no 'one-size fits all' approach for pre-briefing in simulation.
Take-home message: Facilitators should seek student opinion prior to providing pre-briefing material.

3FF14 (2914)
Graphic feedback summaries after large simulation events – a possibility to deepen the learning experience?

Authors
Julia Freytag
Fabian Stroben

Presenter: Julia Freytag, Charité Universitätsmedizin Berlin, Germany

Background: Simulation-based education is a common technique used in medical education. Research shows that the learning outcome of simulations mainly depends on the debriefing and feedback.
Method: After intense simulations, lots of aspects could be discussed, but participants can only process a limited amount of feedback. We therefore designed a graphic summary to complement the verbal debriefing and deepen the simulations' effect. Recipients were asked if and how they benefited from this summary. The feedback summary followed an 8-hour simulation for final year medical students (7 teams of 5 students, completing 6 cases). It included the following components:
- Performance scores (quality of anamnesis, diagnostic & treatment) & comparison of these with participants' confidence (bar/line charts)
- Comparison of each team's performance to the other teams' performances (traffic-light system)
- Feedback from simulated patients (SP)
- Impulses to improve (non-)technical skills

With these components we aimed at improving participants' self-assessments and guiding them towards learning opportunities. Participants were asked to complete a short questionnaire on the features of the summary (e.g. comprehensibility).
Results: 28 participants received a feedback summary. Preliminary results showed, they found the feedback generally helpful and easy to understand (Mean_help=1.3, Mean_understand=1.5.; scale from -3 to +3; N=8). Especially the feedback of SP was mentioned positively. Participants were undecided whether they benefited from the comparison of their confidence and performance and whether the summary helped them to compare themselves to other students (both Mean=0.3).
Although students generally request more feedback, the literature shows inconclusive results about the benefits of graphic feedback, e.g. in progress testing. Similarly, our participants rated parts of the summary to be helpful, while other parts elicited mixed responses. The amount of time needed to design such a complex summary is another limiting factor.
Conclusion: Graphic feedback can positively influence the learning experience of simulation scenarios – its components need to be selected carefully, though. In this study, detailed reflections of participants' own performances, like verbatim SP quotes, were valued the most whereas the recipients reported, the summary has not helped them to gauge their skills in relation to others.

Defining curricular content for simulation–based training in gynecology and obstetrics: A national general needs assessment

Authors
Leizl Joy Nayahangan, Copenhagen Academy for Medical Education and Simulation, The Capital Region of Denmark, Copenhagen, Denmark
Lars Konge, Copenhagen Academy for Medical Education and Simulation, The Capital Region of Denmark, Copenhagen, Denmark
Inge Marie Møller-Skuldbøl, Center for Women, Horsens Regional Hospital, Horsens, Denmark
Dorthe Kolster, Department of Gynecology and Obstetrics, Aarhus University Hospital, Aarhus, Denmark
Charlotte Paltved, MidtSim – Centre for Human Resources, Central Region of Denmark and Aarhus University, Aarhus, Denmark
Jette Led Sørensen, Juliane Marie Center for Children, Women, and Reproduction, Rigshospitalet, University of Copenhagen, Copenhagen, Denmark

Presenter: Leizl Joy Nayahangan, Copenhagen Academy for Medical Education and Simulation, Copenhagen, Denmark

Background: Gynecology and obstetrics has been using simulation-based education, providing trainees with the necessary skills amidst today's challenges including limited training opportunities, very rare events in obstetrics and increased focus on patient safety. Unfortunately, simulation-based programs are most often developed based on available resources or coincidences rather than a systematic plan. The development of a curriculum should start with a general needs assessment to ensure that training programs are relevant to current training needs. The objective of the study was to perform a needs assessment to identify technical procedures that should be included in a simulation-based curriculum.
Method: We performed a needs assessment using the Delphi method by engaging 165 participants identified according to their role and responsibility in the education of residents. Round 1 was brainstorming to identify technical procedures that a new specialist should learn. Round 2 determined need for simulation training by using a needs assessment formula exploring 1. Frequency of procedures, 2. Number of physicians that should be able to perform procedure, 3. Risk and/or discomfort when performed by an inexperienced physician and 4. Feasibility for simulation training. Round 3 included elimination and re-prioritization of procedures.
Results: The response rates were 61%, 50%, and 53%, respectively. After qualitative analysis in the first round, the technical procedures were: gynecology (n=51), obstetrics (n=40) and general procedures (n=10). The final round resulted in a prioritized list where gynecology procedures (n=17) is led by basic laparoscopy, vaginal ultrasound, laparoscopy with tubotomy and salphingectomy, open surgery including instrument handling and use of vaginal and abdominal ultrasound

equipment; obstetrics procedures (n=16) is led by basic resuscitation of newborn, vacuum extraction, management of shoulder dystocia, management of postpartum bleeding and management of vaginal birth; and general procedure (n=1) consisted of basic resuscitation of adult.
Conclusion: The Delphi process resulted in a prioritized list of technical procedures that are highly suitable for simulation. This helps to guide decisions and development of simulation-based training programs for residents in gynecology and obstetrics.
Development and effective integration of simulation-based curricular content should start with a structured needs assessment.

3FF17 (3538)
Simulated hospital round for history-taking and problem-solving

Authors
Ayad Al-Moslih, Qatar University, Doha, Qatar
Alison Carr, Qatar University, Doha, Qatar

Presenter: Ayad Al-Moslih, Qatar University, Doha, Qatar

Background: History-taking and problem-solving are crucial for making accurate diagnoses. Gathering, organizing, and interpreting information, followed by decision-making are functions of problem solving. These can be affected by factors like time-constrain and unfamiliarity of context. Creating an authentic context to allow practice on such skills for medical students is a challenge.
Method: Simulated rounds constituted of teams of 4 to 5 students, who stopped for 20 minutes by each patient. It included mixed-realty encounter where students watched a 90-seconds 360o video with a Virtual-Reality goggle then met the patients' father, two beds had simulated patients, and a fourth was a video-based scenario.
Results: 16 of 38 students (42%) responded to the e-survey. 87.5% rated this method of training as good or excellent, and 12.5% as fair. Finally 100% found the experience to be engaging. Students received instant feedback from SPs and clinical tutors on their clinical reasoning, communication, empathy, and team-work.
The complexity of clinical encounters makes them difficult to simulate. History-taking should not be taught in isolation from reasoning or problem-solving, empathy, and team-dynamics. Authentic environments supported by feedback may warrant better transfer of skills into real practice. Starting early in the curriculum provides an opportunity of spaced-practice and remediation.
Simulated rounds are liked very much by the students. Having students commit to specific objectives or questions to address after each patient encounter can keep them focused. Timed patient encounters seem to add an element of stress and has a value in creating an authentic context.
Conclusion: Simulated hospital rounds can be a golden opportunity if planned well. Ensure that students receive feedback instantly. Train and allow simulated patients to provide feedback especially on aspects like communication and empathy.

3FF18 (728)
To explore the competency requirements for standardized patient training in the National Objective Structured Clinical Examination (OSCE)

Authors
Min-Shu Wang
Ya-Fen Fan
Jiun-Lu Lin
Ching-Chung Lin
Yih-Jer Wu
Hung-I Yeh

Presenter: Min-Shu Wang, Mackay Memorial Hospital, New Taipei City, Taiwan

Background: The Objective Structured Clinical Examination (OSCE) has been adopted as the prerequisite for the two-step Taiwan Medical Licensing Examination (TMLE) since 2013. However, there were no formal norms and requirements announced by the authority. In view of the time-limit for SP training on the day of National-OSCE execution and the high consistency should be attained among all National-OSCE centers, we aimed to investigate the pivotal contents required by SP training course in the National-OSCE.
Method: We use semi-structured questionnaires to assess the current status of implementation in SP training course for National-OSCE in Taiwan. Besides, data obtained from focus group interview for SPs and SP trainers were analyzed by encoding and classifying. The results of above investigations help to identify the quality dimensions in SP training course and to define the main competency requirements of SPs.
Results: The current study elucidates two major demands to guarantee high quality SP performance. First, set up national selection criteria when recruiting the SP before the National-OSCE. Second, develop a multiplex education system in National-OSCE SP training course could ensure the standardization and enhance the professional performance of SPs.
SP recruited for National-OSCE should have the characteristics of punctuality, responsibility, adaptability, high compliance and performance consistency. Therefore, the selection criteria and the elimination mechanism are major steps forward to achieve a fairer and transparent OSCE process. Diverse training methods and practical two-way feedback also facilitates SP to learn.
We will continue to review and revise the National-OSCE SP training program according to the result of current study by using specific instructional recruiting and training protocol. After accumulating plentiful experiences, a systematic and localized standardized training modules will ensures the fairness and justice in TMLE.
Conclusion: The results of this study should increase awareness about and stimulate interest in using qualified SP training strategy to advance the state-of-the-art of TMLE.
Clarifying the competency requirements of the SPs to improve the SP training course can be a win-win-win solution for SP, medical students who attending National-OSCE, and SP training sites.

3FF19 (3130)
Simulated patients (SP) training other SP – a successful "Train the trainer" approach at Charité Berlin

Authors
Susanne Lück, Charité Universitätsmedizin Berlin / Prodekanat für Lehre / Team Spezielle Lehrformate / Simulationspatientenprogramm, Berlin, Germany
Julia Freytag, Charité Universitätsmedizin Berlin / Prodekanat für Lehre / Team Spezielle Lehrformate / Simulationspatientenprogramm, Berlin, Germany
Peter Eberz, Charité Universitätsmedizin Berlin / Prodekanat für Lehre / Team Spezielle Lehrformate / Simulationspatientenprogramm, Berlin, Germany
Tanja Hitzblech, Charité Universitätsmedizin Berlin / Prodekanat für Lehre / Team Spezielle Lehrformate, Berlin, Germany

Presenter: Susanne Lück, Charité Universitätsmedizin Berlin / Prodekanat für Lehre / Team Spezielle Lehrformate / Simulationspatientenprogramm, Berlin, Germany

Background: The German Association for Medical Education (GMA) is currently discussing qualifications that are needed to become a successful SP trainer. At the Charité Berlin, we developed an approach to expand our regular staff of trainers by educating a selected group of SPs in giving training courses themselves. The goal of this report is to demonstrate how a "Train the trainer"-approach can be a time- and cost-efficient way to educate high qualitative trainers.
Method: In three seminars consisting of 9 hours in total, we trained four SPs in instructing other SPs. We selected the future trainers on the basis of three criteria: (1) He/she has been an SP for several years; (2) the SP meets the Charité's quality standards of portraying patients and giving feedback; (3) the SP is experienced in coaching.
To evaluate the quality of the role training courses given afterwards, the trained SPs filled out a survey and rated the perceived quality of the training after each training session.
Results: Evaluation data showed no significant differences between training courses given by permanent employees (N_{pe} = 107) and those given by the "trained trainers" (N_{tt} = 62).
Satisfaction with the new trainers was overall very high on a five-point Likert scale. Examples for items we used are:
1. "I feel sufficiently prepared for my upcoming interactions in this role." (M_{pe}=4.83; M_{tt}=4.88)
2. "The practical preparation for the role was helpful." (M_{pe}=4.74; M_{tt}=4.72)
3. "The role-specific feedback for the interactions has been sufficiently trained." (M_{pe}=4.60; M_{tt}=4.66)
Germany is discussing qualitative criteria necessary for becoming an efficient SP trainer. We were able to show that SPs who meet the criteria we selected can give training courses of high quality after attending just three short seminars.
A minor downside of this approach would be that more administrative efforts are necessary to coordinate the "trained trainers" because they are not involved in organisational tasks.

Conclusion: Our data indicate, educating SPs in training other SPs can be a successful and efficient approach to support the regular trainer staff of an SP program.

What are the perceptions of medical students regarding the usefulness of GTA (Gynaecology Teaching Associate) sessions?

Authors
Manju Netto
Melissa Whitten

Presenter: Manju Netto, Homerton University Hospital, London, UK

Background: GTAs (Gynaecology Teaching Associates) enable medical students to perform pelvic and/ or speculum examinations on them and provide feedback regarding communication and examination skills. Whilst being used since around 2013 there is limited evidence regarding students' perceptions on their usefulness.
The few existing studies report positively, however this study uniquely provides data from 2013 from two research methodologies (questionnaires and a focus group).
Method: Feedback from students was obtained regarding: content, style, developing confidence in examination skills, developing confidence in communication skills, advantages and disadvantages of learning from GTAs. Data was analysed using inductive thematic analysis to find relevant codes and themes relating to the students' perceptions of these sessions.
Results: Students reported positively regarding content and style of sessions. Students felt GTA sessions increased confidence in carrying out pelvic examinations and taking a cervical smear, as well as developing communication skills. Advantages of these sessions related to the session itself, such as providing practical experience, and to the GTAs themselves, for example learning in a non-- threatening atmosphere. Disadvantages were very rarely reported and included feeling embarrassed during the session.
Understandably students may have feelings of fear or embarrassment when carrying out intimate examinations in clinical practice. This study has clearly showed that GTA sessions improve confidence in both examination and clinical skills in Gynaecology which form a necessary part of undergraduate education and competence required as a junior doctor.
Conclusion: GTA-led sessions are a valuable educational experience for undergraduate medical students in increasing confidence and clinical skills in Gynaecology placements.

Development of an Educational Intervention to Teach and Assess Interprofessional Conflict Management Using Standardized Professionals

Authors
Stephen Charles, East Carolina University, Brody School of Medicine, Greenville, USA
Luan Lawson, East Carolina University, Brody School of Medicine, Greenville, USA
Helen Houston, East Carolina University, Brody School of Medicine, Greenville, USA
Jim Eubanks, East Carolina University, Brody School of Medicine, Greenville, USA
Natalie Karr, East Carolina University, Brody School of Medicine, Greenville, USA
John Norbury, East Carolina University, Brody School of Medicine, Greenville, USA

Presenter: Stephen Charles, East Carolina University - Brody School of Medicine, Greenville, USA

Background: Teamwork and the ability to resolve conflict professionally is a crucial skill for practicing physicians as evidenced by medical school Entrustable Professional Activities (EPAs) and resident milestones that focus on functioning as part of an interprofessional team. The objective of our study was to develop a meaningful educational experience including a simulated conflict management situation and to develop and validate a competency-based assessment to measure interprofessional conflict management.
Method: Students participated in an educational intervention on conflict management using skills adapted from TeamSTEPPS and the DESC script. Using role-play, the students completed clinical conflict scenarios with a standardized "professional" and completed a post-encounter survey. Six investigators (2 physicians, 2 medical educators, and 2 allied health professionals) then individually scored the videotaped encounters using the Brody Interprofessional Conflict Assessment (BICA) tool.
Results: Ten students participated in the pilot study. According to post survey data, all students perceived the session to be a valuable experience. The investigators who developed the behavioral anchors demonstrated moderate interrater reliability (K=.54) likely due to a shared mental model of expectations. Kappa scores were found to be low (average K=0.03) across raters with minimal training. The highest level of agreement was in the students' description of the conflict and lowest level of agreement was in the overall assessment of the conflict. While the students appreciated learning evidence-based methods for conflict resolution and an opportunity to practice in a low stakes environment, it is difficult to reliably score their performance in a standardized encounter. Possible explanations include difficulty identifying the distinguishing? behavioral anchors, lack of standardized training, a small sample size, lack of a shared mental model of a gold-standard performance, and the rater's own varying conflict management styles.
Conclusion: Teaching and assessment of conflict resolution is an essential skill for health professionals. Simulation with standardized professionals is an effective

method for students to practice this skill in a safe environment. Developing a reliable tool to assess performance is a challenging, but necessary, step to entrust learners with this important interpersonal skill.

3FF22 (1520)
Perceptions of participants in simulation training in psychiatry

Authors
Tanja Svirskis, University of Helsinki, Department of Psychiatry, Finland

Presenter: Tanja Svirskis, University of Helsinki, Department of Psychiatry, Helsinki, Finland

Background: Simulation is a useful and practical way to learn communication skills and clinical skills in medicine. This pilot study looked at how simulation training is perceived among participants at the University of Helsinki where simulation training in psychiatry had not been used previously.
Method: Several workshops that consisted of clinical scenarios in psychiatry with a standardized patient were organized with trainees in psychiatry (N=23) as a part of their specialist training and with physicians working in general practice and occupational medicine (n=87) as continuing professional development (CPD).
Results: Few participants had previous experience with simulation training with a standardized patient. Simulation was well-accepted as a learning method, even when organized in bigger groups. The standardized patient (an actor) was perceived as real as a real patient, and the usefulness of the feedback from the patient was rated especially high. In general, the possibility to received feedback was appreciated, especially among trainees in psychiatry. Participants reported they learnt clinical skills that are needed in their work. Trainees in psychiatry strongly expressed the wish that more simulation training would be organized in the future.
Conclusion: Simulation training in psychiatry offers a possibility to learn and receive feedback on clinical situations. It seems a well-accepted method of learning in both specialist training and continuing professional development in psychiatry.
Take-home message: Simulation is a useful and well-accepted method of learning in psychiatry in both specialist training and CPD.

Development of a national near-peer Core Surgical Training interview course with emphasis on group feedback to improve confidence in the interview process

Authors
Zobia Gundkalli, The Princess Alexandra Hospital NHS Trust, Harlow, UK
Hasna Anda, The Princess Alexandra Hospital NHS Trust, Harlow, UK
Ayush Kapila, The Princess Alexandra Hospital NHS Trust, Harlow, UK
Nicholas Birkett, The Princess Alexandra Hospital NHS Trust, Harlow, UK
Luke Granger, The Princess Alexandra Hospital NHS Trust, Harlow, UK
Pratik Solanki, The Princess Alexandra Hospital NHS Trust, Harlow, UK

Presenters: Zobia Gundkalli and Hasna Anda, The Princess Alexandra Hospital NHS Trust, Harlow, UK

Background: Application to Core Surgical Training in the UK is competitive and requires rigorous preparation. Feedback is a crucial component of this process, identifying strengths, improvements and the steps needed to meet ideal standards.
Method: We developed a national Core Surgical Training interview course with emphasis on group feedback to address knowledge gaps, aid confidence and develop experience for the final interview. 27 candidates attended. They received a talk on the interview and the domains assessed (clinical, management and portfolio), then rotated through sessions on each domain in groups of 3. These involved individual 10-minute simulations by 2 near-peer tutors in surgical training with recent interview experience, while the remaining 2 candidates observed. A 15-minute group feedback session followed, enabling social group learning. The Pendleton feedback model was used with scoring for additional guidance. Candidates completed questionnaires before and after the sessions to explore levels of confidence and knowledge and to evaluate the course.
Results: There was a 38.4% increase in candidates' knowledge of the interview process and a 27.4% increase in their confidence in gaining a place. There was a 37.5%, 36.5% and 41.3% increase in confidence in the clinical, portfolio and management stations respectively. All results were statistically significant (p<0.0001). Out of a maximum score of 5 being above average, candidates rated the course 4.72 for organisation, 4.64 for usefulness and 4.8 for fairness of feedback.
We found that emphasis on group feedback enhanced candidates' confidence and knowledge in all domains. This was further supported by near-peer teaching, which offered a relevant and consistent perspective into the process. The course was evaluated as organised, useful and fair, highlighting that it was well received, allowing candidates to maintain interest and align their expectations for the interview.
Conclusion: Core training interviews remain very competitive and courses are a useful way to improve confidence in candidates. The use of near-peer and social teaching ensures that the course remains relevant and fully engaging. There are high levels of satisfaction for this format of interview preparation.

A Sustainable Ophthalmology Training Program in the Pacific: Methodology and Key Factors for Success

Authors
Catherine Green, Royal Australian and New Zealand College of Ophthalmologists (RANZCO), Sydney, Australia
Neil Murray, RANZCO
Harris Ansari, Pacific Eye Institute, Suva, Fiji
Roger Dethlefs, Pacific Eye Insititute, Suva, FIji
Sonja Cronje, RANZCO
John Szetu, Pacific Eye Institute, Suva, Fiji

Presenter: Catherine Green, Royal Australian and New Zealand College of Ophthalmologists, Sydney, Australia

Background: The Pacific region has been dependent on visiting eye care teams to provide eye care to its population of nine million. The key to sustainable eye care is the training of local eye care professionals. The Pacific Eye Institute (PEI) was established in Suva, Fiji, in 2006 to achieve this.
Method: 1. Planning and engagement: Analysis identified the stakeholders: ministries of health, non- government organisations, education institutions, hospitals and eye care personnel including ophthalmologists; all of whom were engaged - along with the support of the New Zealand and Australian governments - and invited to contribute in relevant areas, including provision of funding. A dedicated training facility, with teaching resources and a fully equipped eye clinic/ operating theatre was built.
2. Curriculum development: Needs analysis conducted, based on eye disease prevalence surveys.
A Delphi technique was used to agree content, (which included tailoring an internationally benchmarked ophthalmology syllabus) and assessment (exams, workplace-based and surgical). Participants included ophthalmologists and educators from the Pacific and Australasia. Outcomes were peer reviewed.
3. Program establishment: Master of Medicine over four years, conferred by the University of the South Pacific. Full-time local faculty appointed, supported and augmented with a structured, rotating program of sub-specialty teaching provided by visiting lecturers from the Royal Australian and New Zealand College of Ophthalmologists (RANZCO). The sub-specialty teaching is designed to augment generalist teaching.
Training is workplace based, both at the PEI and through a program of remote surgical outreach.
13 graduated specialist ophthalmologists, with 12 currently enrolled.

7 countries self-sufficient in ophthalmologists, others projected to be so by 2026.

Number of cataract procedures performed in Solomon Islands increased from ~ 1000 per year in 2013/14 to ~5000 in 2015, with sustained performance.

Conclusion: A systematic and flexible approach to specialist training, at the macro, meso and micro levels, has demonstrated a successful and sustainable outcome in the Pacific. This model has demonstrated a measurable societal and economic impact from improved education. Although complex and presenting challenges, this model could be replicable in other developing health system contexts.

Assessment for Medical Radiation Technologist Core Competency Training in Taiwan

Authors
H.Y. Chiu, JCT, New Taipei City, Taiwan
C.C. Huang, CMH, Tainan City, Taiwan
Chii-Jeng Lin
S.H.Lee, JCT, New Taipei City, Taiwan
C. I. Huang, JCT, New Taipei City, Taiwan
P.C. Wang, JCT, New Taipei City, Taiwan

Presenter: HSIN-YI Chiu, JCT, New Taipei City, Taiwan

Background: Since 2007, Taiwan established 2-year post-graduate program of 14 medical professionals, and then developed Medical Radiation in 2013, both of them are by means of core competency, developing relative training evaluation of effect, evaluating skills and appraisal standards. With the aim of whether the trainees can achieve the efficiency of core competency by utilizing systematic and structural methods.

Results: By collecting 25 Department of Radiology teaching hospitals, which including 79 trainees from 2013 to 2017, the result shows that DOPS average pre-test score is 6.19 (P<0.001,95%CI[±2.169])、 post-test score is 8.74(P<0.001,95%CI[±0.962])、 mini-CEX average pre-test score is 4.75(P<0.001,95%CI[±2.078])、 post-test score is 8.17(P<0.001,95%CI[±0.852]) have significant differences after training. Therefore, trainees' core competency has significant increased by providing them with stage training.

Conclusion: Through 2-year post-graduate training for fore and post analyzed research, we concluded that this program is definitely beneficial to new trainees. We will continuously assess the effect of program as a reference for the adjustment of training program.

Take-home messages:
1. This course intensifies the establishment of core competency as a reference for adjusting training time.
2. In comparison with the methods which senior medical staff trained trainees, the course provides systematic and structural evaluation works.

3GG4 (1874)
Important lessons learnt from a qualitative study exploring the F3 generation

Authors
Chantelle Rizan
Julia Montgomery
Charlotte Ramage
Jan Welch
Graeme Dewhurst

Presenter: Chantelle Rizan, Brighton and Sussex University Hospitals NHS Trust, Brighton, UK

Background: The number of doctors directly entering UK specialty training after their Foundation year 2 (F2) has steadily declined from 83% in 2010, to just 50.4% in 2016. This year following F2, outside the UK training pathway, is informally termed an 'F3' year. There is a paucity of qualitative research exploring why increasingly doctors are taking F3s. Our study illuminates some of these reasons and offers possible suggestions to support these doctors.

Method: This is a cross sectional qualitative research study using an explorative narrative bounded case study design. Fourteen participants were interviewed from one foundation school, using a narrative enquiry approach. Participants include 5 doctors who commenced their F3 in 2016, 5 who started their F3 year in 2015 and finally 4 recently starting this in 2017. Thematic analysis was conducted using process tracing and cross-case analysis.

Results: A major theme arising was the feeling of lack of control, including over work/life balance. There was also a spectrum of exhaustion with some doctors feeling undervalued and unsupported. Many participants used their time away from formalised training to develop their skills and experience, noting this helped them to become better doctors whilst exploring career possibilities. The timing of specialty applications was felt to be too early for many junior doctors to a) decide what to apply for b) obtain sufficient CV material to be competitive at specialty applications. The advantage of time away from training allowed these doctors to improve their specialty application, enhancing choice over future career and training location. When doctors returned to NHS posts they bought valuable experience.

Conclusion: This study provides evidence to help educators, trusts and postgraduate deans in addressing the challenge of retaining and supporting junior doctors. This may include developing new F3 opportunities and providing career support to assist in reintegrating them with training programmes. Health Education England is exploring mechanisms to appropriately recognise the experience and training gained during time out of specialty training.

More and more doctors are taking F3s and we should adapt to support them and ease subsequent re-entry into training.

Which are changes of medical professionalism after one year in internal medicine residency training?

Authors

Patnarin Pongkulkiat, Khon Kaen University, Khon Kaen, Thailand

Kittisak Sawanyawisuth, Khon Kaen University, Khon Kaen, Thailand

Presenter: Kittisak Sawanyawisuth, Khon Kaen University, Khon Kaen, Thailand

Background: Medical professionalism is one important aspect during residency training and also medical practice. This skill may develop over time of clinical practice and training. This study aimed to evaluate the changes of medical professionalism in internal medicine residents after one year of training.

Method: We enrolled residents in 2017 internal medicine residency program, Khon Kaen University, Thailand. Self reported questionnaire (33 items) was used to evalute the medical professionalism at the beginning and at one year after training. Each item had a score from 0-10; 10 is the highest score. There were two types of residents; normal residents and special track resident. The special track residents are those entering the residency training right after receiving a medical degree.

Results: In 2017, there were 22 residents in internal medicine and categorized as 10 normal residents and 12 special track residents. The special track resident group had younger age (25 vs 27 years) and more residents with GPA over 3.50 (100% vs 40%) than the normal residents. The overall professionalism level of all residents after one year of training was slightly increased from 7.27 to 7.36. There were two significant items after one year. The special track residents reported that the ideal medical professionalism on the encouraging the patients to ask questions significantly after one year of training (7.17 to 9.25; p value < 0.01). The normal residents had significant lower score on the same item above (8.50 to 6.80; p value 0.01).

After one year of training in internal medicine, there was no significant change in medical professionalism. The item on encouraging the patients to ask questions was a significant item in subgroup analysis by type of residents. An evaluation at the end of training or third year residents may be required because medical professionalism may take times to develop.

Conclusion: Residency training in internal medicine may have little effects on medical professionalism after one year of training. Types of resident may have different outcomes.

A 2-day point-of-care post-graduate ultrasound course (PoCUS-Braga) achieves knowledge and self-confidence gains on participating physicians

Authors

José Diogo Martins, School of Medicine, University of Minho, Braga, Portugal

Manuel João Costa, School of Medicine, Life and Health Sciences Research Institute (ICVS), Braga, Portugal

Dario Fernandes, Center for Education Development and Research in Health Professions (CEDAR), University of Medical Center Groningen, University of Groningen, Groningen, The Netherlands

Jorge Teixeira, Emergency Department, Intermediate Care Unit (EDIMCU), Hospital of Braga, Braga, Portugal

Marco Antonio Carvalho-Filho, Marco Antonio Carvalho-Filho

José António Mariz, School of Medicine, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Emergency Department, Intermediate Care Unit (EDIMCU), Hospital of Braga

Presenter: José Diogo Martins, School of Medicine, University of Minho, Braga, Portugal

Background: The benefits of Point-of-care ultrasonography (PoCUS) for patient care has led to the development of POCUS post-graduate training courses worldwide. It is important to understand the impact of such courses for improvement and dissemination purposes.

Method: This study evaluated the impact of the 2-day course PoCUS-Braga on participants' self-confidence in using PoCUS and on immediate and long-term knowledge retention. PoCUS-Braga includes didactic lectures and expert-led hands-on training in simulated and real settings. Knowledge (two MCQ tests on lung, cardiac and abdominal ultrasound) and self-confidence were assessed at the start and after the simulation components. The test results were calibrated using Rasch Calibration Model. One month upon return to their workplaces, participants took a survey about self-confidence and actual use of ultrasound in their practice. Survey results, knowledge and confidence assessments were analyzed with ANOVA, Pearson's correlation, and t-tests.

Results: There were 61 participants in 3 editions. Mean test scores were $78.3 \pm 14.6\%$ (at start), $93.1 \pm 5.90\%$ (after hands-on simulation) and to $89.1 \pm 6.45\%$ (after real-settings practice). Self-confidence increased significantly from the start of the course to the standardized-patients practice ($p < 0.001$). Upon return, participants reported the use of PoCUS in 4 patients (median), below the pre-course prevision of 10 patients. The accesibility to an ecographer in their workplaces was rated 5.82 on a scale of 1-10, and was considered the main constraint for more use.

Conclusion: PoCUS-Braga impacted positively on knowledge and confidence. Knowledge gains with didactic and simulation were sustained after training in real settings. The use of ultrasound upon return to practice

was below initial expectations. Insufficient availability of equipment was the main barrier for US usage reported by participants.

Short post-graduate PoCUS courses such as PoCUS-Braga may increase doctors knowledge and confidence. Barriers inherent to workplace circumstances may condition the application of PoCUS upon return.

3GG8 (1399)
Experience of a blended learning paradigm in teaching benign paroxysmal positional vertigo (BPPV) - a randomized controlled trial

Authors
Khalid Bashir
Shahzad Anjum
Amr Mohammed Abdallah Mohammed Elmoheen
Biju Ghafoor
Mahmoud Fawzy Haddad Eltawagny
Stephen Thomas

Presenter: Khalid Bashir, Hamad Medical Corporation, Doha, Qatar

Background: Benign paroxysmal positional vertigo (BPPV) is a common emergency presentation that requires specific knowledge and skills for the emergency physician. The traditional face-to-face (F2F) teaching of BPPV often entails significant time for both the teachers and learners. Blended learning (BL) has become a common teaching approach in graduate medical education with its advantages of reduced time and comparable efficacy but has not been tested in the context of BPPV teaching to Emergency Medicine Residents (EMR). The primary aim of this study was to assess whether a BL approach would prove more effective than a F2F approach in the EMR education on the management of BPPV. The secondary aim was to gauge the resident opinion of each educational approach.

Method: 38 EMRs residents were randomly allocated to either F2F or BL approach. They were all assessed before and after implementation of BPPV education. Skills acquisition was measured through the performance of Dix-Hallpike maneuver (DH) and Canalith repositioning maneuver (CR), rated 0 (worst) through 5 (perfect) by raters blinded to the study groups. Medical knowledge was assessed through a written examination comprising 20 multiple-choice questions (MCQs). A validated electronic questionnaire was sent to all study participants to assess their perceptions and self-perceived competence of BPPV with each educational approach.

Results: The characteristics of the residents in the two study groups were similar. In both the F2F and the BL groups, there was a clear improvement in the post-intervention scores in BPPV skills and medical knowledge. The DH and CR evaluations of BPPV skills showed a median difference of 0 (95% CI, -1 to 1). For MCQ, the mean improvement seen in F2F group was 0.1 higher than BL but the 95% CI (-1.2 to 1.4) crossed the null value. More residents preferred F2F approach over BL approach for teachings of BPPV.

Conclusion: The results showed significant improvements in the medical knowledge and skills acquisition of BPPV

with both F2F and BL education approaches. Although the improvements were virtually identical, more residents favored the F2F approach over BL approach for learning BPPV.

Sustainable Improvements in ABIM Pass Rates for Struggling Residency Programs

Authors
Sonia Lin, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA
Nida Hamiduzzaman, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA
Andrea Lu, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA
Seth Politano, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA
Patrick Sarte, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA
Eric Hsieh, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA

Presenter: Sonia Lin, Keck School of Medicine, University of Southern California, Los Angeles, USA

Background: From 2010 – 2014, the rolling ABIM pass rate was 77.8%, below the ACGME requirement of 80%. Prior attempts to improve the board pass rate included hospitalist-led small group lectures, reading packets, monthly mock exams, subspecialist teaching on general medicine rounds, lectures guided by deficiencies on the annual In-Training Exam, board-focused review lectures by Department of Medicine faculty, and sending all our PGY3s to a week-long, third-party preparatory course. Our program aimed to improve and sustain our pass rate to above 90%.

Method: We anonymously surveyed residents of the class of 2015 during their PGY2 year to determine their motivations behind passing the boards and adjusted our educational approach based on the results.

Results: 49 of 55 residents responded. All 49 residents reported that their primary motivator was "personal embarrassment over not passing" with 41 respondents stating that "letting down the program director" was the next greatest motivator. We then designed a longitudinal year-long board review course for all PGY3s given by the program director, capped by a week-long course given by our assistant and associate program directors. Consequently, our board pass rate rose to 96% in 2015 and has been sustained across the past 3 years for a rolling rate of 97%.

We restructured our approach to board review to capitalize on the second most common motivator by placing program leaders at the forefront of board review. We felt that if the residents could see that the program leadership was making a conscious effort to invest in their success, it would promote the sense of accountability and encourage more preparation for the exam.

Conclusion: Programs striving to improve their board pass rate should consider surveying trainees to assess their reasons for passing the boards. With that information, programs can customize their educational approach to

utilize the most common motivators to raise and maintain their pass rate.

Take-home message: For programs struggling with low board pass rates, surveying the residents to determine their motivations behind passing the boards may allow the program to tailor its educational approach to achieve a higher board pass rate.

Learning evidence-based medicine skills in postgraduate medical education: effects of deliberate practice

Authors
Eelco Draaisma, Beatrix Children's Hospital, University Medical Centre Groningen, Groningen, the Netherlands
Jolita Bekhof, Women and Children's Hospital, Isala, Zwolle, the Netherlands
A. Debbie C. Jaarsma, Lifelong Learning, Education & Assessment Research Network (LEARN), University Medical Centre Groningen, Groningen, the Netherlands
Paul L.P. Brand, LEARN and UMCG Postgraduate School of Medicine, University Medical Centre and University of Groningen, Groningen, the Netherlands

Presenter: Eelco Draaisma, Beatrix Children's Hospital and Lifelong Learning, Education & Assessment Research Network (LEARN), University Medical Centre Groningen, the Netherlands

Background: Postgraduate education in evidence-based medicine (EBM) is usually delivered through standalone courses. These can improve knowledge and skills, but likely have little impact on EBM attitude and behaviour in the workplace. The theory of deliberate practice advocates acquisition of complex skills through systematic practice and feedback. Viewing competence in EBM as a complex skill we hypothesised that, compared to only attending standalone courses, learning EBM through deliberate practice results in a more positive attitude towards EBM, and leads to changes in clinicians' behaviour.

Method: A group of paediatric registrars and consultants, who learned EBM through deliberate practice, were compared to peers who only attended a mandatory standalone EBM course. The deliberate practice group comprised those who had received deliberate training in search, appraisal and application of research evidence, either by working in a paediatric EBM department (Isala, Zwolle) for 1-2 years, or by completing a PhD. Participants completed a 10-item multiple-choice questionnaire, assessing EBM knowledge, and the evidence-based practice inventory (EBPi), which assesses five dimensions of self-reported EBM attitude and behaviour.

Results: 50/62 (81%) of eligible participants completed the questionnaires. Compared to controls (n=20), the deliberate practice group (n=30) scored significantly higher on the EBPi dimensions 'perceived behavioural control' (p=0.000) and 'decision making' (p=0.047). Compared to non-PhDs (n=32), participants who had completed a PhD (n=18) scored significantly higher on the EBPi subscales 'subjective norm' (p=0.039), 'perceived behavioural control' (p=0.000) and 'decision making'

(p=0.000), and tended towards better EBM knowledge (p=0.059) and a more positive attitude (p=0.060). The deliberate practice group reported more self-confidence in applying EBM skills in daily practice, and higher priority given to using EBM principles in medical decision making. These differences seem largely attributable to the subgroup of PhDs, possibly because they spent more time on deliberate, supervised practice.

Conclusion: Learning EBM through deliberate practice might improve attitude towards EBM and lead to more EBM behaviour in the workplace.

Teaching EBM to specialist registrars through deliberate practice might achieve deeper learning effects in terms of improving attitude and behaviour, compared to only attending a standalone course.

Reasons for prolonged residency in Switzerland

Authors
Céline Favrod, CHUV, Lausanne, Switzerland
Jean-Blaise Wasserfallen, CHUV, Lausanne, Switzerland
Nathalie Koch, CHUV, Lausanne, Switzerland

Presenter: Céline Favrod, CHUV, Lausanne, Switzerland

Background: Swiss doctors reach the average age of 34 years before obtaining a specialist title, even though, the duration of residency is 5 to 6 years by regulation. We wanted to analyse the reasons why residents have a prolonged residency at our University hospital in Lausanne, Switzerland.

Method: In 2016, we conducted a short telephonic survey with all doctors in our hospital who were working as residents in their 9th year or more (77 respondents, response rate 77%) with one open ended question: "Why you have been working as a resident for nine years or more?".

Results: Three principal reasons were identified: the choice of a second speciality (39% respondents), years of residency spent in a field not recognised for the chosen specialty (30%) and breaks during residency for reasons related to family or research activities (30%).

Internal and external reasons that prolong residency were distributed into three main domains of which only one is under hospital control. Hospitals have to improve the structure of residency tracks to prevent residents working in fields not relevant to their specialty.

Swiss residents compose their residency track themselves according to available job openings. They may work in disciplines unrelated to their chosen specialty while waiting for a desired job opening, change their mind about the desired specialty, choose to obtain several specialties or interrupt residency for family or professional reasons.

Conclusion: The Swiss system of postgraduate training gives residents a large autonomy in organizing their residency. This is an advantage for residents desiring to combine residency with other activities. However, it

results in a long duration of residency as well as lack of coherent structure of residency programs.

3GG13 (3344)
Respiratory therapy technology: The continuous teaching and training courses based on Miller's pyramid

Authors

Tsai-Chen Yu, Taipei Medical University Shuang-Ho Hospital Division of Chest Medicine, New Taipei City, Taiwan
Chao Hu, Taipei Medical University Shuang-Ho Hospital Division of Chest Medicine, New Taipei City, Taiwan
Han-Lun Yu, Taipei Medical University Shuang-Ho Hospital Division of Chest Medicine, New Taipei City, Taiwan
Che-Wei Lin, Taipei Medical University Shuang-Ho Hospital Department of Medical Education, New Taipei City, Taiwan
Bei-Wen Wu, Taipei Medical University Shuang-Ho Hospital Department of Medical Education, New Taipei City, Taiwan
Chien-Ling Su, Taipei Medical University Shuang-Ho Hospital Division of Chest Medicine, New Taipei City, Taiwan

Presenter: Tsai-Chen Yu, Taipei Medical University Shuang-Ho Hospital Division of Chest Medicine, New Taipei City, Taiwan

Background: In the past, our PGY training program for respiratory therapists is non-coherent and lacking decision-making training, resulting in incompetent clinical performance. However, therapeutic technology training courses focus on hang-on technical operations and applications. We design the new training courses based on Miller's pyramid as a clinical assessment. Throughout the consistent training, trainers could assess the competency of learners.
Method: In the past, we only have lectures and the final assessment. We noted that the outcome is not satisfied and we re-design the training course based on Miller's learning pyramid. There are four stages in our revolutionized training course. 1. Knows: We use the "Flipped Classroom" to build the knowledge. 2. Knows how: The "teach-back" method would confirm the competence of trainees. 3. Shows how: We design clinical scenario to assess the clinical decision-making of trainees. 4. Does: Trainers use "direct observation of procedural skills (DOPS)" to observe trainees and give bilateral feedback.
Results: Before the program, 7 trainees' average score is 58 out of 100. After the first stage of training, their score increases significantly to 89. In the second stage, the accuracy of assembling devices raises from 71% to 100%. In the third stage, trainees could handle 71.4% of troubleshooting, pass 100% of the clinical assessment, and achieve 71.4% of their clinical decision-making. In the last stage, the score of DOPS raises from an average of 3 to 4.7 (total 6.0) and trainees satisfaction marked 4.8 (total 5.0).
Conclusion: We apply Miller's pyramid principle in our design. Through our data showed that this course combines the different strategy of training and assessment to progressively build the concept of integrative learning. As a result, trainees gain significant learning outcome and satisfaction.
The training program should build on Miller's framework and progressively form the concept of integrative learning

to bridge the gap between medical education and clinical application.

Evaluation of Student Self-perceived Progress and Competence after the Self-directed Medical Simulation Based Trauma Life Support Course

Authors

Rita Gudaityte, Department of Surgery, Lithuanian University of Health Sciences, Kaunas, Lithuania
Povilas Ignatavicius, Department of Surgery, Lithuanian University of Health Sciences, Kaunas, Lithuania
Algimantas Tamelis, Department of Surgery, Lithuanian University of Health Sciences, Kaunas, Lithuania
Dinas Vaitkaitis, Crises Research Centre, Department of Emergency and Disaster Medicine, Lithuanian University of Health Sciences, Kaunas, Lithuania
Asta Krikscionaitiene, Crises Research Centre, Department of Emergency and Disaster Medicine, Lithuanian University of Health Sciences, Kaunas, Lithuania
Zilvinas Dambrauskas, Department of Surgery, Lithuanian University of Health Sciences, Kaunas, Lithuania

Presenter: Rita Gudaityte, Department of Surgery, Lithuanian University of Health Sciences, Kaunas, Lithuania

Background: HybridLab is a fusion of distance learning and self-directed medical simulation that allows learners to train 24/7 at their work place without direct presence of the instructor and/or technician. In 2014 original trauma course was developed on the new HybridLab learning platform. The aim of this study was to assess the satisfaction of participants and the course utility.
Method: The curriculum focused on strengthening basic trauma management skills, setting ABCDE priorities for the early management of critically injured trauma patients and strengthening non-technical skills. Twenty-seven surgical residents of Lithuanian University of Health Sciences were enrolled. Progress of the student was assessed immediately and 6 months after the course. Post-course survey was performed and the feedback of the participants and the estimation of self-perceived ability to carry out the crucial clinical tasks and skills was evaluated.
Results: During the post-course survey 92% of the participants stated that they found the acquired knowledge and skills clinically relevant and applicable (60% said it was very useful, 32% - useful). After the course 88% of the respondents were confident that they were capable of safely applying the acquired skills in the clinical setting (43% stated that they felt proficient, 45% - skilled). During the post-course survey, we asked the participants to estimate their self-perceived ability to carry out the crucial clinical tasks and skills, including the primary and secondary survey of the patient, management of the airways, immobilization and control of external bleeding. Overall, 94% of the course participants acknowledged that the course has increased their competence to provide advanced care for the severely injured patient and 56% of the respondents stated the change was significant and encouraged them to review their daily clinical practice.
Conclusion: Evaluations of students' opinion and acceptance can be seen as first step when establishing a

new learning program. Our study revealed a high approval of the participants for the offered blended (hybrid) learning environment and contents.

Broad acceptance is crucial for successful programme implementation, but it is also important to evaluate its influence on participants' gain of practical skills.

Group Reflective Learning Sessions improve Anaesthesiology Residents' engagement and confidence in conducting a Personal Reflective Practice

Authors

Caroline ONG YM, Department of Anaesthesiology, Intensive Care and Pain Medicine, Tan Tock Seng Hospital, Singapore and, NHG Anaesthesiology Residency Program, Singapore
Adeline LEE HL, National Healthcare Group Education, Singapore

Presenter: Caroline Ong, Tan Tock Seng Hospital, Singapore

Background: Reflection is an advanced meta-cognitive process of analysing, questioning and re-framing experiences, to develop greater understanding of one's thoughts, feelings and behaviours. Reflecting on one's practice is vital for lifelong learning and improvement. In our context, Anaesthesiologists practise within multi-disciplinary teams, but with little interaction with fellow Anaesthesiologists during working hours. Many cases of learning value get discussed informally as "tea-room talk" between colleagues.

Method: Compulsory written reflective pieces tend to be unpopular with trainees and may generate resentment or apathy. We sought to develop an effective and enjoyable peer reflective activity simulating conversations between friends. This weekly activity began in July 2017 with an introduction to the concept and objectives of reflection. Residents were encouraged to use question prompts (AMEE Guide no.44, Appendix) to guide their reflections. Residents were free to select any case with learning value in one or more of the ACGME Core Competencies. Each resident's reflection was enhanced by peer-to-peer formative feedback (facilitated by a core faculty member), followed by development of a personal improvement plan. Confidentiality of patients, staff involved and residents' thoughts/ emotions was emphasized, to maintain a safe and non-judgmental environment for learning.

29/33 (87.8%) of residents responded to a survey conducted after 6 months.

Self-Reflection and Insight Scale (Roberts, 2008) was used to assess for differences in (1) Engagement in self-reflection, (2) Need for self-reflection, and (3) Insight, before and after introduction of these sessions.

Improvement was noted in scores for components (1) and (2), especially for residents who had presented >/= 2 times, or attended >/= 7 sessions.

Results: 80% understood the importance and goals of reflective practice and were familiar with the process of reflection, while 66% were confident of independently conducting a personal reflective practice.

Vast majority were comfortable with the group format.

Conclusion: As medical landscapes rapidly evolve, self-regulated learning and reflection has surpassed knowledge acquisition in importance. Group sessions are an effective and non-threatening way of fostering reflective practice in residents.

Take-home message: Participation in group reflective learning sessions positively influences residents' engagement and confidence in conducting a personal reflective practice.

3GG16 (454)

Transition to Practice: Evaluating the need for formal training in supervision and assessment among senior emergency medicine residents and new-to-practice emergency physicians

Authors

Sarah Kilbertus, University of Toronto, Canada
Kaif Pardhan, Sunnybrook Health Sciences Centre, Canada
Glen Bandiera, St. Michael's Hospital, Toronto, Canada
Juveria Zaheer, Centre for Addiction and Mental Health, Toronto, Canada

Presenter: Sarah Kilbertus, University of Toronto, Canada

Background: Emergency medicine residents may be transitioning to practice with minimal training on how to effectively supervise and assess trainees. It remains unclear how comfortable senior residents and new attending physicians are with these competencies. Our study sought to examine physician comfort with supervision and assessment; whether there was a perceived need for formal training in these areas; what the current gaps were in training; and what barriers or enablers exist in implementing it.

Method: Qualitative data were collected in two phases during September 2016-November 2017 through one-on-one interviews of PGY5 and CCFP-EM emergency residents, and attending physicians within their first 3 years of practice, at the University of Toronto and McMaster University. A semi-structured interview guide was developed in consultation with a qualitative researcher, and then refined after the first phase of interviews, to ensure that all potential areas of thematic generation were touched upon. Transcripts were coded, analyzed, and collapsed into themes using NVivo software. Data analysis was guided by a constructivist grounded theory based in a relativist paradigm, which assumes that ones' reality is constructed inter-subjectively through understandings that are developed socially and experientially.

Results: Thematic analysis revealed five themes: Residents and staff described acquiring the skills of supervision and assessment passively through modeling the behaviours of others; the training that is available in these areas is variably used, creating a diversity of physician comfort levels; the many competing priorities in the emergency department represent significant barriers to improving supervision and assessment; providing negative feedback is universally difficult and often avoided; the move towards competency by design (CBD) will act as an impetus for more formal curriculum being required in these areas.

Conclusion: There appears to be a lack of standardization in how supervision and assessment are taught, and gaps in physician comfort, particularly in how to identify failing trainees and approach negative feedback.

As programs transition to a CBD model, there will be a greater need for formal training in supervision and assessment to achieve a standard level of comfort and competence among senior residents and new-to-practice physicians.

Partnering with Industry to develop a multidisciplinary Professional Development Programme for a Paediatric quaternary centre

Authors

J Poisson
D Hothi
S Sharma
E J Parish
S Skellett

Presenter: Justin Poisson, Great Ormond Street Hospital for Children, London, UK

Background: Morgan Stanley's relationship with Great Ormond Street Hospital (GOSH) began in 2007. As a corporate sponsor, they have donated much needed facilities for staff and patients. In addition, Morgan Stanley employees volunteer their time to work with young people and staff, providing support and mentoring. The Postgraduate Medical Education team at GOSH utilised this relationship with industry to develop a Professional Development Programme (PDP) for GOSH Staff.
Method: The PDP was designed to address the professional development needs of doctors, nurses, allied health professionals (AHPs) and admin staff at various bands in the hospital structure. The programme was structured on three levels, catering to varied experience. Level 1 for junior members of staff, Level 2 middle grade and Level for the senior members of the organisation. Level 1 gave an introduction to professionalism in the National Health Service (NHS). More advanced levels focused on building NHS wisdom, covering areas such as leadership, self-awareness, quality improvement and finances.
The Morgan Stanley team offered their expertise delivering sessions on topics including financial administration techniques, business case writing and team management.
Results: On average, 16 delegates attended each course. All professional areas were represented, from various clinical specialties. The face-to-face sessions were a mixture of lectures, learning games, flipped classrooms, action learning sets and reflective practice. 100% provided feedback and all agreed, or strongly agree, the course was relevant, well facilitated and it would influence their future practice.
Conclusion: Leadership and professional development are important in upskilling the workforce and staff retention. Having a multi professional audience provided a great dynamic to the sessions; participants gained a respect for

the work their colleagues do on the front line or the back office. Participants valued the sessions, finding them relatable despite the stark contrast in the organisations. There is much benefit in working with other industries. The private sector has a focus on resource efficiencies, something the public sector needs. Setting the sessions off-site gave participants an opportunity to remove themselves from the clinical setting, allowing them to immerse themselves into the educational offering.

3GG18 (580)
Educational needs of neonatologists on end of life care in a tertiary hospital

Authors

Wing Yee Tong
Komal Tewani

Presenter: Komal Tewani, KK Women and Children's Hospital, Singapore

Background: The topic of neonatal palliative care is often a difficult one to address for physicians and parents alike, and there are many challenges faced in providing optimal care for terminally ill babies. This study aims to assess the perspective of neonatologists towards palliative care services and end of life issues, and determine how terminally ill babies and their families can be better supported.
Method: We conducted a survey amongst the neonatologists in KK Women and Children's Hospital, which has a tertiary level neonatal care facility. An online survey was sent to the physicians in the department, with the objective of assessing the challenges they faced in the care of terminally ill babies, as well as their understanding of the services provided the hospital's palliative care team for neonates.
Results: There were 17 respondents to the survey, mainly senior medical staff with experience in caring for terminally ill neonates. A common challenge cited by neonatologists was initiating discussion on the topic of end of life care with families, and a large majority (70.6%) did not feel that the palliative care team was usually involved in such conversations. All the respondents were aware of the Advanced Care Planning programme (ACP), and a large majority (94.1%) agreed that the ACP helps to align the goals of care for terminally ill neonates. Only 47.1% of respondents felt that families were adequately involved in decision making about their terminally ill children, and 35.9% felt that parents did not have adequate support and resources. General understanding of community palliative services available was also limited. Majority of the respondents (70.6%) strongly agreed they would benefit from further teaching about end of life care, including initiating conversations with families on the topic.
Conclusion: This survey has demonstrated some of the challenges faced by neonatologists in the care of the terminally ill babies, as well a lack of understanding of the resources available for families of patients, especially in the community setting. These results can guide the design and implementation of training sessions for staff to

overcome these specific barriers, and improve care for these neonates.

Assessing the Quality of Educational Supervisor Reports and Supervised Learning Events

Authors
Mumtaz Patel, Health Education England North West, Manchester, UK
Paul Baker, Health Education England North West, Manchester, UK

Presenter: Mumtaz Patel, Health Education England North West, Manchester, UK

Background: Our previous research has shown that Educational Supervisor Reports (ESR) and Team Assessment of Behavior are strongly predictive of doctors in difficulty (1). However, quality of ESRs and Supervised Learning Events (SLEs) are variable and this study evaluates whether this can be improved using a structured form and targeted feedback to trainers.

Method: A one page framework was used to assess the quality of each ESR (n=15) by the Renal Medicine Annual Review of Competency Progression (ARCP) panel at Health Education England North West (HEE NW) in 2014. Formative feedback was sent to each educational supervisor (ES) and their comments were invited and individually discussed. The successive ESRs (n=15) were then assessed by the Renal ARCP panel in 2015 and 2016 to see if there had been any improvement in quality. A similar framework was used to assess the quality of SLEs (sample of 3-4 per ES) by the Renal ARCP panel (n=21) in 2016. The ES and trainee feedback was assessed qualitatively using a thematic analysis.

Results: Successive ESRs showed:
- Significant improvement in quality with increase in excellent grading from 13.3-80% (P<0.0001).
- Detailed free-text comments referenced to multiple sources of evidence
- More constructive feedback with specific learning objectives incorporated into the personal development plan.
- Good evidence of learning from clinical incidents.

The SLE quality was:
- Variable with 2/3 being acceptable.
- Minimal free-text limited to clinical skills.
- Few comments on generic skills including communication skills and professionalism.
- Feedback was poor and non-specific

The ES and trainee feedback was:
- Overwhelmingly positive; trainees felt valued for being asked

Conclusion: A simple structured form to assess ESR and SLE quality during ARCPS can provide useful formative feedback to ES and this significantly improves quality of successive ESRs. The ESR quality work has now been rolled out regionally at HEE NW and nationally through the Joint Royal Colleges of Physicians Training Board.

Report: Development Trial of an Abdominal Emergency Medical Training Course

Authors
Hiroshi Mihara, University of Toyama, Toyama, Japan
Seisuke Okazawa, University of Toyama, Toyama, Japan
Hiromasa Tanaka, Asaka Medical Center, Saitama, Japan
Masafumi Mizooka, Hiroshima University Hospital, Hiroshima, Japan
Takayoshi Yamanouchi, Hitachinaka General Hospital, Hitachinaka, Japan
Koji Kajinami, Kanazawa Medical University, Kanazawa, Japan

Presenter: Hiroshi Mihara, University of Toyama, Toyama, Japan

Background: Abdominal pain is a frequent complaint of ambulance outpatient (5%). The Japanese Society for Abdominal Emergency Medicine in collaboration with four other medical societies published the Practice Guidelines of Acute Abdomen in 2015. The Japanese Society of Internal Medicine has held the Japanese Medical Emergency Care Course(JMECC) since 2009, but the abdominal emergency scenario has not been included in the course.

Method: We developed a training course specified for abdominal medical care (Hokuriku branch of Fellow of the Japanese Society of Internal Medicine). We identified 23 core competencies and core ultrasound skills for abdominal medical care. Total score for these core competencies significantly increased during the careers of clinical resident and gastroenterologist.

The goals of the course are as a physician to obtain the ability to quickly respond to patients complaining of abdominal symptoms (emergency medical care, interview, physical and ultrasound examinations, clinical reasoning, presentation and patient attention). Eleven courses for five hours were held from 2011 with over 200 participants. The course contains preparation and questionnaire, abdominal physical and ultrasound examinations and simulated medical care, followed by formative evaluations and lectures according to results of the questionnaire until the seventh course.

Results: Of the trainees, 75.3 per cent answered very helpful for future learning and 64.9 per cent were satisfied (The recovery rate was 95.1 per cent). The total score for abdominal core competencies were significantly lower in medical students and higher in gastroenterologists than the other groups (clinical residents, other specialized physician and general medicine). The biggest difference between gastroenterologists and the other was abdominal ultrasound competence.

Conclusion: There are learning needs for abdominal medical care, especially performing abdominal ultrasound. Keeping the quality and quantity of the instructors and simulated patients are the most difficult. Introduction of abdominal ultrasound phantom might be considered instead of simulated patients. It is important to provide opportunities of ultrasound to the beginners. In order to standardize abdominal medical care, development and holding of standardized course is required. We have

developed the five-hours Abdominal Emergency Medical Training Course. The use of abdominal ultrasound is the key component.

3HH: Posters: Interprofessional Education - Postgraduate

Location: Hall 4.u, CCB
Date: Monday 27th August
Time: 1015-1200 hrs

3HH1 (1662)
Understanding context in collaborative decision making at interprofessional team meetings (IPTM) using the Cynefin framework

Authors
Keng Teng Tan, Tan Tock Seng Hospital, Singapore
Mary Lee, National Healthcare Group, Singapore
Yu Han Ong, National Healthcare Group, Singapore
Wee Shiong Lim, Tan Tock Seng Hospital, Singapore

Presenter: Keng Teng Tan, Tan Tock Seng Hospital, Singapore

Background: Leading an interprofessional team is a complex task which healthcare professionals seldom receive training in. IPTMs provides an important platform for the interprofessional team to come together to discuss patients with multifaceted needs and formulate a shared care plan. The Cynefin framework helps leaders determine the prevailing context to facilitate decision-making in different situations. We aim to evaluate the discursive strategies used in the IPTM of geriatric medicine teams and how collaborative decision making is carried out can be enhanced using the Cynefin framework.
Method: Tape-recorded observations of IPTM chaired by 6 different senior doctors were transcribed and analysed to identify what discursive strategies were used in patient case discussions, the complexity of the prevailing context, and the effectiveness of collaborative decision was reached.
Results: Using the Cynefin framework, patient case context was categorized into 4 categories: simple, complicated, complex or chaotic. Team members and leader adopted discursive strategies such as structured sequence narrative, story –telling and questioning. Team leaders who were better able to adapt discursive strategies to manage the prevailing context were more effective in collaborative decision-making. For complex and chaotic cases, repeated IPTM discussions over 2 or more weeks were necessary to sort out the complex medical, functional or social issues.
Collaborative decision-making in interprofessional teams occur within varying complexities of patient context. Without structured training, physicians and other healthcare professionals are often tasked to lead discussions and decision making which will impact significantly on patient's care. The Cynefin framework provides a feasible model for team leaders to appraise the prevailing context in IPTMs so that discursive strategies can be tailored to improve team decision-making.
Conclusion: A keen understanding of context while deliberating care decisions during IPTMs can enable interprofessional teams to adopt discursive strategies for effective collaborative decision-making. Our findings corroborate the importance of equipping interprofessional

team leaders with conceptual frameworks that promote contextual awareness, so as to enhance interprofessional communication and decision-making during team meetings.

3HH2 (1625)
Enhancing Interdisciplinary Patient Care via Patient-Centered Interprofessional Collaboration Computerized Platform

Authors
Yen-Ling Ko, Chimei Medial Center, Tainan, Taiwan
Kun-Ming Chung, Chimei Medial Center, Tainan, Taiwan
Ya-Wei Kuo, Chimei Medial Center, Tainan, Taiwan
Chia-Jung Chen, Chimei Medial Center, Tainan, Taiwan
Chung-Feng Liu, Chia Nan University of Pharmacy and Science, Tainan, Taiwan
Hung-Jung Lin, Chimei Medial Center, Tainan, Taiwan

Presenter: Yen-Ling Ko, Chimei Medical Center, Tainan, Taiwan

Background: Interprofessional collaboration among healthcare workers improves outcomes of medical care provided to the patient and is also an important element of continued medical education and professional development. Multidisciplinary meetings can be conducted for having a holistic patient-based discussion. However, these timed discussions may not be conducted frequently enough to serve the purpose of "real-time" patient care. To truly provide continuous interdisciplinary care, a patient-centered communication platform is helpful. Chimei Medical Center organized a project to develop a patient-centered computerized platform to fulfill interprofessional collaboration needs for hospitalized patients. The computerized platform features a spiral-shaped integrated care area which provides updated information on patient progress and a communication area that allows instant communication, virtually putting all the different professionals on the same page. Besides providing the means for timely communication, more importantly, this platform can also provide learning and teaching resources.
Method/Results: A five-scaled online survey with convenience sampling by referring to Technology Acceptance Model (TAM) was used to get feedback from pilot users of this computerized platform. In total, there were 108 valid copies of the questionnaire obtained from 35 respiratory therapists, 22 nurses, 21 nurse practitioners, 10 doctors, 8 rehabilitation therapists, 6 pharmacists, 3 nutritionists, 2 quality managers, and 1 administrative personnel. The responses, with respect to the platform, show high approval for perceived usefulness and perceived ease of use (mean > 4.0) as well as high behavioral intention to use (mean > 4.2).
Conclusion: Multidisciplinary teamwork can achieve greater efficiency and provide better quality in patient care. But scheduled multidisciplinary discussions at set intervals are inadequate and more frequent meetings can add on clinical burden. Thus, a dynamic, integrated and updated information platform that also allows multidirectional communication facilitates simple and

efficient interprofessional communication and collaboration.

Medical professionals need to be equipped with the ability to work in interdisciplinary teams to provide the best quality patient care. By using this newly developed computerized information and communication platform, members of the health care professions can come together at all times to give professional advice for optimal patient care.

3HH3 (1350)
Knowledge and Attitude towards Interprofessional Collaboration among Postgraduate Medical Students of Bangladesh

Authors
S M Tajdit Rahman
Adiba Tarannum

Presenter: S M Tajdit Rahman, National Institute of Diseases of the Chest & Hospital, Dhaka, Bangladesh

Background: Interdisciplinary healthcare teams are central to improve patient outcomes. Strong interprofessional education (IPE) is fundamental for effective team performance. IPE is also essential for a good healthcare system. But, in Bangladesh, there is lack of knowledge and process to develop a positive attitude towards Interprofessional education and collaboration.
Method: A cross sectional type of descriptive study was conducted to assess the knowledge and attitude of postgraduate students of BSMMU, Dhaka towards interprofessional collaboration. 300 students were purposely selected for study. Data were collected by face to face interview from the respondents through semi-structured questionnaire.
Results: Majority of the students showed lack of knowledge (70.33%) about interprofessional collaboration. Most of the Students did not know the importance (79.33%) of interprofessional collaboration and education. Very few students enjoy team work (24.67%). Majority of them do not know how to implement (69 %) interprofessional collaboration.
Poor knowledge of postgraduate trainees is a sequel of lack of introduction in undergraduate level. Without proper knowledge and application of IPE a good healthcare system would not be possible. Measures like classes from under graduation, campaigning, review of curriculum, collaboration with other countries, student exchange etc. should be taken.
Conclusion: It can be concluded that knowledge and attitude about interprofessional collaboration of postgraduate medical students of third world country like Bangladesh is very poor. For future doctors it could be difficult to take part in the era of interprofessional collaboration which is very important for patient care.
Take-home message: Poor knowledge and attitude about interprofessional collaboration between postgraduate medical trainees of Bangladesh.

3HH4 (980)
Unmet needs in communication between residents and nurses in internal medicine wards: at a university teaching hospital in Korea

Authors
Kyong Hwa Park, Korea University Anam Hospital, Seoul, Korea
Yoon-Ji Choi, Korea University Anam Hospital, Seoul, Korea
Young Mi Lee, Korea University, Seoul, Korea

Presenter: Kyong Hwa Park, Korea University Anam Hospital, Seoul, Korea

Background: Inter-professional communications between the healthcare practitioners is an important issue for patient safety. Residents and nurses in our hospital also perceived that inter-professional conflict has been increased after introduction of new regulation on resident duty hours. The purpose of this study was to assess unmet needs in communication between residents and nurses, which may cause interprofessional conflict.
Method: Residents and nurses in the internal medicine wards at the Korea University Anam hospital (Seoul, Korea) were invited to participate in the survey. A questionnaire asking perception towards competencies in interpersonal/teamwork skills of each counterpart, frequency/main causes/resolving methods of conflicts, and the actual vs. preferred tools of communication was developed.
Results: Twenty-four residents and 213 nurses voluntarily participated in the survey. The mean score of satisfaction level of inter-profession communication in nurses was 4.1 out of 10, but it was 5.1 out of 10 in residents. About 70.1% of the nurses reported stressful conflicts and the mean number was 8.75 over the last 12 months. About 54% of the residents experienced conflict with nurses and the mean was 4.9 over 12 months. Most of the nurses regarded residents' disrespectful attitude (75%) and unwanted way of communication (23%) as causes of conflicts. More than 50% of residents claimed that clinical competency of nurses was unsatisfactory. In addition, residents were not satisfactory about nurses' choice of communication tools; inappropriate considering medical urgency. Currently, cellphone was the most popular communication tools (85%), followed by mailbox (10%), face-to-face (5%). However, 60% of nurses wanted to communicate using intranet messenger, followed by face-to-face (27%), cellphone (13%). On the other hand, residents wanted to use cellphone in 50%, followed by intranet messenger (40%), face-to-face (10%).
There was considerable amount of inter-professional conflicts due to discrepancies in communication methods according to medical urgency. We also found that intranet messenger and discussion about appropriate use of communication methods are urgently needed to foster inter-professional collaboration.
Conclusion: Various strategies and investment are needed to improve inter-professional communication. Smart application of technology-based communication tools might contribute to decrease unnecessary conflicts in clinical field.

3HH5 (1820)
Analysis of Learning Behavior and Learning Performance in Blended Learning of IPP/IPE to Clinical Nurse

Authors
Li-Chen, Lin
Ying-Jung, Lai
Tsung-Kun, Lin

Presenter: Li-Chen Lin, Tri-service General Hospital, Taipei city, Taiwan

Background: Our hospital used Blended Learning to provide interprofessional education. Health care teams with basic knowledge of case demographics, health care matrix and the integrated medical care notification on the intranet teaching platform. The day of the seminar will be conducted by simulation and video recording to model appropriate interprofessional teamwork. Nurse can watching and learning online after the seminar.
Method: Nursing department has been using both the course satisfaction and test scores, only know the reaction and learning situation in Kirkpatrick Model. We start used Interdisciplinary Education Perception Scale (IEPS) to monitor changes in attitudes and perceptions of nurse. The analysis was conducted in March to October 2017, after nurse participating in seminar, in addition to online satisfaction, completing the quiz and study sheet, need to write the IEPS. The original 4 subscales version of the IEPS was published by Luecht et al. (1990, Journal of Allied Health, 181-91). that can be used to assess the effect of interprofessional education experiences on Nurse.
Results: Total of 789 Nurse completed the learning, only 640 completed the questionnaire. The proportion of satisfaction was 91.9. The IEPS 4 sub-scale: competency and autonomy was 5.45 ± 0.70, perceived need for cooperation was 5.44 ± 0.68, perception of actual cooperation was 5.50 ± 0.76 and understanding others' roles was 5.35 ± 0.64.
Further analysis of the sub-questions 「Individuals in my profession have a higher status than individuals in other professsions」 show a lower degree of feedback(5.15 ± 1.02).
Using of Blended Learning to provide interprofessional education care team, the content of the course and the video on the process of testing and discussion on the network, the scene by the all health professions use and learn from others to solve problem, the core knowledge, skills and attitudes converted to the contextualized-KAS. That means Clinical nurses have less affirmation of their own professional, but also look forward to their performance in the interprofessional care team.
Conclusion: Clinical nurse in addition to by the education and training courses, nursing division intensified recognition of care team, we should also organize and summarize Nursing professional knowledge and skills to demonstrate the uniqueness of the nursing profession in the clinical care process and teamwork.

3HH6 (2090)
Physicians and nurses in simulation: Perceptions of interprofessional Collaboration in Trauma-team Simulations

Authors
Alexander von Wendt
Eeva Pyörälä
Leila Niemi-Murola

Presenter: Leila Niemi-Murola, Helsinki University, Espoo, Finland

Background: There is a wealth of simulation studies on learning knowledge and technical skills in a single profession. However, there are fewer studies about non-technical skills in interprofessional clinical simulation; and studies about perceptions of interprofessional teamwork are rare. This phenomenographical study focuses on work-based, high-fidelity simulations of interprofessional trauma-teams; and aims to explore how the participants of these simulations percieve teamwork in interprofessional healthcare teams.
Method: Our data consist of semi-structured interviews of ten healthcare professionals at Töölö Hospital in Helsinki. Participants were selected using purposive sampling aiming at a variation between professions, and their working-life experiences. Four residents, three experienced nurses, and three experienced clinicians who have participated in trauma-team simulations were recruited for the study. Data were transcribed word for word and analysed using phenomenographic research methodology, which explores differences between participants' perception of a phenomenon.
Results: The analysis of the data revealed an interesting dichotomy related to the professional experience of the physicians. The more experienced physicians focused on medical and logistical problems which made teamwork more difficult. Senior physicians expressed that the teamwork itself worked well, while residents and nurses indicated several flaws in the collaboration. Interprofessional tension, lacking communication, and lacking leadership was frequently brought forth as examples of suboptimal teamwork. As participants gave examples of problematic teamwork, blame was usually assigned to a member of another profession. However, participants sometimes also expressed flaws inside their own profession. The experienced nurses described their role in the simulation as being co-instructors; to actively support junior physicians' learning.
Conclusion: This study recognised divergent views about interprofessional teamwork between residents, senior physicians, and nurses. These observations are valuable for the future, especially when designing interprofessional simulation exercises, when planning how to choose participants, and when conducting the debriefing of an exercise.
The junior physicians, senior physicians, and experienced nurses had differing perceptions of collaboration. Senior physicians focused on factors outside the teamwork which made interprofessional collaboration challenging, while the junior physicians and the nurses focused on analysing the teamwork.

3HH7 (2351)
Interprofessional collaboration education initiatives: what works for whom, how and under what circumstances

Authors
Isabelle Gaboury, Université de Sherbrooke, Longueuil, Canada
Frédéric Pinard, Université de Sherbrooke, Sherbrooke, Canada
Dave Bergeron, Université de Sherbrooke, Longueuil, Canada
Véronique Lisée, Université de Sherbrooke, Sherbrooke, Canada
Chantal Lemire, Université de Sherbrooke, Sherbrooke, Canada
Hélène Corriveau, Université de Sherbrooke, Sherbrooke, Canada

Presenter: Isabelle Gaboury, Université de Sherbrooke, Longueuil, Canada

Background: An optimal collaborative practice is rooted in the exposition of future healthcare professional to interprofessional education (IPE). IPE initiatives are defined as "occasions when two or more professions learn with, from and about each other to improve collaboration and the quality of care". However, few research have studied the facilitating or impeding factors and the underlying mechanisms to this apprenticeship.
Method: This project aims to achieve a realist review of the literature to understand context and underlying mechanisms related to successful and unsuccessful IPE initiatives for medical and health sciences trainees. This presentation focuses on the Context-Mechanism-Outcome (CMO) configurations developed through this research project. This review was built on an initial framework combining theories about the development of prejudice, the intergroup contact, self-efficacy belief, and self-development. From the 6178 articles identified through a search of Medline, CINAHL, PsychInfo, and Google Scholar (1997 to 2017), 367 were considered for directed content analysis.
Results: The review included trainees from various disciplines including medicine, nursing, rehabilitation sciences, social work and psychology. The analysis shed light on CMO chains allowing for a better understanding of the successes and failures of various IPE learning situations. Notably, a clear learning context (e.g. explicit goals of the IPE initiative, roles and expectations of the participants, multidisciplinary representation of the participants, and qualified educators) and concrete examples from the trainees' hands-on practice led to openness (or not) to learning IP, attitudinal change, and self-reflexivity; which in turn resulted in improved (perceived or measured) collaborative skills, teamwork, and understanding of one's role.
Conclusion: This study is the first one to highlight CMO chains that apply to an IPE context within an academic setting. It emphasizes the need to carefully plan IPE initiative set-up in order to maximize the outcomes of the intervention.

From this review, medical and health sciences programs will be able to develop better initiatives and workshops allowing for more effective IPE initiatives through, for example, the clarification of the activity terms or by leveraging the challenges encountered by the trainees.

Chandrika Dini Khaerani, Medical Education Center Indonesia Medical Education and Research Institute Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia

Presenter: Ardi Findyartini, Department of Medical Education & Medical Education Center Indonesia Medical Education and Research Institute Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia

Background: Interprofessional collaborative practice (IPCP) is important for high quality health care. The dynamics of IPCP depends on the setting in which it operates. This study aims to explore the perceptions of health professionals on IPCP in a primary health care setting in Indonesia.
Method: A mixed method design was conducted. A validated Collaborative Practice Assessment Tool (CPAT) was administered. FGDs involving health professionals were completed afterwards. Comparative analyses among groups based on demographic characteristics were conducted. Verbatim transcriptions and thematic analyses were completed.
Results: A total of 303 health professionals (61.8% response rate) from 35 primary health centers in Depok-Indonesia participated. A total of 9 FGDs involving 74 informants were completed. The CPAT score of the health professionals is at 74-77% of total score 265. Of 8 subscales, there were differences of leadership and vision-mission-aims subscales between medical doctors and other health professional groups. There were also differences of the score in decision making subscale based on the length of work experience, and in patient involvement subscale based on the age group. Five themes and 36 subthemes were identified from the FGD data. The five themes were: forms, supporting factors, inhibiting factors, perceived benefits and challenges of IPCP.

Conclusion: The CPAT result indicates that the perceptions of health professionals on the collaborative practice was good. Given burden on the individual based and community based health care, IPCP is considered a must. The forms are flexible according to the needs. Role of professions are blurry in the community based and are clearer in the individual based health care. Sociocultural issues such as power differentials among health professions, the need of clear standard operational procedures, and the art of communications between groups are evident in this study. These issues can become strong supporting or inhibiting factors of IPCP. Exploration of IPCP requires understanding of specific characteristics of the healthcare settings and sociocultural factors at the organization, group and individual levels. Studies on IPCP are very important for health professionals in improving the collaborative competences continuously and constructive for the development of IPE.

KAS thinking template improves hospital interprofessional practice and education

Authors
Tzu-Chao Chung, Division of Neurosurgery, Tri-Service General Hospital, Taipei, Taiwan
Yuan-Hao Chen, Division of Neurosurgery, Tri-Service General Hospital, Taipei, Taiwan
Chiung-Hsi Tien, Division of Pediatrics, Tri-Service General Hospital, Taipei, Taiwan
Hui-Fang Yang, Division of Family Medicine, Tri-Service General Hospital, Taipei, Taiwan
Tai-Long Cha, Division of Urology, Tri-Service General Hospital, Taipei, Taiwan
Feng-Cheng Liu, Division of Rheumatology, Tri-Service General Hospital, Taipei, Taiwan

Presenter: Feng-Cheng Liu, Tri-Service General Hospital, Taipei, Taiwan

Background: The ultimate goal of today's medical care is to improve the quality of holistic health care. By exploring interprofessional practice and education, we can learn how professionals in diverse fields interact and collaborate with each other in a mutually respectful and task-oriented manner to learn the knowledge and skills necessary for effective teamwork. In addition, we can understand how to approach patients in ways that meet their needs and when to call for timely assistance. The health care system can also be strengthened in order to provide patient-centered medical services that improve prognoses.
This study examines a case of spontaneous intracerebral hemorrhage where the KAS (Knowledge, Attitude, Skill) thinking template is incorporated into the cooperative health care and teaching methods. Through cross-disciplinary case discussion, new trainees are able to learn about professional expertise in other disciplines, thereby gaining valuable knowledge about the different roles the members of an interdisciplinary team play in the health care process.

Method/Results: Among the 226 participants in IPP during this neurosurgery transdisciplinary curriculum, 95 of them (42 %) are clinical doctors; 45 of them (20 %) are clinical nurses; 41 of them (18 %) are the intern doctor; 45 of them (20 %) are medical personnel. Most of the participants (224 participants, 99%) were satisfied with the course. The effectiveness of these lectures is compared before (60.42 %) and after (82.33 %) the class, with an average of 22 % of the participants' progress.
Our results show that integration of KAS model with IPP/IPE role playing can be an effective innovation in transdisciplinary teamwork, guarantees that our patients receive the best level of care. This cultivates respect for the specialties of various professions, enables the sharing of expertise and experience, and initiates a shared decision-making process that places patients at the center, whereby their health problems are solved in a cooperative manner.

Conclusion: This KAS model can be routinely applied to clinical healthcare to help promote continuous learning of team members at work and enhance their ability to care for patients.

3HH11 (2575)
Conscious Competence in IPL in Healthcare Education

Authors
Annwyne Houldsworth

Presenter: Annwyne Houldsworth, HECL, Plymouth, UK

Background: The delivery of effective, high-quality patient care is a highly complex activity, demanding health and social care professionals to collaborate in an effective manner. IPL (IPL) is professionally relevant, intellectually stimulating and evidence based. The evolution of healthcare professional cultures has developed, as the individual professions have developed, and are influenced by gender and social class issues. New learning paradigms for healthcare professionals explore new ways to combine expertise, delivering IPL programmes where patient safety and quality of care can be improved (WHO 2010). Intervening early in the health professional's career with collaborative activities with IPL is now considered important in healthcare training. Development of multidisciplinary student centred ideas hopefully results in the enhancement of patient-centred care. Conscious competence in understanding human factors and the benefits of IPL is needed to recognise those that are naïve to IPL and competent professionals who are able to design new curricular and deliver training to address unconscious incompetence to IPL. Considering the values and ethics associated with IPL involves participants gaining mutual respect for each other and their roles and responsibilities but also in shared values and concern for their patients. Being clear about the respective roles that each professional plays, in responsively addressing the needs of the patients, is an important factor in understanding respective responsibilities. are many diverse theories applied to IPL where theory is observation of practice, confirmed by practice. Much development and consolidation of IPL theory is needed.

Take-home message: No one healthcare profession can give complete healthcare single-handed.
'Whenever people listen to one another humbly and openly, their shared values and aspirations become all the more apparent. Diversity is no longer seen as a threat, but as a source of enrichment.' Pope Francis

3HH12 (2751)
Learning Effect Analysis of Implementing Inter-Professional Education (IPE) Teaching Template

Authors
Wei-Fang Wang, National Cheng-Kung University Hospital, Tainan, Taiwan
Ying-Shu Wang, National Cheng-Kung University Hospital, Tainan, Taiwan
Chiung-Yu Chen, National Cheng-Kung University Hospital, Tainan, Taiwan

Presenter: Wei-Fang Wang, National Cheng-Kung University Hospital, Tainan, Taiwan

Background: The purpose of Inter-professional Education (IPE) is to educate students or trainees on how to enhance their ability toward Inter-professional Practice (IPP), of which the ultimate goal to enhance Holistic Health Care quality. At Domestic, currently the most common way to Carried IPE out is participating combined conferences, however it is easy to become "learning together with different professions" (Multi-professional Education, MPE) rather than emphasizing "interactions between different professions".
Method: In order to avoid IPE turn to MPE in Inter-professional combined conferences, this study is designed the "IPE Teaching Template" for Inter-professional Education using. By a good "teaching" and "learning" interaction between clinical teachers and students, the students effectively learn operations of Inter-professional Practice, and due knowledge, skills, and attitudes. For understanding the effectiveness, advantages and disadvantages of the "IPE Teaching Template", we regard clinical cases in combined conferences as course contents, and collect learners' course satisfaction, quantitative and qualitative feedback. This study applies reaction level, learning level, behavior level of Kirkpatrick model to evaluate learning effectiveness.
Results:
1. 695 trainees responded.
2. Reaction level: Response of participating IPE help to understand Inter-professional Practice operating is 4.75 and to improve service quality is 4.74 (in 5-point scale).
3. Learning level: The learners have significant improvement in knowledge (80.1%), skill (79.4%) and attitude (77.5%) with the application of IPE Teaching Template.
In addition to the current quantitative evaluation and Kirkpatrick level III outcomes, we will analysis qualitative evaluation to understand phenomena to explore the impact of our IPE Teaching Template on the learner outcome.
Conclusion: The results of this study are review bases and improved references, which will be helpful in the future development of the teaching strategy. And also look forward to this teaching strategy experience could be a domestic medical education implementation Inter-professional education reference.
Take-home messages:
1. IPE & IPP enhance Holistic Health Care quality.
2. IPE Teaching Template has positive results.

3HH13 (3491)
Development of a toolbox for multisource evaluation of Interprofessional Education and Interprofessional Collaboration in Switzerland

Authors
Florian B. Neubauer, Institute of Medical Education, Bern, Switzerland
Felicitas L. Wagner, Institute of Medical Education, Bern, Switzerland
Andrea C. Lörwald, Institute of Medical Education, Bern, Switzerland
Sissel Guttormsen, Institute of Medical Education, Bern, Switzerland
Sören Huwendiek, Institute of Medical Education, Bern, Switzerland

Presenter: Florian Neubauer, Institute of Medical Education, Bern, Switzerland

Background: There is no standardized toolbox to evaluate outcomes of Interprofessional education (IPE) and Interprofessional Collaboration (IPC) from the perspectives of different stakeholders (multisource) which is validated for the context of the Swiss health care system. Based on an assignment by the Swiss Federal Office Of Public Health, we aim to provide such a toolbox, the Swiss InterProfessional Evaluation Instruments (SIPEI).
Method: We scrutinized theoretical models in the literature which depict the chain of causes and effects present in the sequence of IPE -> IPC -> health-related outcomes, and identified conceptual weaknesses that seem to hinder meaningful evaluations of Interprofessional activities. We created an adjusted model which stresses the multi-causality of IPC by adding the domain of organizational factors (IPO), i.e. management decisions and supporting institutional frameworks which also must be present in an institution for IPC to happen. Using this model and observing project specifications about cost efficiency, we defined final purposes, objects and methods of evaluations using SIPEI: SIPEI is a toolbox of questionnaires designed to enable multisource evaluation of the entire chain of causes and effects in the field of IPE/IPO/IPC with the purpose of formative use on a local institutional scale and the summative purpose of gaining knowledge about outcomes of Interprofessional initiatives on a federal scale.
Results: We present a preliminary concept for SIPEI which stipulates five questionnaires for different stakeholders, i.e. health professions as learners in educational settings (asking about IPE), directors of educational programs (asking about IPE), patients (about perceived IPC), health professions in clinical settings (about IPE, IPO, IPC at their workplace), and leaders of clinical units (about IPE, IPO, IPC).

Conclusion: Formative evaluation of IPE, IPO and IPC is expected to improve health-related clinical outcomes. Summative evaluation at multiple institutions may consolidate evidence for the usefulness of Interprofessional initiatives. SIPEI promises to facilitate both. SIPEI next will be validated by a panel of experts. When finalized, SIPEI will enable multisource evaluations of output and outcomes of IPE, IPO and IPC in educational institutions for health professions and in health care institutions in Switzerland.

3HH14 (1696)
Verifying the reliability and validity of the Japanese version of Interdisciplinary Education Perception Scale (IEPS)

Authors

Hyuga Suzuki, Nagoya University School of Medicine, Nagoya, Japan
Mina Suematu, Department of Education for Community-Oriented Medicine, Nagoya University Graduate School of Medicine, Nagoya, Japan
Noriyuki Takahashi, Department of Education for Community-Oriented Medicine, Nagoya University Graduate School of Medicine, Nagoya, Japan
Kentaro Okazaki, Department of Education for Community-Oriented Medicine, Nagoya University Graduate School of Medicine, Nagoya, Japan
Masafumi Kuzuya, Department of Community Health and Geriatrics, Nagoya University Graduate School of Medicine, Nagoya, Japan
Kenta Murotani, Division of Boistatistics, Clinical Research Center, Aichi Medical University, Nagakute, Japan

Presenter: Hyuga Suzuki, Nagoya University School of Medicine, Nagoya, Japan

Background: In recent years, the necessity of Interprofessional Education (IPE) for undergraduate healthcare professions students has been increasing worldwide. Interdisciplinary Education Perception Scale (IEPS), one of the global evaluation scales measuring the effect of IPE, was originally reported by Luecht RM et al. in 1990. In Japan, Itakura et al. translated into Japanese and created the Japanese version of IEPS in 2012, but it was not sufficiently considered about reliability and validity. Therefore, we analyzed its reliability and validity along with its sub-scales.

Method: Subjects were 186 health care professions students which were composed of 99 medical students (5th year), 21 nursing students (4th year), and 66 pharmacy students (5th year) who participated in one-day IPE session conducted as a part of clinical training at Nagoya University Medical School from April 2017 to November 2017. We asked them to answer the Japanese version of IEPS before and after this IPE. This scale is composed of 18 items, scoring on a 6-point Likert scale which ranged from 1 (strongly disagree) to 6 (strongly agree). Statistical software (IBM SPSS 24.0 Statistics) was used for factor analysis and factor reliability was verified (Cronbach α). After that, content validity was verified by several experts familiar with IPE.

Results: From the factor analysis, three factors were extracted from 15 items excluding 3 items. The value of Cronbach α was the following: factor 1 was 0.861, factor 2 was 0.882, and factor 3 was 0.785. Three factors ware named "self-respect for own professions", "cooperation with other professionals", "fundamental ability of own professions" respectively. The content was validated by several experts.

Since the each value of Cronbach α was more than 0.7, the three factors proved to be reliable. We expect that the Japanese version of IEPS will be widely used as a measure of the educational effects of IPE, especially three sub-scales: "self-respect for own professions", "cooperation with other professionals", and "fundamental ability of own professions".

Conclusion: This Japanese version of IEPS will lead to the dawn of international collaborative research related to IPE.

3HH15 (2294)
Interprofessional high-fidelity simulation: a pilot project

Authors

Ricardo Tjeng, University of Beira Interior, Faculty of Health Science, Covilha, Portugal
Paula Carvalho, University of Beira Interior, Faculty of Humanities and Social Sciences, Covilha, Portugal
Maria Barbosa, University of Beira Interior, Faculty of Humanities and Social Sciences, Covilha, Portugal

Antonio Sequeira, Polytechnic Institute of Guarda, Superior School of Health, Guarda, Portugal
Miguel Castelo-Branco, University of Beira Interior, Faculty of Health Science, Covilha, Portugal

Presenter: Ricardo Tjeng, University of Beira Interior, Faculty of Health Science, Covilha, Portugal

Background: Simulation in health professions education is an important tool for development of technical and non-technical skills. Patient care requires good teamwork and coordination between different healthcare professionals. Experiential learning strategies, e.g. high-fidelity simulation (HFS), could provide opportunity for undergraduate students of different health professions to improve effective interprofessional (IP) collaboration and teamwork.

Method: This pilot project was a cooperation between three faculties from two institutions. It included medical, nursing, psychologist, and pharmacy last year undergraduate students, and faculties from all four healthcare areas. An IP HFS scenario was created, and faculty-facilitated debriefing was conducted after each simulation. Objectives of the pilot-project included: the feasibility of an IP HFS, and if the students could demonstrate through a simulated scenario their relational skills with the patients, family members and other health professionals.

Results: Four HFS sessions were conducted with four students each (medical, psychologist, nurse, and pharmacist), debriefings were performed after the sessions. Open questions about HFS´ pros and cons were

evaluated, as interactions between team members. Faculty discussion was also completed after the sessions. All participants referred that the simulation was a good method for training their specific professional competencies and their relation with others health professionals. They would like to include HFS in their undergraduate curriculum.

Conclusion: It´s important for all healthcare professionals to interact and know better the role of each other in the patient care to establish better interactions and improve individual and team performance. Some difficulties observed about the HFS were: time constrain, restricted physical space, and limited access to clinical information. All participants gave positive remarks about the simulation, valued the importance in their individual area and interaction with other health professionals. Interprofessional HFS appears to be feasible and positively accepted by students from different healthcare areas.

Interprofessional Training, is not just Education, but Collaboration

Authors

Joseph House, University of Michigan Medical School, Ann Arbor, MI, USA
Amber Dallwig, University of Michigan, School of Nursing, Ann Arbor, MI, USA
Leslie Smith, University of Michigan-Flint, Flint, MI, USA
Karen Farris, University of Michigan, College of Pharmacy, Ann Arbor, MI, USA

Presenter: Joseph House, University of Michigan Medical School, Ann Arbor, USA

Background: There is an increased emphasis on including Interprofessional Education (IPE) in all healthcare training. However, IPE is not enough as shown by the WHO Framework for action on IPE and Interprofessional Collaborative (IPC) practice. It is the job of schools to create opportunities for students to work together, not just learn together.

The College of Pharmacy already had an IPE course which involved 8 classroom sessions which discussed the Social Ecological Model of Health along with 20-hours of community service. All students participated in the IPE classroom sessions. A group of Interprofessional faculty modified one community service site, Ypsilanti Meals on Wheels (YMOW), and intentionally create interprofessional collaborative teams. All students reflected on "What insights have you gained about how different professionals think about the factors in the social ecological model of health?" A comparison of reflections from students who participated in the intentionally created IPC with a random sample of all other sites was completed, and themes in the reflections were identified, quantified, and compared.

Method: There were 72 students enrolled in the course. Thirteen students were assigned to YMOW. During the YMOW service house, students completed nutritional assessments during at least six sessions with students of their same profession and six sessions as part of intentional IPC teams. Their reflections were qualitatively

analyzed by 3 members of the research team. Twelve themes were identified. The reflections from the 13 IPC and 12 non-IPC students were analyzed.

Results: Roles/Responsibilities was reflected on by 13/13 (100%) of IPC and 5/12 (42%) non-IPC and learning about another health professional was reflected on by 9/13 IPC (70%) and 1/12 (8%) non-IPC, both are significant. There were no other significantly difference in themes.

Conclusion: Intentionally creating IPC teams in an IPE course, significantly affected what and how students learned about each other and learning the roles and responsibilities of other health professionals. Educating students needs to include collaboration (IPC) as well as education (IPE).

Take-home message: When developing IPE session, creating an accompanying IPC experience should be considered.

3HH17 (3019)
An Outcome Measure of Inter-Professional Education Experiences: One Method to Consider

Authors

W. David Carr, Missouri State University, Springfield, MO, USA
Michelle L. Dugan-Day, Missouri State University, Springfield, MO, USA
Natalie Curry, Missouri State University, Springfield, MO, USA

Presenter: David Carr, Missouri State University, Springfield, MO, USA

Background: An Inter-Professional Education (IPE) collaborative was started within the College of Health and Human Services amongst the faculty from each academic unit. The purpose of the collaborative was to create and encourage IPE experiences for the students.

Method: The initial structure focused IPE planning around four types of experiences; simulation, journal club, case study, and grand rounds. An outcome measure was added to assess the effectiveness of the experiences. The outcome measure was based upon the work of Lockeman (Lockeman et al, 2016) who identified 16 variables to measures two domains of IPE; professional interaction and values.

The questionnaire was created in an online survey platform for ease of distribution to the many cohorts of students from across multiple departments that would be involved in IPE experiences. A pre- and post-experience measurement methodology was adopted to determine if the students reported a change in their opinions of professional interaction and values. A series of open-ended questions were added to the post-experience questionnaire. Instructors incorporated one of the four types of experiences into their coursework, students were given a link to the questionnaires via an online course management tool.

Results: Data collection is ongoing, to date over 100 students (male = 27, female = 63, average age = 27 ± 6.82 years) have completed the pre- and post-experience questionnaires. An analysis of variance indicates significant changes (p = .04) with reported improvements in

students' opinions of interaction and values. Review of the open-ended questions indicates that the students enjoyed the various experiences and discovered many new aspects of the various other professions involved.

Conclusion: While our results are preliminary, it is clear that our efforts to encourage IPE are proving to be successful. Our assessment method has indicated significant positive changes from pre- to post-experience for the students.

Planning for IPE experiences can be challenging from a planning standpoint. Determining the effectiveness of that planning is incumbent upon the instructors. We have shared one method for measuring the impact of the IPE experiences.

3HH18 (2214)
How the presence of social work students influences multi-disciplinary decision making in IPE

Authors
Kumiko Yamaguchi, Tokyo Medical and Dental University (TMDU), Tokyo, Japan
Chiharu Kawakami, Tokyo Medical and Dental University (TMDU), Tokyo, Japan
Mina Nakagawa, Tokyo Medical and Dental University (TMDU), Tokyo, Japan
Kanako Noritake, Tokyo Medical and Dental University (TMDU), Tokyo, Japan
Jun Tsuruta, Tokyo Medical and Dental University (TMDU), Tokyo, Japan
Kazuki Takada, Tokyo Medical and Dental University (TMDU), Tokyo, Japan

Presenter: Kumiko Yamaguhi, Tokyo Medical and Dental University (TMDU), Tokyo, Japan

Background: In super-aged societies, the patient-centeredness in care provision as well as home health care and/or regional health care will be of prime importance. Common interprofessional education (IPE) programs, however, invite students of care-providing professions such as medical, nursing, and dental students and not care-coordinating professions. We therefore investigated if and how the addition of social work students helps improve multi-disciplinary decision making in our IPE program.

Method: A total of 367 final-year students from eight health professions, including 106 medical students, participated in a two-day IPE program which included a mixed-small-group case study. Among the total of 48 groups, 31 had a social work student. After the completion of the case study, participants answered a questionnaire concerning "how the presence of social work students helped multi-disciplinary decision making". Of the 367 attendees, 350 students completed questionnaire. The results were analyzed quantitatively, and the comments from 105 medical students were analyzed qualitatively.

Results: Seventy percent of students answered affirmatively that the presence of social work students helped group's decision making. Affirmative answers were more common among students whose group had social work students (73.6%) than those whose group did not have them (60.4%, P=0.009). Also, the percentage of students answering affirmatively was the highest among

medical students (76.2%) and the lowest among social work students (45.2%). Qualitative analyses revealed that the knowledge of the social welfare system increased the use of various services available for home health care. Discussion with social work students broadened the perspectives, added the focus on cost and financial resources, and brought more patient-centered conclusions.

Conclusion: In the previous study, our IPE program helped students understand the roles and responsibilities of other healthcare professions (Yamaguchi et al., AMEE 2014), and the importance of patient-centeredness (Yamaguchi et al., AMEE 2017). In this study, the addition of social work students brought more patient-centered conclusions. Mixed-small-group IPE programs with multiple healthcare professionals better prepare students for coordinated and collaborative care needed in aging societies. In addition, the addition of social work students to IPE programs may improve patient-centered decision making.

The Impact of Interprofessional Education in the Community

Authors
Vivian Lee, School of Pharmacy, The Chinese University of Hong Kong, Hong Kong
Janita Chau, The Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong
Ann Lau, School of Biomedical Sciences, The Chinese University of Hong Kong, Hong Kong
Michael Chung, School of Chinese Medicine, The Chinese University of Hong Kong, Hong Kong
Samuel Wong, The Jockey Club School of Public Health and Primary Care, The Chinese University of Hong Kong, Hong Kong
Wallace Chan, Department of Social Work, The Chinese University of Hong Kong, Hong Kong

Presenter: Enoch Ng, School of Pharmacy, The Chinese University of Hong Kong, Hong Kong

Background: Developed in 2013, CU CHAMPION is a joint school outreach team of the Faculty of Medicine, The Chinese University of Hong Kong (CUHK). Interprofessional collaboration and service learning are integral parts of CU CHAMPION's outreach program every year. It aims to offer students of different healthcare disciplines the opportunities to work together as an interprofessional team and engage them in raising health promotion in the community.

Method: In 2017, CU CHAMPION conducted a large-scale community outreach program in Hong Kong, which focused on improving the public's awareness on disease prevention and medication safety. Enrolled student volunteers had to attend training workshops to learn about the outreach logistic, and participate in case discussion. They were also enrolled in an e-learning course called CATALYST 2017, which provided a cross-disciplinary platform in health sciences education. During the outreach services, student volunteers were assigned to carry out various duties such as conducting health questionnaire,

providing basic health check, giving health and medication safety education to the service participants.

Results: Totally 480 students and professional volunteers participated in the outreach program. The team successfully reached out to 4235 Hong Kong citizens, most of them were elderly. Evaluation surveys among CUHK student volunteers showed significant improvement in medical knowledge, skills, confidence, and program satisfaction. There was an 11.6% increase in medication safety knowledge, 17.1% increase in dementia understanding, 29% increase in atrial fibrillation knowledge, and a 19% increase in geriatric care knowledge.

Conclusion: CU CHAMPION successfully demonstrated interprofessional service learning to improve students' attitudes toward geriatric medicines, elderly care, and enhancing their awareness of health needs in the community.

Interprofessional outreach program is a significant and useful addition to undergraduate medical education. The increase in students' understanding for community patients can highly enhance their empathy toward their future patients. Students can also exchange their medical knowledge and specialty with peers of other disciplines. In short, such collaboration will induce positive influence on interprofessional team work in healthcare frontline, and a very positive impact on patient care in the long run.

3HH20 (2263)
Clinical Reasoning for Inter-Professional Pregnancy Care – Everyone on the Same Page!

Authors
Michelle Schlipalius, Monash Health, Melbourne, Australia
Clare Delany, Melbourne University, Melbourne, Australia

Presenter: Michelle Schlipalius, Monash Health, Melbourne, Australia

Background: Inter-professional collaboration is crucial to provide women with safe and effective team-based pregnancy care. However, it can be challenging for all team members to develop shared mental models and the required clinical reasoning and thinking steps. This paper reports on the development of an inter-professional workshop aimed at facilitating the development of shared understanding regarding clinical reasoning.

Method: The workshop comprised a one hour, face to face, interactive session using typical case studies. A common framework and set of thinking steps necessary for formulating a pregnancy care plan was presented. Four thinking steps were developed to "make thinking visible".

1. Issue identification - What medical, psychological and social issues are relevant to this woman's pregnancy and birth?
2. Issue management - How will we manage each issue, integrating clinical guidelines and the woman's preferences?
3. Evaluation of care type - Does this woman require low, medium or high-risk care?
4. Communication / Documentation - Clearly and concisely communicate with the woman. Document the issues, management plan and care type.

Results: 103 midwifery and medical learners attended a workshop. The majority (94%) agreed or strongly agreed to better recognising the need, acquiring the skills and being more confident to develop a pregnancy care plan. Learners liked the structure provided by the thinking steps, realistic case studies, relevance to their work, opportunity to ask questions and interactive approach. Apart from the opportunity to complete more case studies, no areas for improvement were noted.

Conclusion: Although pregnancy care is provided by an inter-professional team, there is often a presumption that inter-professional collaboration will automatically occur. This workshop suggests deliberate practice enables learners to apply their own clinical reasoning to pregnancy care and also consider that of their colleagues. The workshop made visible the 'practices' of a community, with discussions at inter-professional meetings providing ongoing feedback to staff. Overall, clinicians were very positive about the workshop.

Take-home messages: Clinicians value explicit education on clinical reasoning. This assists them to provide pregnancy care to women and ensures all members of the inter-professional team are on the same page!

3II: Posters: Transitions in Education/Professionalism

Location: Hall 4.u, CCB
Date: Monday 27th August

Student Assistantship Programme in Family Medicine

Authors
Wern Ee Tang, Lee Kong Chian School of Medicine, Singapore
Kum Ying Tham, Lee Kong Chian School of Medicine, Singapore
Kang Yih Low, National Healthcare Group Polyclinics, Singapore

Presenter: Wern Ee Tang, Lee Kong Chian School of Medicine, Singapore

Background: Student assistantships during which final year medical students undertake responsibilities of a postgraduate year 1 (PGY1) doctor under supervision aims to provide experiential learning to improve the transition of medical students to doctors. At the Lee Kong Chian School of Medicine, Nanyang Technological University, has developed a student assistantship programme that includes a 3 week Family Medicine posting in primary care in addition to a7 week hospital posting (general medicine and general surgery/ orthopaedic surgery). This is the first time that a student assistantship programme in Family Medicine (FM SAP) has been developed in Singapore. The differences in organizational structure , patient population and learning opportunities between tertiary care and primary care presents different opportunities and challenges in the affordance of a safe learning environment that will optimise students' preparedness to start work
In this work, we describe the Student Assistantship Programme in Family Medicine, its development process, and the learner and teacher experiences from the inaugural cohort of students completing the FM SAP. Critiques and comparisons will be made following a narrative review of relevant literature in student assistantships and clerkships.
Results: Early results suggest that adequate resourcing to ensure supervision with progressive independence and a varied patient mix is valued by students. More detailed exploration is ongoing.
Conclusion: A student assistantship programme in Family Medicine provides experiential learning opportunities that help the transition of medical students to doctors. Supervision with progressive independence and a varied patient mix are valued by students. Further work is necessary to understand how students' preparedness to start work can be optimized.
Take-home message: Student Assistantship Programme in Family Medicine provides experiential learning opportunities that prepare students for work.

3II2 (3659)
Easing the transition into clinical years: the role of student-led introductory sessions

Authors
Shiffa Shahid, St George's, University of London, London, UK
Hesham Khalid, St George's, University of London, London, UK
Nikita Punjabi, St George's, University of London, London, UK
Nikhil Sahdev, St George's, University of London, London, UK

Presenter: Hesham Khalid, St George's, University of London, UK

Background: The transition between pre-clinical and clinical years is a major step during medical school, with many students initially struggling to adapt. The use of senior medical students is a potential solution that has been proven to have many benefits such as increasing student engagement. Student input is widely used in other aspects of the curriculum including clinical skills and anatomy. This study aims to assess whether there is a role for senior student involvement in easing the transition of students into clinical years.
Method: Currently, introductory lectures organised by this UK-based medical school are faculty-led. For this study, 4 senior medical students delivered a talk at the start of the first clinical year. The talk covered how to approach placement, problem based learning, written exams and OSCEs. Post-lecture, attendees were invited to complete an cross-sectional questionnaire of 8 questions. Modified Likert scales, Yes/No questions and free text responses were used. Questions covered: (1) quality of the event; (2) content of introductory lectures delivered by the medical school; (3) potential for integrating student experience into introductory lectures.
Results: Eighty-two students responded to our questionnaire. Regarding event quality, 96% rated the talk 'excellent' or 'very good', 99% said the talk met their needs and expectations and 99% students were 'very satisfied' or 'satisfied' with the content. Only 14% were 'satisfied' with their faculty-led introductory lectures. Eighty-eight percent felt that the current introductory module would benefit from previous students' input. If student input was to be added, 51% of students preferred a prepared lecture format.
Conclusion: This is the first study examining the role of student engagement in easing the transition of preclinical medical students into clinical years. This peer-led introductory session was well received. The results can be explained by the theories of social and cognitive congruence. Peers often share similar demographics and personal experiences, facilitating an open exchange of ideas.
Take-home message: Student-led introductory sessions are well received and therefore student involvement in introductory modules may be a useful supplement to enrich the medical school curriculum.

Adaptation to Early Clinical Rotation: Roles of Transition Period

Authors
Rulliana Agustin, Facuty of Medicine University of Indonesia, Jakarta, Indonesia
Ardi Findyartini, Facuty of Medicine University of Indonesia, Jakarta, Indonesia

Presenter: Rulliana Agustin, Faculty of Medicine, University of Indonesia, Jakarta, Indonesia

Background: Early clinical rotation is a period in which usually students feel hesitate and need lots of learning strategies to cope with the change from pre-clinical to clinical stage in their education. For preparing them into clinical practice, there is a transition period, usually one semester before the clinical rotation. Transition is a dynamic process, in which the individual moves from one set of situations to another. Students also cope with new challenges, opportunities, and different emotions. Also, there are evidences of the relation between transitions and the level of stress and negative emotions. In the other hand, transition periods may also present individuals with opportunities to personal development.
Method: This research is part of evaluation process which conducted by Medical Education Unit. It is important for us to explore how students adapt with the clinical rotations and what are the roles of transition period.
Focus group discussions were performed to four different clinical rotations. Each group has finished their major clinical rotation in semester 8: internal medicine, pediatric, obstetrics and gynecology, and surgery. Data analysed then clustered into different themes.
Results: Five important themes were clustered:
1. Different emotions happened when going through first clinical rotations.
2. Characteristics of clinical learning.
3. Challenges students faced in the transition period.
4. Strategy to adapt.
5. Factors determine the adaptation into transition period.
Conclusion: It is important to provide an improved transition between pre-clinical and clinical periods. In our curriculum, seventh semester represents a transition period from pre-clinical to clinical learning.
Students need to understand the characteristics of clinical learning. In transition period, it is important to prepare students for clinical learning, such as using different learning strategies.
Faculty members need to prepare students and put some changes into the transition period if needed.
Take-home messages:
a. Staff should prepare students about adaptations.
b. Peer mentoring can be used to provide understanding that clinical practice is full of uncertainty.
c. Students are encouraged to make reflections.
d. Academic counselors need to monitor and helping students identify their strengths and weaknesses.

3II4 (747)
New Beginnings: A Resident Orientation Program

Authors
Ozlem Serpil Cakmakkaya
Mehmet Riza Altiparmak
Oktay Hakki Seymen
Hakan Karpuz
Serkan Teksoz
Kerim Sonmezoglu

Presenter: Ozlem Cakmakkaya, University of Istanbul, Cerrahpasa Medical Scool, Istanbul, Turkey

Background: Starting residency is a challenging transition for every young doctor. Junior residents have to understand hospital policies at their new institution, learn about medical liability and malpractice, find their ways around and get familiar with their new position, responsibilities, and team of colleagues. To help incoming residents at the University of Istanbul, Cerrahpasa Medical School (CMS) to settle in to their new positions and their new institution, all are required to attend a resident orientation program since 2010. We continuously evaluate and monitor residents' acceptance and satisfaction with the program. Goal of the program is to meet their needs and to ease the start into a new phase of their medical career.
Method: The 15-hour residency orientation program consists of lectures, discussion sessions and skills instructions. Lectures include medical ethics, scientific research, databases, communication skills, hospital management structure, payment system, history of CMS, infection control policies, and hospital laboratories work flow and requirements. Discussion session include medical liability and malpractice laws and regulations. An ACLS course is provided as well.
At the end of the program we asked residents to complete a program evaluation questionnaire.
Results: Eighty junior residents attended the last program, 33% of the participating residents graduated from CMS, 67% graduated from other Medical Schools nationwide. The total satisfaction score was 7.36 ± 1.94 (11-point scale from 0 to 10). Residents perceived the content and the faculty contact time as the strengths of the program. Discussion session on medical liability and malpractice, ACLS skills instructions and scientific methods sessions were overall highest rated. Residents who graduated from other Medical Schools especially appreciated the laboratories workflow session.
Conclusion: Overall, the orientation program was very well received. Based on the distinct evaluations of local versus national Medical School graduates, we plan to tailor the program specifically to the needs of each group in the next years.
A resident orientation program will surely facilitate starting the residency. This serves not only the well-being and performance of the residents, but also adds the institutional benefits due to increased resident knowledge of local specifics and general skills.

A foundation year one led teaching programme for medical students: a review of student feedback

Authors

Thurkaa Shanmugalingam, The Royal London Hospital, Whitechapel, UK
Uzma Ayub, The Royal London Hospital, Whitechapel, UK

Presenter: Thurkaa Shanmugalingam, The Royal London Hospital, Whitechapel, UK

Background: The greatest challenge of working as a newly qualified foundation year one (FY1) doctor is the sudden progression in responsibility and independence compared to as a medical student. We designed a three month bedside teaching programme for a small group of 3rd year undergraduate medical students at Queen Mary, University of London which focused on tackling key problems dealt by FY1 doctors. At the end of each teaching assessment feedback was provided for the tutors. Student feedback was submitted through an online feedback form which was collated by the lead teaching organisers. The questions included were 1) What was the topic? 2) How would you rate this teaching session overall? 3) What was particularly good about this session? 4) What, if anything, could be done better? 5) Do you feel more confident examining patients after this session? 6) Would you recommend this session to other students?
Method: Positive feedback were identified from reviewing student feedback which mainly focused on two areas 1) informality and how interactive the session were and 2) ability of students to discuss and brainstorm amongst themselves. Areas of improvement mainly focused on scheduling conflicts. Overall, the teaching session was rated as 'good' and the students 'somewhat felt confident' in examining patients after the session.
In our teaching session we discussed and brainstormed typical case presentations encountered and how this would be tackled as an FY1 doctor. The feedback primarily focused on how the student felt comfortable in an informal and interactive environment. History and examination were discussed amongst the group wherein ideas and thoughts were shared and at times debated amongst students.
Results: This teaching programme overall was received well by the students and the same students would recommend the session to others. We aim to extend this programme again for the next three months by making slight changes to our teaching plan.
Conclusion: The inclusion of a FY1 led teaching program especially for final year medical students is beneficial in helping them progress from medical student to graduating doctor.

3II6 (684)

The impact of a peer-led revision programme on the self-perceived preparedness of final year medical students for examinations and work as an FY1 doctor

Authors

Laura Spurgeon, University of Birmingham, Birmingham, UK
Samuel Bourke, University of Birmingham, Birmingham, UK
Leo Feinberg, University of Birmingham, Birmingham, UK
Ananth Srinivasan, University of Birmingham, Birmingham, UK
Alexander Moffat, University of Birmingham, Birmingham, UK

Presenter: Alexander Moffat, University of Birmingham, UK

Background: Countdown-2-Finals (C2F) is a peer-led revision programme developed by Foundation Year 1 (FY1) doctors for final year medical students to serve as an adjunct to formal medical and hospital-based curricula for the transition into life as a doctor. The course was developed and co-ordinated by five FY1 doctors, and was delivered weekly by 30 different FY1s, each presenting a different topic from the final year curriculum over eight months (30x1-hour sessions). The underlying premise was that as the tutors were recently qualified, they would be more familiar with both academic and personal concerns of final year students, whilst simultaneously creating a more relaxed and approachable learning environment due to their "junior" status. It was anticipated that this would facilitate open discussion and promote group interaction, compared with the more formal, didactic teaching usually delivered to the students.
Method: All final year medical undergraduates were invited to attend; participants (n=120) were asked to assess the programme through self-completed questionnaires to provide quantitative/qualitative data on: knowledge-improvement; confidence; sense of preparedness for final year exams/FY1; preference for peer-led revision; and areas for further improvement. Participants were also asked for up to three reasons for their decision to attend the course.
Results: Preliminary evaluations suggested that participants valued the content, accessibility and approachability of the tutors, and felt better prepared for final year examinations. Ongoing analysis of the results also indicated that participants preferred peer-led sessions which promoted interactive case-based discussions. Reasons for attendance varied, but included concern about previous results, lack of confidence and desire to extent their knowledge-base.
Conclusion: The peer-led revision course appeared to satisfy its original aims, insofar as participants valued the contemporaneous nature of the tutors, their familiarity and understanding of participants' concerns, and the more relaxed atmosphere of the sessions compared with formal, consultant-led teaching. Future data collection will focus on whether academic and clinical performance was improved by course attendance.
Take-Home Messages:
- preparation for finals/first year of work may be more effective if provided by peers;

- interactive, rather than didactic, teaching is more conducive to learning in final year students

3I7 (1006)
Ready... Steady... Learn! Utilizing Student and Faculty Feedback to Enhance Transitioning to Clinical Clerkship and Residency

Authors
Simon Field
Darrell Kyte

Presenter: Simon Field, Dalhousie University, Halifax, NS, Canada

Background: Medical students frequently experience difficulties transitioning to clinical learning. To increase student preparedness for clinical learning and subsequent transitioning into stages of medical training, Dalhousie unrolled a program of learning experiences, named PIERs (Positioning, Integration, Evaluation, Research and Review) in September 2013. PIERs 1 and 2 are delivered at crucial periods in the 3rd year of training; PIERs 3 and 4 are delivered in the 4th year.
Method: PIER 1 is delivered prior to students entering their clinical training and PIER 2 is delivered after they complete one quarter of that training. PIER 3 is delivered prior to students beginning 4th year electives while PIER 4 prior to residency. The PIERs curriculum is designed to develop students' skills in clinical procedures, skills interpreting diagnostic tests, critical thinking and communication skills, and professional behaviors and attitudes. Each PIER is evaluated through surveys administered at the conclusion of sessions.
Results: Five years of PIER session evaluations show them to be well received and effective at enhancing preparedness for clinical learning. The procedural skills sessions have consistently been the best reviewed and are regarded as the most useful. Results also show students consistently identified certain skills requiring more guidance than others over multiple years. For example, students felt prepared to perform communication related tasks with minimal guidance while unprepared to interpret imaging and lab results. Pre-post survey results show students feel better prepared for residency following PIER 4.
Conclusion: The feedback has led to significant improvements to PIERs and the overall curriculum. The establishment of PIERs also led to the creation of a PIER unit head/curriculum lead who modifies sessions annually after reviewing unit feedback. Also, longitudinal curriculum leads in radiology and pharmacology have been established to aid in the curriculum planning and review for PIERs.
Students continue to find the transition to clinical learning difficult. Curriculum enhancements can ease that transition if responsive to student feedback while incorporating the input of faculty. The continuing strength of our curriculum relies on solid multi-year feedback and a truly collaborative faculty effort invested in curriculum improvement.

'Life, death and taxes, what I wish I had known' – A Near-Peer Led Transition Course for New Doctors Focusing on Non-Technical Skills

Authors
Yun Mei Lau, Royal Free London NHS Foundation Trust, London, UK
Jade Chen Zhao, East Kent University Hospitals NHS Foundation Trust, Margate, UK
Tom Oldham, University Hospitals of Morecambe Bay NHS Foundation Trust, Lancaster, UK

Presenter: Yun Mei Lau, Royal Free London NHS Foundation Trust, London, UK

Background: The transition from student to doctor in the clinical setting is well-known to be stressful. In 2012, induction training for new Foundation doctors was made mandatory in the UK. Research show these preparation courses typically bias toward technical work rather than non-technical skills (NTS), personal confidence and self-insight. Yet others have shown that task management, team working and communication difficulties are leading sources of stress for new doctors. Our novel transition course focuses upon these non-technical aspects of work as a doctor, often not covered within medical school.
Method: We developed a 3-day regional transition course for medical graduates. The course was delivered by out-going Foundation doctors focusing upon NTS through a mixture of interactive cases, workshops and tutorials. Practical aspects of common Foundation doctor jobs and 'top-tips' were also covered. Participants completed pre-course and post-course questionnaires of free-text responses and a 5-point-likert scale on self-rated confidence and proficiency (1 Strongly Disagree-5 Strongly Agree).
Results: Thirty-two participants attended this course from 2016 to 2017. Both perceived confidence and preparedness for starting work rose significantly after the course (3.04vs4.00 and 3.15vs4.00 respectively, p<0.001). There was also significant (p<0.001) increase in self-rated confidence in: prioritising clinical jobs (2.96vs3.66), escalation (3.26vs4.19), making referrals (2.78vs3.47), working out-of-hours (2.37vs3.47), stress management (3.08vs4.09) and career planning (2.74vs4.06). Qualitative feedback highlighted participant appreciation for personalised career planning advice, increased work-life-balance awareness and feeling more 'orientated to start work'.
Near-peer led skills-specific teaching is effective in raising confidence in non-technical aspects of work and improve perceived preparedness for clinical practice amongst graduates. Hospital, rotation and situation-specific advice may be contributory reasons for the effectiveness of this course.
Conclusion: This course aims to prepare medical graduates for life as a junior doctor through developing transferable NTS. Local educational boards and medical schools should consider holistic transition courses to enhance preparedness and reduce stress for graduates.

Take-home message: Transition courses focusing upon NTS improve confidence and perceived preparedness amongst new junior doctors.

3II9 (2121)
The Dutch transition to graduate medical training: How clinical experience between graduation and residency affects career choice

Authors
Sophie Querido, University Medical Center Utrecht, Center for Research and Development of Education, Utrecht, The Netherlands
Sjoukje van den Broek, University Medical Center Utrecht, Medical School, Utrecht, The Netherlands
Lode Wigersma, Dutch Association of Public Health Policy Physicians (NVAG), Utrecht, The Netherlands
Marlies de Rond, Royal Dutch Medical Association, Utrecht, The Netherlands
Olle ten Cate, University Medical Center Utrecht, Center for Research and Development of Education, Utrecht, The Netherlands

Presenter: Sophie Querido, University Medical Center Utrecht, Center for Research and Development of Education, Utrecht, Netherlands

Background: Medical trainees need to make an important career choice when they face the transition to residency. For Dutch medical trainees' residency does not necessarily directly follow graduation. Many trainees build clinical experience after graduation as a physician-not-in-training (PNIT) before they make a career choice. The aim of our study was to explore what influences trainee's career preference during the final study year and the period after graduation.
For medical students, experience with clinical responsibilities is acquired through the program in the final year of Dutch medical school curricula, when during extended rotations students work with a high level of clinical responsibility under strict supervision.
Method: The authors conducted a longitudinal interview study with medical students. A first interview was at the start of the final curriculum year, a second at graduation and a third one year after graduation.
The interviews focused how trainees establish career preferences and how preferences evolve over time. Transcripts were thematically analyzed by three researchers using open and axial coding, to identify data patterns and interrelationships, all researchers met over several meetings to discuss the developing analysis.
Results: In the first interview round 24 medical students participated, 22 of them in the second, and 20 in the third round.
Clinical responsibility appeared to be a dominant factor for career preference. Subjects frequently mentioned what it is like to work in a clinical context: being a doctor, making decisions, having one's own patients and responsibility for them. Some subjects mentioned changing their career preference because of this experience.
Conclusion: By experiencing clinical responsibilities, a medical student's or PNIT's perception of a specialty changes. One is forced to reflect, (re)consider and possibly adjust personal career preferences. The underlying process of career choice is stimulated by these iterative reflections, and we conclude career choice is partly made based on experiencing to work independently as a doctor. This implies that Dutch medical trainees benefit from the advantage of working as a PNIT.
Take-home message: Experiencing a high level of clinical responsibility is critical for the development of preferences and choice for residency.

3II10 (2185)
Training students to be doctors: the use of ward round simulations

Authors
Sindhu Bhaarrati Naidu
Maria Bashyam

Presenter: Sindhu Naidu, Imperial College London, London, UK

Background: A junior doctor is integral to an efficient ward round. In our current undergraduate curriculum, students have informal ward round training through hands-on experience during clinical placements. However, this is not sufficient to prepare junior doctors. The Royal College of Physicians (1) advises all new staff should be trained in ward rounds to improve practice. Current evidence suggests simulation is a valuable method of training (2).
Method: We conducted a study in the interpretive paradigm evaluating the effect of ward round simulation on self-rated preparedness for becoming junior doctors, and for developing required skills for ward rounds. Final year students in our local hospital were invited to participate. Students roleplayed junior doctors engaging in typical ward round duties. Four faculty members supervised the simulation and acted as consultants, patients and allied healthcare professionals. This was followed by a focused debrief to highlight areas for development and key learning points for action.
Students completed a pre- and post-session questionnaire to evaluate the effect of the session. They were also assessed on their technical and non-technical skills by two faculty observers and provided with verbal feedback. We applied for and received ethics approval for the study from the College ethics committee.
Results: Five students volunteered to enrol in the study. A convergent parallel mixed-methods approach was chosen to collect and analyse the data. Quantitative (Likert-scale) responses were obtained from the feedback forms, while qualitative feedback was obtained from open-ended questions and verbal feedback. We will use an inductive approach to analyse qualitative data. Full results will be available in March.
Conclusion: We posit that ward round simulations are useful in undergraduate teaching to improve both confidence and skills, and crucially, prepare for transition to practice.
Structured training and formative assessment in ward rounds should be included in undergraduate medical curricula to improve student confidence and skills.

1. *Royal College of Physicians (2012) Ward rounds in medicine: principles for best practice.*
2. *Harvey, R. et. al (2015) Developing non-technical ward-round skills The clinical teacher 12(5), 336-40.*

Can assessment drive behaviour change? The use of the conscientiousness index in an internal medicine residency programme

Authors
Faith Chia, National Healthcare Group, Singapore
Selvia Kosim, National Healthcare Group, Singapore
Wee-Khoon Ng, National Healthcare Group, Singapore

Presenter: Faith Chia, National Healthcare Group, Singapore

Background: Professionalism is a difficult concept to define and assess, and many tools in use are confined to clinical contexts. Conscientiousness with administrative duties is a component that is often not assessed when evaluating professionalism, although lack of compliance with administrative tasks has been shown to be correlated with poorer outcomes in examinations. Our programme was inspired by the work of Maclachlan et al on the conscientiousness index (CI) that provides a scalar measure of conscientiousness with administrative tasks, and started to use a modified version of this in July 2013. We were interested to see if the use of the CI had changed how conscientious our residents are.
Method: Our version of the CI includes
1. Attendance at teaching activities
2. Submission of administrative data
3. Submission of evaluations done with faculty
4. Uncategorised events such as absence without leave and failure to register for mandatory examinations
Residents gained points for completing tasks punctually, to a maximum of 17 points. They could lose points for uncategorised events. The CI was calculated every 3 months. Residents were briefed about the components of the CI at orientation and updated semi-annually on their performance. The CI formed a minor component of the total assessment for professionalism.
Results: When the CI was first administered, the average score across our programme of about 130 residents was 7.1. This rose to 9.7 by the end of the first academic year and steadily increased to 12.5 by July 2015 and is currently hovering at 14.1-14.7.
Conclusion: The CI is a useful tool that allowed us to measure conscientiousness with administrative tasks, and also send a message to learners about the importance of their responsibilities as learners. We were pleasantly surprised that there was a sustained increase in the CI of the programme as a whole which suggested an element of culture change.
Take-home message: Assessment may drive not just learning but also behaviour change.

3II12 (890)
Understanding of medical professionalism among Polish medical teachers

Authors
Anna Kocurek
Derek Jones

Presenter: Anna Kocurek, Jagiellonian University, Kraków, Poland

Background: The concept of medical professionalism is culture and context specific: without a precise understanding of what this means it remains an empty slogan. Indeed, the lack of agreed definitions in this domain generates differing perspectives within medical institutions in Poland. The objective of the proposed study was to explore the meaning of the term "medical professionalism", for Polish medical teachers working in one Department of Medical Education.
Method: A qualitative study, using semi-structured interviews, was performed between October 2016 and June 2017. The ten participants recruited had different clinical backgrounds and varied in their work arrangements (such as the proportion of clinical workload and teaching responsibilities). Analysis involved a process of coding and categorisation resulting in the development of a descriptive thematic scheme. Due to the nature of the inquiry, the interviews and initial analysis were carried out in Polish before being discussed in English with the academic supervisor.
Results: Participants' understanding of professionalism in Poland is complex, reflecting the historical development of medicine and, at least to some extent, changes in the Polish political situation. More recently Polish understanding of professionalism in many aspects has become similar to the Western frameworks. However, there are some features, which are unique for the Polish perspective. Medical professionalism can be understood as an inter and intrapersonal, construct, experienced in an organizational context, and emerging from a cultural (including linguistic) and historical context.
Conclusion: Changing curricula respect to professionalism along 'western' lines without acknowledging cultural context is a risky endeavour. Acknowledgement of historical aspects of professionalism may help to avoid an educational trap, which may lead to the perception of professionalism as an imposed external construct. Knowledge about culturally specific features in understanding of professionalism could serve as guidance during planning of the teaching or any curricular reform.

3II13 (2052)

Mistreatment, abuse, unprofessionalism and unproductive behaviour: A comparative qualitative analysis of how medical learners and educators define negative behaviour in the clinical workplace

Authors

Meredith Vanstone, Department of Family Medicine, McMaster University, Hamilton, Ontario, Canada
Amanda Bell, Department of Family Medicine, McMaster University, Hamilton, Ontario, Canada
Emily Block, Master's of Health Science Education program, McMaster University, Hamilton, Ontario, Canada
Alice Cavanagh, Health Policy PhD program, McMaster University, Hamilton, Ontario, Canada
Catherine Connelly, School of Business, McMaster University, Hamilton, Ontario, Canada

Presenter: Meredith Vanstone, McMaster University, Hamilton, Canada

Background: Nearly half of graduating medical students in Canada and the USA report experiencing mistreatment and abuse via anonymous surveys. Existing definitions of mistreatment and abuse tend to refer to violations of legislation and human rights codes, without addressing the less defined "grey areas" that learners may perceive as abuse (e.g. incivility, neglect, aggression, deception). Drawing upon an understanding of professional behaviour as dynamic and contextual, this research examines medical learner and educator understandings of what constitutes mistreatment and abuse in the clinical workplace. Different understandings of what constitutes abusive treatment may contribute to the challenge in identifying appropriate courses of action to report, address, or remediate mistreatment and abuse.

Method: Using constructivist grounded theory, we conducted interviews with 32 Canadian medical learners and educators at varying points in their career. Using a semi-structured interview guide, we solicited the personal experiences of participants with mistreatment, abuse, and unprofessional behaviour. Participant stories became the prompts for exploration of what they considered to be abusive behaviour as compared to behaviour that was rude, erosive or unprofessional, but did not constitute mistreatment or abuse.

Results: Participants offered many examples of "grey area" behaviours they weren't sure whether to characterize as mistreatment or abuse. They describe how intent, context, relationship dynamic and outcome are integral to sense-making about their personal experiences, offering instances in which nearly identical behaviours were interpreted differently due to these modulating factors. Through this analysis, we offer a framework to help contextualize different forms of negative interpersonal interactions.

Conclusion: This data highlights the challenge in articulating what constitutes mistreatment or abuse. Understanding how learners respond to highly structured, hierarchical, quickly changing environments contributes one piece of information to the complex puzzle of why mistreatment and abuse is so infrequently reported and so challenging to remediate.

A more nuanced understanding of what constitutes mistreatment and abuse could be used in learner orientation and faculty development to help orient expectations of acceptable vs. unacceptable behaviour, highlight different perspectives, and assist clinicians in knowing when to "tread carefully", and when to seek assistance or support.

3II14 (3267)

Rating the severity of medical student professionalism issues and the quality of insight demonstrated in students' response to professionalism remediation

Authors

Margo Mountjoy, McMaster University, Hamilton, Ontario, Canada
Raquel Burgess, McMaster University, Hamilton, Ontario, Canada
Rob Whyte, McMaster University, Hamilton, Ontario, Canada
Meredith Vanstone, McMaster University, Hamilton, Ontario, Canada
Lawrence Grierson, McMaster University, Hamilton, Ontario, Canada

Presenter: Lawrence Grierson, McMaster University, Hamilton, Canada

Background: The Undergraduate MD Program in the Michael G. DeGroote School of Medicine at McMaster University (Hamilton, Canada) is currently engaged in a data management project that will afford statistical determinations of the predictive value of student admission data as it pertains to their performance within the program. As part of this endeavour, information regarding students' in-training professionalism issues will be reflected through inclusion of their appearances before the Academic Progress Committee (APC), which provides disciplinary oversight, support, and remediation to struggling students. However given considerable variation across professionalism violations, there is a desire to further characterize these data with ratings of the severity of professionalism offenses as well as the degree of insight demonstrated by the students in response to the remediation process.

Method: Prior to operationalizing a rating scale for severity and insight inherent to any retrospective or prospective APC file, it was necessary to first establish that we could assign scores for these constructs in a reliable manner. Accordingly, we randomly sampled 39 APC files from the Program records and invited 6 individuals with formal relationships to the APC to review these files and rate both constructs on independent 7-point, anchored Likert scales. These ratings were then subjected to two-way, consistency-type, average measures, random-effects inter-rater reliability analysis in order to determine the consistency of rater perceptions across files.

Results: The results of these analyses revealed intra-class coefficients for severity (0.924) and insight (0.864) that indicate high inter-rater reliability for these measures. These findings highlight that reliable judgements of the severity of professionalism issues demonstrated by students can be levied via review of their interactions with the Academic Progress Committee. Also, via the same

review, reliable ratings of the quality of insight demonstrated by students through the remedial process can also be levied.

Conclusion: Data indicating that a student has registered a professional issue in training will be indexed in the data management project via APC appearances. These data will be further described with appended ratings of the offenses' severity and the quality of students' subsequent insight.

3II15 (1027)

The Development, Over 12 Years, of our "White Coat Ceremony" for Cultivating Professionalism in Medical Students in Japan

Authors

Michito Hirakata
Toshiaki Monkawa
Hidekazu Suzuki
Kuniaki Mukai
Rika Nakajima
James C. Thomas

Presenter: Michito Hirakata, Keio University School of Medicine, Tokyo, Japan

Background: Professionalism is an essential core competency for medical students and physicians, but a valid methodology for teaching this important proficiency has not been established due to its abstract concept. To welcome our students into the profession and introduce them to their responsibilities to patients, White Coat Ceremonies (WCC) have been performed prior to commencing clinical clerkships in our school since 2006.
Method: To demonstrate, reinforce, and nurture medical professionalism, we have developed an original WCC that consists of two major components; (1) formal addresses quoting aphorisms from Osler, et al. delivered by our Dean and guest speakers who are leading experts in medical professionalism and ethics, and (2) a project designed to create a student-authored-oath (SAO). The messages suggesting principles of medical ethics and valuing the honorable tradition of the "Caring Doctor" have encouraged humanistic qualities in our 4th-year-students and were published in book form. In the SAO project, students have conducted a survey on students' perceptions of a "Good Doctor" and discussed key issues regarding compassionate and ethical care, and interviewed health professionals and patients about society's need for excellent physicians, recorded on video, before declaring their own oath in front of their relatives, peers, and senior doctors.
Results: Our students learned the meaning of the responsibility that comes with wearing a white coat that symbolizes trust, shared their experiences and ideas on the important attributes of good doctors, and reaffirmed their dedication to the competent and ethical care of patients.
Conclusion: We found that our students were highly motivated by the WCC and further developed their aspiration and commitment to the ethical principles of beneficence, respect for patients' autonomy, and justice. The WCC is a valuable opportunity for medical learners to

reaffirm their dedication to the compassionate and ethical care of patients and encourages humanism and professionalism in clinical medicine.
Take-home message: The WCC has emphasized the professional behavior of our medical students and developed their aspirations and commitment to Medical Professionalism.

3II16 (3452)

A qualitative analysis of students' perceptions on professionalism in hidden curriculum: a pilot study in internal medicine rotation

Authors

Saranya Prathaithep, Sunpasitthiprasong Hospital, Ubon Ratchathani, Thailand

Presenter: Saranya Prathaithep, Sunpasitthiprasong Hospital, Ubon Ratchathani, Thailand

Background: Professionalism is a core competency in internal medicine as in all clinical practice. In hidden curriculum, medical students develop professional competency from various processes in the current educational environment. This pilot study aim to explore students' perceptions of what and how they learn about professionalism in hidden curriculum.
Method: Using a thematic analysis of 8 stories from writing narratives of medical students with opened end question about what events that thought them about professionalism during practice in internal medicine rotation at Sunpasitthiprasong Hospital, Ubon Ratchathani, Thailand, October through December 2017.
Results: Majority of the students' stories were coded as positive elements. Other 20% of the stories were hybrid that included both positive and negative element. Most of the experiences are in inpatients setting. The senior medical students, resident and attending staff are the main models in the stories. Two main domains are identified as a student or doctor-patient communication and student or doctor-patient ethical decision making about end of life issues. For instance, student interact with a relative who did not want the patient know his diagnosis of end stage liver cancer. Most of participants indicates that they learned about professionalism from positive role models.
Conclusion: The pilot study firmly suggest that students' narratives are a rich source of information to explore students' perceptions on professionalism in hidden curriculum. This findings suggest that role modelling is the active learning process to transmit professional values throughout the hidden curriculum. The particular experiential learning shape the student to be a competent doctor. Due to small numbers of participants, this study can not identify different educational needs in different year of study. Furthermore, the identified themes might be used to develop professional education in hidden curriculum.

3II17 (3554)
Self-development activities and Reflection, to promote Medical Professionalism

Authors
Thawanrat Chayaanantapat, Vachira Phuket medical education center, Phuket, Thailand

Presenter: Thawanrat Chayaanantapat, Vachira Phuket Hospital, Phuket, Thailand

Background: Professionalism is one of the challenging parts for medical education. The goal of self-development program is to educate medical students to be medical professionals with an understanding of humane.
Method: A group of 4th medical students were assigned to participate with self-development program (Enneagram). Three days activities consist of Ice-breaking activities, lecture, narrative, reflection and panel interview were done. After 1 year, medical students were followed up. Data was collected by in-depth interview.
Results: Most medical students agree that activities promote them to more understand themselves and other persons. They could recognized their intra-psychic conflicts including their resolving skills. They reflected that program teach and support them to be more compassion for others along with themselves.
Conclusion: This activity is one of teaching technique and tools to encourage medical professionalism. Enneagram is the one useful method to promote self-awareness and reconstructs professional identity for medical students. medical students should be encouraged to participate in extracurricular activities to promote their development of professionalism.

Professionalism and Cinemeducation

Authors
Martina Balaam, Edinburgh University Medical School, Edinburgh, UK

Presenter: Martina Balaam, Edinburgh University Medical School, Edinburgh, UK

Background: Medical Schools are required to teach professionalism outwith the clinical environment (GMC 2013). Without the context of real life situations classes can often lack authenticity and students are often disengaged. The challenge therefore is to offer students a more stimulating and rewarding learning experience.
Method: I conducted a literature review to investigate how to make classroom professionalism teaching more stimulating and rewarding for students. Relevant empirical research and theoretical literature were identified through a number of medical education, social science and media search engines. After an initial search we used snowballing techniques to look for recurring references within reference sources.
Results: There is a dearth of literature in this area however I found that there is some evidence that role play and the use of media scenarios taken from television hospital dramas are perceived well by students. I found a few examples of teaching professionalism in the classroom which were perceived by students as both meaningful and entertaining. This included role play and using video clips from Television hospital drama. These examples were seen as of educational value by the students who participated.
Conclusion: As evidence reveals that students learn better when they enjoy the learning experience and teaching professionalism in the classroom can be perceived as non contextual and dull it was pleasing to find examples of teaching practices which increased the students enthusiasm for professionalism teaching in the classroom. There are some good examples of engaging students in professionalism teaching. Due to a dearth of literature in this area further work is required to explore how we can make professionalism teaching more stimulating and rewarding for students.
Take-home messages: Cinemaeducation
- Makes Learning fun, bringing dry concepts to life by captivating emotions and encouraging creative thinking (Lumlertgul et al. 2009)
- Can promote empathy, discussion and reflection (Blasco et al. 2006)
- Provides the opportunity to experience highly emotive scenarios in a place of educational safety (Shevell et al. 2014)
- Engages students with humanities using a medium which is easily accessible and time efficient (Alexander et al. 2012)

3II19 (2360)
Investigating professionalism experts' opinion: toward developing an undergraduate medical professionalism curriculum

Authors
Nikoo Yamani, Isfahan University of Medical Sciences, Isfahan, Iran
Soolmaz Zare, Isfahan University of Medical Sciences, Isfahan, Iran
Tahereh Changiz, Isfahan University of Medical Sciences, Isfahan, Iran

Presenter: Nikoo Yamani, Isfahan University of Medical Sciences, Isfahan, Iran

Background: There is no doubt that professionalism is one of the main capabilities for general practitioners and its importance is growing every day. The literature suggests that professionalism is a notion that can be learnt. So, this study investigated medical professionalism experts' perspectives toward teaching and learning professionalism during undergraduate medical education as a step to help developing an outcome based medical professionalism curriculum.
Method: This study was a qualitative content analysis research . Data were collected from 10 semi structured interviews with medical professionalism experts in Iran between June and September 2016. All sessions were audio-recorded, transcribed and subjected to inductive content analysis. Data analysis included open coding, creating categories and abstraction.
Results: Participants expressed their views about professionalism and its features. They discussed about professionalism, teaching and assessment methods, the learning environment and provided helpful tips to develop a medical professionalism curriculum. During content analysis, four categories, 17 subcategories and 110 codes were emerged. Learning outcomes of medical professionalism, teaching and learning medical professionalism, evaluation of medical professionalism and context were identified as main categories.
Conclusion: The results of this study emphasized the importance of professionalism and provided the needed information for integration of a longitudinal strand during undergraduate medical education curriculum for developing professionalism in medical students. Deploying the effective learning and assessment methods by means of qualified teachers and staff in a supportive learning environment provides students with needed experiences and facilitate the process of educating professionalism. To address the development of professionalism in medical students designing a formal medical professionalism curriculum would be necessary and the notion of professionalism must be intricate with all phases of it.

Vulnerability and disillusionment as a threat to residents' professional identity development

Authors
Naike Bochatay, University of Geneva, Geneva, Switzerland
Nadia Bajwa, Geneva University Hospitals, Geneva, Switzerland
Katherine Blondon, Geneva University Hospitals, Geneva, Switzerland
Noelle Junod Perron, University of Geneva, Geneva, Switzerland
Stephane Cullati, Geneva University Hospitals, Geneva, Switzerland
Mathieu Nendaz, University of Geneva, Geneva, Switzerland

Presenter: Naike Bochatay, University of Geneva, Switzerland

Background: The healthcare environment is prone to conflicts between professionals. These conflicts have negative consequences on physicians-in-training and may affect their professional identity development. This is concerning given the importance of professional identity in role performance. Our aim was to identify professional identity aspects involved in conflicts experienced by physicians and to suggest solutions to support professional identity development.
Method: We conducted semi-structured interviews on conflict experiences with 43 residents and fellows at the Geneva University Hospitals, Switzerland. During interviews, we noticed that professional identity was involved in a number of conflict stories. To explore this, we iteratively analyzed de-identified interview transcripts and regularly met to discuss emerging themes related to professional identity, following constructivist grounded theory. Themes that we identified either represented sources of conflicts involving professional identity or were resulting consequences.
Results: Sixteen (nine residents, seven fellows) of 43 participants reported conflicts that involved identity aspects. Conflicts involving professional identity took place early on in residency, portraying it as a vulnerable period of a physician's career. Sources of conflict included participants' characteristics, feelings such as exhaustion or frustration, issues of professionalism, or power differentials between residents and their hierarchy. Conflicts led residents to lose their self-confidence and doubt their professional practice. They also led to residents' disillusionment with their professional ideals and to the development of negative perceptions of other groups.
Conclusion: Our results can be explained by social identity theory, which posits that members of a group view themselves positively, whereas they view individuals who do not belong to their group negatively. Social identity theory suggests that residents would benefit from developing a stronger group identity that would be acknowledged by their hierarchy and other healthcare professionals.
Take-home message: Physicians-in-training are vulnerable to conflicts with co-workers. These conflicts may affect their professional identity development and can lead to disillusionment and to negative perceptions of others. Support to residents and adaptation of the working environment are needed to ease the transition into residency.

Implementing FAST-sonography for German 4th year medical students

Authors
Philip Bintaro, Hannover Medical School, Hannover, Germany
Sabine Schneidewind, Hannover Medical School, Hannover, Germany
Christina Quandt, Hannover Medical School, Hannover, Germany
Christiane Beck, Hannover Medical School, Hannover, Germany

Presenter: Philip Bintaro, Hannover Medical School, Hannover, Germany

Background: The FAST algorithm (= Focussed Assessment with Sonography in Trauma) is defined as a screening examination to detect free fluid in the abdomen and the pericardium after trauma. The extended FAST examination additionally includes the examination of the lung to rule out a pneumo-/hematothorax and/or pleural effusion. A detailed evaluation of the organs is explicitly not part of the algorithm. The goal of detecting free fluid is quite easy to achieve, whereas the learning objectives in conventional sonography courses (e. g. measurement of organs) usually take more time. Furthermore, the German Catalogue of Learning Objectives (NKLM) recommends teaching FAST-sonography as a diagnostic porcedure for all medical graduates.
Method: An interdisciplinary team of anaesthetists and internists developed a three-hour course for small groups with a ratio of five participants to one teacher. A flipped-classroom concept with provision of mandatory online learning material about the theoretical background was established to maximize hands-on training time during the course. The course starts with a simulator-based section in which the FAST examination points are demonstrated, followed by the participants performing the examination on the training mannequin with simulated physiological and pathological findings. Afterwards, the participants examine each other according to the FAST algorithm. This course concept was introduced to 5th year medical students in May/June 2017 on a voluntary basis. A refined version was then implemented into the curriculum for 4th year medical students beginning in October 2017.
Results: Preliminary data suggest that students had a significant increase in their ability to identify free fluid. Furthermore, students reported that the FAST algorithm (although intended for patients with trauma in the first place) was overall easy to learn and gave them confidence to conduct the FAST examination also on patients without trauma, since the identification of free fluid is crucial for all patients.
Conclusion: Teaching FAST sonography is feasible. Constant recruitment of new teachers helps to distribute the workload of small group education.

Our concept might be a useful addition to conventional sonography classes in the context of limited time resources and financial constraints.

3JJ2 (1768)
Problem oriented and simulation for teaching mechanical ventilators in medical students

Authors
Yada Siriphannon
Rungnapa Pengprakhon
Narin Chindavech
Surasak Aumkaew
Thanatpong Thienwuttiwong

Presenter: Yada Siriphannon, Buriram Medical Education Center, Buriram, Thailand

Background: According to the feedback of our young graduated doctors after practicing in the rural hospitals, one of the most difficult problems is managing patients with mechanical ventilator. The preset of ventilators in acute respiratory failure patients are complexity and need experience in real situations. Actually, the medical students learned in medicine and anesthesia rotation with limit time to practice. Furthermore, many cases using mechanical ventilator admitted in intensive care unit which difficult to assess. Currently, patient simulation is increasing used in education of medical healthcare providers. Therefore we incorporated teaching modules using simulated ventilator setting in anesthesia curriculum to enhance learning experience in medical students.
To determined the learning outcomes between two methods of teaching of principles of mechanical ventilators: patient simulated ventilators (group1: PSV) versus bedside demonstrated ventilators teaching (group2; BD).
Method: Thirty three of 5th year medical students were instructed with narrated online PowerPoint presentation, then group 1 assigned to learning with problem oriented with clinical scenario using simulated ventilators; whereas group 2 to bedside demonstrated for mechanical ventilators. Measurement outcomes included in CRQ and OSCE knowledge questions and 10-items satisfaction scores.
Results: Both groups had significant improvement in knowledge scores including in initial setting, waveform analysis, basic troubleshooting (89.8(SD 9.5) versus 71.4 (SD 2.7), $p<0.05$). Student satisfaction with their learning methods was significantly in PSV group (8.7 versus 7.8, $p<0.05$). Students also were enthusiastic to participate in simulated ventilators after the study completion with good learning atmosphere.
Conclusion: Incorporating teaching with simulated ventilatory program improved knowledge and satisfaction and preferred to online and bedside demonstrated teaching. We planned for evaluate retention of knowledge in long term and feedback when visited post-graduated doctors, subsequently.
Take-home message: Simulation for teaching mechanical ventilators enhanced the confidence and learning outcomes in medical students.

3JJ3 (1534)
Assessing the effectiveness and perceptions of Fundoscopy teaching in core medical trainees

Authors
Ruth Chen, Nottingham University Hospitals NHS Trust, Nottingham, UK
Shawn S Joseph, Royal Derby Hospital, Derby, UK

Presenter: Ruth Chen, Nottingham University Hospitals NHS Trust, Nottingham, UK

Background: In the UK, fundoscopy is an essential skill for undergraduate students, foundation year doctors and core medical trainees (CMT). Despite this, its importance has been diluted in the expanding medical curriculum and this has led to its demise. Clinicians often struggle, lacking the confidence to perform it reliably.
This study evaluates the perceptions of core medical trainees towards fundoscopy. It also assesses the effectiveness of a 45-minute fundoscopy teaching session to this cohort.
Method: Pre- and post-intervention questionnaires using a 5-point Likert scale assessed the confidence in performing fundoscopy and the perceived competency. Candidates received a 15-minute demonstration of the technique, followed by 10 minutes of practice to locate the optic disc, and 20 minutes practising on a digital eye retinopathy trainer model (Adam Rouilly®). The data normality was checked by Shapiro-Wilk test and tested for significance.
Results: 16 candidates were enrolled. 56% reported not having used the ophthalmoscope since medical school. 67% of candidates attributed this to lack of availability of an ophthalmoscope. 67% found ophthalmoscopy a diagnostic challenge whilst 11% found it technically challenging. 33% felt ophthalmoscopy should be performed by a specialist, and 33% perceived it to be obsolete. All the candidates had no fundoscopy teaching during CMT training.
The mean confidence level before intervention was 2.125 (median=2, SD=1.02), increasing to 3.65 (median=3.5, SD= 0.62) post intervention. The mean rated competency level before and after intervention was 1.9 (median=2, SD=0.92) and 3.5 (median=3, SD=0.63) respectively. This non-parametric data showed significant improvement by Wilcoxon rank test (p ≤ 0.05). Before intervention, 50% of trainees could not locate the optic disc, which improved to 100% afterwards.
Conclusion: Despite barriers to fundoscopy, it remains important in physical examination. It forms part of the CMT training, however our study confirms that trainees lack confidence in performing this skill, likely attributed to the lack of emphasis during training. We conclude from our results that a 45-minute targeted and structured approach with hands-on experience on human subjects and a simulator significantly improved the candidates' confidence and competence.
Take-home message: Hands-on fundoscopy training bypassing didactic teaching significantly improves confidence and competency.

Basic Obstetrics and Gynecology procedures of 6th year Medical Students in Roi-et Hospital, Thailand

Authors
Sirikanya Somsri

Presenter: Sirikanya Somsri, Roi-et Hospital Medical Education Center, Roi-et, Thailand

Background: While the training of clinical skills is a requirement for medical study, it is necessary to evaluate whether a student receives enough learning experience, then go on to new idea with assess the clinical experience of student is the evaluation of the number of patients whom the medical student had taken, which is recorded in a logbook.
Method: In this study, the Department of Obstetrics and Gynecology, Roi-et Hospital aimed to analyze the number of studied cases with the basic obstetrics and gynecology procedures as shown in the students' logbook. The data of number of patients were collected from 15 logbooks of 6th year medical students that were handed in to the department after the 6-week training session in 2017.
Results: The numbers of cases of basic obstetrics and gynecology procedures that were collected from the students' logbook were normal labor 88 cases, episiotomy and repair 79 cases, amniotomy 26 cases, Pap smear 24 cases, marsupialization 11 cases, cervical biopsy 4 cases, cervical polypectomy 3 cases and vaginal packing 1 case. The average number of cases that were done by 6th year medical student per case were normal labor 3-12 cases, episiotomy and repair 3-12 cases, amniotomy 0-5 case, Pap smear 0-2 cases, marsupialization 0-3 cases, cervical biopsy 0-4 cases, cervical polypectomy 0-1 cases and vaginal packing 0-1 case.
Conclusion: These data revealed that the students should practice the clinical skills from enough number of patients. Therefore, the criteria for checking the student's logbook should be evaluated and adjusted for better assessment of clinical training in the department.
It would be our recommendation that all medical students have the opportunity to practice these skills under clinical supervision in order to fulfill the requirements of the Medical Council of Thailand.Furthermore,we need our students to learn about any obstetrics and gynecologic complication and practice pre-counselling before performing any clinical procedures.

3JJ6 (2065)

Comparison of Teaching Basic Orthopedic Procedural Skills by Peer Assisted Learning (PAL) Tutoring and by A Teacher's Teaching in Undergraduate Medical Students

Authors

Meena Permthai, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand
Orawan Chaiyamahapurk, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand

Presenter: Meena Permthai, Buddhachinaraj Medical Education Center, Phitsanulok, Thailand

Background: Thailand medical curriculum is assigned for medical students to study orthopaedics less than the past. Studying basic orthopaedic procedural skills under limited time and teachers cannot help students study more details in every skill. PAL developed and implemented as vehicles helps students learn tutoring in defined learning standards.

Method: This is a retrospective cohort study with all sixth-year medical students. Collecting data was in two academic years: twelve-hour PAL (2016,N=61) and twelve-hour teacher's teaching (2017,N=49). We collected data of teaching processes and a number of practical basic orthopaedic procedural skills and compared OSCE results of concerning skills.

Results: The results of study are PAL tutoring helps students practise all basic orthopaedic procedural skills (100%) while teacher's teaching helped each student practise only 33.3-41.7% of all skills. When comparing OSCE scores of Short Arm Cast, Short Leg Slab, Figure of Eight and Interlocking Arm Sling, the results shows Means of PAL tutoring are 7.06, 7.98, 8.62, and 8.62 respectively. Results of teacher's teaching are 6.79, 8.46, 9.02, and 8.98 respectively. Variances of two groups are equal. Means of them in each skill are equal.

Only one teacher's teaching under limited time cannot help students practise all basic orthopaedic procedural skills. Therefore, teacher chooses to give details in only 4 fields of the skills (assigned in exams), but lacking details in other skills, not in exams. PAL tutoring has processes, frameworks, learning standards, follow-up methods, and correct suggestions; consequently, students can achieve practicable skills in spite of outside studying time.

OSCE shows Short Arm Cast has the highest difficulty level. Therefore, there should be more practices and feedbacks in order to increase students' basic orthopaedic procedural skills.

PAL tutoring can be parts of studying basic orthopaedic procedural skills, but there should be correct teaching processes, and teachers with suggestions and continued follow-ups are still important in achievement of studying purposes.

Conclusion: Nowadays there are a lot of medical equipment and instruments assisting how to teach and study, but we must consider their advantages and disadvantages. Moreover, we must improve procedures, standards, and continued evaluations of medical courses.

Physical examination contests effectively improve learning outcomes

Authors

Bai-Chin Lee, National Taiwan University College of Medicine, Taipei, Taiwan
Jann-Yuan Wang, National Taiwan University College of Medicine, Taipei, Taiwan
Chien-Ching Hung, National Taiwan University College of Medicine, Taipei, Taiwan
Po-Yuan Chang, National Taiwan University College of Medicine, Taipei, Taiwan
Chien-Hung Chen, National Taiwan University College of Medicine, Taipei, Taiwan
Fen-Yu Tseng, National Taiwan University College of Medicine, Taipei, Taiwan

Presenter: Fen-Yu Tseng, National Taiwan University College of Medicine, Taipei, Taiwan

Background: The physical examination training course was started at the preclinical year (M4). Students were divided into 12 small groups. Each group had one physician assigned as their tutor. Students learned skills of physical examination through lectures, videos, mutual practice, and patients. Variations of tutors' teaching styles and students' learning outcomes were concerned.

Method: Tutors listed 12 important clinical conditions with significant signs. The group and the order of presentations were decided by draw. The contest was held at the last class of the semester. Each group had 10 minutes to present the physiologic meaning, the skill, the sensitivity, the specificity, and the confounding factors of the related signs. Group presentation scores were decided by all the tutors and students. Awards were given to the top three groups.

Results: The 12 clinical conditions/signs were aortic regurgitation, asterixis, stroke, Castell sign, appendicitis, hypocalcemia, deep tendon reflex, respiratory pattern, percussion for pleural effusion, meningeal signs, ascites, and Murphy's sign. Students present the signs intelligently and creatively. Understandings and skills of physical examinations were improved effectively through the contest. The contest was videotaped, uploaded to our teaching platform, and reserved as teaching materials. Physical examination contest provided a chance for students to learn from different groups. The contest successfully fulfilled the aims of improving students' interest and abilities of physical examinations.

Conclusion: Physical examination contests enhance students' interest, understanding, and skills of physical examination. New designs to curriculums may improve students' leaning outcome.

3JJ10 (1421)
Improving physicians' ward round communication through simulation-based training

Authors
Marc Grünewald, Chair of Medical Education, TUM Medical Education Center, Munich, Germany
Evelyn Klein, Chair of Medical Education, TUM Medical Education Center, Munich, Germany
Martin Gartmeier, Chair of Medical Education, TUM Medical Education Center, Munich, Germany
Pascal Berberat, Chair of Medical Education, TUM Medical Education Center, Munich, Germany

Presenter: Marc Grünewald, Chair of Medical Education, TUM Medical Education Center, Munich, Germany

Background: Ward rounds are an essential part of medical doctors' everyday work. They are a central opportunity for patient and doctor to interact with each other (Weber & Langewitz 2011). To perform ward rounds well, doctors need non-technical-skills, especially communication, to establish a shared understanding with the patient. Currently, the scarcity of training in ward round communication in undergraduate medical education is likely to cause insufficient competence in conducting ward rounds (Nikendei et al. 2008). Hence, developing interventions and understanding what makes them effective are relevant goals for research.
Method: Few training programs aimed at ward round communication are documented in the literature (Nikendei et al. 2007; Thomas 2015). Drawing upon these, we developed a simulation-based half-day workshop dedicated to advanced medical students including a theoretical and a practical part. During the theoretical part, trainees were familiarized with the procedure of surgical ward rounds based on the "Basler Visitenstandard" (Weber & Langewitz 2011). The practical part consisted of simulated ward rounds with standardized patient scenarios and actors as patients. The aim of the present study was to investigate the efficacy of this intervention for fostering ward-round communication competence through a randomized controlled trial. The ward round performance of an intervention group (n=17) was compared between ward rounds performed before and after the half-day training program. The control group (n=11) performed two ward rounds without the workshop in between. Performance was assessed with a validated ward round rating tool (Ahmed et al. 2015) by two blinded and trained raters.
Results: Analysis of the ratings suggest that ward round performance scores of the intervention group improve between assessments while scores of the control group decrease.
Conclusion: The results of this study show that simulation-based training is an effective way of improving competency of medical students in conducting ward rounds and should be further explored and implemented in medical curricula.
Take-home messages:
- Ward rounds are an essential part of almost every doctor's work
- Current ward round quality is unsatisfactory

- Simulation-based training is a viable strategy to improve ward round quality

3JJ11 (2814)
An Educational Approach to Support Family Witnessed Resuscitation – Enhancing Continued Professional Development Through Animation

Authors
Natalie Smee, NHS Education for Scotland, Glasgow, UK
Ronald MacVicar, NHS Education for Scotland, Inverness, UK
Clare Tucker, NHS Education for Scotland, Edinburgh, UK
Janice Turner, NHS Education for Scotland, Glasgow, UK
Rob O'Donnell, NHS Education for Scotland, Glasgow, UK

Presenter: Natalie Smee, NHS Education for Scotland, Glasgow, UK

Background: Family witnessed resuscitation is endorsed by the Resuscitation Council UK, however a review of current literature and educational materials did not identify any focused resources aimed specifically at supporting healthcare staff to improve their communication skills when safely enabling families to be present during a resuscitation. Following discussion with key stakeholders including postgraduate medical trainers and trainees it became apparent that additional resources aimed at helping to equip staff with the communication skills necessary for these situations would be a welcome teaching aid.
Method: Stakeholders were identified including the Ambulance Service, resuscitation officers and key clinicians with an educational/ supervisory remit. Two short, animated, scenario based videos titled 'Supporting Families During and After Paediatric Resuscitation/ Adult Resuscitation' were produced. These complement a suite of existing videos used to support healthcare professionals gain increased preparedness with regard to a variety of challenging bereavement related conversations.
Family witnessed resuscitation has been shown to improve the outcomes for those who are bereaved. However, NHS Education Scotland identified a gap in the availability of teaching materials to support practitioners negotiate these situations. This informed the development of two bespoke educational animations which have multiprofessional application within the adult and paediatric settings.
Results: Use of video animation as a tool to support practitioners to enhance their communication skills in challenging death related situations is an innovative approach to continuing professional development. The versatile and accessible nature of these open resources which are quick to view allows for flexible learning out with traditional educational environments, thereby reducing the amount of time needed to be away from clinical duties.
Conclusion: Video animation is an effective educational tool which can be used to support the development of enhanced communication skills in challenging situations. Its versatile application as both a structured and independent learning resource makes it an ideal format to

deliver continuing professional development in a busy clinical environment.

3JJ12 (1906)
Improvised encounters – theatre-based methods in medical education

Authors
Kari Hevossaari, University of Helsinki, Medical Faculty, Helsinki, Finland
Asta Toivonen, University of Helsinki, Medical Faculty (Clinicum, Department of Public Health), Helsinki, Finland
Otto Helve, Pediatric Research Center, Children's Hospital, University of Helsinki and the Helsinki University Hospital, Helsinki, Finland

Presenter: Kari Hevossaari, University of Helsinki, Medical Faculty, Helsinki, Finland

Background: Learning communication skills is a fundamental part of medical education. For the last 20 years, second year students have participated in a course called "Interviewing the patient". This year we introduced a new method of teaching in the course based on techniques commonly used in training of actors. In addition to patient interview simulations, we carried out an introductory session of short, hands-on practices refining improvisation and mental and bodily presence for the students to gain self-knowledge and confidence in communication.
Method: In January 2018, at the beginning of the course, a two-hour teaching intervention was implemented in groups of 36, 42 and 38 students. In each group, subgroups of 2-6 students practiced the use of body, voice, and self-awareness as building blocks of communication. At the end of each session, students were asked to fill in a feedback online qualitative questionnaire. In April, after patient interview simulations with professional actors, students will be questioned by an online questionnaire on whether actor-initiated teaching was deemed valuable in regard to patient simulation experiences and patient interviewing skills.
Results: 99/116 (85%) students answered at least one question in the online questionnaire. In the feedback concerning the teaching intervention, 58/92 (63%) reported having at least some experience on communication skills training or performing prior to the course. 74/99 (75%) expressed feelings from mild nervousness to anxiety when interacting with unknown people.
Students perceived the sessions useful. Storytelling while being instructed (e.g. be glad, use your hands more, try to whisper) and observing this practice was considered useful by 31/71 (44%). Also, posture and voice training were found useful together with mindfulness-oriented relaxation 9/71 (13%).
Conclusion: Most of the students were new to this kind of training. The students found the session useful, especially the improvisation techniques involved. While we believe this could be a valuable new method for teaching communication skills to medical students, more in depth-analyses will be performed at the end of the course.

Take-home message: Theatrical training methods could be useful when planning to improve medical students' communication skills.

3JJ13 (2283)
The Intention-Behaviour Gap: Students' views as predictors of exploring the patient's perspective

Authors
Annie Cushing
Esther Murray
Simon Packham

Presenter: Annie Cushing, Barts and The London School of Medicine and Dentistry, Queen Mary University of London UK

Background: Patient-centred communication involves exploring the patient's perspective in addition to biomedical information as part of a medical history. There is evidence that learning communication in simulation settings does not transfer to practice unless applied immediately and supported (Heaven et al 2006, Brown 2010, Rowlands et al 2013, Cushing 2015). This study explored students' attitudes and systems factors as predictors of behaviour in clinical placements.
Method: Following a two-week clinical communication course as preparation for a nine-week ward placement, students completed a questionnaire. They rated the importance of and intentions to explore psycho-social aspects as well as symptoms in forthcoming ward placements. At the end of the placement they completed another questionnaire rating importance and reported behaviour. Matched questionnaires were available for 75% of those surveyed (N = 165).
Results: Pre-placement ratings on a 10 point Likert scale of importance and likelihood were high; mean 8.78 (SD 1.33) and 8.23 (SD 1.30) respectively. Spearman's rho correlation was 0.328 (p 0.01). Post-placement ratings of importance remained high; 8.76 (SD 1.65). Reported behaviour from 'Never to Always' exploring the patient's perspective was mean 3.96 (SD 0.67) on a 5-point Likert Scale. Spearman's rho correlation between pre-placement intention and reported behaviour was 0.197 (p 0.05).
Factors affecting students' ward behaviour were explored as were their experience of being observed and receiving feedback on their communication by clinicians.
Conclusion: Following a targeted clinical communication course students commenced their ward placements with strongly positive attitudes and intentions to apply patient-centred communication. There is a positive albeit weak correlation between these and their subsequent behaviour. Behaviour is mediated by other factors which students identified as obstacles and which will be discussed.
Take-home message:
- Students were found to hold positive attitudes and intentions towards patient-centred communication
- Behaviour is influenced by more than attitudes.
- Collaboration between teachers in simulation settings and clinicians on ward could enhance and support students' application of learning in clinical settings.

Bad News or Life Altering Diagnoses? A Randomized National Needs Assessment of Canadian Neurology Trainees' and Neurologists' Perceptions towards Disclosing Diagnoses

Authors
Carol S. Hodgson, University of Alberta, Edmonton, Canada
Catherine Bell, University of Alberta, Edmonton, Canada
Janis Miyasaki, University of Alberta, Edmonton, Canada

Presenter: Carol Hodgson, University of Alberta, Edmonton, Canada

Background: Giving bad news is included in most medical school and post graduate training; however, studies indicate that giving a diagnosis is often done poorly leaving patients traumatized. Could this be related to physicians not considering many diagnoses as "bad news?"
Method: Neurologists and residency programs, randomized to two groups, received surveys listing 14 diagnoses; one group indicated which diagnoses were "bad news," the other "life-altering." Chi square was used for each diagnosis with "prompt" ("bad news"/"life-altering") or "role" (resident/neurologist) or gender. An ANOVA used total diagnoses with "prompt," "role," and gender as independent variables.
This study was approved by the university's institutional ethics board.
Results: More often respondents with "life-altering" prompt (n=138) chose the diagnoses versus those with "bad news" (n=121) prompt: epilepsy (80%, 54%); functional-neurological disorder (43%, 19%); migraine (22%, 7%); multiple-system atrophy (99%, 89%); muscular dystrophy (94%, 76%); Parkinson's (91%, 74%); peripheral neuropathy (25%, 13%); and stroke (91%, 64%).
Residents versus neurologists checked: Bell's palsy (12%, 5%); epilepsy (76%, 64%); multiple sclerosis (97%, 89%); progressive-supranuclear palsy (89%, 97%); and stroke (88%, 73%).
More diagnoses were marked "life-altering" (M=9.5) versus "bad news" (M=7.8). "Prompt" was significant for total diagnoses marked (p=.01); however, "role" and gender were not. There was a significant interaction (p=.03) for gender by "role" with female residents choosing more diagnoses overall.
Residents were, generally, more likely than neurologists to include particular diagnoses regardless of their "prompt" ("bad news"/"life-altering"). Overall, respondents chose more diagnoses if prompted with "life-altering."
Patients report physicians are often poor at giving "bad news." This could occur for numerous reasons: e.g., poor training, stressful experiences, lack of time. It could also be diagnosis severity is viewed differently depending on the terminology used. Perception may affect how physicians approach explaining a diagnosis to a patient.

How diagnoses are perceived may be related to terminology used, such as "bad news" versus "life-altering." These findings indicate perceptions about disease severity should be included in curricula.
Conclusion: Educational interventions are planned for medical students, residents, and physicians to discuss how perceptions affect their approach to difficult conversations with patients.

3JJ18 (623)
Implicit and Explicit Weight Bias in Physician Assistant Students

Authors
Gail Curtis, Wake Forest School of Medicine, Winston-Salem, USA
Sonia Crandall, Wake Forest School of Medicine, Winston-Salem, USA

Presenter: Gail Curtis, Wake Forest School of Medicine, Winston-Salem, USA

Background: The influence of unconscious (implicit) weight bias on clinical decision making and behavior toward patients is well documented in the medical literature. Data are lacking regarding whether Physician Assistant (PA) students are empathic and invulnerable to unconscious bias toward overweight and obese patients.
Method: To appreciate the magnitude of unconscious weight bias in PA students, we examined implicit and explicit weight biases and whether these biases correlated with empathy.
Three classes of first year PA students (2015, 2016, 2017) completed the weight implicit association test (IAT) and the Jefferson Scale of Physician Empathy. Associations among explicit and implicit measures were analyzed using Pearson correlation; differences in means were analyzed using t-tests.
Results: Response rate was 86% (205 of 237); statistics revealed no class variations (% women, mean IAT and JSPE scores, age); thus data were pooled. The overall mean IAT score across the three classes indicated that this group of students had a slight implicit preference for thin people. A significant correlation existed between implicit weight bias and explicit preference for thin people (r = .28, p<.000). As explicit preference for "thin" increased, there was a tendency for empathy to decline (r = -.158, p=.024). Empathy and implicit weight bias were unrelated; thus empathy did not mitigate unconscious bias.
Students who explicitly reported preferring "thin" people had significantly higher implicit preferences for "thin." Unfortunately, we found that as explicit preference for "thin" increased, empathy declined. This finding suggests that early in their educational process, guidance should be provided for how to manage patients who are overweight or obese without allowing explicit bias, known bias, to influence the care they provide. Interestingly, these PA students were more aware of and willing to acknowledge their weight biases.
Conclusion: More than 50% of the patients PAs evaluate and treat will be overweight. With explicit bias toward thin being associated with decreased empathy, efforts to intervene and educate in this area are warranted.

The Comparison of Teamwork Between Senior Medical Teams and Junior Medical Teams

Chien-Ming Lo, Joint Commission of Taiwan, New Taipei City, Taiwan
Pei-Chia Hsu, Joint Commission of Taiwan, New Taipei City, Taiwan
Elma Hung, Joint Commission of Taiwan, New Taipei City, Taiwan
Daniel Lo, Joint Commission of Taiwan, New Taipei City, Taiwan
Shing Liao, Joint Commission of Taiwan, New Taipei City, Taiwan
Pa-Chun Wang, Joint Commission of Taiwan, New Taipei City, Taiwan

Presenter: Chien-Ming Lo, Joint Commission of Taiwan, New Taipei City, Taiwan

Background: According to research, the teamwork of medical teams is closely related to a patient's safety. By identifying the weakness in a medical team's Team Resource Management (TRM), a medical team can provide related training to its team members and hence improve its effectiveness. This study aims to analyze the teamwork of senior and junior medical teams participating in Simulation Campaign of the Joint Commission of Taiwan (SCJCT).

Summary of Work: SCJCT is based on the design of simulation to let medical staff experience how to take care of patients, as well as how to communicate and cooperate with each other. Data was collected from SCJCT conducted from 2014 to 2017. Junior teams were consisted of Post Graduate Year (PGY) or Under Graduate Year (UGY) medical students. We used the four constructs of TRM—leadership, situation monitoring, mutual support, and communication—to measure the teamwork of each team. There were 4 to 8 items in each construct. Based on the teams' performances, scores of 0, 50 and 100 were assigned to the teams accordingly.

Summary of Results: There were 114 medical teams (73 senior teams and 41 junior teams) form 33 hospitals participating in SCJCT from 2014 to 2017. 20% of the members in the senior teams have participated in SCJCT for more than twice. We used the independent T test to compare the teamwork performance between senior and junior teams. The result shows that the overall teamwork of the senior teams improved year by year. Moreover, senior teams performed better than the junior teams, especially in mutual support (Senior: 67.8 V.S. Junior: 52.2, $P<0.01$) and communication (Senior: 68.6 V.S. Junior: 54.6, $P<0.01$).

Conclusions: It can be concluded that mutual support and communication in the senior teams are better than they are in the junior teams. In the future, we will employ Kirpatrick's model, which include the constructs of reaction, learning, behaviour, and result, to evaluate the effectiveness of training on TRM.

Take-home Messages: Hospitals can provide related training, such as TRM, to junior medical staff to improve the teamwork.

Is learning how to ride a bike from a text book possible? Undergraduate medical student perception on communication skills training

Authors

Mariana Searle
Carolina Pérez
Verónica Silva
Peter Mc Coll
Jéssica Goset

Presenter: Mariana Searle, Universidad Andrés Bello, Viña del Mar, Chile

Background: Communication skills training is an essential part of undergraduate medical education. Using simulated patients is the chosen didactic strategy, as it allows students to have a "first person" experience, identify their personal styles in the clinical relationship; and facilitates self-evaluation and feedback. Implementing this methodology across curriculum is foreseen.
Objective: To determine student perception of the learning experience during communication skills training using simulated patients.
Method: Mixed quantitative and qualitative methodology, were used respectively. 51 students participated and responded to a Likert-type Scale that evaluated: non-verbal communication valuation, personal communication style recognition, feedback effectiveness, self-reflection opportunities, clinical clerkship application, use of simulated patients and methodology satisfaction. Discourse analysis through deductive categories on open questions was performed.
Results: All categories ranged between "totally agree" and "generally agree", Cronbach´s Alpha 0.84. Use of simulated patients (4.76), self-reflection opportunities (4.72) and feedback effectiveness (4.68) were the highest scores. Amount of role play and simulated patients sessions were negatively evaluated. Qualitative analysis shows positive perception for simulation, climate and feedback.
Students positively valued activities with simulated patients, the positive and constructive learning environment with immediate feedback, and the opportunity to self-reflect and discover personal communication styles. Negative perceptions reveal student need to increase number of learning opportunities, as practice leads to mastery for skill development.
Conclusion: Communication skills training through student direct involvement in simulated scenarios, is a didactic strategy that allows for a "first person" protected immersion in the complexities of the doctor-patient communication reality. Simulation, self-reflection and feedback ought to be academically considered as the strategies of choice for relational skill development in medical professionalism.
Communication skills training through simulation, in a positive and constructive learning environment is also about professor/student relational modeling on how to communicate and give constructive feedback for personal and skill improvement. This is a unique teaching opportunity to help students grow on self-confidence.

Developing Medical Students' Competency to Communicate Bad News to Patients with Dementia

Authors

Vanessa Peixoto, UFRN, Natal, Brazil
Clecio Godeiro Jr., UFRN, Natal, Brazil
Rosiane Diniz, UFRN, Natal, Brazil
Julianna Arouca, UFRN, Natal, Brazil
Letícia Pontes, UFRN, Natal, Brazil
Ana Raulino, UFRN, Natal, Brazil

Presenter: Vanessa Peixoto, UFRN, Natal, Brazil

Background: Dementia is a life threatening and stigmatized condition, with devastating impacts on patient's personal identity and caregivers. There are many barriers to an effective diagnosis disclosure to dementia patients, including fear of causing distress, uncertainty of diagnosis, caregivers objection and lack of training on communication skills in undergraduate medical schools. Therefore, it is important to implement strategies to help medical students to build up multiple skills for an appropriate relationship between doctor, patient and family, including the ability of disclosing the diagnosis.
Method: First, we adapted SPIKES protocol to dementia patients. Then, an interventional, cross-sectional, randomized study with third-year medical students at our university was carried out. The goal was to evaluate how this protocol could help to improve communication skills of the medical students.
Results: Eighty-six students joined the study, divided into three groups: GI (trained protocol before lectures about dementias), GII (trained protocol after lectures about dementias) and GIII (did not join the protocol). Students on GI and GII were assessed by two similar OSCE (Objective Structured Clinical Examination); students on GIII only took part at the second OSCE.
Groups GI and GII showed better results on the second OSCE comparing to GIII (GI:7,56±1,22, GII:7,47±1,09, GIII:6,42±1,68, p<0,001). Students on GI performed better on this assessment than students on GII (p<0,001). Groups GI and GII exhibited increasing scores along the two OSCEs (GI OSCE1: 6,38±1,34, GI OSCE2: 7,56±1,22, p<0,001; GII OSCE1: 5,31± 1,36, GII OSCE2: 7,47± 1,09, p<0,001). Most students (98%) agreed that training on communicating the diagnosis of dementia is important for their career development.
Suggested adaptations to SPIKES protocol seem to encompass current guidelines about communication of the diagnosis of dementia, keeping its didactic approach. This training was well accepted by the medical students and contributed for their improvement on communication skills.

Conclusion: This model of training, as well as the adapted protocol, may represent replicable strategies for other curriculum elements in a way of improving communication abilities on health schools.

Teaching communication skills in order to make inevitable death discussable

Authors
Dorine van Woerden, Academic Medical Centre, Department of Medical Psychology, Amsterdam, the Netherlands

Presenter: Dorine van Woerden, Academic Medical Centre, Department of Medical Psychology, Amsterdam, Netherlands

Background: A timely discussion about the inevitable death of terminally ill patients is imperative to avoid misunderstanding. Misunderstanding about the care that terminally ill patients want and need during the last phase of their lives. This requires appropriate measures to be taken. Too often patients are 'over-treated' because their nearby death is not discussed. An explanation could be that doctors are trained to provide curative treatments rather than handle the heavy emotions of patients facing the end of their life. Also, patients themselves are reluctant to initiate this difficult subject. There is an increasing awareness that doctors need to be trained to initiate this discussion with patients.
Method: Effective communication about inevitable death can contribute to optimal palliative care. Therefore, we have developed a communication module for physicians. During this 4 hour training physicians: a) become aware of their own emotions that may hinder effective communication. b) are provided with the relevant theory and skills. c) practice these skills with the help of a professional actor.
During the last 8 years we have offered this module to four hospitals in the Netherlands. Participants were internal oncologists, gynecologists, intensive-care physicians and also 5th year medical students. Satisfaction was measured by means of a semi-structured questionnaire.
Results: Participants generally appreciated this module: "…it provides practical communication tools to initiate a consultation about inevitable death". Results also show that this module enables physicians to initiate this consultation, cope better with emotions and tolerate the fact that they cannot offer options for cure.
During which phase of medical education should this module be offered?
For which physicians is this module most appropriate (general physicians, specialists, medical students?)
Conclusion: Communication skills regarding inevitable death are helpful in initiating a discussion with terminally ill patients.
A timely discussion about the inevitable death requires communication skills that can be taught.

Tanya Apichatvullop, Kalasin Hospital Medical Education Center, Kalasin,Thailand
Suthasinee Mataneedol, Kalasin Hospital Medical Education Center, Kalasin,Thailand

Presenter: Chayanis Trakulthong, Kalasin Hospital Medical Education Center, Kalasin, Thailand

Background: Nowadays communication is important way connecting physicians and their patients. Miscommunication often leads to conflict among community, sometimes raising serious legal issues. Formerly, we never held interactive workshop involving communication skills. So, this might be fascinating and useful.
Method: Two-day workshops were held, one day for each group of students, divided into two parts. First, theoretical part. Secondly, practicing. Medical students formed groups, taking role-plays as a doctor and his/her patient, the other students observed the process. The situations were breaking bad news about brain death and cancer, asking permission for lower leg amputation, giving information about patient's child having Thalassemia and Febrile convulsion. Then, we let participants freely discuss, share what they had learnt and examples of how they chose to communicate. Our teams, doctors from different medical specialties including psychiatrist, directed feedback as a learning tool. Students assessed themselves using likert scale scoring tools.
Results: All 80 4th-6th year medical students participated. Most of them (95%) were highly satisfied. Students stated role-play helped improve their communication skills. It also helped to make situations practical and comprehensible. Since role-play situations were very common, it helped students prepare for their future practices. The students' confidence was statistically signicifant increased. Shifting from medium to high level. (3.3 VS 4.1 95%CI 0.6-0.9, p-value <0.05)
Dividing students into small group, both teachers and students thoroughly participate the workshop. The students understand those specific situations and feelings of listeners better. Teachers can immediately give reflections and explanation how students can have much more appropriate communication. Building up confidence in the short time.
Conclusion: Interactive workshop let the students better understand their patients, building up confidence about communications in both daily-living and clinical practices. Learning by doing. Small-group role-play practicing helps to make communication more practical and

comprehensible. It's also the way to learn how to be more humanistic in medical health care.

Implementing longitudinal curricula of communication: Experiences from four German faculties of medicine

Authors
Barbara Hinding, IMPP - Institut für medizinische und pharmazeutische Prüfungsfragen, Mainz, Germany
Christian Brünahl, Universitätsklinikum Hamburg-Eppendorf, Hamburg, Germany
Holger Buggenhagen, Universitätsmedizin Mainz, Mainz, Germany
Kirsten Reschke, Universitätsklinikum Magdeburg, Magdeburg, Germany
Jobst-Hendrik Schultz, Universitätsklinikum Heidelberg, Heidelberg, Germany
Jana Jünger, IMPP - Institut für medizinische und pharmazeutische Prüfungsfragen, Mainz, Germany

Presenter: Barbara Hinding, IMPP - Institut für medizinische und pharmazeutische Prüfungsfragen, Mainz, Germany

Background: In Germany, teaching communication competence in medical studies has been subject of political documents and initiatives and is practiced at the medical faculties since a longer time. Particularly the Masterplan Medizinstudium 2020 outlines the directions to reform medical studies. It stresses the importance of communication skills and recommends the implementation of the National Longitudinal Core Curriculum of Communication. To assist the faculties in this task, knowledge concerning the conditions and circumstances of implementation processes is necessary. Therefore the objective of our research is the identification and implementation of support measures to facilitate the realization of longitudinal concepts of teaching and examining communication competence.
Method: We carried out a comparative case study with four faculties of medicine in Germany. In 2014 and 2017 we conducted an inquiry to assess the state of implementation. To get more detailed information, Interviews with teaching staff, professors and lecturers and moderated group discussions with subsequent comparative qualitative content analyses were used to gain a better understanding of the implementation processes.
Results: The findings provide insights into different states of development of communication curricula and the settings and circumstances under which the change process is taking place. Regarding limiting and facilitating conditions numerous factors were identified: the motivation and qualification of teaching staff, committed students, organizational factors like a central coordination of and responsibility for teaching as well as the exchange of ideas and concepts between faculties and teaching staff.
Conclusion: Teaching and assessment of communication skills can be significantly different from university to university. Where teaching and examining communication is embedded in a longitudinal concept with a coherent

series of training units other kinds of support are needed than in faculties only offering single courses. Support measures for further steps of implementation therefore include a range of measures like examples of best practice, assistance in developing examinations, improvements in internal coordination and communication as well as overarching activities such as publicity work, better qualification of teaching staff and active involvement of students.
We need different measures for different states in the implementation process.

Communication at the End of Life. Experience Report from a Brazilian University

Authors
Willian Megumi Momoeda
Amanda Ciriaco Dantas
Juliana Farias Pereira
Laís Arraes de Carvalho
Vitor Hugo Araujo Cabral
Fernanda Patrícia Soares Souto Novaes

Presenter: Willian Megumi Momoeda, UNIVASF, Petrolina, Brazil

Background: New Brazilian Curriculum Guidelines for Medicine were developed with the aim of promoting more humane medical training, with criticality and responsibility. The object is to inform the educational experience that develops communication skills among doctors and patients nearing the end of life.
Method: The discipline Communication in Health, of the School of Medicine of the Federal University of the Valley of São Francisco - Brazil, uses the Doc.ComBrazil 's online platform "Communication near the end of life" to highlight the importance of the subject. The 2017.1 class was divided into subgroups to create playful seminars. The group of 5 student facilitators planned and executed the class using the steps of Reflection Based Learning (RBL). Step 1: Students arranged in a circle, shared prior knowledge, introducing the topic. Step 2: Class divided into 4 subgroups that received questions withdrawn from the digital platform, were: "How much do you avoid talking about palliative care?"; "How much do you overestimate the prognosis when talking to the patient?"; "How often do you use euphemisms when discussing difficult issues?" And "How much does bringing to the surface the issue of palliative care makes you feel like giving up your patient?" Step 3: A spokesman of each group summarized the reflections generated. Step 4: The facilitator group categorized the answers and explained some concepts about the subject removed from Doc.ComBrazil and academic articles, correlating the points raised by the class. Step 5: Dramatizations with positive and negative communicative attitudes in the clinical context.
Results: Generated reflections like "How far take care is really take care?", "The importance of honesty and clarity when it comes to reporting a diagnosis", "Suffering is only intolerable when there is no care". After the analysis and synthesis, the themes that emerged from the

conversations and dramatizations were: life story, human respect, empathy.

Conclusion: The RBL and the Doc.ComBrazil promote integration, discussions, dynamism, in addition to rescuing and strengthening empathy. Early focus on communication skills at the end of life expands the ability of health professionals to deal with patients in this difficult situation.

Patient-focused communication skills in medical education through public advocacy

Authors
Nicole P Tanner
Rachel WC Lai
Joey HY Chan
Paul BS Lai
Justin Wu

Presenter: Wing Chuen Lai, The Chinese University of Hong Kong, Hong Kong

Background: Advocate is a medical student-initiated online platform to promote public medical education in Hong Kong. Each week, medical students are invited to publish evidence-based articles, translating complex medical concepts for general public. Medical specialists review the articles before publication to ensure reliability. Articles are then published online, where readers from the community are encouraged to feedback and comment. A creative space for medical students and public to explore current medical advancements and healthcare issues are thus developed.

Method: A quantitative survey assessing the educational value to medical student writers was administered online. Likert scale was applied in the survey. The study received all 16 responses from the writers' team.

Results: Medical students reported improved literature review and research skills (56.3%, n=16), and reported a mean of 3.625 (out of 5) in their improvement in language skills in delivery of professional medical content to the public. 62.6% indicated enhanced understanding towards patient's needs and the specific healthcare knowledge of highest educational value to the public. 62.6% indicated knowledge growth in the topic of their article, which they would have otherwise not been familiar on.

In writing education-focused articles, students learn to understand the patients' needs, specifically in a local context. To gauge patients' level of understanding, students develop skills in self-learning and research. Students, through Advocate, also learn how to deliver professional medical content in layman terms. They learn to bridge the gap between medical journals and the patient - a critical skill for future doctors. The highlight of Advocate is the platform it creates for engagement and active discussion between students and the public

readers, which allow for feedback from readers on content, language and ease of understanding.

By connecting the public and medical students, Advocate is a platform for students to learn patient-focused communication skills, strengthening their abilities and awareness in public education.

Conclusion: Providing hands-on experience in delivering healthcare information to the public early on in medical school develops essential communication skills.

The impact of the medical communication course on shaping the attitudes of medical students

Authors
Agata Stalmach-Przygoda, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland
Łukasz Małecki, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland
Stanisław Górski, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland
Michał Pers, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland
Magdalena Szopa, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland
Michał Nowakowski, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland

Presenter: Agata Stalmach-Przygoda, Department of Medical Education, Jagiellonian University Medical College, Cracow, Poland

Background: Many clinical communication courses focus on knowledge about the doctor-patient relationship and the teaching of communication skills. The results of studies analyzing the possibility of changing the attitude of students are ambiguous.

In constructing a medical communication course at the Medical Education Department, Jagiellonian University we have paid particular attention to shaping the students' attitudes. In our clinical communication course, the role of patient's perspective, autonomy, the role of therapeutic cooperation (e.g concordance) and empathy has been emphasized. Our perspective is consistent with the patient-centered approach as well as elements of relationship-centered care.

Method: In the presented study, we evaluated changes in 4th-year students' attitudes of the Medical Faculty at the Jagiellonian University during the course of clinical communication. The course lasted 20 hours, teaching methodology included work with Simulated Patients, small group reflection. 116 students of the fourth year, before the first classes and after the last classes of Laboratory Teaching of Clinical Skills, completed the Leeds Attitude to Concordance II (LATCon II) and Patient-Practitioner Orientation Scale (PPOS) questionnaires.

Results: The initial average LATCon II score was 37 pts and reached 40 pts after the course ($p < 0.001$). The average PPOS results have not changed (4.05 and 4.09).

Neither the results nor their change depended on the gender of the student nor on having a doctor in the family but we noted lower initial results in PPOS Caring Subscale in students with non-humanistic motivation to (compared with other students). We classified students' motivation also in terms of cognitive, based on values and other. Students with motivation based on values compared with student motivated by cognitive aspects reached higher initial results in PPOS Caring subscale with decrease during the course.

Conclusion: Clinical communication course can affect the elements of student attitude. In our research, we observed increase in doctor-patient concordance. On the other hand there is a possibility of decline in attitudes related to caring in selected groups of students. Medical students' attitudes can be modified and working with attitudes can be incorporated into clinical communication course curricula.

3KK14 (1738)
Priorities of medical students regarding patient communication in their clinical electives: A Q-method study

Authors
Kristina Schick, Technical University Munich, Munich, Germany
Pascal O. Berberat, Technical University Munich, Munich, Germany
Martin Gartmeier, Technical University Munich, Munich, Germany

Presenter: Kristina Schick, Technical University Munich, Germany

Background: Much effort is dedicated to teaching doctor-patient communication skills in undergraduate medical education. Still, little is known about which attitudes medical students have towards doctor-patient dialogues during their clinical electives. Researching these attitudes is relevant because they are an important basis for communicative behaviors in clinical situations and might be more or less functional with regard to clinical practice. Researching these attitudes by means of self-report measures is challenging because results might be affected by several forms of response bias, like social desirability.

Method: We applied Q-method for this purpose because it allows to partially avoid shortcomings of more common approaches in attitude research.

Results: N=47 medical students in their clinical electives sorted 34 communicative behaviors of the Kalamazoo Communication Skills assessment form with the flashQ-software. They sorted the statements according to a normal distribution grid from "very important" across "important" to "less important". We use pqMethod for conducting a Q-Factor analysis for the sorting of the statements (Q-Sorts), where persons respectively individual Q-sorts were correlated with each other instead of the statements itself. We clustered similar Q-sorts to find differences in the perspectives of pre-service physicians.

42 Q-sorts could be clustered into three factors. The correlations between the three factors vary from $r°=°.31$ to $r°=°.56$. Two factors show a high agreement with the statement "I explain using words that the patient can understand", whereas another factor declares the statement "I greet and show interest in the patient" as most important. All factors differ in the less important statements.

Our results suggest that there are similarities and differences in the priorities of medical students towards doctor-patient dialogues during their clinical electives. These findings can be considered in the training and assessment of communication skills of pre-service physicians while taking differences in the students' perspectives into account.

Conclusion: There are considerable differences between medical students towards their priorities regarding important parts of doctor-patient dialogues during their clinical electives. These finding can have impact on further communication trainings and assessments in undergraduate medical education.

3KK15 (1142)
Evaluation of a mixed-methods skill training in patient-physician communication for Swiss first-year medical students

Authors
Stefan Markun, Institute of Primary Care University of Zürich, Switzerland
Dominik Bleisch, Department of Health Sciences and Technology, ETH Zürich, Switzerland
Prof. Jörg Goldhahn, Department of Health Sciences and Technology, ETH Zürich, Switzerland
Stefan Neuner-Jehle, Institute of Primary Care University of Zürich, Switzerland

Presenter: Stefan Markun, Institute of Primary Care University of Zürich, Switzerland

Background: A new bachelor of medicine program for 100 students has been launched at the ETH Zurich in 2017. The program intends to integrate communication skills training at an early stage. Here, we present the structure and evaluation of the patient-physician communication skill training.

Method: The principal learning objective was the ability to conduct a full medical interview in simulation. Training took place weekly in two-hour lessons during the first semester. Lessons were structured in three parts; lecture, role-playing and debriefing. Lesson contents were elements of the medical interview in accordance with the Calgary Cambridge Framework and the Swiss learning objective catalogue for medical students (PROFILES). During the lectures, theory and communication techniques were introduced and exemplified by two lecturers present. The role-plays were performed in groups of three students, each assuming either the role of the physician (implementing lesson contents), patient (applying a storyboard), or observer (protocoling the physicians' implementation of lesson contents, using items from the Calgary Cambridge Guides). The role-plays were self-administered and the required storyboards and observation protocols were available electronically. The last two lessons focused on integrating the individual

communication elements to a full medical interview. Students self-evaluated their confidence in their skills for each sixteen individual communication elements (scale from 0 to 100 equalling very low or very high confidence respectively).

Results: After the training, students' self-evaluated median confidence combining all elements of patient-physician communication was 66, IQR 60-71. Confidence was highest in "opening the interview" (median 85, IQR 70-99) and lowest in "time management" (median 54, IQR 42-67).

Conclusion: A mixed teaching format including lectures and electronically guided self-administered role-plays actively involved students in learning medical interviewing technique and resulted in intermediate to high confidence in their own communication skills. The course will be further enhanced by coordinating role-play contents with medical background knowledge delivered in parallel lectures, thus enabling students to better assume the role of medical professionals.

Take-home message: An innovative patient-physician communication skills training was successfully launched and evaluated at the ETH Zürich. The roadmap to further advancements is set.

3KK16 (793)
How do first-year medical students communicate with elderly people? Changes in their interaction patterns across time

Authors

Rintaro Imafuku
Koji Tsunekawa
Chihiro Kawakami
Kaho Hayakawa
Takuya Saiki

Presenter: Rintaro Imafuku, Gifu University, Gifu, Japan

Background: Building relationships across generations is an essential social skill for physicians who need communicate with people from diverse backgrounds. However, due to the recent changes in social structure in Japan, including the trend toward the nuclear family, medical students have relatively little experiences of face-to-face interaction with elderly people. Therefore, we provided first-year students with opportunities of constantly interacting with the elderly in a non-clinical setting across six weeks (12 hours in total) to develop their communication skills and social identities.

Method: The aim of this study was to reveal how the interaction patterns and language in use among the students and elderly have been (or not) changed across time. The audio-recorded data of all the activities of two randomly selected groups (five students and two elderlies) were analysed from a discourse analytical perspective. Moreover, 30 written reflections in a series of e-portfolios by the students were collected to thematically examine their perceptions of learning through actual interactions with the elderly.

The student-elderly interactions in the first and second encounters were characterised by many question/answer adjacency pairs, long silence as a verbal disengagement and frequent topic shifts. From the third encounter on, the

students had tried to manage discourse cohesion and coherence in conversation, such as marriage, parenting, and view of life and death. Probing questions were made more frequently and effectively to explore the elderly's experience. Furthermore, as their focus was shifted to team building from individual behaviour, student-student interactions were observed in addition to student-elderly interactions.

Results: Through six weekly encounters, students struggled with and sought to better ways of communicating with the elderly. Their reflections indicated increased attention to coherence and development of topic, active listening and opinion-sharing, understanding of interlocutor's feelings, and collaborative conversation. They could not only deeply understand the elderly's sense of value and lifestyle, but also enhance their communicative competence, including linguistic, sociolinguistic, discourse and strategic components.

Conclusion: Constantly interacting with the elderly early in medical education is an important opportunity to learn to communicate and build social relationships with people from different generations.

3KK17 (525)
Developing numerical risk communication skills for medical undergraduates: An evaluation of multidisciplinary teaching

Authors

Katherine Joekes, St George's, University of London, London, UK
Judith Ibison, St George's, University of London, London, UK

Presenter: Katherine Joekes, St George's, University of London, UK

Background: Communicating about the risks and benefits of medical interventions is a core competency for physicians, and its importance has been reinforced in changes to UK case law (Montgomery, 2015). However, facilitating patient tailored choice, particularly numerical risk communication, has not been a traditional focus for undergraduates.

Method: At St George's, University of London, a new interdisciplinary (clinician, communication skills tutor, and statistician) teaching session was devised for the surgical placement in the penultimate 'Specialties' year. This 1.5 hour session revisits shared decision making, sets out ethico-legal aspects, considers barriers to effective risk communication, revisits relevant statistics, highlights numeric risk communication skills, and offers the opportunity to practise risk communication skills using relevant clinical scenarios.

To evaluate the sessions, all 214 students (in 2016-2017) were invited to complete a brief paper-based anonymous evaluation form, which contained three questions on the value of the sessions, answered using a three point Likert scale. The questions focused on: understanding of medical statistics and interpretation of research data; numeric risk communication skills; patient-centred decision-making. Free-text comments were also invited.

Results: 174 (81%) students completed the form. Students overwhelmingly rated the session as (very) valuable, with

question 3 (patient-centred decision-making) ranking highest. Thematic analysis of the free-text generated 283 separate comments, from 150 students who completed the evaluation. This revealed that practice and roleplay were identified as most valuable aspects of the session (55 comments), that students wanted further opportunities to practise (26 comments), and that reviewing relevant statistics was useful (23 comments). Students valued interprofessional input from of the three teachers.

The session facilitates the explicit integration of evidence-based medicine and communication skills for authentic clinical practice, whilst role-play highlights areas of competence and the need for further development.

Conclusion: Offering an experiential risk communication skills teaching session in the context of shared decision making is well received by senior medical students.

Presenter: Pedro Morgado, School of Medicine - University of Minho, Braga, Portugal

Background: Poor performance on clinical communication skills assessment requires remediation. Little is known about techniques used to remedy students' skills deficits and their effectiveness. The objective of this work was to design a structured remediation program in communication skills for medical students that failed clinical evaluation.

Method: Students that failed in the clinical skills examination at the end of the third-year were invited to join the 7-steps structured remediation program. This communication skills program included clinical practice with standardized patients, self-evaluation and evaluation by experts in communication skills and personalized interventions to improve communication abilities.

Results: All students enrolled in the program have obtained success in the subsequent clinical skills examination and the program was valued by students enrolled, who asked for more steps and similar opportunities to learn.

Conclusion: Implementation of a structured remediation program to improve communication skills was successful and well appreciated by enrolled students. The replication of this experiment in other medical schools will allow to better understand and quantify its advantages.

Medical schools should address remediation in clinical communication skills and implement programs to deal with students in difficulties. Structured remediation programs for communication skills add value to the training process and enhance the learning environment for students and faculty.

SESSION 4: SIMULTANEOUS SESSIONS

Monday 27th August
1400-1530 hrs

4A: Symposium: Acquisition, Maintenance, and Verification of Surgical Skills

Location: Event Hall
Date: Monday 27th August
Time: 1400-1530 hrs

Presenters:
Ajit K. Sachdeva, Division of Education, American College of Surgeons; Society for Academic CME; Feinberg School of Medicine, Northwestern University, Chicago, USA
Teodor Grantcharov, University of Toronto, Canada
Stephen Tobin, Royal Australasian College of Surgeons, Melbourne, Australia
Wa'el S Taha, King Abdulaziz Medical City, Al-Madinah, Saudi Arabia; Chairperson of AOTrauma Education Commission

Summary: Transformational changes in health care, unprecedented advances in science and technology, and ongoing innovations in teaching, learning, and assessment require a new paradigm to address acquisition, maintenance, and verification of surgical skills. A range of effective education and training interventions can help surgeons to perform at the highest levels of skill and fidelity throughout their professional careers. Such interventions need to be based on contemporary principles of adult education, experiential learning, and mastery-based learning. Simulation remains at the core of these interventions. State-of-the-art education and training should help in delivery of safe surgical care of the highest quality. This symposium will address the key advances in this burgeoning field and will focus on challenges and opportunities that need to be harnessed to achieve the best outcomes. Perspectives from different countries will be presented. There will be sufficient time for an interactive discussion with the meeting attendees, following presentations by the speakers.

4B: Symposium: Intersections, Introspections and Divergences: Sustaining the Growth of Medical Education Research and Training

Location: Montreal, 2nd Floor, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

Presenters:
Mathieu Albert, Wilson Centre, University of Toronto, Canada
Nicole Woods, Wilson Centre, University of Toronto, Canada
Tina Martimianakis, Wilson Centre, University of Toronto, Canada
Klara Bolander Laksov, Department of Education, University of Stockholm, Sweden
Albert Scherpbier, Faculty of Health, Medicine and Life Sciences, Maastricht University, the Netherlands

Summary: As a field, medical education research has made remarkable strides over the last 50 years. Our community of researchers has made impressive gains in terms of breadth and depth of scientific inquiry, legitimization of education as a science and professionalization of education research as a career pathway. This evolution has led to a significant increase in the quantity and quality of the research conducted. We can say without doubt that collectively we have become a healthy and strong research community.
These gains can in part be attributed to strong methodological and theoretical contributions from disciplines outside of the health professions including sociology, psychology, cognitive science, kinesiology, political science, humanities, and higher education among others. Collectively, these disciplines have provided theoretical foundation and inspiration for research and innovation in teaching and learning across the continuum from undergraduate to continuing medical education. Evidence of this growth is also manifested in several organisational developments. In the last few decades there has been an increase in the number of graduate training programs specific to health professions education research, a significant rise in continuing education courses and certification programs related to education research and an increase in the number of journals devoted to publishing medical education research.
However, as the community grows in size, we may be paradoxically narrowing in scope when it comes to the kinds of research we are doing and the research we are preparing our students to do in the future. For example, when we cite predominantly medical education scholars and train future researchers who have limited understanding of the original disciplinary foundations of the work, are we inadvertently limiting the field's capacity to grow? Does our current success contain the seeds of our decline?
The goal of this symposium is to take stock of our achievements and start a conversation about our future as an academic community.
Panellists in the symposium will address several critical questions:
Does interdisciplinarity necessarily foster better knowledge production within the field of health professions education?
Are we at risk of becoming increasingly insular; leaving less room for the disciplinary and interdisciplinary traditions that fostered the development of our community at its start? Does that matter to our growth?
Is the current medical education research landscape welcoming to other disciplines or have we defined standards that have the effect of excluding scholars from external disciplines?
What kind of training would best prepare our graduate students for their academic and professional life in the coming years?

At a time where the medical education community is faced with pivotal questions concerning teaching, learning, and theory, we believe it is timely to also be reflective and consider the best strategies in terms of research and training to answer these questions moving forward.

Who should participate in the symposium? Our symposium will raise broad organisational, scientific and educational questions potentially impacting the broad medical education community. As such, we think this symposium will be of utmost interest to medical education researchers, medical school administrators (deans, department's chairs, and research centre directors), graduates students and clinician-educators. Moreover, the symposium is international in scope since the nature of the questions we are raising are not limited to one context, but of international interest.

What will they gain from participating? Participants will gain a broad understanding of some of the theoretical and conceptual debates in the field of medical education research.

Participants will have an opportunity to critically reflect on their own research practice and contribute to an on-going discussion on the direction of medical education research internationally.

4C: Symposium: Open Space Technology Applied to Wicked Issues in Medical Education and Health Care Practices

Location: Sydney, 2nd Floor, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

Presenters:
Glenda Eoyang, Human Systems Dynamics, USA
Stewart Mennin, Human Systems Dynamics, USA

Summary: The most important and challenging issues in the current health system that affect us both as individuals and as groups are complex. They won't stay solved or can't be solved with existing traditional methods. This symposium will make accessible a different way to perceive, understand and take informed wise action to shift patterns of complex challenges. Participants will identify their own complex challenges and apply selected models and methods to shift the conditions that give rise to these challenges. Participants will have hands on practice in small groups during the symposium.
Open space technology is a self-organizing experience. Participants will join others who share passion and responsibility for innovation and change in medical education and health practices. The technology brings people together, holds them in a generative conversation, and promotes sharing experiences and discoveries. Diverse groups will share the results of their innovation dialogues. Notes from the various conversations will be shared with participants, and collected for wider distribution. Join us as we push the bounds of innovative practice together.

Who should participate in the symposium? Anyone who is engaged in teaching and organizing learning, assessment, design and implementation of curriculum and health practices; especially those involved in applying and evaluating new methods and models of medical education. The symposium is relevant for all levels of educators and practitioners in the health system.

What will they gain from participating? Participants will learn and practice a simple yet deep methods to be able to shift the complex challenges they face in the workplace of medical education and clinical practice. Each participant will bring their own innovative insights and questions. Join others who share the same passion and responsibility for creative responses to complex challenges. Do you want to talk about novel approaches to:

- Assessment in the moment?
- Community-based practice?
- Working with diverse cultures?
- Supporting inter-professional practice?
- Curriculum design, implementation and evaluation?
- Communication skills?
- Working with immigrants?
- Disaster response and recovery?
- More...

4D: Symposium: The role of the Biomedical Sciences in Teaching and Learning Medicine in the 21st century

Location: Singapore, 2nd Floor, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

Organised by IAMSE:
Aviad Haramati
Peter GM de Jong
Neil Osheroff
Kelly M Quesnelle
Dujeepa D Samarasekera
Richard C Vari

Summary: In this high-tech, clinically-oriented healthcare arena in which information is readily available online, the role for teaching specific facts regarding the basic sciences is often questioned. What is the value of teaching our students foundational sciences as part of their medical training? Recent findings from the literature will be presented.

4E: Research Papers: Success & Failure

Location: Delhi, Ground Floor, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

Early predictors in medical school: Supporting students early on through the use of data

Authors
Cassandra Barber, Western University, London, Canada
Gary Tithecott, Western University, London, Canada
Tisha Joy, Western University, London, Canada
Robert Hammond, Western University, London, Canada
Saad Chahine, Western University, London, Canada

Presenter: Cassandra Barber, Western University, London, Canada

Abstract Text:
Background: Medical students that underperform within the first year of studies often continue to struggle throughout their academic career and professional practice. While early student academic success within medical school has been strongly correlated with several preadmission variables, such as: MCAT scores, undergraduate GPA and the MMI (Multiple Mini Interviews), the problem still persists. The relationship among student's undergraduate academic backgrounds or majors and early student performance has shown to be inconsistent. It has also been reported that no differences in performance are observed between students from science or non-science backgrounds. Yet, the dichotomous groups (science/non-science) are not homogeneous, and the extent to which internal differences in performance exists within heterogeneous science/non-science backgrounds is unknown. This study examines the heterogeneous backgrounds of medical students over 12 overlapping years to identify key preadmissions variables, predictive of early student performance.
Methods: The study sample consisted of 696 medical school students, across 4 cohorts that matriculated between 2013 and 2016 (~174 students per cohort). During the period under study, applicants were required to have completed a four-year undergraduate degree prior to entry. The data was analyzed using hierarchical linear modeling (HLM), where students were nested within cohorts. Student characteristics and preadmissions variables, such as: gender; age at matriculation; urban/rural hometown origin; MCAT score; undergraduate GPA; admissions interview score and undergraduate degree were used to predict student performance within the first two years of medical school. Group-based centering was selected to allow us to compare group mean differences across cohorts for each variable. Through a stepwise process of manually entering and removing variables, two parsimonious models were created to predict early student performance using Year-1 and Year-2 curricular cumulative averages.
Results: The results of the HLM analysis identified small, yet significant portion of variation in student performance

was attributable to cohort (4% Year-1, 2% Year-2). The conditional Year-1 model included: gender, MCAT score, undergraduate GPA and having a biological science or general medical science undergraduate major as significant predictors of Year-1 performance ($p<0.05$) and explained 22% of the variation at the student level. The conditional Year-2 model included: gender, MCAT score, undergraduate GPA and general medical science undergraduate major as significant predictors of Year-2 performance ($p<0.05$) and explained 15% of the variation at the student level. Overall, males on average have lower Years 1 & 2 curricular cumulative averages than females, when controlling for all other variables. MCAT score and undergraduate GPA were positive predictors of Years 1 & 2 performance and students with biological science degrees have higher Year-1 cumulative averages and those with general medical sciences have lower Year-1 & 2 performance than those from other undergraduate disciplines.
Conclusion: Extending previous studies, evidence from our models suggest that undergraduate major matters early on in medical school, however, this predictive relationship dissipates within the second year of studies. This study suggests that undergraduate science majors are not homogeneous and internal differences in performance are observed within disciplines. These internal differences often remain unobserved when dichotomous outcomes (science/non-science backgrounds) are compared. In practice, we can use this model to better identify and support students at admissions, as they enter our program and transition into medical school. The potential of supporting students early on may have subsequent effects in enhancing how they perform on national licensing examinations and in practice.

Abstract Text:
Introduction: Undergraduate medical students may have to confront significant interruptions in academic progress (IP) through course or academic year repetition, or even dismissal. The consequences may be social, psychological, and financial. Medical schools also bear the burden of developing remediation techniques, and providing special accommodations to students in areas where resource constraints can be challenging. Stegers-Jager noted that student grades at the fourth month of medical school were associated with completion of the first year of medical education; that is, poor grades at month 4 meant a lower likelihood of successful completion of the academic year.1 In a similar light, Jackson and Dawson-Sanders identified withdrawals in undergraduate courses to be associated with subsequent difficulty in completion of the medical curriculum.2 We hypothesized that the clinically familiar pediatric growth curve metaphor could be exploited as a method for early recognition of IP.
Methods: The assessment office provided the research team a de-identified table of internal summative assessments for 518 sequential medical students. An additional column identified if the student had IP or uninterrupted progress (UP). IP was defined as students having to repeat a module, several modules, or an entire year; go on a leave of absence; withdraw; or were otherwise hindered from UP. The data was organized such that percent scores were added in a cumulative manner over time. At every examination point the data were analyzed for distribution and a mean class score calculated; thereby creating the backdrop standards for individual student comparison. Each student's points accumulation was plotted and a linear fit accommodated. Using the mean of the class as the horizontal axis, students gaining points against the class mean show a positive slope; conversely students losing points against the mean reveal a negative slope.
Results: Twenty-nine students had an interruption in progress, and an additional 9 were identified as being at-risk, accounting for 7.3% of the total student population. Using a receiver operating characteristic approach, we identified a slope of -5 as an excellent screening test with 85% accuracy (sensitivity= 82%, specificity= 86%). The area under the curve (AUC) calculation, plotting sensitivity vs. (1-specificity), revealed an AUC=0.917, reflecting excellent screening properties. Twenty-five of the 38 students had an APA trailing slope below -5 as early as the 5th assessment, climbing to 35 by the 10th assessment.
Discussion: While some students who are at-risk of IP self-identify, and seek out assistance, other students must be identified based on their academic performance. When a student suffers IP, we sometimes wonder whether this could have been avoided had administration known at an earlier point in the student's academic career that intervention was necessary. This study aimed to develop an early warning system that would help to identify students who are at-risk IP, thus allowing for intervention that could mitigate that risk. This predictive modeling tool represents an opportunity for simplifying the process for identifying students at risk for IP.
Conclusions: We present an innovative approach with 85% accuracy for identifying students at risk for IP; utilizing a -5 slope, two-thirds of students at-risk for IP could have been identified by the fifth internal assessment . Implementation of this screening tool requires minimal programming expertise. Plans are in place to validate the approach at other medical colleges as course sequencing, and grading paradigms may affect the reproducibility of this approach.

Abstract Text:
Introduction: Most postgraduate medical learners will complete their training without significant difficulties. Residency programs are demanding, and 10-15% of learners will experience some problems during their training. One of the frequent barriers for clinical teachers to report unsatisfactory trainee performance is the lack of knowledge regarding available remediation options for the trainee. Most remediation interventions (individualized additional teaching) do not appear to be based on explicit conceptual frameworks and are more focused on anecdotal advice than evidence-based results. This review aims to identify evidence-based remediation interventions for postgraduate medical learners with academic difficulties and link them to a theory-based conceptual framework.
Methods: This systematic review searched MEDLINE, CINAHL, EMBASE, ERIC, Education Source and PsycINFO based on the following concepts: 1) medical education, 2) professional competence or difficulty and 3) educational support, from January 1st 1990 to December 31st 2016. Studies were included if they met the following criteria: primary research studies, innovation reports and reviews evaluating at least one remediation intervention for postgraduate medical learners in difficulty. Data were extracted following Michie's Behaviour Change

Techniques (BCT) Taxonomy1 and program evaluation models from Stufflebeam's CIPP model (context/input/process/product) and Kirkpatrick (reactions/learning/behaviour/results). The quality of each study was assessed using the Mixed Methods Appraisal Tool. The synthesis of extracted evidence is illustrated through descriptive statistics.

Results: Of the 16,692 screened titles, 20 met the inclusion criteria. Most articles identified more than one educational diagnosis: insufficient knowledge (80%), deficient skills (75%), attitudinal problems (45%) and personal (30%) or teacher-related (5%) issues. The 78 remediation interventions we identified involved at least one BCT, most commonly the following: Feedback and monitoring (37%), Shaping knowledge (28%), Repetition and substitution (22%), Social support (13%), Goals and planning (10%) and Regulation (11%). Program evaluation reported in the articles assessed context (20% of articles), input (35%), process (40%) and products (90% of articles assessed effectiveness of the interventions at the learning, behaviour and/or results (30%) levels). Effective interventions often included a variety of learning strategies: directed reading programs with feedback, mentoring or resident-led review sessions (n=3); standardized 10-step clinical reasoning remediation plan (n=1); individualized learning plans with deliberate practice, feedback and reflection (n=1); written clinical protocols with audits and back-up coverage (n=1); study skills mentoring (n=1); oral examination course (n=1); and structured additional year of remedial training (n=2).

Discussion & conclusions: This review identified 78 evidence-based remediation interventions with their BCT. This review states the importance of not only shaping knowledge or test-taking abilities, but also mainly to encourage feedback, peer/faculty support and structured remediation plans, and finally to ensure patient safety through various compensatory measures. It is difficult to report on the effectiveness of individual remediation interventions since few studies evaluated a single strategy. Despite the high percentage of studies assessing the remediation interventions effectiveness through learning, behaviour or results outcomes, many studies revealed methodological issues. This review provides clinical teachers and educators with a repertoire of evidence-based interventions that can be used for mentoring postgraduate medical learners and for faculty development purposes. Further remediation interventions should build upon effective BCT (or test the unexplored ones), use their associated theories, and undergo thorough program evaluation.

Abstract Text:
Introduction: Problem-based learning (PBL) is known being effective, if done in a constructive, self-directed, collaborative and contextualized way [1]. Recently, there has been a tendency to move from linear paper-based patient cases to web-based virtual patients (PBL-VP), leading to better midterm learning outcomes [2]. Medical schools often introduce PBL-VP track due to its effectiveness for academic performance, in developing personal qualities and life-long learning strategies. However, there is an emerging theme in medical education research exploring PBL relation to academic stress and cognitive engagement of students, and testing whether the effectiveness is bought at a high price to learner wellbeing. The goal of our study is to estimate this frequently neglected 'price' and to provide evidence-informed advice on how to overcome the problem.

Methods: In the framework of an international project co-funded by the EU Tempus Programme and a research on the academic stress impact, Karaganda State Medical University surveyed 118 medical students in 2 tracks: PBL-VP (21 - in year 2, 10 - in year 3) and traditional lecture-based teaching (73 - in year 2, 14 - in year 3). Assuming that imbalances in achievement goals, cognitive load, perceived stress, personality and learning strategies may contribute to the 'price', we measured 70 parameters, further reduced to 17 factors by EFA and CATPCA. Factorial ANOVA compared the main effects of instructional method and study year on these factors and academic performance (GPA and progress test results).

Results: As expected, academic performance was better in PBL-VP track compared to traditional instruction – GPA did not differ for year 2, but was significantly higher for year 3 students (F=3.905; p=0.05). Progress test scores were better for PBL-VP for both years (F=7.243; p=0.05). Effectiveness of PBL-VP was also supported by better (p<0.05) development of convergent thinking ("think and do"), and a tendency to higher extraversion (p=0.09). However, PBL-VP did not seem to stimulate self-directed

learning. The most effective habits of distributed practice and practice-testing being initially high in year 2 PBL-VP students were replaced by abstract 'self-study for more than 2 hours' in year 3 students. Traditionally taught students showed the tendency to develop better self-directed learning skills over time. Year 3 PBL-VP students showed decreased germane cognitive load with a tendency to increase extraneous and intrinsic loads, and lower achievement goals. The overall intrinsic load was lower in PBL-VP track. The perceived stress was significantly higher for PBL-VP students increasing with the study year ($F=9.93$; $p=0.002$).

Discussion & Conclusions: PBL-VP led to significantly better academic results, critical thinking skills and extraversion confirming the positive effects of its constructive, contextual and collaborative features. One could be satisfied by this, if not paying attention to costs involved. The skills of effective self-directed learning even though initially naturally applied by students in the PBL-VP group deteriorated over time leading to lower achievement goals and germane cognitive load, as well as higher academic stress; the exact nature of such findings should be investigated with future qualitative research. But PBL-VP students were obviously at risk of burning out. Tutors need to pay closer attention to the emotional status of their students and actively promote the development of effective learning strategies. The goals and learning tasks also need to be tailored to PBL-VP curriculum to prevent a risk of imbalances in cognitive load experienced by learners.

Abstract Text:
Introduction: Excellence in teaching in the clinical environment is a priority for academic health centers, but ongoing faculty development in this setting is challenging to implement and measure. Barriers to effective faculty development include competing demands of attendings to patient care and safety, identifying and meeting the training needs of residents and students, and staying current in best practices with respect to clinical care and teaching. We developed an initiative to develop and deliver educational content in the context of clinical care and assess changes in teaching behaviors. This study aimed to improve teaching in three areas identified as hospital and teaching priorities: critical thinking (CT), high value care (HVC), and healthcare equity (HCE).
Setting: U.S. teaching hospital.
Intervention: We used the behavior change Theory of Planned Behavior[1] to inform the development of the intervention, targeting faculty skills, knowledge, perceived group norms, and teaching intentions. Three working groups (CT, HVC, HCE) of 6-8 members each developed the intervention. Each group developed resources that included video, didactic sessions, structured exercises, and handout materials. Learning objectives were aligned with key elements of each topic as distilled from literature reviews, and resident competencies as defined by the medical school and housestaff education accrediting bodies. The training was delivered to faculty from January-March 2017.

Methods: Evaluation of the intervention was conducted addressing Kirkpatrick's[2] outcome levels of faculty satisfaction, learning, and behavior. Methods of data collection included direct observation and audio-recording of ambulatory and inpatient precepting and inpatient rounds. We created and validated an observation instrument based on the learning objectives for each topic. For CT, domains included use of questions to stimulate critical thinking, teaching about sources of bias in thinking (e.g., premature closure), and cognitive constructs such as System 1/System 2 thinking. In HVC, domains included discussion of costs, test characteristics, and patient-centered decision-making. HCE domains included attention to affordability, access to care, need for interpreters, and unconscious bias. Three groups of faculty were observed: intervention group (IG), comparison group (CG), and working group (WG) members. Primary analyses compared counts of total post-intervention teaching behaviors per hour in each of the three topics across the three faculty groups. Statistical analyses of counts were modeled with a generalized linear model using the Poisson distribution.
Results: Thirty faculty members participated in the IG; 27 faculty served as CG, and 29 faculty participated as WG members. Observation results: 68 faculty members (IG n=28, CG n=23, WG n=17) were observed teaching in the clinical setting, with a median of 3 observation sessions each and median of 5.2 observed hours each. Pre-intervention counts of teaching behaviors were similar in the three domains between IG and the CG, suggesting that pre-intervention teaching was similar across groups. Post-intervention comparison of teaching (average counts per hour of observation) showed statistically significant differences across groups as follows: critical thinking CG=5.1, IG=5.8, WG=6.0; high value care CG=0.6, IG=0.9, WG=1.3; and healthcare equity CG=0.2, IG=0.5, WG=0.7.
Conclusion: A faculty development intervention in teaching in the clinical setting is feasible and demonstrates more frequent teaching in each of the targeted domains of critical thinking, high value care, and healthcare equity. With the creation of durable teaching materials and a cadre of trained faculty, this project sets the foundation for ongoing quality improvement in teaching that can be disseminated and implemented in other departments and hospital settings.

Video versus bedside teaching of paediatric clinical examination skills: A mixed methods study

Authors

Abstract Text:
Introduction: Video usage offers a number of benefits for medical education, including the teaching of clinical skills (1). Increasing student numbers in South African medical schools have resulted in larger groups for bedside tutorials, raising concerns about maintaining the standard of clinical teaching. Paediatricians at Chris Hani Baragwanath Academic Hospital recorded videos for teaching clinical examination skills. This study compared the effectiveness of one of these videos to bedside teaching, and explored student perceptions of the two teaching methods, with a view to better understanding the role of video usage in clinical teaching.

Methods: Equivalence testing is useful for showing that a novel intervention, which may offer certain advantages over the standard method, is not inferior to the standard method (2). Data from a pilot study was used to calculate the required sample size of 52 for equivalence testing, using an equivalence margin of 10 percentage points and 90% power. For the actual study, 60 medical students were randomly assigned into two groups. The experimental group watched a video of an abdominal examination, while the control group was taught the same procedure at the bedside. Immediately after, blinded assessors observed the students conduct an abdominal examination in a 10-minute mini-OSCE (objective structured clinical skill examination). Students were evaluated on their professionalism and organisation/ efficiency using rating scales of 1-10, their physical examination skills using a checklist of 10 items rated from 1-5, and were also allocated an overall grade. All scores were converted to percentages for analysis. A t-test was used to calculate the 95% confidence interval of the difference between the groups and compared to the specified equivalence margin. Linear regression was used to calculate the difference between the groups, adjusting for assessor effect, age, gender, and previous academic performance. Separate focus group discussions were held for the bedside and video groups. Students were asked which aspects of the teaching method they experienced were most useful, and which could be improved. Data were analysed thematically.

Results: The video usage was found to be equivalent within the 10% margin to the bedside teaching for all criteria. For example, the difference in the overall grade between the video and bedside groups was -2.58% [95%CI: -6.17-1.01] (unadjusted) and -3.14% [95%CI: -6.45-0.17] (adjusted). Students valued the various interactions possible at the bedside, with the tutor, their peers, and the hands-on interaction with patients, which the video did not permit. However, the recorded examination was regarded as being more systematically structured than the bedside teaching. The video usage also overcame the limitations of not being able to hear or see properly at the bedside, especially in large groups. Useful suggestions for improving the content of the video emerged, with students asking for more explanations to be included. Students also commented on technical aspects that could improve the acceptability of the videos.

Discussion and Conclusions: This study confirms other findings that video usage is not inferior to bedside teaching. Our results suggest that video usage could serve as a useful adjunct to compensate for the challenges of teaching large groups at the bedside. While students indicated that they would prefer a combination of the two teaching methods, further increases in student numbers may require more extensive use of videos, warranting further investigation into the possibilities of teaching with interactive videos to augment clinical teaching.

Monica Lypson, United States Department of Veterans Affairs, Washington, D.C., USA

Presenter: Cristina Gonzalez, Albert Einstein College of Medicine/Montefiore Medical Center, Bronx, NY, USA

Abstract Text:
Introduction: Despite a four decade focus on cultural competency education, patients globally continue to report experiencing bias in clinical encounters (1). In response, medical educators have begun to address the role of implicit bias in clinical encounters. Existing frameworks (2) expect faculty to instruct students in developing knowledge, attitudes, and skills in implicit bias recognition and management, but most faculty have not received this instruction themselves. The purpose of this study was to inform curriculum design by exploring faculty perceptions of challenges and opportunities when facilitating instruction on racial and ethnic implicit bias recognition and management.

Methods: We recruited faculty participants using typical case sampling. We conducted semi-structured interviews using a constructivist grounded theory approach. Interviews explored participants' perspectives of implicit bias within themselves and others, its role in medical care and education, and preferences and concerns for facilitating instruction with medical students. Interview transcripts were analyzed using a constant comparative method, and we performed post hoc member checking.

Results: We reached thematic saturation after nineteen interviews. Our analysis identified four themes related to faculty's perceptions of influences on facilitating implicit bias instruction. Theme One. Faculty identities and emotions impacted perceived ability. Participants were concerned with how they would be perceived by the students based on their race, ethnicity, gender, age, and/or doctoral degree. They hesitated to discuss race worrying about emotions limiting their facilitation. "Talking about implicit bias is asking someone to look at themselves and say, 'I do things I'm ashamed of, yet I'm still doing it.'" Theme Two. Institutional values affect faculty success. Participants believed implicit bias may be discredited as a "soft science." The institutional climate could inhibit discussion and growth around it. "There's this acculturation [in Academia] where we rarely call anybody out. You never know when you're going to need somebody's support. People just tend to look the other way." The hidden curriculum and its potential influence to undermine implicit bias instruction was another factor. Theme Three. Perceived obstacles to instruction. Participants identified many potential obstacles, including the safety of the learning environment, getting buy-in from faculty and students, and resistant learners, including those who believe bias isn't important and those who think they don't have biases. "It is a little bit of, 'No, I am one of the good guys trying to help the people who are at the mercy of the bad guys.'" They described consequences of not teaching skills to mitigate the influence of bias after raising awareness. "It raises frustrations when you're feeling a little vulnerable after you've recognized something perhaps about yourself that you aren't totally thrilled by." Theme Four. Enhancing instructional opportunities and competence. Participants identified opportunities to enhance the faculty experience during facilitation and overcome concerns identified in the other three themes. They envisioned continuing instruction and role modeling during clinical rotations. "We do debriefs for hemorrhage. Why can't we do debriefs for bias?'"

Discussion: These themes provide novel insights for many who might teach in the area of bias, with potential implications for faculty development, curriculum design, and program-level decision making. Incorporation of these perspectives may enhance faculty comfort and confidence during facilitation and could facilitate the success of implicit bias curricula by making room in the existing curriculum for multiple sessions, recognizing the topic as an institutional priority, and facilitating culture change.

Presenter: Johanna Jacobs, VUmc School of Medical Sciences and LEARN! VU University, Amsterdam, Netherlands

Abstract Text:
Introduction: Teachers' conceptions of learning and teaching affect their teaching behaviour and indirectly their students' achievements. [1] Faculty development should pay more attention to these conceptions in order to achieve enduring changes in teaching practice. To measure these conceptions, we constructed the COLT (Conceptions Of Learning and Teaching) questionnaire and conducted several studies in two Dutch student centred curricula. The COLT (http://colt.vumc.nl) comprises 18 items and three scales, i.e. 'teacher centredness', 'appreciation of active learning' and 'orientation to professional practice'. In a previous study in student-centred curricula we found five teacher profiles based on their conceptions, ranging from Transmitters, Organizers, Intermediates, Facilitators to Conceptual Change Agents. [2] In the present study we investigated teachers' conceptions in an international context. Our research question was: What kind of profiles of teachers are found in an international context?

Methods: The data used in this study were collected with the COLT-website which is freely accessible. After filling out the the questionnaire, teachers receive instant feedback about their conceptions and teaching profile. Participants are explicitly asked if they agree that their answers will be used in a coded form for research purposes. An information letter is provided as well as an explanation on informed consent, filling out the complete questionnaire is seen as an informed consent to participate. Ethical approval was provided by the NVMO Ethical Board (nr. 330). Ward's method was used to explore the number of clusters based on the explained variance and a k-means clustering was used to identify the groups. Also Cronbach's alpha's were determined to assess the agreement between the clusters identified based on different datasets. A split half validation was performed for validation of the profiles.

Results: Respondents (n=694) hailed from 32 countries. Fourteen outliers were excluded from the analysis. Cronbach's alphas for the reliabilities of 'teacher centredness', 'appreciation of active learning' and 'orientation to professional practice' were 0.67, 0.54 and

0.66 respectively. The cluster analysis produced two solutions: of six clusters and of five clusters. The six cluster solution fitted best because of better psychometric properties and interpretability. Explained variance for 'teacher centredness' was 71%, for 'appreciation of active learning' was 51% and for 'orientation to professional practice' was 60%. Relative to the five teacher profiles found in the earlier study, the sixth cluster had high scores on teacher centredness and appreciation of active learning. We labelled this 6th teacher profile as 'Neo-Transmitters'.

Discussion: The new teacher profile 'Neo-Transmitters', found in the present study, reflects a new category of teachers with teacher centred conceptions. We assume that this new teacher profile reflects the heterogeneity of the large international group of teachers, with different national cultures, curriculum types and teacher characteristics. Insight into one's teacher profile can trigger reflection and contribute to a change in a teacher's conceptions. Also, insight into teacher profiles may enable faculty developers to tailor their activities to the needs of teachers. An overview of teacher profiles at an institutional level may serve as a useful starting point for a curricular change.

Conclusions: We found six teacher profiles based on their conceptions of learning and teaching in this international study, comprising teachers from several curriculum types and cultures. Future research exploring the relation between teacher profiles, national cultures and curricula might be promising.

Introducing a Clinical Teaching Unit to increase autonomy, competence and relatedness in medical training using Self Determination Theory principles

Authors
Esther Hamoen, Leiden University Medical Center, Leiden, The Netherlands
Argho Ray, Leiden University Medical Center, Leiden, The Netherlands
Peter de Jong, Leiden University Medical Center, Leiden, The Netherlands
Marlies Reinders, Leiden University Medical Center, Leiden, The Netherlands

Presenter: Esther Hamoen, Leiden University Medical Center (LUMC), Leiden, Netherlands

Background: Learning in a clinical environment is a complex process in which residents, interns, nurses and specialists need to apply acquired theoretical medical knowledge to patient care. Due to several challenges including time pressure and complexity of patient cases the clinical learning environment is suboptimal. Previous studies have shown that specific adaptations to this environment and training program can benefit learning.
Method: At LUMC we developed a Clinical Teaching Unit (CTU) on an Internal Medicine ward, using teaching activities based on Self Determination Theory (SDT) principles in order to increase motivation, engagement and autonomy and to provide a learning continuum in a multidisciplinary setting.
Rearranging the existing ward allowed for learners' exposure to more diverse clinical presentations. A weekly multidisciplinary Grand Round has been established to promote interprofessional learning and collaboration. Teaching takes place from supervisor to resident during observed rounds, from doctor to nurse in clinical lessons and from nurse to doctor in skills training. Weekly teaching visits with peer-feedback, pre-rounds and optional case reporting sessions are organised for interns improving participation, hands-on training and observed assessment of clinical performance. Training activities are being delivered by trained teaching clinicians with allocated teaching time.
Results: Introduction of clinical teaching based on SDT design principles resulted in an active learning environment that is autonomous and individualised, and competence training that is both observed and assessed. The multidisciplinary approach, peer-learning and presence of dedicated teachers stimulate relatedness between above mentioned learners.
Conclusion: The construction of the CTU has resulted in a ward where the whole spectrum of clinical cases in Internal Medicine can be taught and where teaching, learning and teamwork are now a cornerstone in daily patient care. Using SDT principles has enriched clinical learning for interns, residents, nurses and specialists. The resulted open learning-atmosphere is barrier-braking and improves work atmosphere and mutual communication between health care providers, which in the end is expected to positively affect patient care and safety.
Take-home message: Using SDT principles in clinical teaching can generate effective learning in the complex clinical setting.

Iran International Public Health Summer School (IPHS): A Report of an On-site Educational Game on Global Health for Healthcare Professions Students

Authors
Helia Ashourizadeh, AVECEN Co., Tehran, Iran
Aidin Parnia, AVECEN Co. & Isfahan University of Medical Sciences, Tehran, Iran
Ali Ganjizadeh, AVECEN Co. & Tehran University of Medical Sciences, Tehran, Iran
Poorya Maghsoudi, Tehran University of Medical Sciences, Tehran, Iran
Navid Manouchehri, AVECEN Co. & Isfahan University of Medical Sciences, Isfahan, Iran
Pouria Rouzrokh., AVECEN Co. & Tehran University of Medical Sciences, Tehran, Iran

Presenter: Azim Mirzazadeh, Tehran, Iran

Background: Games can make considerable changes in the learning environment of the learners and are becoming increasingly popular in healthcare professions education. However, more insight into their design features and effectiveness is needed. This study describes several aspects of organizing of IPHS as an on-site educational game.
Method: IPHS is a 7-day long on-site game in which participants in the role of health specialists, try to promote the health status of their own community through doing ten missions. Each mission contains game play(s) that simulate different aspects of public health specialists' tasks. Some examples of the missions are advocacy of the authorities to start their activity on the community, investigate and control an outbreak and write a policy brief.
Besides, Games are designed in a way that encourage students to develop their soft skills such as team management, problem-solving, time management and communication skills.
Results: At the end of the IPHS2017, a Likert scale questionnaire was given to students to evaluate their overall satisfaction on the course. Scores were evaluated using 1 (highly disagree) to 10 (highly agree) Likert scale. The mean score of the questions "The games were effective in making me more enthusiastic for learning about public health." and "I hope that other courses can also adopt games in their educational methods." were respectively 9.12 and 9.15.
Conclusion: Our 5-year experience demonstrated the feasibility of conducting games on training healthcare professions students on the topic of global health. As the participants report a high level of satisfaction with

adopting game plays to other different educational topics, we could suggest that this effort is able to reach broader educational topics with greater impacts on students' learning. Although designing and implementing well-structured educational games require a lot of time and effort, we can conclude using games in education will lead to increased joy of learning and significant improvements in comprehension of training material and the application of knowledge to practice.

Take-home message: Although games have proven to be effective in medical education, the cost efficacy of organizing educational games still needs to be investigated.

Changing the healthcare education through teacher assistants

Authors
Marcos Rojas, University of Chile, Santiago, Chile
Nicolás Ortiz, University of Chile, Santiago, Chile
Diego González, University of Chile, Santiago, Chile
Karim Gallardo, University of Chile, Santiago, Chile

Presenter: Marcos Rojas, University of Chile, Santiago, Chile

Background: Faculties of medicine face an increase in the number of students, limited educational resources and the constant need to develop the abilities of the graduate and the evaluation of their competences. In order to improve the learning of the students of the 8 undergraduate careers of the Faculty of Medicine of the University of Chile and to positively impact the process of curricular innovation through promoting in the teachers the use of active learning methodologies and ICT's, the Teacher Assistants Program (PAD) is created.
Method: The PAD was founded on August 24, 2014 by a group of 14 students of Medicine. It is composed of undergraduate students who design, prepare, administer and execute teaching assistantships for the 8 undergraduate careers of this faculty. The participating students do their work on an honorary basis. The assistants not only participate in subjects, but also manage innovations, extend the university to the community through Coursera and carry out research in Higher Education.
Results: Since its foundation, the PAD has been diversified and increased, currently it is present in 60 subjects of the 8 careers of the faculty, with a historical participation of 492 teaching assistants in 3 years of operation. The PAD has made it possible to increase the quality of the learning of the students through the creation of the website: ayudantesdocentes.med.uchile.cl which has free access resources for students in the health area developed by teaching assistants along with the teachers of the respective subjects. This website is visited from 47 countries around the world.
Due to the growth and expansion, this program was incorporated to the Undergraduate Department of the Faculty of Medicine on October 1, 2017.
Conclusion: The PAD has proven to be a convenient approach to respond to the academic needs of students

and motivation of teachers to innovate. It is expected that in the coming years there will be greater growth and expansion to more subjects and universities, and the curricular integration of program activities.
Take-home message: Consider the students to share your teaching role.

Déjà vu all over again: An innovative 3-year spiral curriculum in antimicrobial stewardship and infectious diseases

Authors
Peter Chin-Hong, UCSF, San Francisco, USA
Arianne Teherani, UCSF, San Francisco, USA
David Irby, UCSF, San Francisco, USA
Brian Schwartz, UCSF, San Francisco, USA

Presenter: Peter Chin-Hong, UCSF, San Francisco, USA

Background: By 2050, antimicrobial resistance is predicted to account for 10 million deaths worldwide/year, more deaths than cancer today. Physicians frequently prescribe antibiotics unnecessarily leading to high antibiotic resistance rates. Early, continual, and integrated medical student education may help students develop a framework before prescribing patterns become part of their mental repertoire.
Method: We designed a spiral antimicrobial stewardship curriculum (defined as revisiting the same concept but with increasing complexity) for medical students in years 2-4. Data provided by the Graduation Questionnaire (GQ) administered by the U.S. Association of American Colleges were used. We compared student responses over 2013-2015 between classes at our institution and students at other schools. We surveyed graduating seniors in 2015 about antimicrobial stewardship training.
Results: Using GQ data for the class of 2013 (pre-intervention), a similar proportion of UCSF medical students compared to other US medical students rated microbiology clinical preparation as excellent (43.6% vs 45.1%, P>0.20). For the 2014 class, we developed interactive case-based sessions at the beginning of years 3 and 4. After this first intervention, a higher proportion of UCSF students rated the microbiology clinical preparation as excellent (51.3%) compared to responses at all schools (39.8%, odds ratio [OR] 1.59, 95% confidence interval [CI] 1.1-2.3, P=0.013). For the class of 2015, we added content during the medicine clerkship and 1 week before graduation. For the 2015 class, an even higher proportion of UCSF students rated microbiology preparation as excellent (57.6%), compared to all schools (41.2%, OR 2.23, 95% CI 1.54-3.22, P<0.0001). From our survey, 88% were very or extremely satisfied with antimicrobial stewardship training.
Conclusion: A spiral curriculum focusing on antimicrobial stewardship and infectious disease increases student perception of clinical preparation prior to graduation. As the curriculum was incrementally introduced, students' knowledge increased indicating a dose-response pattern. Based on these positive results, we plan to introduce more content throughout UME, and link to curriculum for GME and practicing clinicians.

Take-home message: Providing a spiral curriculum in UME can be a powerful way of engaging students with and preparing them for antimicrobial stewardship.

4G6 (383)
Using visual- and e-learning methods to enhance medical student engagement in clinical genetics

Authors
Adam Jones, Cardiff University, Cardiff, UK
MJ Coffey, Cardiff University, Cardiff, UK

Presenter: Adam Jones, Cardiff University, Cardiff, UK

Background: With the diagnosis, analysis and treatment of diseases with a genetic basis becoming a more common component of clinical practice, it is vital that medical students have an appropriate working knowledge of common genetic pathologies, both at the molecular and patient level. Students have anecdotally reported struggling with some concepts in Genetics and have indicated that traditional didactic methods of teaching the material can lead to disengagement.

Summary of Work: Through the creation of a user-friendly e-learning package, we devised an innovative way of covering key Learning Outcomes for medical genetics to students. The e-learning package utilised graphics-rich interfaces and animations to facilitate student-centered learning of epigenetics and its clinical relevance, through exploring 3 virtual patient cases. The e-learning package was piloted with a small group of year 2 medical students who had expressed a subject interest in Medical Genetics.

Summary of Results: Creation of the package was informed through staff feedback on current methods of delivery and through analysis of pre-existing student feedback on areas of the medical course that had a taught component of genetics. The e-learning package targeted clinical genetics specifically but had common structural interface elements deliberately engineered for use as a template to facilitate teaching other challenging topics in Medicine.

Discussion: From my own experience as a medical student and polling current medical students, there is a clear consensus that clinical genetics is perceived as a challenging topic. This work highlights the potential usefulness of illustration, animation and e-learning in engaging medical students in clinical genetics.

Conclusion: Students and staff appreciate this novel approach to teaching aspects of genetics. Utilising a number of graphics, animation and web-design applications can be used to create highly effective and immersive content that can facilitate knowledge acquisition through visual learning.

Take-home message: Providing an appealing visual platform that fosters independent learning of complex science concepts facilitates making medical and clinical genetics more comprehensible and accessible to medical students.

The Sim360 Trial – Innovating simulation training with the use of a 'flipped' 360-degree virtual reality video

Authors

Jordan Tsigarides, Norwich Medical School, Norwich, UK
Jordan Curl-Roper, Norwich Medical School, Norwich, UK
Sophie Holland, Norwich Medical School, Norwich, UK
Veena Rodrigues, Norwich Medical School, Norwich, UK

Presenter: Jordan Tsigarides, Norwich Medical School, Norwich, UK

Background: Simulation is a widely-employed teaching method in undergraduate medical education, providing a safe and supportive experiential learning experience. However, for inexperienced students, it can often be a stressful and daunting prospect with technical aspects of the SimMan® impeding learning. Production of a low-cost virtual reality (VR) resource has the potential to provide an appealing, immersive learning experience for the millennial learner, increasing preparedness and enhancing the learning potential of formal sessions.
Method: In this Pecha Kucha, we will showcase our journey into VR, starting from nothing and leading to the creation of a 360-degree 3D video. Our immersive video was based on content covered in the first simulation teaching session attended by first-year medical students at our institution. Twenty-nine first-year students were independently randomised to one of three groups: (1) viewing the video on their smartphone using a VR headset (n=9); (2) viewing the video on a desktop computer screen (n=10); or (3) not viewing the video at all i.e. the control group (n=10). We assessed student performance in an OSCE-style simulation station and evaluated subjective experience using a survey, including the use of a validated assessment of students' motivation.
Results: All participants completed the survey following the intervention. Provisional results show that students who watched the virtual reality video felt significantly more prepared for their simulation teaching session compared to controls (p=0.03). Participants viewing the video using a VR headset reported higher median ratings of immersion and engagement compared to those viewing on a desktop monitor.
Conclusion: We filmed this VR video with no prior film production or editing experience and limited funding. This presentation intends to showcase how any educator, regardless of technological know-how can produce immersive, low-cost, accessible resources for technology-enhanced learning.

4H2 (255)
Technology-Enhanced Learning: Audio Tours in Anatomical Pathology

Authors

Lynelle Govender, University of Cape Town, Cape Town, South Africa
Dhirendra Govender, University of Cape Town, Cape Town, South Africa

Presenter: Lynelle Govender, University of Cape Town, South Africa

Background: Pathology education faces many challenges. Seen as the bridge between the basic sciences and clinical practice: Pathologists argue for the prioritization of Pathology in an undergraduate medical education, particularly in the setting of an integrated curriculum. Timetable pressures, competing clinical workloads and increasing intakes into medical school, challenge the Pathologist's ability to teach using traditional methods. Furthermore, in the South African setting: resource-constraints, student diversity and external pressures from the healthcare system create a unique landscape where these challenges are to be met.
Method: At the University of Cape Town in 2017, the authors sought to adapt the way Pathology is taught by making use of technology-enhanced learning. This took the format of "Audio Tours" in Anatomical Pathology. Audio Tours served as a means to guide students through a series of Pathology specimens. Specimens are preserved human tissue and were sourced from the existing collection at the Pathology museum (Pathology Learning Centre) at the University of Cape Town. Specimens were selected based on their application to the material students were engaging with, in their Problem-Based Learning cases. Audio files were scripted and recorded using input from specialist Anatomical Pathologists. These audio files serve as an in-ear, expert guide while students examine specimens at the Pathology Learning Centre. This PechaKucha presentation seeks to share with the audience our experience of implementing these Audio Tours. The presenter will share difficulties experienced as well as insights gained throughout this process. In a resource-constrained setting, where teaching time with Pathologists is limited; Audio Tours have proven to be an innovative means to increase guided, student engagement with Pathology content. Moving forward, several avenues can be considered in the evolution of this project including: multilingual tours, sharing Audio Tour content with students in outlying teaching sites and the application of Audio Tours in the postgraduate setting.

Short supplemental videos produced by students, for students

Authors
Simon Albrechtsen, University of Copenhagen, Copenhagen, Denmark

Presenter: Simon Albrechtsen, University of Copenhagen, Copenhagen, Denmark

1. Why and how are students using online videos?
2. Problems of irrelevant or wrong information.
3. Advantages of the format.
4. How could we improve?
5. Aligned with curriculum in collaboration with professors.
6. Language and pedagogy.
7. What have we done? (Clip from video)
8. More than ten videos produced within first year.
9. Digital blackboard, draw and talk format.
10. Short, focused videos.
11. Choosing the subject based on input from other students and professors.
12. Professors approving and recommending individual videos.
13. Channels of access for students (YouTube, Facebook and university intranet).
14. University support and collaboration.
15. Resistance to change - turned to visions of possibility.
16. Survey results - does it work? (Yes)
17. Direct video-specific feedback as a tool for further improvement.
18. Students as teachers - widely used at UCPH.
19. A sense of helping each other.
20. Improving opportunities for making the best doctors of tomorrow.

Clinic instead of lecture room – to start the medical curriculum!

Authors
Jörg Goldhahn, ETH Zurich, Switzerland
Rahel Kubik, Kantonsspital Baden, Germany
Manu Kapur, ETH Zurich, Switzerland
Ursula Brack, ETH Zurich, Switzerland

Presenter: Jörg Goldhahn, ETH, Zurich, Switzerland

Why should medical students wait for years to see what they are aiming for? In the newly developed bachelor in human medicine at ETH Zurich, we utilize the theory of Productive Failure (Kapur, 2008, 2016) to design learning experiences for medical students on the second day of their study to the clinical environment. A complex clinical case serves as the anchor for the clinical introductory week, where students are introduced into basic principles of patient management including interprofessional trauma care, multimodal imaging and principles of treatment and rehabilitation. The case is also utilized to introduce basics of biology, chemistry, mathematics and terminology. In addition, students practiced the basics of first aid, ultrasound imaging, wound treatment and rehabilitation. Consistent with the theory of Productive Failure, even though students were not able to solve the case successfully, nor was it a goal to begin with, the experience activates their knowledge, makes them aware of what they know and do not know, and prepares them for future learning by motivating them to look for solutions and ask challenging questions,. Student feedback was extremely positive with more than 85% of students indicating a deeper understanding of the physician's job, a better understanding of the curriculum, and learning of the first practical skills. The course contributed significantly to active student engagement form the very first day and provides the base for continued interaction with highly motived medical students.
Kapur, M. (2016). Examining Productive Failure, Productive Success, Unproductive Failure, and Unproductive Success in Learning. Educational Psychologist, 51(2), 289-299.

Let's Share a SIX Pack...for Faculty Development

Authors
Heather Billings, Mayo Clinic, Rochester, MN, USA
Lotte Dyrbye, Mayo Clinic, Rochester, MN, USA

Presenter: Heather Billings, Mayo Clinic, Rochester, USA

Our challenge was to create high quality and applicable faculty development resources. Our charge was that it NOT be another asynchronous online module. We built upon the Snippet model to create a series of stand-alone, mini workshops that can be delivered by faculty to faculty, within their own practice environment (M. Bar-on, 2014). A 2016 systematic review of more than 100 faculty development programs suggests that the most successful programming includes, among several other things, evidence-informed design principles, relevant content, experiential learning, opportunities for practice, application, feedback and reflection, and intentional community building (Steinert ,2016). Many clinical departments and schools are charged with delivering faculty development programming and resources, however, clinical, research and administrative obligations limit the amount of time available to create and lead these activities. The return on investment and efficiency of this model is suspect - especially if they are only going to be delivered once, to a small and siloed audience. We want to make it easy for high quality faculty development to be shared, received and applied – in an efficient, consistent and effective way. The SIX-Pack Faculty Development program includes a collection of Succinct, In-person, eXpandable faculty development sessions that can be taken off of the "shelf" (ie downloaded from a website), reviewed and adapted by the facilitator, and delivered, in person to a diverse audience - when and where appropriate. The SIX-Packs include 6 components 1) objectives, 2) powerpoint slide deck, 3) facilitator guide, 4) activities, trigger videos, case scenarios, 5) resources, and deeper dive references, and 6) evaluation tools. We utilize the Successive Approximation Model (Design, Develop, Evaluate, repeat) for continuous improvement and feed the evaluation data back into the design and revision process (Allen, 2012). Lessons learned, impact data and next steps will be shared.

4H6 (3549)
Interprofessional collaboration education: The experience of students at the end of their professionalizing journey

Authors
Brigitte Vachon, Université de Montréal, Montreal, Canada
Tania Deslauriers, Université de Montréal, Montreal, Canada
Johanne Beaulieu, Université de Montréal, Montreal, Canada

Presenter: Brigitte Vachon, Université de Montréal, Canada

Background: The aim of this presentation is to describe the experience of rehabilitation students who participated in a 3-year interprofessional collaboration education program. This program brings together students from 12 health and psychosocial training programs. It is led by patients--trainers who cofacilitate problem-based learning sessions with a professional.
Method: We conducted discussion groups with students in occupational therapy, physiotherapy and nutrition to understand how they felt prepared and competent, at the end of their professionalizing journey, to collaborate with patients and work in team. Seven students participated to each group. Content was recorded and analysed using the framework analysis approach.
Results: Interesting themes emerged from these groups such as "interprofessional collaboration being part of who they are", "putting the patient first in the decision-making process" and "nurturing curiosity for other professional roles and expertise". However, they also reported how difficult it was to enact these values and ways of being in practice. They were able to recognize gaps between what they learned and what they experienced during their clinical training. They reported not having yet enough self-confidence and competence to take the risk to act on situations and to change practice. Even if they expressed their disappointment towards a clinical environment that does not always support the transfer and continued acquisition of their interprofessional collaboration competencies, they felt well trained and prepared to work in team in partnership with patients.
Conclusion: These results illustrate the impacts and challenges related to training future clinicians to become competent inteprofessional collaborator.

Jindaola: The process of embedding Indigenous knowledge into mainstream medical and health science curricula at the University of Wollongong, NSW, Australia

Authors
Pippa Burns, School of Medicine, University of Wollongong, Wollongong, NSW, Australia
Karen Fildes, School of Medicine, University of Wollongong, Wollongong, NSW, Australia
Jade Kennedy, Learning and Teaching, University of Wollongong, Wollongong, NSW, Australia
Jola Stewart-Bugg, School of Medicine, University of Wollongong, Wollongong, NSW, Australia
Teresa Treweek, School of Medicine, University of Wollongong, Wollongong, NSW, Australia
Scott Winch, School of Medicine, University of Wollongong, Wollongong, NSW, Australia

Presenter: Teresa Treweek, School of Medicine, University of Wollongong, Australia

Background: The disparity in health outcomes between Indigenous and non-Indigenous Australians continues to be National challenge. In an effort to redress these inequalities, the University of Wollongong (UOW) has built respectful, reciprocal relationships with custodians of local Aboriginal knowledges and collaborate to embed these knowledges into mainstream medical and health science curricula. This innovative approach shifts the focus from learning about Aboriginal culture to valuing Aboriginal knowledges, empowering the knowledge-holders as teachers and creating authentic knowledge-exchange between UOW academics, Aboriginal organisations, elders and students.
Method: This paper represents the inquiry phase of a qualitative study employing Indigenous research methodology embedded in an overarching framework of Participatory Action Research (PAR). Immersive workshops were conducted with Aboriginal and non-Aboriginal staff members over the period in which the curriculum innovation was being developed. Experience-based evidence was collected via interviews and focus groups with participants.
Results: Significant risks inherent to the process of embedding Aboriginal knowledges were identified. Protocols to avoid tokenism and cultural knowledge appropriation must be developed to preserve the 'cultural capital' that Aboriginal knowledges and perspectives represent. An authentic approach that reduces the risks identified above is heavily reliant on non-Aboriginal academics becoming students of the process themselves before modifying curricula. This includes engaging non-Aboriginal academic staff members in whole days of learning throughout the year in order to better understand 'the way' in which these innovations must be respectfully implemented.
Conclusion: Through first re-orientating teaching staff to focus on Aboriginal knowledges and their value rather than on Aboriginal culture as if it is outside of, and irrelevant to, the dominant culture, we can then re-orientate students. It is our aim that UOW graduates will become culturally capable health professionals with a critical understanding of Indigenous determinants of health and a greater appreciation for the strength and resilience of Aboriginal communities.

'You Murderer!' - challenges faced by recent veterinary graduates when performing euthanasia

Authors
Claire Vinten, Royal Veterinary College, London, UK
Ruth Serlin, Royal Veterinary College, London, UK

Presenter: Claire Vinten, Royal Veterinary College, London, UK

Background: Euthanasia is one of the most challenging aspects of veterinary practice, but also one of the most rewarding. Being able to end the suffering of an animal is one of the many privileges of being a veterinarian, and requires tremendous compassion, excellent communication and considerable technical skills. It also necessitates resilience - for those cases where the heartbreak is unbearable, when the animal has suffered for too long or where the owners channel their grief into anger. It takes practice to develop these abilities, which veterinary students are expected to be competent in by the time they graduate. But as exposure during training is often limited, what are the challenges those new to the profession face when performing euthanasia by themselves for the first time?
Method: We performed a pilot study asking a cohort of 45 recent graduates to produce a 'displayed thinking' mural about their experience of euthanasia and to explain it.
Results: The thematic analysis of the data showed graduates struggling to manage the emotional needs of both their clients and themselves, whilst at the same time trying to build their practical skill competency. It also highlighted the extreme impact that euthanasia 'gone wrong' can have on the confidence and wellbeing of a recent graduate.
Conclusion: This presentation presents these results and discusses how we can better equip our graduates for the realities - good and bad - of euthanasia.

Comparative efficacy of postgraduate MD longitudinal integrated clerkships in rural communities translating to regional internships

Authors
Scott Kitchener

Presenter: Scott Kitchener, Griffith University School of Medicine, Toowoomba, Australia

Background: Rural medical school programs in Australia have been developed to address the maldistribution of medical practitioners away from rural communities. The Griffith University 4-year postgraduate medical program includes the Rural Medical Longlook Program of amalgamative, blended and comparative longitudinal integrated clerkships (LIC), for students to choose their path of scholarship in third and fourth year. These represent adaptive syllabi for longitudinal rural placements.
Methods: The aim here is to determine the comparative efficacy of different forms of LIC in terms of regional workforce outcomes in internship and thereafter. Students were classified by participation in one or more of these LIC. Their postgraduate location of practice choice was recorded as outcome variables categorized as Regional or Metropolitan for analysis.
Results: Of 108 medical graduates through the Griffith Longlook Program the postgraduate locations of practice of 103 have been identified. Overall, 61% began their medical career in a regional hospital and 56% of post-internship/foundation graduates are still practicing in regional locations in 2017.
Students who completed two consecutive LIC (through their third and fourth year) were more likely to practice in a regional hospital ($X2 = 6.7$, $p<0.01$) than those completing only one LIC. No significant difference was found between the those participating in either third year comprehensive or fourth year blended or amalgamative LIC.
Discussion/Conclusion: These further findings confirm previous results of Griffith Rural Longlook LIC placements translating into regional internships on graduation. With more graduates of the Longlook Program, the two-year combined LIC is demonstrated as more closely associated with graduates choosing regional hospital practice. This association may indicate student choice of a scholarship pathway to prepare them for a regional internship, or a positive influence on their choice towards regional communities, or both. Any differences existing between the efficacy of third-year comprehensive compared to fourth-year blended or amalgamative LIC are small enough to require a greater sample size to demonstrate.

Rural LIC are effective in addressing regional workforce maldistribution. Longer LIC of any form are more effective in translating graduates to regional medical practitioners.

Personal learning perceived by students and teachers from primary care experiences in vulnerable population of Northern Argentina

Authors
Fabiana Reboiras
Clara Facioni
Florencia Cararo
Mauro Fioramonti
Julio Busaniche
Marcelo Figari

Presenter: Clara Facioni, Instituto Universitario Hospital Italiano, Buenos Aires, Argentina

Background: Training programs on primary care in vulnerable rural population have proven to strengthen health professional competencies for clinical practice in different contexts (Pullon, S. et al, 2016). The Instituto Universitario Hospital Italiano in Argentina is a private non-for-profit institution dedicated to the training of professionals in health sciences, and integrates a consortium with a high complexity university hospital. The rotation in Primary Health Care with vulnerable population in the north of Argentina is oriented to transform the professional perceptions of students and residents by practicing in a context with critical health indicators, where infant mortality rate reaches 11.3 per one thousand and 80% of the population is native.
Methods: Along 2017, 28 students, residents and teachers of the medical and nursing careers participated in the project. A qualitative study was carried out based on structured, open-response, self-administered, electronic questionnaire before and after the rotation in order to record and identify the usefulness and transformational power of the experience. 50% of the responses has been processed, so far.
Results: In 100% of the total responses processed, students, residents and teachers reported having exceeded their expectations and emphasized teamwork experience and the possibility of professional practice in unfavorable contexts. Although they had little previous training for comprehensive care in this context, they all agree in the improvement experienced.
Discussion: The rotation allows to transform the professional approaches, understanding the social role of the practice, and enables being an agent of change of the indigenous population reality. The results challenge us to review the gap observed between the current curricular contents and the competences required for the rotation.
Conclusion: The experience reinforces the importance of promoting this kind of community and rural projects that provide the educational opportunity of developing professional expertise in primary health care in vulnerable contexts.

An Interdisciplinary primary care approach to multimorbidity: a pilot study of medical and nursing students' home visits in developing patient care plans

Authors

Carmen Ka Man Wong
Matthew Cheuk Kun Hui
Samuel Yeung Shan Wong
Ka Ming Chow

Presenter: Carmen Wong, The Chinese University of Hong Kong, Hong Kong

Background: Interdisciplinary primary care teams enhance comprehensive care options, increased continuity, and coordination of care. Interdisciplinary home visits involving medical students and nursing students in developing care plans for patients with multimorbidity were piloted.

Methods: One medical student was paired with 1-2 nursing students volunteered to conduct an assessment of a patient with chronic disease and develop an integrated care plan.

Evaluation using e open-ended, qualitative reflection and evaluation of learning exercise using a six-point Likert scale ranging from strongly disagree (0) to strongly agree (5) evaluated usefulness, teamwork, similar learning tasks and increasing scope to other professions.

The interviews were taken at the patients' home in Nov – Dec 2017. 10 groups of students (10 medical and 19 nursing students) in clinical years of training visited 10 patients with multimorbidity.

Results: Reflections: Nursing students

- Scarce opportunity to communicate/ collaborate on the wards
- Have space and time to express nursing concerns
- Difference in approach to primary care
- Equal platform
- Enhance alertness to symptoms

Reflections: Medical students

- Allow nurses more proactive
- Greater understanding of nurses
- More patient centred and holistic approach
- Attention to detail
- Comprehensive assessment

Overall rating on usefulness, team-working, further collaborative work and involving other disciplines was 3.87, 3.92, 3.97 and 4.13 respectively.

Medical students had higher ratings than nursing students (4.13, 4.13, 4.13 and 4.25 vs. 3.87, 3.92, 3.97 and 4.13 respectively)

Both medical and nursing students were positive about the learning task. Medical students had higher ratings on usefulness, teamworking, further collaborative work and involving other disciplines.

Suggested improvements include onsite professional for advice, additional learning with interdisciplinary collaboration. Further follow-up visits/exercises and addition of other allied health students e.g. pharmacists, physiotherapists. Group size of 3 was optimal.

Challenges will be in scaling up the project for the whole year and collaborating with other disciplines with varying student numbers.

Conclusion: This was a feasible and useful learning task which can be used to enhance interdisciplinary student clinical learning in primary care.

4I4 (2645)

Mapping the Thinkable: ways of characterising and researching general practice placements

Authors

Sophie Park

Presenter: Sophie Park, UCL Medical School, London, UK

Background: How we construct and produce research about general practice matters: making general practice thinkable in particular ways.

Methods: This study aimed to examine research texts about UK general practice placements from 1960s to present, to make visible how research is justified and placements characterised. A Foucauldian approach to discourse analysis was used to examine discursive boundaries and rules of acceptability within research texts, to understand power relations and normative ways of seeing or being. This produced a map of how research is justified; placements characterised; and related, how particular subject positions are made available (or not) for GPs, patients, students and researchers.

Results: Two distinct ways of characterising placements were identified. A 'gaze of discovery' characterises placements as workplace-based learning about 'Generalism as a speciality', valuing experiential knowledge of patients and GP-teachers; and encouraging students' active participation in practice, although sometimes positioning students as 'intruders'. A second 'gaze of deciphering' characterises placements as pre-determined compartments of knowledge, often supplementing what is not taught in the hospital setting, such as interactional knowledge or 'basic'. Patients are pre-selected as relevant to a curricular component and GPs positioned as 'teacher' or 'GP'. Different ways of justifying research (e.g. as evaluation, or making visible) enable placements to be characterised in particular ways. These also produce differing available positions for practitioner-researchers, legitimising (or not) their experiential knowledge.

Discussion: This discourse positions placements as supplementary and different to hospital teaching. Justifying research as evaluation produces challenges for the field's legitimacy in relation to other research. While teaching is treated as exchange of existing knowledge, research is positioned as informing teaching practice, legitimising its value through innovation and production of 'new' knowledge.

Conclusion: A Foucauldian approach to evidence synthesis can map the thinkable (and unthinkable) in relation to how general practice placements are characterised, and highlights important tensions between ways in which research and teaching and treated in published literature.

The Role of Student-Led Community Health Projects in a Singapore based Graduate Medical School - Critical Reflection and Learning Experience

Authors
Rui Xin Ng, Duke-NUS Medical School, Singapore
Jung Hiong Tan, Duke-NUS Medical School, Singapore
Li Wen Lee, Duke-NUS Medical School, Singapore
Siang Hui Lai, Duke-NUS Medical School, Singapore

Presenter: Rui Xin Ng, Duke-NUS Medical School, Singapore

Background: Duke-NUS Medical School is the only graduate entry medical school in Singapore. Established in 2005, the school aims to nurture clinicians with skills, knowledge and abilities to impact the future of medicine and healthcare delivery. With faculty support, successive classes of medical students have initiated, inherited and adapted a wide range of community projects to increase healthcare accessibility for underserved populations. Such projects range from running overseas rural community clinics to organizing local public health screenings. This paper features a reflective journey of experiential learning arising from an annual public health screening initiative, documenting various anecdotal pieces by organizers, volunteers, alumni and faculty.

Methods: For the last five years, students co-organised an annual community health screening event with the Chinese Development Association Council targeted at underprivileged members of the community. A targeted follow-up three months after the project has been planned to assess the impact of the health screening on subsequent lifestyle modifications and healthcare utilization. Interviews were conducted with student organizers, volunteers, alumni and supervising faculty involved in the project to document their reflective journey of experiential learning.

Results: Among the first year students, the greatest motivation for engaging in the community health screening was the opportunity to translate the knowledge and skills learned in the classroom to serve the community. Students in the health counselling room discussed the need to familiarise themselves with clinical practice guidelines before counselling participants on adherence to medical therapy, follow-up clinic visits and appropriate cancer screening. The paper will further elaborate on the selected reflections and the impact of these projects on the students' professional development.

Discussion: A strong tradition of altruism and volunteerism has evolved alongside the school's unique pedagogical philosophy emphasizing a holistic learning experience. Students and alumni have gained much professional insight into the calling, purpose and art of Medicine through active and consistent organisation and participation in community based events over time.

Conclusion: Student-Led Community Health Projects are an important element of medical education. Facilitating reflection and communication amongst students can enhance medical education and steer future project developments.

Physical Findings Progress Test at a Medical School – Longitudinal Data Analysis

Authors
Reed G. Williams
Debra Klamen
Ted Clark
Susan T. Hingle
Gary M. Rull
James Daniels

Presenter: Heeyoung Han, Southern Illinois University School of Medicine, Springfield, Illinois, USA

Background: Detection of physical findings is a core aspect of clinical performance in medical education. However, there is a limited understanding of medical students' development of physical finding skills. This study investigated students' physical findings skills progress over four years of the curriculum to understand their skills development.
Method: We developed a computer-based physical findings progress (PFP) exam to measure students' diagnostic abilities of visual and auditory discriminations. Sixty items were created. The exam includes detection and description of ecg, x-ray, heart/breath sounds, skin lesions and movement findings. The exam was implemented at the beginning of the year with incoming students since 2014. Additionally, we implemented the exam with the class of 2017 prior to their graduation. Descriptive statistics, ANOVA, and Tukey HSD were used to determine group differences.
Results: Test completion rates ranged from 98% to 100%. One way ANOVA showed that students' physical findings skills increased by training year until their incoming fourth year. While group means increased, variation within the classes did not change across four years. It means that the class did not become more homogeneous in physical findings skills as they went through the medical curriculum. Repeated measures ANOVA of the class of 2017 longitudinal data showed that the students' performance patterns were same as the cross-sectional data up to their incoming fourth year. However, there was no difference in their performance between when they became incoming year 4 students and when they were graduating. Box plots showed that performance of the bottom quartile of graduating fourth year students was not much higher than the performance of the top quartile of incoming first year students without medical training. Medical students' physical finding skills increased for three years and showed a flat pattern during the fourth year. While increasing, students' physical findings skills within classes did not become more uniform, suggesting that growth is opportunistic rather than through planned curriculum.

Conclusion: There is a need for planned curriculum for physical finding skills in medical education. We also call for study of reasons why performance does not improve during the fourth year.

Progress testing and self-evaluation in undergraduate medical students

Authors
Janina Ulbl, Faculty of Medicine, University of Maribor, Maribor, Slovenia
Monika Sobočan, University Medical Centre Maribor, Division of Obstetrics and Gynecology, Maribor, Slovenia
Sebastjan Bevc, University Medical Centre Maribor, Clinic for Internal Medicine, Maribor, Slovenia
Radovan Hojs, University Medical Centre Maribor, Clinic for Internal Medicine, Maribor, Slovenia

Presenter: Janina Ulbl, Faculty of Medicine, University of Maribor, Slovenia

Background: The self-evaluation ability serves in developing critical thinking and learning skills. Students need to assess their own knowledge level in order to learn new material effectively. Self-evaluation is also important in clinical work. Our study aims at estimating the self-assessment ability of undergraduate medical students.
Method: Medical students (n=44) participated in progress test with given "I don't know" option (DKO). The obtained DKO scores were compared to the expected DKO scores. The latter were estimated from the amount of curriculum covered by students. The difference between actual and expected DKO scores smaller than 10% indicates good self-assessment ability.
Results: The difference between actual and expected DKO scores was greater for lower-grade students comparing to end-year students. The largest difference (30.65%) was for year 3 students at the beginning of their clinical work. The difference was the smallest (2.68%) for students near the end of medical school.
Discussion: Significantly lower than expected DKO scores indicate less accurate self-assessing. Similarly, other studies have shown poor self-evaluation of medical students. Our results furthermore reveal students' tendency for knowledge over-estimation. However, the difference between actual and expected DKO scores decreases with increasing year of the study for years 3 to 6.
Students' self-evaluation ability has been shown to be relatively poor especially at the beginning of clinical work. The ability was better for students in the last year of medical school. It can be argued that clinical experiences help in developing critical thinking and reflective practice and thus self-assessing skills.
Conclusion: Medical schools need to provide positive environment for developing self-evaluation skills. Suggestions include more problem-based learning, earlier contact with patients, group discussions and receiving feedback from supervisors. Practising self-assessment should start early in medical school so that students can develop this skill and use it effectively in their clinical work.

4J3 (1686)
Progress test analysis: Is the students' knowledge improved?

Authors
Rahmaningsih Sabirin, UGM, Yogyakarta, Indonesia
Yoyo Suhoyo, UGM, Yogyakarta, Indonesia

Presenter: Rahmaningsih Sabirin, Universitas Gajah Mada, Yogyakarta, Indonesia

Background: Indonesian Medical Council (IMC) arranged a list of standard competencies for the medical doctor. All medical schools have to ensure all students meet these competencies. To assess the progress of students' knowledge that include in these competencies, and how undergraduate curriculum facilitate students to learn it, Faculty of Medicine Univeristas Gadjah Mada has implemented progress test that covered all students in the different year. In this study, we analyzed whether there were differences in the level of students' knowledge between years and whether there were differences between students of the regular and international program in each year.
Method: We studied 1336 data from second to sixth-year students who enrolled in progress test. Since the data were not normally distributed, we analyzed data by using non-parametric test in the SPSS program.
Results: The highest average score was gotten by students in the sixth-year (60.22 ± 6.215), followed by students in the fifth (52.75 ± 9.373), fourth (49.86 ± 8.671), third (46.28 ± 7.775), and second (36.12 ± 7.220) year. By Kruskal-Wallis test, we found that there were significant differences between years ($p < 0.05$). By using Mann-Whitney U test, we found that there were significant differences between students of the regular and international program in the third, fifth and sixth years ($p < 0.05$), but no significant differences in the second and fourth years.
Conclusion: This study showed, that the level of students' knowledge was in line with the years of study. However, the average score of the sixth-years students was below the passing grade (66 of 100). To improve the students' competencies, developing strategies with curriculum team and other stakeholders are necessary.
The differences levels of knowledge between students in the regular and international program were not consistent. Further study to explore the possible factors that affect the results are needed.
Take-home messages: It is important to arrange progress test regularly in order to measure the improvement of students' performance.
An increase of students' mark in each year does not guarantee that the students can pass the passing grade at the end of their studies.

4J4 (1029)
Fourteen years of formative progress testing in radiology residency training: experiences from Netherlands

Authors
Dirk Rutgers, University Medical Center, Utrecht, Netherlands
Winnifred van Lankeren, Erasmus Medical Center, Rotterdam, Netherlands
Cécile Ravesloot, University Medical Center, Utrecht, Netherlands
Anouk van der Gijp, University Medical Center, Utrecht, Netherlands
Olle ten Cate, University Medical Center, Utrecht, Netherlands
Jan van Schaik, University Medical Center, Utrecht, Netherlands

Presenter: Dirk Rutgers, University Medical Center, Utrecht, Netherlands

Background: Progress tests are not common in postgraduate medical training. In this study, we describe the development of the Dutch Radiology Progress Test (DRPT) for knowledge testing in radiology residency training in Netherlands from its start in 2003 up to 2016. The DRPT, a semi-annual comprehensive knowledge test, is required for all Dutch radiology residents in all training years. Residents can apply for dispensation from participation for various reasons, such as holidays and attendance of congresses.
Method: We reviewed all DRPTs conducted since 2003, when the test started as a formative paper-and-pencil test. We assessed key changes and events in the test throughout the years, as well as resident participation and dispensation, test reliability and discriminative power of test items.
Results: The DRPT has been conducted semi-annually since 2003, except for 2015 when one digital DRPT failed. Key changes in these years were improvements in test analysis and feedback, test digitalization (2013), leading to the introduction of test items with volumetric radiological images, and inclusion of test items on nuclear medicine after the merge of the national training programs for radiology and nuclear medicine (2016). From 2003 to 2016, resident dispensation rates increased (Pearson's correlation coefficient 0.74, P-value <0.01) to maximally 16%. Cronbach´s alpha for test reliability varied between 0.83 and 0.93. The percentage DRPT test items with negative item-rest-correlations, indicating relatively poor discriminative power, varied between 4 and 11%.
Conclusion: Various changes in DRPT construction, administration, analysis and feedback have been implemented between 2003 and 2016. Test reliability and discriminative power of test items have remained fair over the years, while resident dispensation rates have increased. In our experience, important factors in the development of the DRPT have been a close collaboration among program directors, support by the national radiological society and development of specific test software for image-based radiological testing.
Take-home messages: The DRPT has proven a feasible and sustainable way of formative postgraduate radiological

knowledge testing. It has moved from a paper-and-pencil test to a digital test with volumetric image-based test items, keeping up with innovations of the radiological profession.

Promoting Empathy among medical students: a two-site randomized controlled study

Authors
Céline Buffel du Vaure, Université Paris Descartes, Sorbonne Paris Cité, Faculté de Médecine, Département de Médecine Générale, Paris, France
Cédric Lemogne, Université Paris Descartes, Sorbonne Paris Cité, Faculté de Médecine, Paris, France
Lucie Bunge, Université Paris Diderot, Sorbonne Paris Cité, Faculté de Médecine, Département de Médecine Générale, Paris, France
Christian Ghasarossian, Université Paris Descartes, Sorbonne Paris Cité, Faculté de Médecine, Département de Médecine Générale, Paris, France
Eric Galam, Université Paris Diderot, Sorbonne Paris Cité, Faculté de Médecine, Département de Médecine Générale, Paris, France
Philippe Jaury, Université Paris Descartes, Sorbonne Paris Cité, Faculté de Médecine, Département de Médecine Générale, Paris, France

Presenter: Céline Buffel du Vaure, Université Paris Descartes, Sorbonne Paris Cité, Faculté de Médecine, Département de Médecine Générale, Paris, France

Background: Observed decline of self-reported empathy during medical training raises important issues. Examining whether empathy can be promoted among medical students is thus of high importance. This study aims to assess the effects of Balint groups on empathy measured by the Consultation And Relational Empathy Measure (CARE) scale rated by standardized patients during objective structured clinical examination and self-rated Jefferson's School Empathy Scale - Medical Student (JSPE-MS©) among fourth-year medical students.
Method: We performed a two-site randomized controlled trial, from October 2015 to December 2015 at Paris Diderot and Paris Descartes University, France. Eligible students were fourth-year students who gave their consent to participate. Participants were allocated in equal proportion to the intervention group or to the control group. Participants in the intervention group received a training of 7 sessions of 1.5-hour Balint groups, over 3 months.
CARE and the JSPE-MS© scores at follow-up were the main outcomes.
Results: Data from 299 out of 352 randomized participants were analyzed: 155 in the intervention group and 144 in the control group, with no differences in baseline measures. There was no significant difference in CARE score at follow-up between the two groups (P=0.49). The intervention group displayed significantly higher JSPE-MS© score at follow-up than the control group [Mean (SD): 111.9 (10.6) versus 107.7 (12.7), P=0.002]. The JSPE-

MS© score increased from baseline to follow-up in the intervention group, whereas it decreased in the control group [1.5 (9.1) versus -1.8 (10.8), P=0.006]. CARE scores were higher in the intervention (versus control) group among men [66.3 (15.9) versus 59.4 (12.6), P=0.009] but not among women (P for interaction: 0.007), and were higher among participants with a baseline JSPE-MS© score above the median [67.1 (17.0) versus 62.1 (13.9), P=0.048], but not among those with a score below the median (P for interaction: 0.035). Sensitivity analysis using the JSPE-MS© score at baseline as the JSPE-MS© score at follow-up for the 53 randomized participant students who did not provide follow-up data yielded similar results.
Conclusion: Balint groups may contribute to promote clinical empathy among medical students.

4K2 (1528)
Evolution of Empathy in French medical students during their first academic year

Authors
Olivier Coste, Ecole de santé des armées, Bron, France
Léa Ruelle, Université Lyon 2, Bron, France
Marion Trousselard, Institut de recherche biomédicale des armées, Brétigny-sur-Orge, France

Presenter: Olivier Coste, Ecole de santé des armées, Bron, France

Background: Empathy is a very important skill in medical art. Several studies indicate that the level of empathy decline during medical studies, but there is no data available dealing with the French military medical students. Last year, a prospective study started in order to follow the level of empathy of a whole promotion of cadets from their first academic year and during the five following years.
Method: The level of empathy was determined using the Jefferson empathy scale just before the beginning of medical cursus in 2016 August and at the end of academic year in April. The promotion initially counted 144 cadets (62 males and 82 females). Forty-five pupils were repeating a year. Indeed, French medical students have to pass high selective exams during their first academic year. Results were analyzed by a repeated measure ANOVA and post-hoc tests with p = 0.05.
Results: We presented the results of the first year only. Initial level of empathy (in 2016 August) was significantly higher in female students (110.3 ± 1.1) than in male students (103.6 ± 1.7). It was also higher in students repeating a year (111.4 ± 2.0 vs. 105.6 ± 1.1). Global score of empathy, 'perspective taking'' score and 'compassionate care' score increased during the first academic year, but only for the cadets who did not repeat a year. At the end of their first academic year, 34 pupils who failed their exams were authorized to repeat a year as military students. A stabilization of their level of empathy was observed at the beginning of the following year (JES: 116.1± 1 in 2017 August vs. 114.5 ± 2.0 in 2017 April), explaining the initial results observed in 2016 August.
An increase of empathy in military medical students during the first academic year, with higher scores in females was our main outcome.

Conclusion: These preliminary results encourage us to continue this evaluation on the same cohort of students during six years at least in order to precise the influence of French medical education on empathy level.

4K3 (1636)
Humanism in medicine - instilling empathy

Authors
Anna Byszewski, University of Ottawa, Ottawa, Canada
Philippe Rousseau, University of Ottawa, Ottawa, Canada
Melissa Forgie, University of Ottawa, Ottawa, Canada
Heather Lochnan, University of Ottawa, Ottawa, Canada

Presenter: Anna Byszewski, University of Ottawa, Canada

Background: Physicians that emphasize garner greater patient satisfaction and may have reduced malpractice claims. Lack of, or diminished empathy has been linked to burnout and in turn diminished quality and medical error. Previous studies have reported that empathy may erode as medical students progress through their studies. This study was designed to determine if the medical curriculum at the University of Ottawa, Canada has instilled empathy in its students.
Method: The Interpersonal Reactivity Index (IRI) was used to measure emotional and cognitive empathy. It was preferred over other measures due to high psychometric properties, use within medical fields around the world, and validation in multiple languages. Students were contacted by email and participation was voluntary.
Results: Empathy was statistically significantly different between the four academic years, $F(3,192)=35.474, p<.001, \eta^2=0.357$. Tukey post hoc analysis revealed that students enrolled in year one of the medical program ($M=9.5, SD=1.3$) had lower empathy scores than students enrolled in year two ($M=11.9, SD=1.5$), year three ($M=11.4, SD=1.6$), and year four ($M=11.5, SD=1.6$), $p<.001$. Interestingly, the empathy measures of the first year students were similar to the scores of typical university students. The higher scores observed in second, third, and fourth year students would suggest that the University of Ottawa medical curriculum may foster empathy in its students. As students gain clinical exposure if provided with appropriate supports such as a reflective writing eportfolio program, diverse professionalism curriculum, wellness and faculty development (as introduced at the University of Ottawa) empathy competency may improve with training.
Conclusion: These findings at our institution are in contrast to some previous studies measuring empathy in medical students where empathy appeared to decline in the clinical years. It could also be reflective of the shift in medical education designed to foster a more positive learning environment. The results indicate also that IRI is a tool that can be applied across a medical school curriculum.

Empathy in training: Applied Drama and Communicating Bereavement in the Maternity Services

Authors
Aisling Smith

Presenter: Aisling Smith, Royal College of Physicians of Ireland, Dublin, Ireland

Background: Publication of the Irish Health Service Executive's (HSEs) National Standards for Bereavement Care in the maternity services as part of the national Maternity Strategy highlighted the importance of empathy and compassion in bereavement care. This topic has received much attention in the Irish media and created a highly pressurised environment of doctors in training. There has also been increasing concern expressed by national and international professional training bodies about the effects of traumatic work-related experiences on clinicians.
In response to this, the Royal College of Physicians of Ireland and the Institute of Obstetricians and Gynaecologists have collaborated with the Community and Education Department of the Abbey Theatre, Féileacáin (National Stillbirth Society) and Patient Focus to develop an innovative educational intervention for Obstetricians and Gynaecologists who are currently in training in the Irish maternity services.
The primary aim of this intervention is to facilitate a deeper empathic understanding and a more compassionate response to stillbirth and pregnancy loss by clinicians in order to provide the highest level of care to bereaved parents. It is also intended that this intervention will provide clinicians with a greater insight into their own emotional responses when faced with these tragic and often unanticipated events - enhancing their abilities to cope with the personal consequences of this trauma.
Method: Following structured interviews the narratives of parents and clinicians were used to develop a series of applied drama workshops for Specialist Registrars in Obstetrics and Gynaecology in which the emotional experience of stillbirth is explored. A research project is running on conjunction with the project to examine the effectiveness of applied drama as a method of teaching in medical education.

Building civic responsibility among medical students through service learning - A visit to a Disability Centre

Authors
Sajida Naseem, Shifa College of Medicine, STMU, Islamabad, Pakistan
Syeda Hanaa Fatima, Shifa College of Medicine, STMU, Islamabad, Pakistan

Presenter: Sajida Naseem, Shifa College of Medicine, STMU, Islamabad, Pakistan

Background: The instructional strategies commonly used in medical colleges generally address the knowledge and skills required for medical students to be a knowledgeable physician. Addressing different attitudes is a difficult task for the educationists and therefore left in hidden curriculum both by faculty and students. Instead of cooperation and service to others, the values modeled in the medical schools focuses much on individual achievements. The objective of this study was to strengthen the civic responsibility among undergraduate medical students while delivering their curriculum objectives through visit to a disability centre.
Method: A cross sectional study involving 100 students in Year 4 was carried out over one year in Shifa College of Medicine, Islamabad Pakistan. The students attending the clerkship of Community & Family Medicine as part of their curriculum, visited the Disability Centre where they interacted with children in an environment of school, performed their general and physical examination, developed and practiced the skill of empathy. The civic responsibility among students was assessed by exploring the perception of medical students. The centre has children with different mental and physical disabilities.
Results: The main themes identified were: empathy, learnt to interact with disabled children, imagined doing consultation with them and their family which they felt would be challenging, they experienced the challenge of to their professional life, philanthropy, felt they are part of our society, brought smile on children face. Details will be shared at AMEE 2018.
Conclusion: Clearly medical education is in a need to expand the strategies and to create a learning environment for teaching such attitudes which are generally left untouched in the form of hidden curriculum. Service learning is a form of experiential pedagogy to educate students to serve the communities.
Take-home messages: Students found visit to Disability centre useful, which opened avenues for wider scope of learning to interact in a different environment. Undergraduate medical teaching through visit to remote centre should be incorporated in the curriculum delivery.

Results from a Global Social Accountability Survey - What do medical students really think?

Authors
Aikaterini Dima, IFMSA, Thessaloniki, Greece
Mohsna Bhiri, IFMSA, Tunis, Tunisia
Ximena Nunez, IFMSA, Quito, Ecuador
Ahmed Elshaer, IFMSA, Mansoura, Egypt
Mohammed Salah, IFMSA, Baghdad, Iraq
Roshit Bothara, IFMSA, Christchurch, New Zealand

Presenter: Aikaterini Dima, International Federation of Medical Students' Associations (IFMSA), Thessaloniki, Greece

Background: In September 2017, together with THEnet - Training for Health Equity Network, the International Federation of Medical Students' Associations - IFMSA published a comprehensive toolkit on social accountability in medical education, aimed to provide students worldwide with the right resources to develop, implement and assess the social accountability of their medical schools.
Method: A group of 8 students from 7 different countries across 4 different regions was appointed to follow up on the creation and dissemination of the toolkit, to ensure its wide implementation and assess its efficacy.
The toolkit is an interactive online platform that provides comprehensive explanations, logistical materials as well as an assessment tool. The assessment tool was isolated and prepared into an online form for IFMSA members to fill in and give an outline of how social accountability is implemented.
Results: Results will be collected until June 2018, with a final report being published in early July 2018.
Conclusion: Social Accountability is not only a challenge affecting education, faculties and hospitals but as well the future health workforce. With an easy-to-use and widely accessible toolkit, we seek to empower an important stakeholder in SA to defend communities' needs and interests. The IFMSA provides a vast network of both over and underrepresented countries across the world, offering very broad input. Medical students should be the first in line to advocate for better education, and through this assessment, it is expected to place social accountability on top of student organizations' agendas.
There's an increased need for an action to ensure Social Accountability of health institutions. By developing such materials and utilizing them across our networks, IFMSA and THEnet strive for the empowerment of a crucial stakeholder, medical students worldwide. Our goal is to ensure that every medical school globally better responds to the community's needs.

4L2 (2858)
A tool for Social Accountability: presenting the iSAT

Authors
Ruy Souza
Jose Garcia Gutierrez
Larisa Carrera
Bjorg Palsdottir
James Rourke
Sarita Verma

Presenter: Ruy Souza, Federal University of Roraima-Brazil, Boa Vista, Brazil

Background: There is a growing interest in social accountability(SA) in medical education, specially concerning the challenge of reforming the curriculum towards a program that align its education, research and service activities with the priority healths needs of the community. Recently many works have been published trying to clarify concepts and define standards for SA, and now it is time to disseminate the concept, specially to medical schools committed to community based education. In this context, the Human Resource unit of PanAmerican Health Organization (PAHO) developed the Indicators for Social Accountability Tool-iSAT, to help schools to evaluate their program towards the objective to better address the health needs of the communities they serve.
Method: The iSAT is a educational tool to help schools to evaluate their curriculum with a focus on social accountability and was developed by the Human Resources Unit of PAHO-DC. After an extensive review of the literature, indicators for SA were grouped in five dimensions: (1) Students; (2) Faculty; (3) Educational program; (4) Research; (5) Governance. The instrument was further validated by experts from some of the leading organizations involved with SA: AMEE-ASPIRE, Training for Health Equity Network-THEnet, Association of Faculties of Medicine of Canada-AFMC, Beyiond Flexner inittiative, and representatives of Medical Schools from Latin America and Caribe.
Results: The resulting tool, is an instrument that can be easily used by the different stakeholders involved in the program of medical schools. The results are organized in the form of a spidergram, allowing a clear view of the current stage of the schools towards SA and also showing which dimension should be prioritize in the process. The instrument has been used by several institutions in South America with consistent results.
Conclusion: The 2017 Dublin Declaration on Human Resources for Health called for increasing SA. Aligning Medical Education with the population needs should be a priority of every institution involved in health professions education, and iSAT offers the possibility of an accurate evaluation of the curriculum.
Take-home message: iSAT is an educational tool that will help schools to align their program towards the population priority health needs.

4L3 (2118)
"Change A World" Program with the TOOTH FAIRY: Promoting oral health among at-risk Youth

Authors
Ruth Margalit
Roi Avrahami
Aviv Binyamin
Roni Maman
Noga Ashkenazi

Presenter: Ruth Margalit, Tel Aviv University School of Medicine, Tel Aviv, Israel

Background: Accessible dental care for youth is not available in Israel. Life experiences of neglect and abuse are barriers to seeking help and developing trust in the health care system. A dental health survey conducted among at risk youth living at Ha'Lev (The Heart) shelter concluded that 45% suffer from oral pain daily, 46% concerned about dental care, 38% received oral hygiene guidance and 82% needed dental care. 70% of respondents said they did not seek dental treatment for economic reasons.
Method: The "Tooth Fairy" is a project of "Change a World", a platform working to promote social responsibility and student engagement with local communities. The project was established to provide care in response to oral health needs of at risk youth, including those in prostitution, at the 24/7-Halev Shelter. It was developed with the careful consideration of both the medical and the psychological needs and barriers that comprise the special context. The treatment is conducted by students and faculty dentists at the Academic Dental Clinic at Tel Aviv University (TAU), alongside other dentists, volunteers from the Alfa Omega organization.
Results: Mapping of the pathology and the dental care plans were carried out in coordination with doctors from the Alpha Omega Association, with the cooperation of the "Ha'Lev", the Faculty of TAU Dental Medicine, and the "Change the World" program students. 55 individuals received care in the first phase. In addition to dental care, selected and interested youth will soon undergo professional training, enabling them a path to employment as dental assistants.
Conclusion: Dental schools provide little preparation for culturally sensitive and compassionate work with disadvantaged youth. Therefore, even when youth in prostitution finally arrive to receive medical treatment they might receive a negative and insensitive approach. The project helped increase skills and break the cycle of alienation and mistrust between this youth and the medical establishment.
Take-home messages: Engaging at risk youth working in prostitution in the planning, development, and implementation of the project brought to its success. The program facilitated the development of skills and sensitivities for the treatment of disadvantage youth based on values of solidarity and compassion.

4L4 (3513)
Winning the ASPIRE-to-Excellence Award in Social Accountability: what's next?

Authors
Emmanuelle Careau, Faculte de medecine, Universite Laval, Quebec, Canada
Marie-Claire Bérubé, Faculte de medecine, Universite Laval, Quebec, Canada
Nadine Martin, Faculte de medecine, Universite Laval, Quebec, Canada
Julien Poitras, Faculte de medecine, Universite Laval, Quebec, Canada

Presenter: Emmanuelle Careau, Faculte de medecine, Universite Laval, Quebec, Canada

Background: Social accountability is part of the Faculté de médecine de l'Université Laval's DNA since its creation in 1852, to serve French-speaking population from the Province of Quebec, which is part of a mainly Anglophone country. In the 2015-2019 strategic plan, social accountability was put forward through a dedicated vice-dean office that has supported numerous initiatives. Its Directions in Global Health (international, First Nations and aboriginal communities, vulnerable and marginalized populations), in Training for Regional and Remote Settings, in Professionalism and Patient Safety, as well as in its offices promoting health and welfare of the Faculty community (Student Assistance Direction and Professor Support Office) were mobilized to fulfill our engagement towards social accountability. In August 2017, the outstanding roadmap of the Faculté de médecine in social accountability was recognized with the granting of the International ASPIRE-to-Excellence award in social accountability. But a year after, what has this recognition changed within our University? What are the next challenges to take up to pursue our efforts in educating more socially responsible healthcare professionals? How to become a truly changing agent supporting social innovations? In this presentation, we will explain the rationale behind the organization of our various Directions contributing to our social accountability mission. We will discuss the specific implications the ASPIRE recognition has brought within our Faculty and our network. We will then present the great projects in which we wish to invest over the years to come in order to keep up to date our leader and changing agent role in social accountability in health and social care.

4L5 (2341)
The Needs of the Many: NOSM Students' Experience of Generalism and Rural Practice

Authors
Roger Strasser
Hoi Cheu

Presenter: Roger Strasser, Northern Ontario School of Medicine. Lakehead and Laurentian Universities, Sudbury, Ontaio, Canada

Background: After this presentation, participants will be able to: Describe NOSM students' experience of generalism; Outline key elements of generalism in rural practice.
Northern Ontario School of Medicine (NOSM) opened in 2005 with a social accountability mandate focused on improving the health of Northern Ontarians. NOSM recruits students from Northern Ontario or similar backgrounds and provides Distributed Community Engaged Learning in over 90 community settings located in a vast underserved rural part of Canada.
Objective: In the context of a growing discourse on generalism, this paper explores the NOSM student and graduate experiences of generalism in rural practice.
Method: NOSM tracking studies use mixed methods drawing on data from various sources including interviews of students, graduates and other informants. This paper reports analysis of semi-structured interviews involving 37 graduating medical students and 9 practising NOSM graduates.
Results: Key themes from student observations include an affinity for Northern Ontario and a recognition that rural medicine involves a broad scope of practice. NOSM students consider generalist care as a comprehensive service with a strong focus on responding to the health needs of the community. Beyond primary care, a rural medicine "true generalist" is viewed as a complete package, a physician who provides care ranging from promoting prevention to performing specialist tasks. Rural practitioners, particularly in family medicine, are extended generalists with a broad scope of practice guided by the health needs of the communities they serve.
Conclusion: NOSM students' and graduates' experience of rural generalism is positive and highly influential in determining their career direction including specialty, scope and location of practice. NOSM's generalist approach may be effective beyond rural applications and an advantageous approach for foundational medical education. Students and graduates report that the NOSM Distributed Community Engaged Learning prepares them well for rural generalist practice.

An Overview of the Medicine and Humanities International Program, an International Educational Initiative

Authors

Ali Chour, Faculté Lyon Est - Université Claude Bernard Lyon 1, Lyon, France
Syeda S. Hashmi, Faculty of Medicine - University of Ottawa, Ottawa, Canada
Jia Wen Lim, Shanghai University of Traditional Chinese Medicine, Shanghai, China
Lyu Bin Benjamin, Shanghai University of Traditional Chinese Medicine, Shanghai, China
Jonathan Gendron-Rossignol, Faculty of Medicine - University of Ottawa, Ottawa, Canada
Nicolas Lechopier, Faculté Lyon Est - Université Claude Bernard Lyon 1, Lyon, France

Presenter: Ali Chour, Faculté Lyon Est - Université Claude Bernard Lyon 1, Lyon, France

Background: In a changing world, with increasing disparity, health care burden, and innovation, medical students are benefiting from a well-rounded, collaborative, and humanistic style of medicine, in order to stay grounded, flexible, and resilient. We present the first Medicine and Humanities International Program (MHIP). The medical faculties of Lyon University (France), Ottawa University (Canada), Shanghai University of Traditional Chinese Medicine (China) and Shanghai Jiao Tong University (China) established a professional partnership in 2016, with the purpose of raising awareness for medical humanities.
Method: The first MHIP Summer School was held in Ottawa in July 2017. It introduced a variety of course work, group activity, and experiential learning, allowing students to work together to address the role of humanities within medicine, as well as critically thinking upon the social determinants of health and its impact on health.
The 2017 Summer School gathered 27 students. The themes included the history of medicine, philosophy, arts, literature and the humanities. Students also learned about Traditional Chinese Medicine (TCM) and its holistic approach towards healthcare. Survey responses were collected from each course, to collect information on student experience and preliminary results show strong satisfaction with highlights on the cultural richness of the experience.
Results: This school allowed students and instructors to forge long-lasting professional networks, paving the way for research, work collaboration, and increased learning. This was represented by work done by three medical students, in their 8-week project in Shanghai, conducting an observational field report and comparison of the medical curricula across the four medical faculties and writing a report for each faculty. Opportunities for clinical exchange internships were also created.
The next Summer School will be organized in Lyon in July 2018, adding a fifth faculty (Saint-Etienne, France) to the MHIP.
Conclusion: The MHIP is an opportunity to explore new approaches to medical training, as well as new educational methods that could be implemented in medical curricula. This school promotes intercultural exchange, professional collaboration, and learning between future physicians and researchers from across the world.

Do you embrace or decline? A study into the influence of physicians' views of the organizational culture on their incorporation of global standards in clinical teaching

Authors

Takuya Saiki, Gifu University Medical Education Development Center,Gifu, Japan
Rintaro Imafuku, Gifu University Medical Education Development Center,Gifu, Japan
Joyce Pickering, McGill University Department of Medicine, Montreal, Canada
Yvonne Steinert, McGill University Centre for Medical Education, Montreal, Canada
Yasuyuki Suzuki, Gifu University Medical Education Development Center,Gifu, Japan

Presenter: Takuya Saiki, Gifu University Medical Education Development Center, Gifu, Japan

Background: In an era of globalization, physicians may experience cognitive dissonance between the global standards of clinical teaching and their local context and practice. Whilst we expect clinical teaching to be associated with organizational culture, few studies have explored how physicians' perspectives on their organizational culture influenced their acceptance of new teaching approaches. We aimed to examine how clinical teachers embrace or decline different teaching approaches when they observe clinical teaching in a foreign country that meets global standards.
Method: We have developed a one-week, on-site faculty development programme in which 29 Japanese clinical teachers from different hospitals/specialties observed and learned about clinical teaching approaches and systems in Canadian teaching hospitals. The transcripts of daily group debriefings and participants' final reports were thematically analyzed. Dimensions of Organizational Culture (Detert, 2000) were employed as a theoretical framework.
Results: Although physicians' views towards the different pedagogical approaches, such as cognitive apprenticeship, respect for learner's autonomy, and creation of a safe learning environment, were positive in general, each participant's decision-making process of accepting such approaches into their work varied and was deeply embedded in their understanding of their own organizational culture. The latter included patient-centeredness (basic truth and rationality), working hours (time), professionalism, work-life balance (orientation to

work/task/coworkers), incentives (motivation) and the promotion criteria(control).

Conclusion: This study indicated that the physicians' understanding of their own clinical work and organizational culture varied and influenced their acceptance of new pedagogical approaches in diverse ways. Detert's dimensions were useful as a framework to examine physician's acceptance of global standards in clinical teaching. This study shed light on understanding physicians' initial response to cognitive dissonance between global standards and their daily clinical work and teaching from an organizational and cultural perspective. The findings can guide faculty developers to better understand physicians' decision-making processes.

Take-home message: Faculty developers should pay simultaneous attention to physicians' views toward pedagogical approaches and organizational culture so that clinical teachers can easiily incorporate new teaching approaches into their daily work.

JPEMS – Joint Program for European Medical Studies – From idea to success

Authors

Tudor Calinici, "Iuliu Hatieganu" University of Medicine and Pharmacy Cluj-Napoca, Romania
Anca Dana Buzoianu, "Iuliu Hatieganu" University of Medicine and Pharmacy Cluj-Napoca, Romania
Ferenc Bari, University of Szeged, Hungary
Márta Széll, University of Szeged, Hungary
Audrey Rousseau, University of Angers, France

Presenter: Tudor Calinici, "Iuliu Hatieganu" University of Medicine and Pharmacy, Cluj-Napoca, Romania

Background: Medical studies are presently poorly involved in international exchanges programs for a number of different reasons. In most European countries the medical curricula tend to be submitted to regulations and constraints related to national health policies, and the organization of medical studies varies a lot across Europe. Language barriers are difficult to overcome as medical studies imply contact with health staff and patients who do not usually speak any other language than their native language.

Method/Results: A group of 7 universities from 5 European countries developed the Joint Program for European Medical Studies (JPEMS) for promoting international exchanges and structured cooperation between higher education institutions through an offer of enhanced quality medical semester thought in English language, with a distinct European added value.

The curriculum was composed of Immunology, Microbiology, Physiopathology, Genetics, Medical Informatics and Biostatistics, Medical English and Medical Research Module for a total of 30 ECTS. The program also comprised a full-time 6-week research placement in a research laboratory. Since 2011, there were 7 editions of the JPEMS program in 4 different locations (Angers – 3 times, Nantes – 2 times, Szeged and Amsterdam) with a total of 189 participating students.

The semesters were focused on pre-clinical teaching, centered on biological sciences and research issues, with the defense of an IMRAD-structured research report. The full accreditation of credits and exams was carried out by the university consortium. The students emphasized the most important positive points of this program, such as linguistic aspect (significant improvement of their English), scientific aspect (direct contact with research), and social aspect (contact with students from other countries).

Conclusion: Despite the difficulties, JPEMS program is a real success, proving that it is possible to create successful international joint programs for medical education on undergraduate level, enabling talented students to benefit linguistically, culturally and educationally from the experience of pursuing academic studies in another country.

4M4 (1935)
Explaining the causes of differential attainment for International Medical Graduates in selection tests and licensing exams

Authors

Fiona Patterson, Work Psychology Group, Derby, UK
Paul Tiffin, York University, York, UK
Safiatu Lopes, Cambridge Assessment, Cambridge, UK
Lara Zibarras, City University London, London, UK

Presenter: Fiona Patterson, Work Psychology Group, Derby, UK

Background: Differential performance at postgraduate exams between home medical graduates and those who qualified outside their country of practise is well recognised. This difference is especially marked in the practical component of the UK Membership of the Royal College of General Practitioners (MRCGP) exam. The potential causes of such disparities are not well understood.

Method: Data were available for 1874 international medical graduates who applied for UK GP speciality training 2008-2012. The primary outcome was performance at the Clinical Skills Assessment (CSA) OSCE component of the MRCGP. The main predictors were performance on the Situational Judgment Test (SJT) and the Clinical Problem Solving Test (CPST- a test of applied clinical knowledge), used in the selection for GP training. Data relating to the demographic characteristics and English language fluency were also available. To understand better the relationship between the predictors, the selection measures, and the outcome, a series of univariable and multivariable models were developed and tested, concluding with a structural equation model to explore causality.

Result: The CSA rating was more strongly predicted by SJT scores (standardised beta 0.26) than by performance on the CPST (standardised beta 0.17). There was a relationship between English language fluency and CSA score that was mainly mediated via SJT performance.

Conclusion: These findings demonstrate that performance on an SJT predicts performance at a high fidelity clinical simulation OSCE in international medical graduates. Whilst the constructs tested by SJTs are likely to vary across settings, culturally appropriate knowledge of

interpersonal competence is likely to be evaluated. Improving the confidence of doctors in this area through targeted educational interventions, rather than focussing on increased clinical knowledge, is likely to be more effective at reducing disparities observed in postgraduate exam performance. Thus there are important implications for the design of speciality selection and licensing assessments globally.

Take-home message: Educational interventions to support international medical graduates in passing licensing OSCEs should focus on improving knowledge of interpersonal competence as measured in SJTs.

4M5 (360)
Sharing stories about medical and health professional education in difficult circumstances: Conceptualising issues, strategies and solutions

Authors
Michelle McLean, Bond University, Gold Coast, Australia
Judy McKimm, Swansea University, Wales, UK
Trevor Gibbs, AMEE, UK
Ewa Pawlowicz, Medical University of Lodz, Poland

Presenter: Michelle McLean, Bond University, Gold Coast, Australia

Background: Medical and health professions students and educators and patients live and work in an increasingly complex and ever-changing volatile world that is all too often fraught with suffering due to conflict, disease, poverty and environmental disasters. These 'difficult circumstances' are challenging in health professional education and health care.

Method: Through various collaborative AMEE activities (e.g. conferences, surveys, MedEdPublish themed issue) over two years, health care educators and students from around the world have shared their 'difficult circumstances' and offered strategies and solutions. We have developed a conceptual model involving individuals, 'culture' and organisations and systems to frame discussions about how we, as a community of health professionals and educators, can share wisdom, experiences and resources to assist colleagues struggling to deliver education and health care.

Results: Leadership and management emerged as a central issue is dealing with many 'difficult circumstances'. Difficult circumstances ranged from natural disasters, war, low resource settings, funding models, role conflict and stress and burnout.

Discussion: Delivering quality health professions education and health care involves an intersection between people, systems, organisations and culture. Thoughtful leadership and collaboration are critical for mitigating and addressing a range of challenges. Contemporary health professions' education leadership needs to be inclusive, mindful, compassionate and caring; echoing and role-modelling how we expect our students to be with patients and colleagues. This means being willing to confront unacceptable behaviours and speak out and challenge authority when needed. It also requires awareness and understanding of the complex systems in which health care education is provided.

Conclusion: Addressing the current and future 'difficult circumstances' requires contemporary health professions education leadership to be inclusive, mindful, compassionate and caring, role-modelling how we expect students to treat patients and their colleagues.

4M6 (1952)
Difference in Communication styles of Western Teachers and Nepalese Learners in an Intercultural Faculty Development Program for Mountain Rescuers in Nepal

Authors
Monika Brodmann Maeder, Institute of Mountain Emergency Medicine, EURAC Research, Bolzano, Italy and Department of Emergency Medicine, Inselspital, Bern, Switzerland
Raphael Saghir, University of Bern, Switzerland
Matiram Pun, Institute of Mountain Emergency Medicine, EURAC research, Bolzano, Italy
Agnieszka Elzbieta Stawinoga, Management and Committees, EURAC research, Bolzano, Italy
Hermann Brugger, Institute of Mountain Emergency Medicine, EURAC research, Bolzano, Italy
Aristomenis K Exadaktylos, Department of Emergency Medicine, Inselspital, Bern, Switzerland

Presenter: Monika Brodmann Maeder, Institute of Mountain Emergency Medicine, EURAC Research, Bolzano, Italy and Department of Emergency Medicine, Inselspital, Bern, Switzerland

Background: Introduction: Educators have become aware of the challenges during teaching-learning activities in different cultures. Until now, publications have concentrated either on intercultural competence of healthcare professionals when caring for patients with different cultural background, or on students being confronted with a different host culture. We conducted a research on intercultural competence of Western Instructors (WI) and Nepalese Instructor Candidates (NIC) during a pilot instructor course for future instructors in mountain rescue in Nepal.

Method: Data collection was based on self-assessments of intercultural competence of NIC and WI, using the "Assessing Intercultural Competencies" (Feil) questionnaire. Additionally, we performed semi-structured interviews with randomly selected NIC.

Results: In a conflict situation in their own culture, half of WI prefer exchanges that are dispassionate and another half of them want reveal people's true feelings and emotions. All [17/18, 1 missing] the NIC declared to reveal people´s true feelings and emotions. (Exact Sig. =0.006, z-test0.05). The semi-structured interviews with three Nepalese rescuers and three Nepalese physicians highlighted the importance of language, time and dedication of teachers. NIC described that the WI did not have enough time to get to know the host culture. Prior exposure with the host culture clearly was an advantage for WI.

Conclusions: We found significant differences in communication styles between NIC and WI: NIC establish relationship before talking about business, and in conflict situations, they prefer not to speak openly so as not to offend anyone. WI are much more direct. Such differences

are relevant for intercultural medical education. Unless addressed, they can heavily disturb teaching and learning. Giving feedback in such a situation can be difficult or even harmful. Faculty members should be prepared before going abroad. Organizers of trainings in foreign cultures must raise awareness for these issues. Content of the training should include knowledge about the host culture, language and communication skills, and attitudes like empathy or respect.

Students' approaches to learning clinical reasoning: Evidence as a threshold skill

Authors
Ralph Pinnock, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand
Madelyne Jouart, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand
Julie Timmermans, Higher Education Development Centre, University of Otago, Dunedin, New Zealand
Megan Anakin, Medical Education Unit, Dunedin School of Medicine, University of Otago, Dunedin, New Zealand

Presenter: Ralph Pinnock, Dunedin School of Medicine, Dunedin, New Zealand

Background: Threshold concepts and skills are new and previously inaccessible ways of thinking about and performing in a discipline. They represent transformed ways of thinking and doing without which learners cannot progress. Clinical reasoning may be a threshold skill. It requires learning a combination of concepts and skills. As yet, threshold skills have not been studied in medical education. Our aim was to establish whether clinical reasoning exhibited features of a threshold skill.
Method: Twenty-four final-year medical students were interviewed with a five-question protocol about how they were learning clinical reasoning. Focus groups were used to collect further data. Students' responses were analyzed thematically then compared with the features of threshold skills.
Results: Students' descriptions of learning clinical reasoning exhibited the features of threshold skills: clinical reasoning was transformative, troublesome, and required prolonged practice. Also present, but less pronounced, were its irreversible and integrative features.
Discussion: Viewing clinical reasoning as a threshold skill is a novel interpretation of its nature and has implications for learning and teaching. Clinical reasoning should be learned intentionally and taught explicitly. With increased awareness of clinical reasoning as a threshold skill, students can advocate for further learning opportunities to solve problems in clinical settings. Teachers can help students to understand that clinical reasoning may be difficult to learn and will require time and repeated practice to develop.
Conclusion: Our study of students' learning of clinical reasoning reveals that it can be interpreted as a threshold skill. It is transformative, troublesome, integrative, irreversible, and requires prolonged practice. In this light, medical educators may be motivated to revise their approaches to teaching clinical reasoning.

4N2 (1010)
The effects of reflection on clinical problems on medical students' engagement in a learning activity and learning outcomes

Authors
Ligia Ribeiro, UNIFENAS, Belo Horizonte, Brazil
Silvia Mamede, iMERR, Rotterdam, Netherlands
Eliza de Brito, UNIFENAS, Belo Horizonte, Brazil
Alexandre Moura, UNIFENAS, Belo Horizonte, Brazil
Rosa de Faria, UNIFENAS, Belo Horizonte, Brazil
Henk Schmidt, iMERR, Rotterdam, Netherlands

Presenter: Ligia Ribeiro, UNIFENAS, Belo Horizonte, Brazil

Background: Reflection on practice is believed to foster learning by enhancing interest in knowing more about a topic, which would increase engagement in learning and learning outcomes. However, despite theoretically sound1,2, this claim is not supported by empirical evidence in medical education.
Method: This three-phase experiment investigated whether structured reflection while practicing with clinical cases influences medical students' engagement in learning tasks and learning outcomes. Seventy-two 4th-year students from UNIFENAS-BH Medical School, Brazil, participated in the study. Initially, the participants, randomly assigned to either experimental or control group, diagnosed 2 clinical cases with jaundice as the chief complaint, either by following a structured-reflection procedure that requires matching the patient's findings to alternative diagnoses3 (experimental group) or by providing a differential diagnosis (control group). Subsequently, all participants received the same study-material about the differential diagnosis of jaundice. Finally, they performed a cued-recall task about the study-material.
Results: There was a significant main effect of experimental condition on participants' engagement in the learning activity, measured as study-time, with students who reflected upon the cases engaging longer than those who made a differential diagnosis ($p = .028$, d=.53). There was also a significant main effect of experimental condition on learning outcomes, measured as the frequency of recalled idea units. Students who reflected upon the cases obtained higher scores than those who made a differential diagnosis ($p = .034$, d=.51). Effect sizes (Cohen's d) were medium for both outcomes.
Conclusion: Relative to making differential diagnosis, structured reflection while diagnosing cases fostered medical students' engagement in learning and learning outcomes. Teachers can, therefore, employ this relatively simple process, possibly both in simulated and real scenarios, to help their students expand their knowledge, an important requirement in their professional development.
Take-home messages: Encourage structured reflection on to-be-solved clinical problems to enhance students' engagement in learning and learning outcomes.

Clinical reasoning in physiotherapy and critical decision method

Authors
Etienne Dayer, HEdS HES-SO Valais & Université de Genève, Sion, Switzerland

Presenter: Etienne Dayer, HEdS HES-SO Valais & Université de Genève, Sion, Switzerland

Background: Clinical reasoning is an essential skill for physiotherapists (Edwards et al., 2004). Unfortunately, this important skill is difficult to teach and learn because it's non-visible, complex and situation specific. Clinical reasoning is also influenced by several contexts as the professional practice context (Ajjawi, 2009). Clinical reasoning involves to gather and to analyse information in order to make the best therapeutic decision specific to the context and patient's wishes (Delany & Golding, 2014). One method to make visible the invisible reasoning in naturalistic context as the practice context is the critical decision method linked to the recognition-primed model (Klein, 1998b, 2008 ; Klein et al., 1989). With this approach we try to better understand the clinical reasoning and the physiotherapists' decision process.
Method: Several physiotherapists, from different levels of expertise and practicing in different contexts, were interviewed according to Pierre Vermersch's methodology of explanation (Vermersch, 1994). The purpose of each interview was to explain a therapeutic session with a patient; this session took place in the days preceding the interview.
The interviews were transcribed and analysed using the critical decision method in order to bring out the stages of physiotherapists' clinical reasoning and the characteristics of this process.
Results/Discussion: The recognition-primed model and the critical decision method are appropriate to analyse the clinical reasoning of physiotherapists in naturalistic context. In the case that will be presented the context of practice and the experience are the two major influencers of the clinical reasoning process. The physiotherapist looks for a lot of different cues to make a therapeutic decision. These cues are mostly linked previous experiences. The contexts of practice (as the therapy schedule) influence the decision-making process.
Conclusion: The analysis of clinical reasoning is a major challenge. Indeed, better understanding the clinical reasoning of physiotherapists in naturalistic context would make it possible to adapt the training and the education.
Take-home message: To understand and analyse the clinical reasoning complexity a method is needed and the critical decision method could be one of the most appropriate.

Instructional approaches for the development of clinical reasoning: the effects of modeled-reflection, cued-reflection and free-reflection on students' diagnostic performance

Authors
Taciana Figueiredo Soares, Federal University of Minas Gerais, MOV-FHEMIG, Belo Horizonte, Brazil
Silvana Elói Santos, Federal University of Minas Gerais, Belo Horizonte, Brazil
Rosa Malena Delbone de Faria, Federal University of Minas Gerais, Belo Horizonte, Brazil
Silvia Mamede, Institute of Medical Education Research Rotterdam, Erasmus Medical Center, Rotterdam, Netherlands

Presenter: Silvia Mamede, Institute of Medical Education Research Rotterdam, Erasmus Medical Center, Rotterdam, Netherlands

Background: Reflection upon to-be-diagnosed cases by comparing/contrasting alternative diagnoses develops students' diagnostic performance[1]. In a study with final-year students, providing additional guidance made reflection more effective: cued-reflection ("which-diagnoses-to-be-compared") and modeled-reflection (reflection worked-examples) were more beneficial than free-reflection[2]. Modeled-reflection, despite requiring less mental effort, was not more advantageous than cued-reflection. This experiment investigated whether this applies for intermediate students.
Method: Eighty 3rd-year medical students were randomly allocated, in the learning phase, to diagnose 9 clinical cases (6 criterion-cases; 3 fillers; counterbalanced) under one of 3 conditions: modeled-reflection, cued-reflection or free-reflection. In a two-week-later test, all students diagnosed 10 more difficult cases (4 of the diseases studied in the learning phase; 4 of related but not studied diseases; 2 fillers).
Results: Learning phase: Diagnostic accuracy differed significantly between conditions [range=0-1; (mean; standard deviation)], $F_{(2,77)}=7.9$, $p=.001$. Modeled-reflection [0.70(0.19)] and cued-reflection [0.66(0.18)] performed similarly, both significantly better than free-reflection [0.49(0.23)]. Mental effort showed a similar pattern: modeled-reflection and cued-reflection scored equally, both lower than free-reflection. Test phase: Diagnostic accuracy differed between conditions, $F_{(2,77)}=3.22$, $p=.04$, only on studied-diseases. Cued-reflection [0.60(0.23)] performed better than free-reflection[0.45(0.20)]; no difference emerged between cued-reflection and modeled-reflection[0.55(0.22)] nor between modeled-reflection and free-reflection. The groups' background characteristics were comparable, and post hoc analyses suggested that so was their initial performance: it was similar in the first cases solved in the learning phase ($p=.46$), with the accuracy of free-reflection decreasing only in late cases ($p<.001$). Mental effort increased as the learning phase progressed, particularly for free-reflection.
Discussion/Conclusions: d-reflection was so beneficial as modeled-reflection for students' performance for studied-

diseases. The mental effort associated with free-reflection apparently accumulated across the learning activity, reducing its effectiveness.

Take-home message: Providing additional guidance simply by cueing reflection is sufficient for increasing intermediate students' performance.

The Glasgow Clinical Review Form: An undergraduate clinical reasoning tool to foster skills in ongoing clinical assessment in the secondary care setting

Authors
Kevin Garrity
James Boyle
Elizabeth Cosgrove
Eilidh MacDonald

Presenter: Kevin Garrity, University of Glasgow, UK

Background: Clinical reasoning skills are fundamental to medical practice and are often thought of through the lens of diagnostic thinking. However, just as important as diagnostics is engagement in ongoing clinical assessment. Through ongoing assessment, clinicians undertake essential tasks including assessing patient response to treatment, detecting patient deterioration or even reviewing and revising other clinicians' diagnoses. Thus, it is important to consider how we might teach these skills to undergraduates in addition to diagnostic reasoning.

Method: Using the existing literature, we sought to explore how we might develop a tool to foster skills in ongoing clinical assessment. A proforma was developed to enable students to gather clinical data and review patient progress. Students were then encouraged to generate a clearly framed 'problem list' based on gathered information. Finally, we used hypothetico-deductive models of reasoning to help students frame a management plan based on their problem list before recording it on simulated medical documentation and prescription charts.

Results: We developed a tool that allowed students to begin assessing the clinical progress of patients they encountered during clinical attachments. Students could view patient encounters through the lens of ongoing clinical review, rather than focusing solely on the initial diagnosis. Students were able to develop skills in 'problem representation', enabling them to assess patient progress and formulate focused management plans to help refine diagnosis or treatments.

Discussion: This study offers an approach to teaching skills in ongoing clinical assessment to undergraduates The proforma proved a useful tool for fostering hypothetico-deductive reasoning, allowing students to focus on not just singular diagnoses, but identify and address multiple ongoing and sometimes separate clinical problems. Problem representation in this fashion is in-keeping with

current models of clinical reasoning. Furthermore, the tool highlighted students' deficiencies in the clinical reasoning process and thus aids in remediation of clinical reasoning difficulty.

Conclusion: Encouraging students to focus on ongoing patient review helped foster skills in clinical assessment and the ability to formulate focused management plans. It also aided as a tool for identification and remediation of difficulties in clinical reasoning.

Using knowledge translation to facilitate the implementation of a novel teaching activity for clinical reasoning

Authors
Martine Chamberland, Université de Sherbrooke, Canada
Jean Setrakian, Université de Sherbrooke, Canada
Christina St-Onge, Université de Sherbrooke, Canada
Lara Varpio, Uniformed Services University of the Health Sciences, Bethesda, USA
Martin Plaisance, Université de Sherbrooke, Canada
Aliki Thomas, McGill University, Montréal, Canada

Presenter: Martine Chamberland, Université de Sherbrooke, Canada

Background: To teach clinical reasoning to medical students in a renewed undergraduate curriculum, we implemented a learning activity combining self-explanation (SE) and structured reflection (SR). Using a knowledge translation (KT) framework, we studied the facilitators and barriers to the implementation from the perspective of students, case developers, curriculum coordinators and instructional designers. This study examines how KT may support the large-scale implementation and uptake of educational interventions (i.e., SE and SR).

Method: The SE-SR activity consists of 10 learning sessions completed individually by students, on a web-based platform over the first two years of the undergraduate curriculum. Students complete the SE-SR web activities at their convenience within a three-day period on three clinical cases. Learners solve each case using SE by verbalisation that is audio-recorded, and then using SR by completing a grid that compares and contrasts alternative diagnoses. Uptake by students is monitored through platform data and surveys. Facilitators and barriers are explored through focus groups.

Results: The SE-SR was implemented for the 205 first-year students. During the first session, 72.3% of students completed all cases. Fifty-five percent of students responded to the survey. Ninety-two percent found SE helped deepen understanding of clinical topics and 96% reported that SE helped identify gaps in their knowledge. Thematic analysis of focus group discussions identified two key facilitators: alignment of the SE-SR with the previous block work, and the practical aspects of the activity. Besides minor technical problems reported, the major challenge was the fact that this innovation constitutes only one piece of a whole curriculum renewal requiring students to adapt to a variety of teaching methods simultaneously. In keeping with KT, revisions to

the activity are being implemented based on these findings.

Conclusion: Findings suggest that SE and SR, implemented via web-based platform, supports knowledge building relevant to clinical reasoning. The KT approach informs ongoing adjustments to optimize the activity as well as its implementation.

Take-home messages: KT is supporting the large-scale implementation of novel SE and SR learning activities. KT frameworks support both adoption of, and subsequent refinements to, curriculum innovations.

Are we missing something? What are medical students missing out on, and why, when they are excluded from doctor patient encounters in general practice?

Authors
Natasha Yates
Jane Smith
Reza Ajam
Holly-Jayne Mellersh-Etherton

Presenter: Jane Smith, Bond University, Gold Coast, Australia

Background: Medical training uses the apprentice model, but medical students are excluded from doctor patient encounters during placements so miss out on learning opportunities. There is little understanding of why patients do not want medical students present. Consent from patients is essential prior to encounter, but where consent is asked, and by whom varies, and may be repeated, or anticipated on the patient's behalf. Research in Australia found that 70 -90% of patients said they would "never refuse" to have a student in the room. But this is not what our students are telling us occurs during their placements.
Method: We are collecting data from medical students during their GP placements to explore why they are not being allowed into consultations. Each participant is asked to complete a short survey each time they are excluded from an encounter during their GP placements. Quantitative information is collected about the demographics of the student, GP, practice, and patient; also who asked for consent, and when; plus the frequency of exclusions. Qualitative data is provided by free text answers about the reasons for exclusion, the nature of the consultation, any cultural issues, and the students feelings regarding exclusion.
Results: Male students are more likely to be excluded by male GPs seeing female patients, however male students with female GPs were excluded more frequently.
The age range of excluded patients was 20 to 50 years
Most students were present when consent was asked, this was mostly asked by the doctor, in the waiting or consulting room, but many were not. It was more likely for the doctor to ask the student to leave than the patient.
Mental and sexual health were commonly quoted reasons for exclusion.
Conclusion: It is important to better understand student exclusions from patient encounters to address the gaps in clinical experience. It may be possible to stop some of the exclusions, for example if the patient's decision is anticipated incorrectly.
Take-home message: Improved insight about the issues causing student exclusions, will improve our ability to either prevent this happening, or compensate the lost learning.

4O2 (2974)
The Clinical Skills Passport (CSP): An innovative approach for the assessment of clinical skills competence

Authors
Laura Smith, University of Leeds, Leeds, UK
Nancy Davies, University of Leeds, Leeds, UK
Jennifer Hallam, University of Leeds, Leeds, UK

Presenter: Laura Smith, University of Leeds, UK

Background: The University of Leeds is recognised for its successful and innovative mobile learning programme where students are able to capture assessment and feedback wherever they are. Medical undergraduates spend 75% of their time off campus in clinical placement, it is therefore imperative that we are able to record when and how students acquire the necessary clinical skills in order to be deemed as clinically competent.
Method: Placement learning is self-directed with students negotiating assessment opportunities with clinical supervisors. The CSP app supports the students by automatically mapping their skills assessments against the MBChB skills framework. Students are then able to action plan based on the feedback they receive. Importantly, the app maps across all years of the programme providing students with a longitudinal view of their development, which also allows staff to remotely monitor student engagement.
Results: The real time data has provided a rich source of information relating to the frequency of supervised practice & workplace teaching. The assessment includes assessor details, location and placement type showing the distribution of teaching opportunities and variety of assessors, particularly by profession. The data also creates a clear audit trail on skill acquisition for governing bodies such as the GMC. By monitoring placements to identify the quality of teaching and areas of poor engagement we have been able to intervene and remediate.
Discussion: A frustration for all healthcare programmes is that placement environments are out of the control of the school and yet we must ensure that our students receive quality teaching and evidence that our students are competent professionals. Mobile assessment provides an ideal view of placements enabling us to address learning and teaching provision in an evidenced way.
Conclusion: Mobile technology is providing a valuable platform to monitor and support student learning and quality of placement provision ensuring safe and effective practitioners. The ability to track clinical skills acquisition longitudinally has multiple benefits for student education, teaching quality and workplace learning.

The Medical Exhibition Seminar: Implementation and evaluation of a new teaching method for clinical reasoning and consultation

Authors

Henk Schreuder, University Medical Center Utrecht, Department of Obstetrics & Gynecology, Utrecht, Netherlands
Myrthe Slijkhuis, University Medical Center Utrecht, Netherlands
Olle ten Cate, University Medical Center Utrecht, Center for Research and Development of Education, Utrecht, Netherlands
Marjo Wijnen-Meijer, University Medical Center Utrecht, Center for Research and Development of Education, Utrecht, Netherlands

Presenter: Henk Schreuder, University Medical Center Utrecht, Netherlands

Background: Clinical reasoning and consultation are important competencies for doctors, but not easy to teach during medical school.
We implemented a new teaching method, 'The Medical Exhibition Seminar'. In a 90-minute seminar for 18-36 students, pictures of 25 gynaecological diagnoses are discussed interactively.
Method: One week before the seminar, learning objectives and a list of 25 diagnoses are published online. Twenty-five posters of gynaecological diagnoses are placed on the wall of the classroom, showing pictures of symptoms, diagnostics or therapies of each of the diagnoses. An answering sheet, containing statements with clinical vignettes chosen to be central for the diagnoses of the pictures is provided. The students form small groups of 2-3 and walk alongside the numbered pictures. They must describe and discuss each picture and correlate the statements with the actual diagnosis in the pictures. Interaction with peers and a consultant-teacher is encouraged. After one hour the pictures and correlating statements are discussed in the full group.
An evaluation questionnaire provided directly after the seminar included ten 5-point Likert-scale (1=totally disagree to 5=totally agree) questions.
All students (N=146) in 7 groups responded.
Results: Setup and content of the seminar were well appreciated (mean 4.60±0.5 SD and 4.44±0.58). The seminar supported clinical reasoning and consultation skills (4.61±45 and 4.23±0.66). Highest appreciation was for joyfulness to do it (4.77±0.55). The workshop was rated better than lectures (according to 64%), interactive classroom (69%), small group (62%), clinical reasoning lecture (62%) and e-module (52%). Narrative comments included compliments ("fun to do, interactive, stimulating, challenging, lets you think and better remember through active participation") and tips ("some pictures difficult/far-fetched").
The active participation this seminar requires may lead to good retentions of information, but this effect needs to be studied.
Conclusion: The Medical Exhibition Seminar appears to be a good addition to conventional methods, is easy to implement and is highly appreciated. The teaching method seems suitable for the competencies of clinical reasoning and consultation.
Take-home message: The Medical Exhibition Seminar is a well appreciated new teaching method for clinical reasoning and can successfully be implemented for various specialties.

Second Year Medical Student Emergency Medicine Rotation: "It's Not Like on TV"

Authors

Colleen Bush, Michigan State University College of Human Medicine, Grand Rapids, MI, USA
JM Monica van de Ridder, Michigan State University College of Human Medicine, Grand Rapids, MI, USA
Jennifer McCarthy, Michigan State University College of Human Medicine, Grand Rapids, MI, USA

Presenter: Colleen Bush, Michigan State University College of Human Medicine, Grand Rapids, USA

Background: Exposure to Emergency Medicine (EM) is a crucial aspect of medical student education yet has historically been absent from training until 3rd or 4th year required or elective rotations. Although there has been an effort among US medical schools to increase early clinical encounters, research has been scant to determine when students should be exposed to the "undifferentiated patient" presenting to the Emergency Department (ED). During our inaugural second year EM curriculum, we conducted a qualitative analysis to explore the following question: What are the potential benefits of this early ED exposure from the student perspective?
Method: We asked students to write two short reflective essays, approximately 150 words, about one point they learned during their rotation. We asked 180 students to respond and received a total of 216 essays during the first 22 of 30 weeks. The reflective essays were phenomenographically analyzed for themes of personal learning. The three authors independently coded 21 essays and developed an initial coding scheme. This was refined by all authors during the coding of the remainder of the essays.
Results: Thirteen themes were identified. The 6 most frequently mentioned themes were differential diagnosis, focused history and physical, oral case presentations, psychomotor skills, teamwork and specific learning experiences (e.g. dealing with death, cyanide poisoning, connecting quickly with patients). Three less frequently mentioned, but interesting themes included transitions of care, taking time to expand knowledge and the reality of the ED (i.e., fast paced, limited workup, insurance restrictions, "not like on TV").
Discussion: The established themes correlated with 9 out of the 13 Association of American Medical College's Core Entrustable Professional Activities. Students learned more about the basic skills of patient care than specific medical details. Future research could explore if this ED experience improves understanding of patient care and safety in any particular clinical scenario, and if it promotes student confidence moving forward.

Conclusion: Students indicated learning a multitude of skills, concepts and refinement of their patient approach during EM shifts.

Mastering or Inventing? The Impact of Instructional Design on Preparation for Future Learning of a Procedural Skill

Authors
Andrea Fiume, McMaster University, Hamilton, Canada
Ryan Brydges, University of Toronto, Toronto, Canada
Andrea Hunter, McMaster University, Hamilton, Canada
Lawrence Grierson, McMaster University, Hamilton, Canada

Presenter: Ryan Brydges, University of Toronto, Canada

Background: Competence in clinical practice involves effective use of previously-acquired knowledge, and the ability to apply knowledge adaptively to innovate across diverse clinical contexts. For trainees, this adaptability has been called Preparation for Future Learning (PFL), the capacity to use resources and strategies to learn about and solve new problems. Various instructional designs that might improve trainees' PFL abilities have been studied, but these have not been compared. We compared how three instructional designs impacted procedural skill acquisition, and transfer to learning a novel procedure.
Method: We randomized 60 medical students to practice simulated infant lumbar puncture (ILP) according to a Simulation based Discovery Learning "Do-then-See" sequence (i.e. self-regulated, hands-on learning before expert instruction), a Simulation based Mastery Learning sequence (i.e., a stringent form of competency-based education), or a control "See-then-Do" sequence. In a second session, we assessed how well learners transferred strategies developed in the first session to learn a novel task – knee arthrocentesis. We compared trainees' post-test ILP performance and their PFL ability via a knee arthrocentesis transfer test.
Results: Data collection is ongoing, however, preliminary data align with our expectations of no significant group differences on ILP post-test, and of more post-test performance variance displayed by the Do-then-See group versus the Mastery group. We expect this pattern of performance will reverse on the transfer test. Differential approaches to training may have differential impact on how learners acquire a target task and, potentially, on how they are prepared to learn new tasks. We will discuss relationships between practice variability, discovery models, and preparation for future learning.
Conclusion: This study contributes to the literature on how instructional design involving discovery and expert instruction might impact procedural skill acquisition and transfer to new learning problems. This is important given the expectation for trainees to problem solve and innovate across varied learning scenarios and diverse clinical contexts.

4O6 (1098)
More than another pair of hands? The impact of medical student placements on the healthcare service

Authors
Elizabeth Molloy, University of Melbourne, Melbourne, Australia
Robyn Woodward-Kron, University of Melbourne, Melbourne, Australia
Stephen Lew, University of Melbourne, Melbourne, Australia
Clare Delany, University of Melbourne, Melbourne, Australia
Mark Lavercombe, University of Melbourne, Melbourne, Australia
Agnes Dodds, University of Melbourne, Melbourne, Australia

Presenter: Elizabeth Molloy, University of Melbourne, Australia

Background: Clinical placements are key to developing work-ready graduates. To date, the literature on workplace learning has focussed on learner-as-consumer, rather than learner-as-contributor. This study aimed to identify the impact of medical student clinical placements for multiple stakeholders in healthcare services.
Method: This study was conducted at a large outer metropolitan healthcare service. Qualitative data collection included: observation of students on placement; activity profiling of supervisors and students; student and supervisor focus groups; and interviews with clinicians, academic and hospital leaders, and patient advocates. The data were analysed using Braun and Clarke's (2006) thematic analysis.
Results: The effects of medical students on the healthcare service were categorised into two higher order themes: 'impact on workflow'; and 'student presence amplifying quality of care'. In terms of affecting workflow, students in their earlier years reportedly absorbed clinicians' time on account of direct teaching, task selection, and supervision of activities. As they approached graduation, students began to take on tasks independently (e.g. history taking, data entry, and coordinating patient discharge). Amplifying quality of care was observed through students' prompting clinicians to reflect on their own practice. Students attended to different aspects of care, often responding to patient or family questions in the specialist's absence. As one supervisor reported, "students often form an important, informed, but lay, connection between the patient and the medical staff so they can identify a mismatch of expectations."
Discussion: The results suggest that although students require an upfront investment of supervisor energy on clinical placement, they add value along a number of dimensions, particularly in the final year of their program. These contributions are beyond being "another set of hands". The presence of students encouraged clinicians to reflect on their practice.
Conclusion: The presence of students prompted clinicians to adopt a more critical gaze on their own work, and students focussed on humanistic elements of care – elements that can be missed or deprioritised when there is an attending expert only. The role of students as a bridge between patients and experienced staff, and how this can be optimised, warrants further exploration.

EPAs-based e-Portfolio facilitated the application of Entrusted Professional Activities (EPAs) among emergency medicine residency training in a regional hospital in Taiwan

Authors

Chen-Wei, Lee, Dalin Tzu Chi hospital Buddhist Tzu Chi Medical Foundation, Chiayi, Taiwan
Yi-Kung, Lee, Dalin Tzu Chi hospital Buddhist Tzu Chi Medical Foundation, Chiayi, Taiwan
Po-Liang, Cheng, Dalin Tzu Chi hospital Buddhist Tzu Chi Medical Foundation, Chiayi, Taiwan
Chun-Ting, Chen, Dalin Tzu Chi hospital Buddhist Tzu Chi Medical Foundation, Chiayi, Taiwan

Presenter: Chen-Wei Lee, Dalin Tzu Chi Hospital Buddhist Tzu Chi Medical Foundation, ChiaYi, Taiwan

Background: EPAs is by far the most integrated and holistic assessment method to evaluate trainees in medical setting. The trainee's earn trustworthiness by direct observation from their supervisor in workplace. Trainees have to meet the provision level of experience, knowledge, skills, attitudes, and constantly being trusted during ad-hoc observation prior entering the clinical competency committee for summative entrustment decision. Meanwhile, gathering and sorting these mass information might create a significant burdens for the user. Thus, EPAs-based e-Portfolio could be a convenience tools for the trainee and the supervisor to catch up all information at a glance.
Method: We have formulated eight EPAs for emergency resident training program in our hospital. Various observable practice activities (OPAs) for ad-hoc entrustment decision were created based on the scope of each EPA's definition. Besides, the provision level of clinical experience, knowledge and skills prior the summative entrustment decision were also clearly defined. These data were recorded in trainee electronic portfolio. We convert these mass information into infographics dashboard for user of different level. The trainees can clarify their ability insufficiency and enhanced self-directed learning. The CCC can obtain the whole picture of the trainee's clinical performance.
Results: The EPAs-based e-Portfolio provide three information level and blogs function for self-reflection to the user. The first level was the completeness of each EPAs. Expansion the EPAs display the archived level of knowledge, skills, attitude and experience in a systemic and concise manner. The third level display the more detail information of knowledge, skills, attitude, experience and OPAs, including the quality, quantity and supervisor's feedback.
Conclusion: EPAs-based e-Portfolio aim to provide a user friendly interface to facilitate the implementation of EPAs.

It save valuable time for the trainee's to figure out their weakness, meanwhile inspire their motivation of self-directed learning. The clinical competency committee could assess the whole picture of trainee performance for summative entrustment decision.
Only important information should be display on the EPAs-based e-Portfolio in order to minimize cognitive load. Besides, using graphical representation and emphasis on readability and follow gestalt laws were both important elements.

Concepts and expectations of Taiwanese first-year post-graduates' feedback in e-portfolio: A realist evaluation

Authors

Ren-Huei Fu, Chang Gung Medical Education Research Centre (CGMERC), Taoyuan, Taiwan
Mojca Babovič, Chang Gung Medical Education Research Centre (CGMERC), Taoyuan, Taiwan
Lynn Monrouxe, Chang Gung Medical Education Research Centre (CGMERC), Taiyuan, Taiwan

Presenter: Ren-Huei Fu, Chang Gung Medical Education Research Centre (CGMERC), Chang Gung Memorial Hospital, Taoyuan City, Taiwan

Background: E-portfolios with clinical teachers' feedbacks are an established part of the Post-Graduate Year 1 (PGY1) training record, but what of the processes of trainees' feedback-seeking behaviors for e-portfolios? Our previous research identified context-mechanism-outcome (C-M-O) models of feedback via e-portfolio using a realist review methodology. The review considered published research within primarily western settings. The question remains, however, to what extent is this applicable in a Taiwanese setting. A realist evaluation study was undertaken using qualitative methods.
Method: A realist evaluation study using qualitative interviews was employed. The context is a teaching hospital in northern Taiwan. Focus group interviews with 25 PGY1 trainees and 14 clinical teachers were conducted May-July, 2017. Each interview comprised 4-5 participants and lasted around 1 hour. Interviews were audio-recorded, transcribed verbatim, and anonymized. Data were analyzed using realist evaluation method.
We identified a number of Contexts (Cs), Mechanisms (Ms), and Outcomes (Os) as follows: synchronous interaction, understanding the purposes of e-portfolio, usage training, format flexibility (Cs); doubt/trust, connection/disconnection, engagement, responsibility, personality, social discomfort, expectation, external motivation (Ms); obligation, effects, guidance, advantages (Os). For example, not understanding the purpose of e-portfolio (C) makes trainee doubt the authenticity of feedback in e-portfolio (M), which leads to poor educational effect (O).
Results: Comparing these C-M-O models, there are differences between our results and realist review. For example, responsibility, and social discomfort (mechanisms) and obligation (outcome) were observed in the qualitative interviews, but not in the realist review. More detail about our preliminary configurations and

comparison with the programme theory developed from literature review will be discussed in the conference. Differences in contexts and mechanisms, such as the understanding of the purposes of e-portfolio, personality of user, and social discomfort, may contribute to the differences in outcomes, and require further analysis.

Conclusion: Our research established the C-M-O model of Taiwanese PGYs' feedback via e-portfolio. There are similarities and differences comparing with C-M-O configuration developed from Western research. Factors contribute to the results, such as personal perspective or cultural influence, require further evaluation.

4P3 (190)
Perceived Needs and Challenges with electronic portfolio implementation in the discipline of Anesthesiology

Authors
Christina Tremblay
Rachel Ellaway
Christina van Barneveld
Rob Anderson

Presenter: Christina Tremblay, Northern Ontario School of Medicine, Sudbury, Canada

Background: In Canada, the Royal College of Physicians and Surgeons of Canada (RCPSC) has created an adapted model of CBME called Competence by Design (CBD). This move has required a large increase in the number of clinical observations of resident performance as well as the introduction of competence committees that review the data from these observations to make decisions on resident progress. Given the volume and complexity of data generated and the need for sophisticated reporting mechanisms, electronic portfolios are an important enabler in moving to CBD. The aim of this study was to assess the perceived data needs and challenges of implementing CBD, specifically as they relate to the use of an electronic portfolio system. Anesthesiology was used as the discipline to illustrate these perceived needs and challenges, as it is one of the larger RCPSC disciplines and is part of the first cohort to move into CBD.

Method: In the first stage of this study, stakeholders were interviewed regarding perceived needs and challenges in handling CBD assessment data. The findings from this stage were used to structure focus groups around different kinds of stakeholder needs and concerns. These include the identified risks associated with this change (resident focus group), daily scheduling conflicts with the increased granularity within CBD (faculty focus group), and clearly defined parameters for information access after residency training (CBD focus group).

Results: The results indicate that although contextual variables are important, there are many similarities nationally. Some of which include assessment tools and practices, information access and ownership, performance monitoring, and training. Additionally, addressing risks such as bias, reductionism, lack of time and space, and legal ramifications were highlighted as priority.

Conclusion: The perceived needs and challenges faced for CBD in Canada could be generalized to those faced at a national level. This study concludes that there are some

key questions that should be posed to all stakeholders when adopting an electronic portfolio for the purposes of CBME.

Take-home message: Applicability of research to your institution, and key questions to pose when adopting an electronic portfolio for CBME.

4P4 (1140)
Portfolio-based assessments: Does the portfolio reflect students' competence development?

Authors
Andrea Oudkerk Pool
D. (Debbie) C. Jaarsma
Erik W. Driessen
Marjan J. B. Govaerts

Presenter: Andrea Oudkerk Pool, Maastricht University, School of Health Professions Education, Maastricht, Netherlands

Background: The validity of portfolio as an assessment instrument for students' competence relies on the assumption that students' competence development is documented in a faithful manner. However, research findings question this assumption. This study aims to contribute to validation of portfolio-based assessment of competence, by exploring how students select and document performance data in their portfolio and how they perceive these data to be representative for their competence development.

Method: Students uploaded performance data in their portfolio on the basis of which their competence was assessed. During one clerkship, twelve students simultaneously recorded an audio diary in which they documented experiences that helped them build a self-image of their level of competence. Afterwards, students reflected on their audio diary and portfolio during a semi-structured interview. The interviews were analyzed using the principles of constructivist grounded theory.

Results: Overall, students considered their portfolio to be representative for their development. However, the portfolio provided more snapshots of the development instead of a coherent narrative. Moreover, several experiences important for student development were not covered in the portfolio. Students' beliefs about the goal of portfolio, what others need to know to be able to make an assessment and their feedback seeking behavior influenced which feedback and experiences were documented. Also, the workplace culture and portfolio structure did not always facilitate the documentation of valuable evidence.

Discussion: This study confirms the importance of taking students' perceptions into account when implementing a competency-based portfolio. Students should receive training on how to use workplace-based assessments and select meaningful performance data. Flexibility in portfolio structure and requirements is essential in ensuring optimal fit between students' experienced competence development and their portfolio content.

Conclusion: The study results have broadened our understanding of students' considerations when constructing their portfolio, which factors help and hinder,

and what portfolio elements are representative for their development. Teachers, assessors and educational developers can use these results to improve portfolio and workplace-based assessment.

Take-home message: Portfolios designed to assess students' competence can only be implemented in a successful manner if students' considerations when constructing their portfolio are taken into account.

Can Reflection be Taught?

Authors
Julia Humphreys, University of Manchester, Faculty of Biology, Medicine and Health, Manchester, UK
Isobel Braidman, University of Manchester, Faculty of Biology, Medicine and Health, Manchester, UK
Maria Regan, University of Manchester, Faculty of Biology, Medicine and Health, Manchester, UK

Presenter: Julia Humphreys, University of Manchester, Faculty of Biology, Medicine and Health, Manchester, UK

Background: Current principles within medical undergraduate assessment incorporate student reflection and learning. This corresponds to the UK General Medical Council's learning objective that students should 'continually and systematically reflect on practice and, whenever necessary, translate that reflection into action'. At the University of Manchester, Faculty of Biology, Medicine, and Health, this is a mandatory aspect of the student's professional development, as recorded in their electronic Portfolio for Personal and Professional Development (PPD Portfolio).

Method: Manchester Medical School has approximately 2,200 undergraduate students currently enrolled on its MBChB Medicine course, all of who complete an electronic PPD Portfolio throughout the course. One of the features of the PPD Portfolio requires students to upload written reflections, drawing on their clinical experiences in a variety of areas. They analyse their clinical learning points and formulate specific action plans, which are then revisited. Such analyses can be used to identify areas of strength, as well as issues that still require improvement. In Years 3-5, students are allocated an Academic Advisor who oversees their PPD Portfolio and completes formative and summative reviews. Successful completion of the portfolio is a mandatory requirement for progression between Years 4 and 5 and for graduation. This study examined the PPD Portfolios completed by a cohort of Year 4 students who graduated from the Manchester Medical School MBChB programme in 2016.

Results: Of the 437 student portfolio outcomes assessed, a total of 54 were 'unsatisfactory' at their formative Review 1, in Section 2 of the PPD Portfolio (Reflective Practice). The study recorded the reasons for students having gained an unsatisfactory outcome in this domain. The feedback and guidance provided by the student's Academic Advisor were explored via a thematic analysis. At summative Review 2, there were only 7 students assessed as 'unsatisfactory' in Section 2.

The study concludes with types of feedback and advice that enabled the students to make adequate

improvements towards a 'satisfactory' assessment of their reflective practice. The efficacy of such feedback will form our **take-home message** – which advice demonstrably improved student PPD Portfolio reflection and assessment outcomes.

4Q: Short Communications: Postgraduate: Junior Doctor as Teacher

Location: Lima, Ground Floor, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

4Q1 (2933)
A three-year longitudinal milestone-based "Residents as Teachers" Program: Experience from the first two years

Authors

Jen-Feng Liang, Taipei Veterans General Hospital, Taipei, Taiwan
Chen-Huan Chen, Taipei Veterans General Hospital, Taipei, Taiwan
Hao-Ming Cheng, Taipei Veterans General Hospital, Taipei, Taiwan
Chin-Chou Huang, Taipei Veterans General Hospital, Taipei, Taiwan
Ling-Yu Yang, Taipei Veterans General Hospital, Taipei, Taiwan
Hui-Chun Huang, Taipei Veterans General Hospital, Taipei, Taiwan

Presenter: Jen-Feng Liang, Taipei Veterans General Hospital, Taipei, Taiwan

Background: Competency-based medical education has yet to be applied to the faculty development activities. Most residents as teachers (RaT) programs are delivered over days or weeks without objective evaluation and long-term follow-up.
Method: We designed a longitudinal three-year, milestones-based RaT program and used a randomized control study design to investigate whether this novel program will produce a better outcome than the traditional short-term program for the first-year residents in Taipei Veterans General Hospital since Sep. 2016. The program were evaluated by the objective structured teaching exercise (OSTE), feedback from medical students, and evaluation for professional performance from program directors.
Results: This program includes three annually courses according to the pre-set teaching milestones for residents. By the end of January, 2018, 13 residents finished the first and second-year course of the milestones-based program and 11 finished the traditional short-term RaT course. 71% of the residents are from internal medicine field. The OSTE conducted 3 months after the courses revealed a higher, but not significant, average score in the longitudinal group. The satisfaction of the milestone-based program and self-evaluated learning results were good. The feedback from medical students revealed higher scores in both groups then residences without complete teaching training and the effect persisted for more than one year.
Conclusion: This innovative RaT program is characterized by 1) a longitudinal design; 2) teaching milestones; and 3) multiple outcome measurements. The main challenge of the randomized control study is the low participation rate, especially in certain specialties, which may be responsible for the insignificant OSTE and student feedback result. A longitudinal milestones-based RaT program has been implemented and is being assessed in an ongoing randomized control study. Preliminary results from the first 2 years showed positive effect.
Take-home messages: It's challenging to conduct a randomized control study on the busy young residents. Different models of faculty training such as web-based training should be designed for the demand of these trainee-teachers.

4Q2 (335)
EPA of residents-as-teachers

Authors

Tadayuki Hashimoto
Makoto Kikukawa
Otaki Junji
Junichi Taniguchi
Syunsuke Kosugi
Takashi Kanazawa

Presenter: Tadayuki Hashimoto, Hashimoto Municipal Hospital, Wakayama, Japan

Background: Residents have the pivotal role of clinical education. However, no teaching competency for residents existed.
Method: We developed and reported the teaching competencies for residents by Delphi approach in AMEE 2016. We plan to hold workshops following this result and developed the teaching entrustable professional activities (EPAs) for residents as a next step.
The first author arranged expert meetings including three medical educators, one specialist of instructional design and two attending doctors on service who have experiences as chief residents, five times to develop the teaching EPAs. The author conducted 90- to 120-minute online and offline meeting.
Firstly, two of the researchers made the initial list of the activities. Six experts discussed it and refined, deleted and added the activities. As a result, we selected ten activities as teaching EPAs for residents.
Discussion: EPAs is a new assessment tool of competency and is garnering attention. Evaluation of being a good teacher can be very challenging. Therefore, teaching EPAs for residents can be useful for the assessment of residents' teaching competency.
Conclusion: This is the first study to develop teaching EPAs for residents. EPAs were designed to link competencies to real practice and make them feasible. We plan to use and evaluate this EPAs for assessment of our future workshops.
Take-home message: EPAs is a new assessment tool. Not only clinical competency but also teaching competency can be assessed by it.

4Q3 (3522)
Making use of students' enthusiasm in technology to improve feedback to clinical teachers

Authors
Dilshani Hunukumbure, Imperial College London, UK
Viral Thakerar, Imperial College London, UK
Diluxshy Elangaratnam, Imperial College London, UK
Rohit Chitkara, Imperial College London, UK
Saroj Das, Imperial College London, UK

Presenter: Dilshani Hunukumbure, Imperial College London, UK

Background: Numerous hospitals across the UK have introduced a new role for doctors, Clinical Teaching Fellow (CTF). These doctors have an interest in medical education and wish to develop teaching skills. Feedback, in particular from students, is necessary to improve teaching competencies.
A survey amongst the CTFs teaching Imperial College students, demonstrated that they usually received little or no feedback. What was received was stated as 'non-specific' with 'contradicting [student] opinions'. Anecdotal evidence suggests that students are reluctant to engage with feedback as they perceive it will not be acted on and not benefit them.
Method: Our aim is to develop an innovative feedback tool to promote effective student feedback for teachers.
We implemented an online feedback tool whereby students can post and view all feedback received anonymously, they then can vote up or vote down each other's statements. At the end of the week CTFs can address the most voted statements with relevant actions. We used three perspectives to collect the data; objective analysis of students' comments from the feedback tool, exploration of student views using focus group and CTF perspectives using a questionnaire.
Results: Most of the feedback was specific and constructive. It allowed conversations to be generated anonymously. Majority of the students engaged with voting and this was found to be particularly useful when there was contradicting feedback. CTFs were able to prioritise actions according to popular votes.
Some students did not engage, stating they would only respond if they felt a strong need such as 'unsatisfactory teaching'.
Conclusion: This tool generated communication between CTF and student, giving them an unique insight into each other's comments and fostering collaborative working. It allows CTFs to timely tailor teaching and students to gain an understanding of the feedback process. Initial engagement with the tool remains a challenge and we have highlighted some of the strategies below.
Take-home messages: Online feedback tools have a role in medical education but to be effective they require:
- easily accessible links or QR codes
- student registration and induction at the start of placement
- prompt response from teachers

4Q4 NOT PRESENTED

4Q5 NOT PRESENTED

4S: Conference Workshop: Applying Threshold Concepts to Health Professional Education—Helping the Struggling Learner (2776)

Location: Wettstein, 2nd Floor, Swissotel
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Janice Hanson, University of Colorado, School of Medicine, Aurora, Colorado, USA
Virginia Randall, Uniformed Services University of the Health Sciences, Bethesda, Maryland, USA
Lindsey Lane, University of Colorado, School of Medicine, Aurora, Colorado, USA
Meghan Treitz, University of Colorado, School of Medicine, Aurora, Colorado, USA
Daniel Nicklas, University of Colorado, School of Medicine, Aurora, Colorado, USA

Background: A threshold concept is an idea that, once grasped, changes the way learners think about themselves. The concept cannot be forgotten and may be emotionally difficult. An example might be the myth of black/white answers in medicine. Through experience, learners see the fallibility of physicians and other healthcare professionals, but may still hope they can know everything and never make a mistake. Identifying threshold concepts in health care may help educators support learners through the challenges of becoming a physician, therapist, nurse, or other healthcare professional. Educators may have noticed that some learners get "stuck" when learning to incorporate key aspects of professional identity; these aspects of professional identify may be threshold concepts. These learners may lose empathy for patients, question whether they should remain in medical school, have difficulty with work/life balance, or experience depression. This workshop will provide strategies for educators to support learners through these struggles and move into their professional identify as physicians, therapists, nurses, or other healthcare providers.
Who should attend: Health professions educators intrigued by the concept of threshold concepts will enjoy this workshop. Classroom teachers, clinical teachers, mentors, advisors, and education leaders will gain insights for their work.
Structure of workshop: A short didactic will introduce threshold concepts. In a facilitated large group, participants will then identify and describe threshold concepts they have experienced as learners, physicians/health professionals, and educators. Participants will write potential threshold concepts on "sticky notes" that workshop facilitators will gather and group on flip charts, engaging all participants. Participants will then work in facilitated small groups to develop strategies to help learners who seem "stuck" at a threshold concept juncture, then report strategies to the large group.
Intended outcomes: Workshop participants will
1. Define the characteristics of a threshold concept.

2. Collaboratively identify several threshold concepts in health professional education.
3. Develop ways to help learners who seem stuck at the identified threshold concepts.
Participants will record definitions, threshold concepts, and strategies for supporting learners on a worksheet, providing them with a resource to take home and apply.
Level: Intermediate

4T: Conference Workshop: The (Forgotten) Art of Receiving Feedback (1073)

Location: Helvetia 3, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Jane Moller, Aarhus University, Aarhus, Denmark
Noelle Junod Perron, Geneva University, Geneva, Switzerland
Claudia Kiessling, Brandenburg Medical School Theodor Fontane, Neuruppin
Kristian Krogh, Centre for Health Sciences Education, Aarhus, Denmark
Bente Malling, Aarhus University, Aarhus, Denmark

Background: Evidence shows that feedback is a key factor for effective learning and developing competencies, and much literature formulates models and principles for giving feedback. The act of receiving feedback, however, seems to receive less attention, even though it plays a crucial role for implementing effective feedback into training. The purpose of this workshop is to help educators better understand how and why learners react and respond to feedback and how to improve it.
Who should attend: This workshop will be of interest to all educators who give and receive feedback, and who are interested in exploring the act of receiving feedback, i.e. ways of understanding and exploring learner reactions to feedback.
Structure of workshop: After a short introduction, participants will identify challenges related to receiving feedback (think-pair-share). They will practice different modes of receiving feedback in groups of three (using video example, followed by a large group debrief). A brief didactic session will present the different factors influencing responsiveness to feedback (feedback triggers, promotion vs prevention orientation) and ways of exploring learner reactions. Participants will consider implications for own practice. We then collect take home messages and wrap up.
Intended Outcomes: By the end of this workshop the participants will be able to: 1) identify factors that influence how feedback is received by learners, 2) reflect on challenges linked to receiving feedback (own reactions and responses), 3) use techniques for better exploring learner reactions and, 4) practice receiving feedback and discuss implications for giving feedback.

4U: Conference Workshop: Adopting Learning Analytics in Medical Education (2684)

Location: Helvetia 4, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Vania Dimitrova, Leeds Institute of Medical Education, University of Leeds, UK
Tamsin Treasure-Jones, Leeds Institute of Medical Education, University of Leeds, UK
Rachel Ellaway, University of Calgary, Canada
David Topps, University of Calgary, Canada
Martin V. Pusic, NYU Langone Health, USA

Background: The growing digitalisation of education leads to accumulating a vast amount of digital data ranging from student interaction with learning resources, to formative and summative assessment, to workplace feedback and student reflections. The abundance of data, together with the availability of tools for automatic processing, offers exciting opportunities for medical education. However, the adoption of big data and learning analytics brings socio-technical challenges, e.g. data availability and reliability, potential for oversimplification and misinterpretation, ethics and institutional barriers. The workshop will discuss the promises and pitfalls of learning analytics for medical education by drawing upon an ensemble of experience into using learning analytics in medical education contexts.
Who Should Attend: Anybody interested in adopting innovative technologies to enhance medical education: medical educators, researchers, medical programme managers, faculty developers in medical education, faculty interested in technology enhanced learning, medical education leaders, learners all along the continuum. A mix of expertise (from inexperienced to expert) in the use of technologies in medical education will help promote stimulating discussion.
Structure of Workshop: The workshop will start with a brief overview of learning analytics and their use in education. The facilitators will then offer reflection on their experience, focusing on evidence-based approaches to assess the advantages and pitfalls in adopting learning analytics. Examples of using analytics include facilitating student engagement with workplace assessment to foster self-regulation; and gaining an understanding of the interaction with online learning tools to improve effectiveness. Small group work around selected case studies will explore advantages and pitfalls of learning analytics. Together, facilitators and participants will draw tips for adopting analytics in their practice.
Intended Outcomes: Participants will familiarise with main definitions and issues in learning analytics, become aware of key developments, and gain insight into challenges and solutions from colleagues who are researching and applying learning analytics in medical education. Participants will engage in an open debate of potential and pitfalls of big data and analytics. They will appraise their practice in the light of new landscape afforded by learning analytics, identify opportunities to adopt learning

analytics, and network with colleagues engaged in this work.
Level: All

4V: Conference Workshop: Causes and prevention of cognitive errors (diagnostic error). How will they inform our methods of teaching this to our learners? Is this possible? (299)

Location: Helvetia 5, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Dan Mayer, USA (Moderator)
Michelle Daniel, University of Michigan Medical School, Ann Arbor, MI, USA
Robin Hemphill, Virginia Commonwealth University, Richmond VA, USA
Sandra Montiero, McMaster University, Hamilton, Ontario, Canada
Geoff Norman, McMaster University, Hamilton, Ontario, Canada

Background: Diagnostic errors frequently cause adverse outcomes in medicine. The causes of most diagnostic errors and proposed methods of preventing them should be taught to our learners across the medical curriculum. The current debate is whether we can give our learners adequate training in recognizing potential cognitive 'traps' that lead to diagnostic errors? Or, should we explore "just in time" approaches like content-specific checklists? Do we need to put more of our educational effort into honing the learner's skills in 'pattern recognition' by increasing their experience in managing various cases? The workshop will present this debate through case presentations informing the discussion to explore competing approaches to this problem.
The audience will be engaged to discuss teaching techniques to reduce diagnostic errors through questioning the panel on past and current research. Using complex diagnostic cases will help share ideas for future research to elucidate the nature and solution of this problem.
Who should participate in the workshop? This is aimed at medical educators at all levels of medical education (UGME, GME and CPD). It will help researchers interested in studying clinical reasoning and cognitive error prevention in diagnosis.
What will they gain from participating? Appreciation of the controversy between teaching cognitive science and causes of diagnostic errors ('debiasing' and 'diagnostic time outs') compared to 'just in time learning' and content specific checklists. The discussion will clarify how these perspectives could improve clinician diagnosis and what unforeseen consequence might occur. Create unique mechanisms to teach techniques to reduce diagnostic error in various educational environments. What current

research is most likely to inform the optimal education our learners require to prevent diagnostic errors?

At the completion of the session, participants should be able to:

1. Describe and contrast attributes of System 1 and System 2 thinking
2. Describe and differentiate and analyze the pattern of the major categories of diagnostic error
3. Discuss potentials for mitigating errors, including "diagnostic time out", "debiasing processes", "just in time" approaches and content specific checklists.
4. Describe systems factors increasing the risk of diagnostic error

4W: Conference Workshop: Developing Continuing Education and Professional Development Programs to Optimize Practice (2441)

Location: Helvetia 7, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
David Wiljer, University Health Network, Toronto, Canada
Sanjeev Sockalingam, University Health Network, Toronto, Canada
Sophie Soklaridis, Centre for Addiction and Mental Health, Toronto, Canada
Maria Mylopoulos, The Wilson Centre, Toronto, Canada
Ivan Silver, Centre for Addiction and Mental Health, Toronto, Canada

Background: Continuing education (CE) and continuing professional development (CPD) have traditionally been limited in changing clinicians' behaviours and patient outcomes. The burgeoning field of healthcare quality improvement (QI) offers a unique model for moving CE/CPD towards enduring practice changes. While the relationship between CE/CPD and QI has been explored more broadly in medical education and through general programs, such as the AAMC Aligning and Educating for Quality (ae4Q), practical application and integration of QI and CPD remains an ongoing barrier. Current trends in CPD have been toward developing master adaptive learners and the development of expertise in new basic sciences, namely quality improvement (QI) and patient safety. The following workshop will focus on advances in the areas of CPD self-assessment, adaptive expertise, motivation to learn and engagement of patients and families in effectively bridging the gap between QI and CPD to achieve mastery.

The workshop will begin with participant reflection on current strengths and limitations of CE/CPD activities offered in participants' settings. Following this reflection, we will present data on the need for evolving current CE/CPD practices and for integrating QI within existing CE/CPD. We will also explore the construct of adaptive expertise and how it can be used to advance CE/CPD to address complexity and ambiguity encountered in practice. Finally, we will provide practical strategies for

self-assessment and engaging patients in assessing current practices. In small groups, participants will apply presented frameworks to build practice improvement opportunities involving both clinicians and patients into their current CE/CPD activities. We provide cases to discuss local program and learning system approaches to aligning CPD and QI and will provide frameworks for preparing practitioners for future learning. We will conclude with a summary and opportunity for further participant questions.

Upon completion of session, participants will be able to:
1) Apply process and practice improvement into continuing education initiatives and consider the role of the patient in achieving change
2) Identify useful frameworks, barriers and solutions to integrating practice change into CPD to promote mastery and adaptive expertise
3) Reflect on how existing CPD can integrate self-assessment and practice improvement to assist professionals development

4X: Conference Workshop: Learning from Failure? How should we prepare newly qualified clinicians and clinical environments to enhance patient safety? (900)

Location: Osaka, 3rd Floor, CCB
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Kevin Weiss, Accreditation Council for Graduate Medical Education (ACGME), Chicago, USA
Jane O'Hara, Leeds Institute of Medical Education, University of Leeds, UK
Trudie Roberts, Leeds Institute of Medical Education, University of Leeds, UK
Robin Wagner, Accreditation Council for Graduate Medical Education (ACGME), Chicago, USA
Robin Newton, Accreditation Council for Graduate Medical Education (ACGME), Chicago, USA

Background: Engagement in patient safety is essential in healthcare, and lack of clinician engagement is an important 'patient safety gap'. To close this gap, new clinicians should engage in patient safety activities during their first year of clinical practice. Leaders of the clinical learning environment (CLE) need to ensure that new clinicians actively engage in and promote the CLE patient safety system, by: (1) understanding how the CLE supports a positive safety 'culture', (2) recognizing and reporting patient safety issues, (3) participating in the analysis of patient safety events, and (4) understanding how the CLE translates patient safety event reports into improvements. Promoting the importance of patient safety needs to begin in undergraduate education. However, the CLE and wider healthcare culture are crucial in shaping student and trainee understanding and engagement with patient safety. Understanding what contributes to safe care and

how adverse events occur is key to systems-based improvement, but this can be difficult in environments that have historically attributed mistakes to individuals. How mistakes are reported, acted on, and judgements of accountability made, will all influence the engagement of students and trainees in safety. Thus, the role of the CLE in supporting this engagement is central to learning and improved patient care.

This workshop will present work from both the UK and US, to ensure that engagement with patient safety is fundamental to the training of healthcare professionals. The recent case of Dr Bawa-Garba in the UK will be discussed, with reflection on the implications for supporting students and trainees to raise concerns, reflect on failure, and engage in patient safety.

Attendees will be encouraged to examine approaches to integrating patient safety into their own curricula.

Who should attend: Healthcare educators involved in clinical training.

Structure of the workshop: A mixture of short presentations by experts and audience interaction and discussion.

Outcomes: At the end of this workshop the attendees will:

1. Understand the importance of education and the CLE in promoting patient safety
2. Recognise the value of leadership in this area
3. Have explored models of reporting and responding to patient safety events

Level: Introductory

4Y: Conference Workshop: Making workplace-based assessment work: leveraging tensions in assessment for learning (872)

Location: Samarkand, 3rd Floor, CCB
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Pim Teunissen, VU University Medical Centre and Maastricht University, Amsterdam & Maastricht, Netherlands
Erik Driessen, Maastricht University, Maastricht, Netherlands
Marjan Govaerts, Maastricht University, Maastricht, Netherlands
Suzanne Schut, Maastricht University, Maastricht, Netherlands
Miriam Wijbenga, Maastricht University, Maastricht, Netherlands
Carolin Sehlbach, Maastricht University, Maastricht, Netherlands

Background: The number of tools for workplace-based assessment (WBA) in under- and postgraduate medical education have steadily increased over the past decade and with it conceptual models for their use have evolved. Research findings, however, indicate a mismatch between assessment theory and practice. WBA procedures can become tickbox excercises, merely being perceived as summative assessment rather than assessment for

learning. This workshop will focus on these challenges by asking what practitioners and educationalists can do to make WBA work for learning.

Sharing their practical and scientific experience with this topic, the workshop moderators and participants will co-produce WBA principles that effectively support learning in clinical practice.

Who should attend: This workshop is aimed at anyone involved in WBA, from undergraduate to postgraduate levels. We expect students, residents, faculty and educationalists to benefit from insights in how WBA can work in clinical practice.

Structure of workshop: The workshop will use the following approaches: small group learning, round robin design, and moderated plenary discussion. We will build on the participants' experiences with and knowledge of WBA. The majority of the workshop will be interactive. After a brief plenary introduction by the moderators, a round robin design will be used to enable small group discussions about different WBA-related topics. Topics include tensions between assessment for and of learning; assessing what counts vs. what can be counted, as well as do's and don'ts for trainees and preceptors. Discussions will be moderated to ensure a variety of ideas and topics are addressed. A plenary discussion will allow synthetisation of outcomes and conclude with take-home messages.

Intended Outcomes: Participants will be able to:
- better understand how inherent tensions in WBA affect assessment practices
- understand under what circumstances WBA can optimally support workplace learning,
- know what role individual trainees and preceptors can play in making WBA work for them.

Level: We recommend some WBA experience for attendance, as the workshop spans from introductory to advanced level.

4Z: Conference Workshop: How to break barriers? International faculty development collaboration (945)

Location: Guangzhou, 2nd Floor, CCB
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Che-Wei Lin, Taipei Medical University Wan-Fang Hospital, Taipei, Taiwan
Barry Issenberg, University of Miami Miller School of Medicine, Miami, USA
Benjamin Berg, University of Hawaii, Manoa, USA
Gen Ouchi, University of The Ryukyus, Okinawa, Japan
Chien-Chih Wu, Taipei Medical University, Taipei, Taiwan
Wen-Cheng Huang, Taipei Medical University, Taipei, Taiwan
Background: We have successfully implemented a faculty development collaboration among simulation educators in the Taiwan, Japan and the United States. This interactive workshop will describe the process of creating and fostering international partnerships for the development of simulation faculty. A model for collaboration and cooperation between different countries and cultures will

be shared. Successful approaches that support these types of international activities will be discussed and evaluated. In addition, we will facilitate discourse and analysis of potential difficulties and barriers to globalization of faculty development efforts in simulation education for healthcare providers. Small group sessions will be used to promote g discussion of topical areas and personal experiences. The session will culminate by having participants conceptualize and outline an international collaboration model for their own institution.

Who should attend: 1. Faculty from institutions that would benefit from international collaboration to improve faculty development programs. 2. Faculty from institutions who will support faculty development efforts in other countries. 3. Participants who would like to learn, discuss and apply successful approaches from an international faculty development collaboration and exchange program.

Structure of Workshop:

1. Faculty and course introduction; 2. Large group activity 1: Interactive presentation of an example for international cooperation; 3. Small group activity 1: Develop Goals and expectation for an international collaboration for supporting faculty development; 4. Large group activity 2: Faculty share additional regarding its international collaboration and efforts including implementation of a faculty development course, addressing barriers and logistical concerns; 5. Small group activity 2: Participants work on their own personalized planning and share with others; 6. Large group activity 3: Discuss strategies to address anticipated challenges to develop a one's own model; 7. Wrap upIntended Outcomes

After this workshop, participants will be able to:

1. Describe the process for establishing international collaboration in simulation education
2. Analyze opportunities and barriers to international collaboration efforts
3. Evaluate methods for overcoming barriers to international collaboration

Level: Intermediate

4AA: Conference Workshop: Use the map: a practical workshop on curricular mapping for faculty development and CPD programming (3316)

Location: Nairobi, 2nd Floor, CCB
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:
Robert Parson
Paul Hendry

Background: Curriculum mapping (CM), traditionally a process applied to UGME programs, can be adapted for use for any educational program including Continuing Professional Development and Faculty Development. Mapping can be used to demonstrate attention to accreditation standards, institutional priorities and

categorize sessions thematically, according to evaluation method, learning methods, level of difficulty and more. Online mapping tools can be adapted for local context and enable the creation of a searchable database of course information. We recently completed a reverse mapping project for programming over the previous 2 years and will share our experience and maps with participants.

Who should attend: This workshop will be of interest to faculty development planners and those involved in curriculum design at all levels including for continuing professional development in the broadest sense.

Structure of Workshop: A brief introduction will serve to frame the benefits of curriculum mapping for faculty development and continuing professional development. Sample mapping results from our local mapping endeavour will be used for illustration. Participants will break out into small groups to complete a curriculum mapping grid based on courses they are familiar with. Their course "grids" will be added to a large scale map that will demonstrate how comprehensive mapping is used. The full group will be guided to interpret the maps to identify gaps or redundancies and learn how mapping can inform planning. Attention to evaluation strategies and learning outcomes (level of evaluation and degree of impact) will be highlighted with suggestions of how mapping can help elevate the level of evaluation outcomes. A meta evaluation exercise will allow participants to apply accreditation criteria.. The exercises will be transferable for use in their own work environments. Application of maps and meta evaluation should demonstrate evidence of quality assurance and enhance accreditation outcomes.

Intended Outcomes: At the end of the session participants will be able to:

1. Describe and create a searchable curriculum map
2. Apply the design principles to construct map for their unique program
3. Identify gaps in their programming by utilizing their curricular map.

Level: Intermediate

4BB: Conference Workshop: Online assessment with the students' own devices: An evidence based and practical approach to eAssessment (1484)

Location: Mexico, 2nd Floor, CCB
Date: Monday 27th August
Time: 1400-1530hrs

Presenters:

Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Helsinki, Finland
Sanna Siirilä, University of Helsinki, Services for Learning and Teaching Technology, Helsinki, Finland
Daniel Folger, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Teemu Masalin, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Jussi Merenmies, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Colin Lumsden, University of Manchester, Manchester Medical School, Manchester, UK

Background: The University of Manchester and the University of Helsinki are active in fostering mobile learning in medicine. Since 2011, the Manchester project has integrated iPads into clinical environment and developed digital work-place assessment. The Helsinki project started in 2013. Today the mobile learning cohorts cover the biomedical and clinical study years. Both units have combined mobile devices with active learning (problem-based learning and the flipped classroom) and developed online assessment with the students' own devices.

Who Should Attend: This workshop provides an evidence-based and practical insight into developing online assessment with the Bring Your Own Device (BYOD) strategy. We invite all those who are at the outset of or in the middle of fostering formative and/or summative online assessment in their units to share experiences and learn from and with us. The workshop is targeted to all health-care professions, both at graduate and postgraduate level, specialist training and continuing professional development.

Structure of Workshop: The workshop is interactive and facilitates active learning. We provide a short overall view of online assessment based on a BYOD strategy and have an online vote on the assessment practices in the participants' units. The Manchester project presents the (UoM) FORM², an online assessment system designed for comprehensive assessment in clinical placements. The Helsinki project compares strategies and tools for online summative examination and reports experiences of organising the International Progress Test (IPT) and the European Knowledge Test (EKT) online. The workshop participants analyse in groups the advantages and challenges developing formative and summative online assessment and adopting a BYOD strategy in assessment. The workshop is concluded with a discussion and a take-home-message.

Intended Outcomes: At the end of the workshop, the participants will be able to:

1. Outline the principles of formative and summative online assessment,
2. Analyse the advantages and challenges of using the students' own devices (laptops, tablet computers and smartphones) in online assessment,
3. Recognize the requirements for developing online assessment in their units.

Level: introductory/intermediate

4CC: ePosters: Engaging with Learning - game-based, problem-based & practice-based

Location: Kairo 2, Ground Floor, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

4CC1 (2363)
Pedagogical Approach of the Family Health Specialization Course of the Federal University of Pelotas, Brazil

Authors
Anaclaudia Gastal Fassa, Federal University of Pelotas, Pelotas, Brazil
Maria Elizabeth Gastal Fassa, Federal University of Pelotas, Pelotas, Brazil
Elaine Tomasi, Federal University of Pelotas, Pelotas, Brazil
Luiz Augusto Facchini, Federal University of Pelotas, Pelotas, Brazil

Presenter: Anaclaudia Fassa, Federal University of Pelotas, Brazil

Background: The strong expansion of the family health strategy teams in Brazil led to the creation of the Open University of SUS, constituted by Public Universities, to offer the Specialization Course in Family Health on a large scale. The course of the Federal University of Pelotas aimed at training the family health professionals of the SUS, promoting the capacity of management and organization of primary health care services (PHC), the institutionalization of health monitoring and evaluation, citizenship and social participation and the qualification of clinical practice
The course is structured around an intervention in the service, focusing on the improvement of the work process and clinical practice. Based on the strategic planning, the student identifies the problems of his health unit, prepares an intervention project on a programmatic action typical of PHC, develops the intervention and evaluates it. The course requires only one face-to-face meeting for the presentation of the final paper and the activities are asynchronous, valuing the distance learning strategy, the professional's link with the service and promoting reflection on the practice.
2300 health professionals were trained over a 5-year period throughout Brazil. Collective health materials for intervention were developed as questionnaires for situational analysis; sheets with aims, goals, indicators and actions for the planning of interventions; clinical forms and automated spreadsheets for individual and population monitoring and interactive clinical cases. The interaction with the colleagues and the personalized attention of the supervisor made possible the deepening of the themes and the exchange of experiences. The materials provided great autonomy for the student.
This pedagogical approach focused on the training of the professional through the transformation of the service, improving the quality of attention and, in many situations, spreading the ideas to the team and even other health services of the municipality.

Reflecting on practice provides meaningful learning; - Prepared learning environment, with instrumental materials for the intervention, facilitates transformations in the work processes; It is crucial that students provide examples of good practice by disseminating them in their services and municipalities.

Using the "Flash Teaching" Model for Prevention of Facial Pressure Injuries during Nursing Training and Education

Authors
Ching-Uen Huang
Shun-Cheng Chang
Fu-Yu Wang

Presenter: Ching-Uen Huang, Taipei Medical University Shuang-Ho Hospital, New Taipei City, Taiwan

Background: Facial pressure injury (FPI) is a common and difficult clinical problem, especially in chronic and long term patients. Effective protection education is an indispensable part of nursing staff's pressure injury prevention implementation measures. Using "Flash teaching" model to improve the shortcoming of traditional teaching method. Clinical staff may memorize key points in short period of time, which helps them to implement the use of clinical protection, and reduce the severity of FPI.
In the past, due to shift work, hospitals or wards need to gather nursing staff for continuous education, which is difficult in practice and the outcomes, promotion and implementation respectively, from the education is often poor. "Flash teaching" is a method, which key teaching points are made into pictures, by using these pictures, learners memories are enhanced. Teachers go to wards, give a 15-minute teach section between shift-change. Teaching materials are transferred into PDF, uploaded to intranet on each ward for reminder learning. Furthermore, training seed staff in each ward to perform Flash Teaching regularly can reinforce the memories.
"Flash Teaching" was held on wards which needed to face FPI on daily practice, there were total 213 staff and seed staff trained. The average pre-education test score was 65, the post score was 90, the average satisfactory score was 4.65. The FPI incidence (2013-2015) dropped from 5.1% to 2.9%, the injury severity also improved from Grade 3 to 1. Teaching method has great impact on learning outcome. Through innovative "Flash Teaching", the traditional group teaching was embarrassed, the new method not only utilizes limited time period but also gives nursing staff clear images; seed staff have provided consistent clinical teaching and assistance, FPI incidence and severity have been reduced effectively.
Understanding the basic problems and difficulties; with imagination, teaching is unrestricted by time and space, yet it is innovative and effective.

Photo Challenge: An Educational Innovation to Stimulate Effective Learning in Ophthalmology

Authors
Sakchai Vongkittirux, Thammasat University, Pathum Thani, Thailand
Tayakorn Kupakanjana, Thammasat University, Pathum Thani, Thailand
Picha Thunpimon, Thammasat University, Pathum Thani, Thailand

Presenter: Sakchai Vongkittirux, Department of Ophthalmology, Faculty of Medicine, Thammasat University, Pathum Thani, Thailand

Background: The learning process in Ophthalmology emphasizes visual disease manifestations, which can be traced to aspects such as epidemiology, pathophysiology, clinical manifestations and management. However, contemporary teaching methods of lecturing are often insufficient for facilitating learning. Additionally, instructors find it difficult to evaluate the knowledge and understanding of students after lectures.
To stimulate effective learning, Ophthalmology residents from the Faculty of Medicine, Thammasat University, invented an activity called Photo Challenge. Fifteen residents from three years of training were randomized and divided into five groups to compete in a quiz and discuss different aspects of the disease depicted in the photo. Qualified ophthalmologist instructors score the team's performance on quality and completion of discussion and provide feedback on the conformity, rationale and omissions of the discussion as a team.
Ophthalmology residents participating in Photo Challenges favored the activity and benefited from engaging in the learning experiences as well as being given opportunities to practice clinical thinking processes by verbally approaching the clinical diagnosis from important findings and management of the disease. Instructors are able to assess their students' degree of success in learning outcomes and provide instant feedback.
Photo-Challenge activities, unlike the traditional photo quiz, are engaging for learners and enable them to demonstrate knowledge and skill in clinical thinking, applicable to everyday practice and, in addition, evaluate themselves after the quiz. Instructors are able to emphasize knowledge and guide clinical thinking relevant to the learning outcomes after each session. It can be noted that the Photo Challenge is evidently more suitable for producing intended results than traditional photo quiz in Ophthalmology studies.
The Photo-Challenge's success demonstrates a counterpart of a teaching method that emphases visual detection of clinical signs and clinical thinking as learning outcomes, in context of Ophthalmology learning.
Photo Challenge is an educational innovation is suitable for Ophthalmology learning and is effective for students to achieve learning outcomes as well as gain straightforward assessment from instructors. This teaching method can also be applicable to other studies where photographs are an important element in the learning process.

Pedagotchi 2.0 – a playful learning concept to train clinical decision making

Authors
Lorenz Grigull, Medical University Hannover, Germany
Urs Mücke, Medical University Hannover, Germany
Ralf Schmidt, gamespired, Uplengen, Germany

Presenter: Lorenz Grigull, Medical University, Hannover, Germany

Background: Children learn whilst playing. For adults, work and play have been segregated. Recently, the terms playful learning or serious gaming (SG) have been introduced. Both describe forms of learning with games or by concepts derived from the game world. In medical education, SG is not very common yet despite its potential to provide engaging learning experiences. To train the important clinical decision making we developed a SG for medical students embedded in a blended learning concept.
After focus group discussions we scripted the screenplay for the game. For students, a game should increase knowledge, competence, and include challenges. Besides, rewards and feedback should be provided. From the educator point of view the system should be easy-to-manage, technically flexible and open for a range of medical subspecialties. Likewise, master-characters for patients (various age-groups and diseases) were created and an excel-based platform for authors developed. The game was settled in the emergency department. On smartphones or tablets students chose a case, explore the past medical history, perform a clinical exam and order blood tests, sonography or X-ray. Finally, the student (-player) is requested to word a diagnosis and possible differentials before deciding upon the clinical placement, e.g. hospital admission or ambulatory care.
Despite broad knowledge base, many students express difficulties to judge clinically upon a scenario. Therefore, they appreciate the playful opportunity of a blended-learning concept to improve decision making. Our SG offers the opportunity to transform students into active learners within a game world that provides various media content and instant feedback. From the teachers' perspective, important diseases and classical clinical presentations can be taught and knowledge gaps can be identified.
SG offers the opportunity to expand the way we teach clinical decision making in medical education. Embedded in a blended-learning concept it might improve the students' understanding for clinical decision making. For medical teacher, SG offers opportunities of interaction with the students and transparency of the learning process.
Games are fun and instructive. Serious gaming works to teach clinical reasoning.

The Pitch for 'QUITCH': Harnessing Mobile Technology to Improve Patient Safety

Authors

Shereen Ng, Department of General Medicine Tan Tock Seng Hospital, Singapore

Christine Balibadlan, Department of General Medicine Tan Tock Seng Hospital, Singapore

Kalpana Vijakumar, Department of General Medicine Tan Tock Seng Hospital, Singapore

Ranjana Acharya, Department of General Medicine Tan Tock Seng Hospital, Singapore

Nihar Pandit, Department of General Medicine Tan Tock Seng Hospital, Singapore

Ung Peck Houy, Department of General Medicine Tan Tock Seng Hospital, Singapore

Presenter: Shereen Ng, Department of General Medicine Tan Tock Seng Hospital, Singapore

Background: Multiple batches of fresh medical graduates rotate through the Department of General Medicine with very little knowledge of hospital safety protocols. The ongoing challenge is to ensure the timely delivery of hospital specific patient safety knowledge upfront so patient care errors are minimized. As mobile applications and games are now ubiquitous and attractive, we developed a web-based game on a mobile application ('QUITCH') to teach patient safety. However, does this translate to effective patient care?

A list of must-know information on daily ward duties and hospital-based safety policies has been translated into a series of 80 multiple-choice questions on the application with a gaming element. All new rotating residents will be enrolled with access to the game on their mobile devices. Each set of 8-10 time-sensitive questions are 'pushed' daily for the first 14 days of their rotation. Residents compete against their peers to reap attractive rewards, such as badges and points, to get on the 'QUITCH Leaderboard'. Relevant bite sized explanations and material are linked to the questions. The faculty reviews the progress and reinforces important concepts with the residents in a face to face session after the game.

Quantitative and qualitative data are collected on reception, perception and engagement towards learning through mobile gaming. The results will be triangulated to see whether this translates to better patient care. Prescription errors from High-Alert Medications (insulin, opioids) are being collected in an ongoing Clinical Practice Improvement Program (CPIP). We will compare the medication error rates before and after the implementation of this project.

Data collection has being ongoing from Jan 2018 till Jan 2019 for each batch for 40 learners (approx. 240 learners). We look forward to the data which will be available by August 2018.

Harnessing technology with mobile learning and constantly innovating our teaching methods are key to sustaining the attention of the busy resident, and ultimately to improve the care to our patients. It is our firm belief that learning through gaming via 'QUITCH' will enable us to do this.

The Application of Gamification in Clinical Teaching - Courses of Quality Management

Authors

Jia-Min Wu, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Zhi-Quan Hsu, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Hui-Jen Chen, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Chen-Jung Yen, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Ching-Shiang Chi, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Presenter: Ching-Shiang Chi, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Background: It is important for medical staffs to use scientific management tools to improve patient safety. However, medical staffs often felt very difficult on the operation and application of quality management. The purpose of this project was to apply gamification in clinical courses.

Quality management and education team made e-learning materials on the hospital platform and Youtube, so learners can learn anytime, anywhere. Teachers have adapted teaching videos into short and interesting videos. Staffs must complete the online learning and homework before the class. In the classroom, teachers implemented the game using staged descriptions, demonstrations, exercises, and confirmations. Team competition, group discussion and brainstorming were conducted. Through designed question, members understood how to make the process more effective in solving problems and internalized quality control practices from the process. After the course, FB was used to conduct the follow-up discussion which provided further self-learning suggestions to staffs.

Before implementing gamification, the willingness to learn was only 45%. After conducting 3 gamification courses continuously, the willingness was raised to 91%. Members actively formed 12 interprofessional teams. Medical staffs applied the acquired skills to their daily work and got 9 awards through teamwork and improvement tools in external quality competitions in 2017.

Gamification was a method rather than a goal. Games which need to be designed according to different staffs were used to increase interpersonal communication, deepen the depth of the courses and enhance team cohesion. Immediate feedback from clinical teachers engaged learners in setting specific goals and expectations. Medical staffs involved in improving medical quality and patient safety could reduce medical risks. We reformed teaching methods to enhance the professional competence and confidence of staffs in quality management. Through well-designed games, staffs understood the meaning and purpose of the work by solving problems and internalized the skills of quality management.

Using multiple teaching methods and diverse approaches to promote learning, staffs can be active, cooperative and studious. Gamification made clinical teaching more interesting and meaningful.

Use illness script theory to teach clinical reasoning skills to nurse practitioners- a pilot study

Authors
Ching-Hsuan Ho
Hsin-Yuan Fang
Hung Yao Chen

Presenter: Hung Yao Chen, China Medical University Hospital, Taichung, Taiwan

Background: The clinical reasoning is an essential ability of caring patients for nurse practitioners (NP).
So we developed a case- based approach for developing NP's clinical skills by using illness script theory and conducted a randomized control trial to determine if this method was effective.
A total of 42 trainees were enrolled in this study in 2017 and divided randomly as experimental, and control group, 21 trainees in each group. Five trainees in the experimental group dropped out because of their personal event. For the experimental group, the clinical reasoning skills, and illness script theory were introduced first, and then start to discuss clinical cases, following a sequence of chief complaints, medical history, and physical examination. The trainees formed their own clinical hypothesis first and then asked the information from the tutor. Finally, the trainees wrote down their differential diagnoses and tried to order the relevant laboratory and image study to confirm the diagnosis. Simultaneously, the control group underwent traditional class-based training program. The effectiveness of intervention was assessed using the Diagnostic Thinking Inventory (DTI) and Objetive Standardized Clinical Exams.(OSCE).
There was no statistically significant difference on total DTI scores between these two groups , but the total DTI scores of experimental group increased 6 points after training. Trainees in the experimental group had higher flexibility in thinking (86.15 vs 80) , and similar in the memory structure scores (77.92 vs 75.88).The total OSCE scores of these two groups after training were close. (63.31 vs 61.12) But the trainees in the experimental group had better performance in disease diagnosis (8.13 vs 5.17), and clinical management (4.23 vs 2.98).
Although there was no prominent performance in the experimental group, the ability of disease diagnosis and management in this group slightly empowered after the case-based training program. This implied that this approach might work but there was inadequate training time (only 12 hours).
The new teaching method is better than traditional class-based training program for developing clinical reasoning skills. Adequate training hours is important.

The correlation between demographic variables and virtual patient integration in the medical curriculum

Authors
Eleni Dafli, School of Medicine, Aristotle University of Thessaloniki, Thessaloniki, Greece
Ioannis Fountoukidis, School of Economics, Aristotle University of Thessaloniki, Thessaloniki, Greece
Panagiotis D Bamidis, School of Medicine, Aristotle University of Thessaloniki, Greece

Presenter: Eleni Dafli, School of Medicine, Aristotle University of Thessaloniki, Greece

Background: The opportunities Virtual Patients (VPs) provide in modern medical education led to a wide trend towards VP creation and use among academic institutions. Aristotle University of Thessaloniki in an effort for a comprehensive evaluation of various parameters of the VP integration process aimed to add meaningful knowledge considering the full adoption of VPs.
The study included the collection of quantitative and qualitative data, using on line available questionnaires, for the medical students' evaluation (n=219). Descriptive statistical analysis and factor analysis were performed.
A correlation of age, sex and year of study with the evaluation of the medical students' clinical experience with VPs was observed. Male young students of the pre-clinical years showed a significant preference in VPs. Generally, students of the pre-clinical years show a high preference in the adoption of VPs as learning activities. A decrease of interest for VPs' curricular adoption in the next years of study was observed, something that was reversed again in the last (6th) year of study.
The preferences of medical students concerning the type of use and integration of VPs in the medical curriculum are presented, sorted according sex, age and year of study.
The virtual clinical encounters used in this study appear to be particularly well suited for learning and assessment for medical students of pre-clinical years of studies, who have had limited clinical contact.

Virtual patients in training against medical error: does group dynamics influence outcome?

Authors

Gulmira Abakassova, Karaganda State Medical University, Karaganda, Kazakhstan

Viktor Riklefs, Karaganda State Medical University, Karaganda, Kazakhstan

Sholpan Kaliyeva, Karaganda State Medical University, Karaganda, Kazakhstan

Alma Muratova, Karaganda State Medical University, Karaganda, Kazakhstan

Presenter: Gulmira Abakassova, Karaganda State Medical University, Karaganda, Kazakhstan

Background: Erasmus+ CBHE project "Training against medical error" (TAME) aimed to use virtual patients (VP) scenarios for clinical PBL with senior year students to help them gain expertise in prevention of medical errors. We looked into how group dynamics influence student perceived ability and experience after exposure to branched General Practice VP cases with medical errors. In the first phase of the project covering linear and branched paediatric cases, we showed that outcomes of branched cases could not be explained by case structure only. Medical teachers created clinical decision-making VP cases using open access platform OpenLabirynth. Team of GP teachers carefully analysed possible medical errors in their practice and designed the VP cases. The responses were collected from 60 students gathered into 7 groups after each case using non-anonymous online questionnaire. The survey aimed evaluating personal experience, perceived abilities, mental effort and emotional reactions. The factor analysis confirmed the presence of 5 factors with emotional reactions divided into positive and negative ones. MANOVA of factor scores produced no significant differences between cases, but there were significance differences between groups of students.
Cluster analysis revealed 5 reaction modes to cases: more than 50% of responses showed high positive experience, perceived ability and mental effort against low emotional reaction; in 30%, there were high emotionality, positive experience and mental effort, but low perceived ability; in <10% we saw only high positive experience with other factors being low; the least frequent modes included high or moderate emotionality against high or low positive experience and perceived ability.
Both MANOVA and cluster analysis confirmed our initial assumption that outcomes of branched VP cases depend on personal characteristics of learners, group dynamics and emotional reactions that they experience during case presentation, rather than the structure of case itself. The higher the level of emotional reactions the less students learn from the case.
VPs in training against medical error are accepted positively by medical students. More research is needed to analyse how group dynamics causes personal emotions influencing perceived ability of students after the case.

Strategy of medical education in home care using immersive Virtual Reality

Authors
Alessandra Dahmer, UNA-SUS/UFCSPA, Porto Alegre, Brazil
Rodrigo Alves Tubelo, UNA-SUS/UFCSPA, Porto Alegre, Brazil
Eduardo José Zanatta, UNA-SUS/UFCSPA, Porto Alegre, Brazil
Juliano Machado Padilha, UNA-SUS/UFCSPA, Porto Alegre, Brazil
Fulvia Spohr, UNA-SUS/UFCSPA, Porto Alegre, Brazil
Maria Eugênia Bresolin Pinto, UNA-SUS/UFCSPA, Porto Alegre, Brazil

Presenter: Alessandra Dahmer, UNA-SUS/UFCSPA, Porto Alegre, Brazil

Background: The use of Immersive Virtual Reality (IVR) in medical education remains a challenge for educators. The process to create educational resources applying this technology requires pedagogical knowledge as well comprehension regarding the digital resources provided by IVR. Therefore, the purpose of this work was to develop a teaching strategy using an Immersive Virtual Reality Game directed towards home care teaching for undergraduate medical students.

Firstly, a survey of all existing educational contents in regard to home care medicine has been carried out. The topics that proved to be the most difficult ones to be developed in the classroom have been selected. A physician selected the topics and those were discussed along with educators, designers, and game developers. The educational topics addressed refer to home cleanliness, psychological care of the caretakers, special care for bed-ridden patients and orientations for feeding patients in the home environment. The educational resource was available by wearing IVR goggles.

The transformation of a traditional educational topic into a serious game requires a multi-disciplinary team, which ought to include health professionals, educators, and computer experts. The discussions were held in order to achieve learning goals and simultaneously turn the game into a pleasant experience for users, resulting in the exchange of experiences among professionals, which may lead to an educational resource with a higher level of quality.

The IVR game developed may be used as a supplementary tool in the teaching-learning process involving undergraduate medical students with regard to practical activities in Home Care.

The use of technology in healthcare education must be encouraged among healthcare educators. The current generation tends to transcend traditional teaching resources, and IVR is suitable for learning contents in which the environment interferes the clinical conduct.

Evaluating the prescribing scheme for fifth years at Keele University medical school: a mixed methods study

Authors
Niamh McCarville, Ruth Kinston, Ahmed Al-Hayalee, Lois Aikins, Elizabeth Akintola, Sayyid Ahmed, Tatiana Christmas, Victoria Greenwood, Carys John, Bhagat Manku, Jacqueline Moneke, Rosie Oatham, Ugo Ogaziechi, Lawrence Oligbo, Charlotte Primavesi, Lauren Thompson, Radha Sharma (Keele University, UK)

Presenter: Niamh McCarville, Keele University School of Medicine, Keele, UK

Background: The GMC's 'outcome for graduates' outlines that medical graduates should be competent in writing a safe, legal prescription from day 1 of foundation rotations. Despite junior doctors being responsible for up to 50% of prescriptions written in hospital, it is well documented that new graduates perceive themselves to be least prepared in prescribing. Due to numerous factors, prescribing errors are common and can have fatal consequences for patients. The EQUIP study of 2009, found that Foundation Year 1 doctors (FY1s) make errors in 8.4% of all prescriptions.
Throughout the UK, there is no uniform approach to allowing students the opportunity of transferring skills learnt in the classroom to the clinical environment in terms of prescribing. The literature does describe, however, a "pre-prescribing" scheme which was implemented at Edinburgh medical school. This involved the use of stickers to identifying student prescriptions and was trialled on 12 students. Focus group feedback proved positive, and students felt that not only did it contribute to prescribing ability, but also professional development as a whole. Three years ago, Keele Medical School introduced a transcribing scheme for final year medical students, commonly called 'the purple pen scheme', due to students identifying their prescriptions in purple ink. This allows students to transcribe prescriptions on hospital drug charts, with a qualified doctor countersigning it. The scheme was implemented following the development of a standards operating procedure (SOP), which includes certain pre-requisites, for example the student must be involved in the care of the patient.
Method: In this study, we are carrying out a mixed methods enquiry to evaluate students' prescribing patterns, student error rate in prescribing, and students' views on the impact of the scheme. We will do this by carrying out an end-of-placement questionnaire detailing frequency of prescribing and prescribing activities undertaken, an audit of student prescriptions on the wards which will critique them against the SOP and detail error rate, and focus groups exploring student views of the scheme and how it contributes to self-perception and preparedness for foundation years.

Results: Data collection will be undertaken between January and April 2018.

4DD2 (365)
The effectiveness of "Flipped classroom" in teaching cardiac auscultation to medical students: a pilot teaching program

Authors
Chun-Wei Lee
Ching-Chung Lin
Chia-Yuan Liu
Min-Shu Wang
Yih-Jer Wu
Hung-I Yeh

Presenter: Chun-Wei Lee, MacKay Memorial Hospital, Taipei, Taiwan

Background: Learning cardiac auscultation is always a challenging issue of physical examination. We conducted a pilot teaching program for comparing the effectiveness of didactic lecture and Flipped classroom (FC).
Method: We divided the fifth year students into two groups, one is the conventional control group and the other is the FC group. The conventional control group will receive a didactic lecture first then we will bring them to see a patient. The FC groups we will provide the same learn material in advance, and then we will first bring them to see a patient following group discussion. The tasks when they are approaching a patient were to describe the cardiac auscultation in detail including timing, grading, shape, pitch, location, and radiation. A clinical teacher monitored the tasks. The students gave feedback anonymously. Knowledge on an implementation of cardiac auscultation was assessed in the final examination.
Results: The feedback was positive, emphasizing the benefits of FC in combining theory and practical steps to approach cardiac auscultation. The results of the written summative examination item were better and excellent in the FC group – the scores varied from 5 to 6 (scale 0-6). Flipped classroom seems to be a suitable method to combine theoretical understanding and practical steps to approach cardiac auscultation. Compared to conventional didactic lectures, medical students felt that FC is effective as a teaching tool. They also felt more impressive and confident in future cardiac auscultation.
Conclusion: New methods to train students and staff are sorely needed. Flipped classroom is shown to be better than the conventional didactic lecture in this pilot program in teaching cardiac auscultation. Medical students felt more satisfied and confident in dealing with cardiac auscultation. We are planning to expand this pilot study further in a larger cohort of medical students.
In our pilot, flipped classroom has shown to be successful as a novel tool for teaching cardiac auscultation. It was well received by medical students as a teaching method and effective in learning physical examination. It can be incorporated into routine teaching if proven successful in a larger cohort.

4DD3 (1426)
ABCDE... easy as 1,2,3?

Authors
Mathijs Binkhorst, Radboudumc, Nijmegen, Netherlands
Marjolein Linders, Radboudumc, Nijmegen, Netherlands
Marije Hogeveen, Radboudumc, Nijmegen, Netherlands

Presenter: Marjolein Linders, Radboudumc, Nijmegen, Netherlands

Background: The systematic ABCDE approach, acronym for Airway, Breathing, Circulation, Disability, and Exposure, is a widely accepted and universally used approach in the management of emergencies in both neonates, children, and adults. However, research about the most effective instructional design for this approach has not been conducted yet. Therefore, the aim of this study was to find the most effective instruction method to teach the ABCDE approach.
Method: A randomised simulation study was performed in which a total of 72 neonatal healthcare providers participated, divided over 10 neonatal advanced life support training days. Per training day, the instruction method for the ABCDE approach was randomised in either an instructional video or a conventional lecture. Subsequently, the group participated in multiple simulation scenarios that were video recorded. The adherence to the ABCDE approach was assessed afterwards by a researcher that was blinded to the received instruction type. The primary outcome of this study was the difference in individual adherence to the ABCDE approach between the two groups.
Results: A total of n=95 scenarios performed by n=72 participants were scored. Scores in the intervention group (n=34) were significantly higher compared to the control group (n=61), with a mean(sd) score of 35.7(17.9) and 25.9(17.3)% respectively (p = 0.011). Furthermore, there was a significant difference in scores between the nurses and paediatric residents/nurse practitioners, with a mean of 24.9(15.1)% and 39.9(18.2)% respectively (p<0.001). No difference in performance was found between the subdomains of the ABCDE approach.
Conclusion: In this study, video-based instruction is a more effective instruction method leading to better performance of the ABCDE approach in neonatal advanced life support training than a lecture. This finding could also be applicable to training of the ABCDE approach for paediatric and adult patients. A well executed ABCDE approach could enhance clinical performances and might lead to improved outcomes of patients in real life.
Based on this study, the use of video-based instruction in the education of the ABCDE approach is recommended.

4DD4 (2909)
A novel approach to collecting undergraduate medical student feedback using "TopHat" to increase student engagement

Authors
Shelina Sachedina, University Hospitals of Leicester, Leicester, UK
Sue Carr, University Hospitals of Leicester, Leicester, UK
Stephen Williams, University Hospitals of Leicester, Leicester, UK

Presenter: Shelina Sachedina, University Hospitals of Leicester NHS Trust, Leicester, UK

Background: Student feedback is a key driver for curriculum development and enables teachers to understand a student's experience of the teaching event and the learning environment. Historically, there has been a lack of motivation from students to complete feedback, as they perceive little personal gain from the activity.
Method: Medical student feedback is collected on a 3-monthly basis using standardized forms; these forms use Likert scales and 4 to 5 open questions. The results are distributed to the University Hospitals of Leicester (UHL) educational leads for review and action. Frequently students do not respond to the open questions which are either left blank or open to interpretation.
To improve the quality of feedback we designed interactive, face-face feedback sessions centered on the undergraduate clinical rotations. We used a forum that was based on UHL's Listening in Action (LiA) forum. This focuses on student's positive experiences and negative experiences. Students are then asked to discuss possible solutions to enhance their experience. Data was collected via 'TopHat,' an app which students have used in their pre-clinical years.
Results: We have conducted 10 face-face sessions (Phase 1). Several common themes have emerged from the data collected; mainly on timetabling and work-based assessments. Students have suggested solutions which are generally easily implementable.
We are now in the process, of implementing the changes and aim to inform students of these changes via a 'You Said, We Did' newsletter which will be posted on their electronic learning platform.
Conclusion: Overall, the student's experiences of Phase 1 sessions have been positive with student engagement and interaction being key to the process. By informing the students of the implemented changes, we hope to further increase motivation for providing feedback. Future projects include conducting Phase 2 sessions to identify if implemented changes have impacted on student's experiences.
Take-home messages: Students often lack the motivation to complete feedback. Creating an interactive online forum that encourages engagement empowers students to provide feedback. This ensures that feedback is more than a tick-box exercise.

4DD5 (3061)
Development of a Program to Inform Entrustment Decisions in Fourth Year Medical Students

Authors
Diana P E Callender
Margrit Shoemaker

Presenter: Diana Callender, Geisinger Commonwealth School of Medicine, Scranton, Pennsylvania, USA

Background: At Geisinger Commonwealth School of Medicine (GCSoM) students participate in a hybrid Longitudinal Integrated Clerkship/Block curriculum in the third (MD3) year with four campuses and multiple learning venues. In the fourth (MD4) year students complete subinternships, including a mandatory Internal Medicine (IM) subinternship, and rotations at clinical sites regionally and nationally. This distributed model has provided a challenge as we try to ensure that all students can perform the core entrustable professional activities (EPAs) for entering residency.

Method: We instituted three assessments in MD3 to facilitate acquisition of the competencies needed for residency. Early cohorts completed one formative (with limited feedback) and two summative objective structured clinical examinations (OSCEs). In 2016 we implemented two formative and one summative OSCE. Students self-assess, receive detailed feedback and generate individualized learning plans (ILPs) with faculty input on areas for improvement after each formative OSCE. In MD4 preceptors evaluate students on entrustment in select EPAs during the required IM subinternship. We are currently piloting a simulation-based assessment with select EPAs in MD4 year prior to their graduation.

Results: Although faculty and students found the individualized feedback helpful, at the end of the 2016-17, 2/99 MD3 students failed the summative OSCE while 16/99 students who passed were felt to not have achieved the expected level of competence in all domains. Preceptor feedback from MD4 IM subinternships also indicates that some students are not deemed entrustable in certain EPAs e.g., recognizing the need for urgent vs emergent care. We have taken steps to ensure that graduates have competencies needed for residency, however we need to further strengthen the MD3 process and integrate additional sources of feedback on student performance from MD4 into our entrustment decisions. We are planning a two-week MD4 capstone evaluation to integrate simulation-based EPA assessments with evaluations from IM subinternships, an interprofessional clinical rotation and validated tools assessing systems-based practice and other competencies.

Conclusion: Entrustment decisions require a combination of simulation-based and real-world training to evaluate students' performance in all domains of competence.

Tanya Mailhot, Montreal Heart Institute Research Center, Montréal, Canada
Marie-France Deschênes, Université de Montréal, Montréal, Canada

Presenter: Guillaume Fontaine, Montreal Heart Institute Research Center, Montréal, Canada

Background: Adaptive e-learning environments (AEEs) can provide tailored instruction by adapting content, navigation, presentation, multimedia, and learning strategies to each user's actions, preferences, knowledge, and competence. AEEs can have various levels of complexity, ranging from simple adaptive functionality (e.g. showing/hiding feedback) to artificial intelligence (e.g. personalized feedback using natural language processing). However, the effectiveness of AEEs for the education of health professionals and students is not yet established.

Summary of Work: A prospectively registered systematic review (#CRD42017065585) was undertaken to identify, appraise, and synthesize the evidence regarding the effectiveness of AEEs in improving knowledge, competence, and clinical behavior in health professionals and students. Eligible primary studies were identified through a search of six bibliographic databases from January 2005 to April 2017. Reference lists of articles and relevant journals were hand-searched for additional articles. Two reviewers screened articles, extracted data and assessed risk of bias independently.

Summary of Results: The search yielded 5,601 articles; 17 were included in the review. Studies were conducted with medical residents/physicians (n=8) and health professions students (n=9). AEEs included content (n=17), navigation (n=15), presentation (n=5), multimedia (n=8) and learning strategies (n=5) adaptation. Average training duration was 4.18 hours. Knowledge and competence were the most frequently assessed outcomes, and most studies (n=15) found positive results on learning outcomes in comparison with the control condition. Overall, four studies were scored as having a high risk of bias due to issues related to participant allocation and similarity of baseline characteristics. Most studies (n=11) had a sample size of less than 50 participants.

Discussion & Conclusions: Findings from this systematic review seem to indicate that AEEs are associated with positive learning outcomes in comparison with other educational interventions (e.g. nonadaptive e-learning environments). However, heterogeneity of study designs, interventions and outcomes was high. Moreover, reporting of AEE design was often incomplete.

Take-home Messages: Despite growing published works, more high quality studies are needed to further solidify the evidence base. Future research should focus on assessing AEEs with larger samples, and report more clearly on AEE design. Moreover, researchers should focus on higher-

level outcomes, such as clinical behavior and, ultimately, patient outcomes.

Early predictors of performance in medical school finals: a retrospective analysis of 4 cohorts at a UK medical school

Authors
John A King
Elizabeth J A Fitchett
Alison Sturrock
Caroline R Fertleman

Presenter: John King, University College London Medical School, London, UK

Background: Qualification from UK medical schools rests on passing finals. Early identification of students at risk of failing finals can help institutions target support. We aimed to assess association between pre-clinical performance with final exam outcomes.
Method: A multiple linear regression model assessed the relationship between the year 2 and year 6 (finals) marks of four cohorts of students (qualifying between 2014 and 2017). A multiple logistic regression model assessed the relationship between failure at year 6 and at year 2, and, separately, students' BSc classification. All three models were adjusted a priori for gender, cohort year, overseas student status and participation in a clinical BSc subject. Pre-clinical and year 6 results were considered independent, given completely different exam topics and formats. Students with missing data were excluded.
Results: Year 2 and 6 data were complete for 1049 students; with 941 having available BSc classifications. Year 2 marks were independently associated with total year 6 marks; with 5 more marks (%) at year 2 correlating with 1.8 more marks (%) at finals (95% CI: 1.6 – 2.0; p<0.0001). Students failing year 2 were 4.8 times more likely to fail finals (95% CI 1.5 – 15.6; p=0.007). Students attaining a 2:2 or 3rd were 7.5 times more likely to fail finals compared with higher classifications (95% CI 2.9 – 19.3; p<0.0001).
Conclusion: Holding known predictors of performance constant (eg. gender, overseas status), failing year 2 exams or achieving less than 2:1 at BSc year is highly correlated with failing clinical finals. This contrasts popular belief that performance in clinical years may improve for those who struggle with science focussed pre-clinical years. Although other unknown factors may be stronger predictors of finals performance, this observational analysis used data readily available to institutions, and that could be used by medical educators to identify where to target and sustain support throughout clinical years to improve chances of qualifying.
Take-home message: Pre-clinical exam performance is predictive of finals performance and should be used to identify students in need of support in clinical years.

4EE2 (507)
Mandatory Licensing Examinations For Graduating Doctors In The UK – How Do Medical Students Perceive This Initiative?

Authors
Rafael Bica, UCL Institute of Education, London, UK

Presenter: Rafael Bica, UCL Institute of Education, London, UK

Background: The GMC has decided to implement by 2022 a licensing examination for graduates from British medical schools: the UK Medical Licensing Assessment (UKMLA). Design and implementation of this exam are currently being discussed with stakeholders, including medical schools, healthcare employers, and the general public. As subjects of the UKMLA, medical students may have unique perceptions about its possible impacts on education and healthcare. This project investigates these views and, based on them, makes recommendations that may contribute positively to the exam's design and reappraisal process.
Method: First-year medical students from University College London were interviewed. They are among the students who will be the first to sit the UKMLA, thus representing a key stakeholder group. Transcripts from interviews were coded. Emerging themes were identified and discussed in light of the current literature about licensing examinations and the UKMLA's ongoing implementation process.
Results: Thirteen students participated. They showed little previous awareness about the UKMLA and, generally, did not regard themselves as stakeholders who should play an active role in its implementation. They raised concerns about loss of diversity in medical education across the UK, overassessment-related stress, unfair questioning and a negative educational impact. The need for the UKMLA was not justified, as current exit-level finals from medical schools were perceived as adequate assessments for graduating students. Regarding possible consequences of the UKMLA, a pessimistic outlook prevailed, as they foresaw negative outcomes for the quality of medical education and healthcare delivery in the UK.
Conclusion: The data suggest that the GMC needs to promote broader awareness about the UKMLA, engage students on assessment design and implementation and address their concerns about negative consequences, thus improving the test's validity and acceptability. Students' disregard for their relevance as stakeholders on their own assessment warrants further studies about profession identity formation. The UKMLA's potentially negative educational impact will need investigation in due time. Strategies to appraise the test's impact on healthcare delivery need to be developed.

Coordination of the national licensing and the faculties' exams in medicine

Authors
Volker Schillings, IMPP, Mainz, Germany
Jana Jünger, IMPP, Mainz, Germany
Ralf Hüwel, IMPP, Mainz, Germany
Houssein Shahla, IMPP, Mainz, Germany
Birgitta Kütting, IMPP, Mainz, Germany
Tobias Michenfelder, Nordwest Krankenhaus, Frankfurt, Germany

Presenter: Volker Schillings, IMPP, Mainz, Germany

Background: The IMPP is responsible for the organization and implementation of the written state exams in medicine, pharmacy and psychotherapy throughout Germany. Approximately 30,000 candidates are examined each year by the IMPP. We present the current status quo of written state exams in comparison to the faculties' exams in medicine and analyze ways of improving the correlation between them.

Method: The data were collected by means of a written questionnaire to the deans of 26 faculties (as of January 2017). The aim of the study was to identify the processes and the tools of the faculties' and state exams and to identify possible ways of correlating them in order to result in a better coordination between them.
96 % of the faculties already set up a central contact for exams and 76 % also provide experts for technical issues.

Results: The result-reports and/or statistical analysis drawn up and transmitted by the IMPP, in particular the university-specific item analysis, are used to compare the faculties nationwide. They are also used to analyze the strengths and weaknesses of the faculties. In addition, 62 % of the faculties create further analysis of the results. The use of classification catalogues as well as the use of blueprints for the production of exams is very heterogeneous. The most common used classification catalogue at the faculties and the IMPP is the NKLM (The German National Competence-Based Learning Objectives for Medicine). Approximately half of the faculties carry out computer-based exams while other faculties are planning to introduce this type of exam. It is obvious that computer-based exams are going to be a standard instrument for the faculties while centralized computer-based state exams are still in a conceptual phase.

Conclusion: The survey results in the desire for closer coordination between facultative internal exams and state exams as well as their competence-based orientation. Furthermore, the focus is on the increased use of computer-based exams and the associated possibilities for improving case-related and practice-oriented examination questions.

4EE4 (1377)
An eye-tracking study: Does the domain of clinical reasoning MCQs predict learners' generation or cueing of answers?

Authors
Jia Rui Kwan, Lee Kong Chian School of Medicine, Singapore
Min Kuan Chua, Lee Kong Chian School of Medicine, Singapore
Claire Canning, Lee Kong Chian School of Medicine, Singapore

Presenter: Jia Rui Kwan, Lee Kong Chian School of Medicine, Singapore

Background: Traditionally, arguments for open-ended questions (OEQ) describe its ability to encourage generation of answers as an advantage over multiple-choice questions (MCQs). Generation is deemed superior to cueing as studies show that information is better retained. However, different domains of questions, divided into diagnostic, investigation and management in this study, may be approached differently, with a possibility of generating an answer in MCQ. This study aims to investigate if the domain type can predict generation or cueing of answers in clinical reasoning MCQs.

Method: Sixteen year 4 medical students from Lee Kong Chian School of Medicine were recruited for this study. Equal number of participants were asked to answer multiple-choice and open-ended versions of the same 23 questions. Eye-tracking and concurrent think-aloud methods were used to determine if an answer was generated or cued. Number of participants who generated answers for OEQs measures the population's knowledge of the question and serves as baseline for number of participants who can generate an answer for that question. Fewer participants who generate answers for MCQ in favour of cueing when compared to the OEQ baseline represents proportion of candidates who preferentially cue answers.

Results: For familiar diagnosis questions, a comparable number of participants per question generated answers between MCQ and OEQ. Fewer participants per question generated answers for investigation and management domains, with one exception where participants generated answers for an investigation question. Questions were also approached differently according to familiarity. Participants could not generate answers for unfamiliar questions, but were able to answer them by cues provided by MCQ.

Conclusion: Studies would suggest that MCQs are answered by the cues rather than an option being generated. This study found that this is not true for familiar questions assessing a clinical diagnosis. An outlier result in the investigation group in an ECG question also points to the possibility of such questions being approached differently.
Some MCQs are not approached as expected but rather more similarly to an OEQ. Knowing how learners approach different domains of questions will improve the efficiency of learning through assessments.

Using Automatic Item Generation based in cognitive models for medical education assessment

Authors
Paulo Marques, School of Medicine University of Minho, Braga, Portugal
José Pêgo, School of Medicine University of Minho, Braga, Portugal
Nuno Sousa, School of Medicine University of Minho, Braga, Portugal

Presenter: Paulo Marques, University of Minho, Braga, Portugal

Background: Nowadays multiple-choice items are the standard for assessment in all dimensions of medical education. Despite being an efficient validated method, the development of each item is, still, a complex and time-consuming process, and for that reason a very expensive process.
With the increasing demand for large number of multiple choice items by medical schools, the current approach to item development struggles to meet this high demand. An innovative solution to this challenge is the use of automatic item generation (AIG) to develop new multiple-choice items.
AIG uses computer technology to generate new questions based in cognitive and item models, created by content specialists.
Method: To validate AIG as an assessment method, a prototype was created (with a cognitive model, an item model and the necessary software), that is capable of generate multiple-choice items with a correct answer and 3 distractors to assess the knowledge in hypertension diagnose, classification and treatment. Afterwards a pilot test with 42 medical students was made, with 50% of both AIG and items developed with the classical approach. After each item, the student had to identify the method of development of the item (AIG vs human generated).
Results: The students had results in both types of items with no significant differences, we also concluded that the students weren't capable of effectively identify an item generated by our software ($\chi2$ (1, n = 420) = .298, p = .585).
Conclusion: AIG is a relatively new and unknown technology, that requires a lot of development and further validation, but, with no doubt, it will be a technology that will shape the future of item development in medical education.

Medical students' performance in early written assessments as a predictor of global academic achievement

Authors
Núria Mascarenhas
Nuno Santos
Nuno Sousa
José Miguel Pêgo

Presenter: Núria Mascarenhas, Life and Health Sciences Research Institute (ICVS), School of Medicine, University of Minho, Braga, Portugal

Background: Higher education students are subjected to several stressful events, namely assessment tasks, during their academic years. Research suggests that stress and anxiety are major causes of cognitive dysfunction, resulting in poor academic performance.
To test the hypothesis that Medical Students' performance' in early written assessments is a predictor of global academic achievement.
To determine the ideal time-points/moments to intervene in order to prevent stress collateral effects.
Method: The electronic register (medQuizz®) of 96 students' assessment (from 1st to 3rd curricular year of study) was analyzed.
Students were grouped in quartiles according to their score on each specific exam. Then they were grouped in quartiles according to their average grade of the first 3 years of study. The variation of grades and quartiles of score were evaluated for each assessment. Repeated Measures Anova was performed to verify whether there were any statistical differences between the average position in each quartile (for every exam). Linear Regression was performed between the average score of the 1st year and the average score of the following years.
Results: There is a variation of grades and quartiles of score, with no clear distinction between quartiles on the 1st year, mainly amongst the middle scorers (Q2; Q3). A constancy of quartile score positioning was verified on the 2nd and 3rd year. The introduction of new curricular units is related with a marked decrease of the academic performance in every quartile of score. There is a differentiated recovery of the quartiles. Grouping the students by decile of scores showed that within each quartile there are subgroups with different behaviors. 81% (r2=0,810) of the triannual average score is predicted by average score of the first year of studies. The intervention potential depends on the student and time-point, in question.
Conclusion: By grouping the students in decile or score percentiles, one should consider the development of developmental potential curves and an anti-stress program.

Assessment of Prescribing Skills using SBA and VSA questions

Authors
Amir Sam, Medical Education Research Unit, Imperial College London, London, UK
Chee Yeen Fung, Medical Education Research Unit, Imperial College London, London, UK
Colin Melville, General Medical Council, London, UK.
Karim Meeran, Medical Education Research Unit, Imperial College London, London, UK

Presenter: Chee Yeen Fung, Imperial College London, UK

Background: Prescribing is a key clinical competency and is largely assessed in the Single Best Answer (SBA) questions or practical examination stations in UK finals examinations. SBA questions allow efficient sampling of the curriculum, but do not assess the student's ability to prescribe. Conversely, practical exams can assess prescribing skills, but often only cover a limited sample of the curriculum. The Very Short Answer (VSA) format using automated marking, may allow efficient assessment of undergraduate prescribing skills.
Method: Year 3 medical students participated in two formative prescribing assessments via an online platform. The first comprised of 20 VSA questions where students had to write a prescription, and the second contained the same questions in an SBA format, where they selected the most appropriate prescription. Students had access to the British National Formulary for both tests. Both the VSA and SBA assessments were computer-marked and the scores were verified by an examiner. In the VSA, students had to get all components parts of the prescription correct in order to gain the mark.
Results: 246 students participated in the study. There was a moderate correlation between the VSA and the SBA results (r = 0.651, p <0.0001). Students performed significantly better on the SBA questions than the VSA questions (mean = 58.37% and 30.56% respectively, p <0.0001). Of the incorrect responses submitted in the VSA, 58% were due to students prescribing an incorrect drug, 10% were due to prescribing the incorrect dose and 7% were due to prescribing the incorrect frequency. The average marking time for each VSA question was 3 minutes 8 seconds for all 246 students.
A significant proportion of students were unable to prescribe correctly, despite being able to select the most appropriate prescription from a list of possible responses. The VSA format highlights an important and inherent weakness of the SBA format in terms of generating a prescription.
Conclusion: Assessing prescribing skills in the VSA format using automated marking with examiner verification allows effective assessment of the ability to write a prescription across a wide sample of the curriculum.

Writing Multiple Choice Questions based on Bloom's Taxonomy: the Answer is in the student approach

Authors
Sally A Santen
Seetha Monrad
Josh Kurtz
Andrea Tai
Karri Grob
Nikki Zaidi

Presenter: Sally Santen, Virginia Commonwealth School of Medicine, Richmond, VA, USA

Background: Multiple choice questions (MCQs) remain the most frequently used method to assess student learning in medical school. It is generally believed that well-written MCQs require examinees to engage higher levels of cognitive reasoning such as application or synthesis of knowledge. The purpose of this study was to describe the variation in student approaches to answering MCQs, and how it affected their Bloom's categorizations of MCQs as lower order or higher order.
Method: We invited five students to review MCQs from preclerkship exams and 1) determine if the questions were higher- or lower-order and 2) to discuss the cognitive processes they used to answer each MCQ, while reflecting upon how these processes led to their Bloom's categorizations.
Results: Consistency among our five students to categorize the questions as higher- or lower-order over 90 exam items was low (Krippendorf's alpha= .37; CI= .18-.54). meaning that for any given question, some students approached the question as a lower-order task (knowledge and comprehension), while other students worked through the problem as a higher-order task (application, analysis, synthesis, and evaluation). There were four themes that affected the variability:1) Pedagogy: The manner in which the material was taught and the students learned the material;2) Student Confidence with Material: When students were confident in their ability to correctly answer an item, they consistently classified those items as lower-order; 3) Images and Graphs: Students felt that if a MCQ included an image which had been previously shown in lecture, it should be considered a lower-order item; and 4) Question Format: vignette items were generally considered higher-order, so long as the question could not be answered by reading the question stem alone.
Conclusion: Our findings suggest that many factors influence the examinees' experience and therefore, examinees' cognitive approach to answering MCQs. The question remains whether Bloom's can be objectively and consistently applied when categorizing MCQs depending on the faculty's and students' approach to learning and testing.

4EE9 (67)
Analysis of Question-Text Complexity for Equality Monitoring

Authors
Daniel Zahra
Steven A. Burr

Presenter: Daniel Zahra, Plymouth University Peninsula Schools of Medicine and Dentistry, Plymouth, UK

Background: To explore the utility and feasibility of text-analysis for evaluating the impact of question complexity, indexed by measures such as word count, sentence length, and readability, on student performance on single-best-answer multiple-choice medical knowledge questions.
Method: Vignette and question text from single-best-answer multiple-choice questions (MCQs) used in summative assessments of first-year Bachelor of Medicine / Bachelor of Surgery applied medical knowledge were pooled. The text of each question was then analysed using both Microsoft Word's native readability statistics calculator and the koRpus text-analysis package in R to create markers of complexity for each question. These included word count, number of sentences, average number of words per sentence, Flesch Reading Ease, and Flesch-Kincaid grade level. These indices were correlated with mean item scores for entire cohorts and demographic subgroups within cohorts.
Results: Analysis using koRpus proved robust and reliable, and produced complexity measures comparable to those calculated by Microsoft Word. No consistent statistically significant relationships were found between indices of complexity and item performance overall or for demographic sub-groups, but the methods show promise as a means of routinely analysing and monitoring this potential cause of variation in assessment performance at the student and demographic sub-group level.
Conclusion: Given the potential impact of question complexity and other linguistic features on item performance, it would seem beneficial to incorporate some degree of standardisation or review of these when constructing MCQ assessments. The current work compared two different methods of assessing these properties, and found that readily available tools such as Microsoft Word provide comparable information to specialist software, enabling this level of scrutiny to be incorporated easily into routine practice. Furthermore, the application of such text analysis techniques may help institutions understand demographic variation where they find it, or rule out one possible cause thereof.

4EE11 (2477)
Multiple choice question writing as a remediation strategy

Authors
Scott Compton, Duke-NUS Medical School, Singapore
Irene Lee, Duke-NUS Medical School, Singapore
SiangHui Lai, Duke-NUS Medical School, Singapore

Presenter: Scott Compton, Duke-NUS Medical School, Singapore

Background: This pilot project addresses a universally important question in education: What are effective and efficient strategies for remediating learners once a specific deficit in content knowledge has been identified?
Method: This is a pilot study testing the feasibility of a proposed intervention that consists of writing multiple choice questions (MCQs), correct answers, distractor responses, and associated explanations as a remediation process for addressing specific deficits in content knowledge. The MCQ intervention was chosen as a means to promote student engagement with content using higher-order cognitive processes, ensuring students made comparisons and contrasts between similar constructs, which, in turn, assists students to mentally construct representations of information in context with prior knowledge.
We conducted a randomized, pretest-posttest control group study of medical students studying for the USMLE Step 2CK to investigate the feasibility of an MCQ writing intervention as a remediation strategy. We specified the following outcomes to be considered as evidence (for or against) the feasibility of conducting the intervention on a broad scale: 1) student compliance with the MCQ protocol, and 2) differences between intervention and control group students' gain-scores on assigned remediation-identified subsections of the Comprehensive Clinical Science Examination (CCSE) taken 3 weeks apart.
Results: Of 13 students allocated to the MCQ intervention, 9 (69.2%) were compliant with the protocol. In aggregate, they contributed 65 questions. In an intention-to-treat analysis, the mean gain-score on remediation subsections of the CCSE between MCQ and control group (n=14) students was 88.2 versus 101.0 (p=0.298), respectively. Yielding results to an as-treated analysis yielded mean gain-scores of 77.9 versus 103.3 (p=0.046), similarly. Insufficient evidence was established to warrant the large-scale implementation of a remediation strategy based on writing MCQs to enhance clinical knowledge test performance. Further investigation is continuing to better understand the student experience and to control for potential confounding factors.
Conclusion: Writing MCQs may not be an effective remediation strategy for improving test performance on broad-based clinical knowledge topics.

4EE12 (2611)

Open book examination and its effectiveness compared with traditional-style closed book examination in stroke rehabilitation medicine course for medical students: randomized controlled trials

Authors

Anon Sathapornsathid, Medical Education Center Ratchaburi Hospital, Ratchaburi, Thailand
Nikom Malitong, Medical Education Center Ratchaburi Hospital, Ratchaburi, Thailand

Presenter: Anon Sathapornsathid, Medical Education Center Ratchaburi Hospital, Ratchaburi, Thailand

Background: Open book examination is assessment method that test medical students's ability to find and use information for problem solving thus encouraging high-order thinking skill. However; Open book examination has never been used with medical students at Ratchaburi Hospital before.

Method: 26 fourth year medical students received the reference paper to study before class. In classroom, the instructor will give interactive lecture that encourage the student to discuss about content, interesting case, practical point and new research on stroke rehabilitation. After class, students were divided into 2 groups of 13 by randomization. First group was tested with open book examination, the second group with closed book examination. Questions were the same in both groups focus on clinical application, also questionnaire for student opinion about open and closed book examination and preference.

Results: Students in open book exam group received a better score in examination than closed book group (71.7% vs. 62.4%, P< 0.05), but students prefer traditional closed book examination (61% vs. 39%). From opinion, many students think that doctor can not open book in most of actual working time so closed book examination is still essential. Open book examination is suitable for analysis of more complicated case that require critical thinking skill. For both type of examination, student have to study and memorise some important information to apply it effectively. Open book can be used to promote student ability to find and use information for problem solving and delivering well-structured solutions. But closed book examination to assess what medical student have learned without additional resources is still important.

Conclusion: Student in open book examination group receives better score in examination focus on clinical application but most of medical students still prefer closed book examination.

Take-home message: Medical education center should consider the use of open book examination together with the traditional closed book examination for medical student to have more confidence to apply knowledge with patients.

Comparing the use of Modified Angoff and Cohen Methods in Standard Setting of High-Stakes Graduating Examinations

Authors

Michael SH Wan, University of Notre Dame, Sydney, Australia
Joel Rhee, University of Notre Dame, Sydney, Australia

Presenter: Michael SH Wan, School of Medicine, University of Notre Dame, Sydney, Australia

Background: Both modified Angoff and Cohen methods have been used to set the pass mark of the Multiple Choice Questions (MCQ) examinations. Angoff methods are labour intensive and Cohen method is relatively simple to apply. We compared these standard setting methods in the final year high-stakes examinations of the graduate-entry Medical Program.

Method: In 2016 and 2017, cohorts of final year medical students, comprising of 120 students each year, sat the 110-item MCQ paper as part of their year-end summative examinations. A multi-disciplinary panel of clinicians set the pass marks for the papers using the modified Angoff method. The modified Cohen mark was calculated according to the cohort's performance scores.

Results: Pass marks derived from the modified Angoff method for the 2016 & 2017 cohorts were 51.6% and 50.5% respectively. The modified Cohen mark was calculated at 60% of the 95th percentile of each student cohort, corrected for guessing. The Cohen pass marks for the 2016 & 2017 cohorts were 51.5% and 53.8% respectively.

Conclusion: Modified Cohen methods using the cohort performance scores calculated at 60% of the 95th percentile gave very similar pass marks as the modified Angoff method in the high-stakes summative MCQ examinations. This is an encouraging finding. As modified Cohen method requires only simple calculation post examination, this might be a more efficient method in standard setting of high-stake examinations.

Take-home message: Modified Cohen method could be used in high-stakes summative examination to set the pass mark of written MCQ papers. Past cohorts data could be used to verify this method compared to any current standard setting methods.

4EE15 (1229)
Statistical modeling allows analysis of factors impacting student performance on the USMLE Step 1 examination

Authors
Robert G. Carroll, Brody School of Medicine at East Carolina University, Greenville NC, USA
Anne C. Carroll, American Dental Association, Chicago, IL, USA

Presenter: Robert Carroll, Brody School of Medicine at East Carolina Univeristy, Greenville NC, USA

Background: Passing the USMLE Step 1 examination is required to practice medicine in the USA. Performance on this examination is multifactorial, making advising students for preparation strategies and analysis of their performance challenging.

Method: A multivariate equation incorporating academic performance of the BSOM Classes of 2015, 2016 and 2017 was developed and used to prospectively calculate a 'projected' USMLE Step 1 score for the Classes of 2018 and 2019 (testing dates summer 2016 and 2017). Data included performance on 4 NBME Subject examinations (Physiology, Microbiology, Introduction to Clinical Diagnosis and Pathology) a Comprehensive Basic Science Exam and course examinations in the pre-clerkship years. Variables were examined for multicolinearity. Actual USMLE Step 1 scores for the Class of 2018 (N = 73) and Class of 2019 (N = 78) were compared to the 'projected' scores.

Results: Correlation of the actual and the projected Step 1 scores was 0.87 (P < 0.05) for the class of 2018 with predicted performance within 5 points for 48% of the class, and within 10 points for 72% of the class. For the class of 2018, the correlation was 0.86 (P < 0.05), 42% of the class scoring within 5 points and 71% of the class scoring within 10 points. Six weeks of preparation yielded the best outcomes, as less than 6 weeks resulted in a score 4 points lower than projected, and 6 and 7 weeks of study both resulted in a score 1 point lower than projected expected. There was no difference in performance between students using commercial board preparation course and a self-directed study approach.

The multivariate equation allowed a successful prediction of our student's performance on the USMLE Step 1 examination. For our students, 6 weeks of preparation yielded the best outcome. Students using a commercial board preparation course did not perform any differently than students using a question-driven self-directed approach.

Conclusion: Statistical modeling approaches can predict student performance on the USMLE Step 1 examination with good accuracy, allowing better advising of students preparing for this examination.

4EE16 (659)
The Journey to STEP 1: A Preparation Mindset

Authors
Sonya Ford, American University of Antigua College of Medicine, Coolidge, Antigua

Presenter: Sonya Ford, American University of Antigua College of Medicine, Coolidge, Antigua

Background: The American University of Antigua College of Medicine's mission is to provide students who would otherwise be unable to receive a medical education with the tools to become successful physicians. One tool provided assists students in preparing for their Comprehensive Basic Science Examination (CBSE) and STEP 1 examination. The American College of Physicians (2017) says, "It is essential to be prepared both physically and mentally for the examination" (page 1). The lack of adequate preparation, study habits, and time management affects examination results of medical students. Although students learn differently, focusing on effective study strategies, time management, self-testing, and self-regulated learning influences academic performance on examinations (Stegers-Jager, Cohen-Schotanus, & Themmen, 2012; Ferguson, James, & Madeley, 2002; West, Kurz, Smith, & Graham, 2014). As such a comprehensive Action Plan program was developed.

Method: Students utilizing the Action Plan were referred to the program through the Appeals Committee, faculty, or self-referrals. The Action Plan was designed to create a preparation mindset assisting students preparing to sit for their examinations. Developing this plan involved assisting students with: (1) becoming active self-regulated learners, (2) using minimal, but appropriate resources, (3) understanding how disciplines are integrated into systems, (4) recognizing strengths and weaknesses, (5) practicing multiple-choice questions (MCQs) to validate content mastery, and (6) developing a time management/study plan.

Results: From Fall 2016 to Spring 2018, participation in this voluntary program increased from thirty-seven percent (37%) to sixty-three percent (63%). Of students utilizing the Action Plan who sat for their examinations, sixty-six percent (66%) passed Step 1 examination and eighty-two percent (82%) passed CBSE.

This program showed that student internal motivation, along with following an individualized preparation plan, enhances student potential to pass examinations.

Conclusion: There appears to be a correlation between the preparation plan focusing on self-regulated learning/practicing MCQs/time management and examination outcomes.

Students who become active self-regulated learners, use minimal, but appropriate resources, understand how disciplines are integrated into systems, recognize their strengths and weaknesses, practice MCQs to validate content mastery, and develop a time management/study plan are more effective in improving their examination performance.

4FF: Posters: Anatomy/Ultrasound

Location: Hall 4.1, CCB
Date: Monday 27th August
Time: 1400-1530 hrs

Students' perceptions of drawing as a tool to learn anatomy and histology

Authors
Maarit Hölttä-Vuori, University of Helsinki, Medical Faculty, Dept. of Anatomy, Helsinki, Finland
Matti Airaksinen, University of Helsinki, Medical Faculty, Dept. of Anatomy, Helsinki, Finland
Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Helsinki, Finland

Presenter: Maarit Hölttä-Vuori, University of Helsinki, Medical Faculty, Dept. of Anatomy, Helsinki, Finland

Background: Students need effective learning strategies in medical studies. At the University of Helsinki, students are delivered iPads and they take notes digitally. Learning by drawing is important in learning anatomy and histology. While drawing, students process and integrate information into personal representations. The aims of this study were to explore (1) How students perceived learning by drawing in histology and anatomy, (2) What was their position in increasing drawing assignments.
Method: The data were collected in 2018 with an online questionnaire sent to the first and second year medical and dental students. The response rates were 54% (1st year) and 58% (2nd year), altogether 227 answers. We asked students how much they used drawing as a tool and which drawing methods they employed in studying histology and anatomy. We further inquired their views of drawing tasks in examinations and teaching activities and whether drawing should be practiced.
Results: Majority (>70%) of the students reported they used drawing as a learning tool for studying anatomy and histology often or sometimes. The traditional pen and paper method was the most commonly employed, despite having iPads. Drawing assignments in examinations were positively perceived. Only 15% of the students considered them unnecessary. Half of the respondents wished that teachers would draw more, and that drawing should be practiced during the courses.
Drawing was a widely employed learning strategy in anatomy and histology. Drawing tasks in examinations were considered useful. Digitalization has had little effect on the drawing method, as the pen and paper were reported as the most common drawing tools. It is noteworthy that half of the students expressed a wish for the teacher to draw more and to have more practice on drawing. This indicates that including drawing assignments in anatomy and histology course design would be beneficial.
Conclusion: First and second year medical and dental students widely use drawing as a tool for studying anatomy and histology. Both students and teachers should practice drawing in teaching and learning activities and assignments.

Take-home message: A picture is worth more than a thousand words.

Implementation of transition course to dissecting room: a step towards introducing "Principles of professional behaviors and respect to cadavers" to fresh medical students

Authors
Mahboobeh Khabaz Mafinejad, Tehran University of Medical Sciences, Tehran, Iran
Mohammad Taherahmady, Tehran University of Medical Sciences, Tehran, Iran
Fariba Asghari, Tehran University of Medical Sciences, Tehran, Iran
Gholamhossein Hassanzadeh, Tehran University of Medical Sciences, Tehran, Iran
Saeedreza Mehrpour, Tehran University of Medical Sciences, Tehran, Iran
Kobra Mehran Nia, Tehran University of Medical Sciences, Tehran, Iran
Ali Ganjizadeh, Tehran University of Medical Sciences, Tehran, Iran

Presenter: Mahboobeh Khabaz Mafinejad, Tehran University of Medical Sciences, Tehran, Iran

Background: Despite the importance of cadaveric dissection in teaching medical students, it has always been associated with many challenges, including concerns about the incidence of non-professional behaviors in fresh students. The transition course to the dissecting room was conducted to facilitate the adaptation of medical students to deal with the cadaver.
Method: The program was designed by conducting several meetings with experts from various fields of anatomy, medical ethics, and medical education, as well as reviewing literature. The program began with an initial explanation of the program objectives. After showing the film, points related to principles of ethical and professional behavior related to the presence in dissecting room were discussed and analyzed by experts. In order to provide an opportunity to contemplate students' views, some of the experiences and opinions of the students participating in the program were presented and reflected. At the end, a valid and reliable questionnaire (r=0.89) was completed.
Results: Of the 193 questionnaires distributed, 129 were filled; mean age 18.15 years, 49.2% female. In general, 93.8% of students believed that the program provided a good opportunity to think and reflect on the principles of professional behavior in cadaveric dissection. 89.9% of students acknowledged that the program had been effective in increasing their motives to respect those who donated their bodies to science. In addition, the results of the survey showed that 92.2% of the students believed that they would use the acquired ethical points of this program in the future.
Findings indicate that it is necessary to describe the principles and rules of professional behavior in the dissection sessions for fresh medical students. In other studies, it is also pointed that it is important and necessary to hold sessions to prepare students to deal with the

cadaver. Another study showed that the majority of students believed preparation sessions were very effective to overcome psychosocial issues.

Conclusion: Transition course to the dissecting room could change fresh medical students' attitudes regarding observance ethical and professional behavior related to the presence in dissecting rooms.

4FF3 (1882)
Three-dimensional Printed and Virtual Airway Models Enhance Knowledge Acquisition and Learning Experience: A Randomised Controlled Study

Authors
Brian Ho Han Khai, Lee Kong Chian School of Medicine, Singapore
Gerald Tan Jit Shen, Tan Tock Seng Hospital, Singapore
Sreenivasulu Reddy Mogali, Lee Kong Chian School of Medicine, Singapore

Presenter: Brian Ho Han Khai, Lee Kong Chian School of Medicine, Singapore

Background: Anatomy curricula in modern medicine have advanced beyond rote identification of structures, with a focus toward clinically significant anatomical relations and applied knowledge of anatomy. Concurrently, the pedagogy has also evolved to feature three-dimensional (3D) printing and virtual 3D models as innovative educational modalities for anatomy. The use of these modalities are currently in evaluation for their ability to deliver content efficiently, balance academic performance from different learners, and optimize the learning experience. Our study evaluated both of 3D printed and 3D virtual models in teaching segmental anatomy of the tracheobronchial tree to undergraduate medical students.

Method: We developed airway models using multi-material 3D printing of segmented airways from human thoracic computed tomography scans. A double-blinded randomized controlled study compared knowledge acquisition with 3D printed models (3DP), 3D virtual models (3DV) and 2D atlas printouts (2D); this was followed by a subjective learning experience survey.

Results: Thirty-one medical students participated (21 males, 10 females). Between-groups and between-sexes differences in test scores were observed ($p<0.09$). Females in the 3DV condition were found disadvantaged relative to females in 3DP ($p<0.05$) and males in the same (3DV) condition ($p<0.05$). Learning experience was rated better using 3DP ($p<0.001$) and 3DV ($p<0.01$) compared to 2D conditions.

We have developed a multi-material 3D printed airway model and evaluated its use in anatomy teaching. The results suggest that the 3D printed models improved academic performance relative to traditional atlas models (2D) without disadvantaging female learners, as was the case for 3D virtual models. Learning experience in both 3D modalities was found superior to the 2D modality. These findings support the inclusion of 3D modalities, especially 3D printing, in the modern anatomy classroom.

Conclusion: 3D modalities enrich anatomy learning beyond the reach of an atlas, both in terms of knowledge acquisition and learning experience.

4FF4 (1621)
Augmented Reality Anatomy: exploring the use of Augmented Reality in the teaching of anatomy in medical schools

Authors
Shi Min Sophia Wong, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore
Peng Huat Eric Yap, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore

Presenter: Shi Min Sophia Wong, Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore

Background: The time dedicated to teaching anatomy has been decreasing in medical schools worldwide, causing tangible negative effects in the medical sphere. Various innovations in teaching have been developed to combat this, among them the use of Augmented Reality (AR). AR consists of virtual elements superimposed on our physical environment. Current anatomy AR applications, however, mostly detect a 2D image to trigger off the 3D virtual overlay. A more revolutionary application of AR would involve virtual overlays on 3D specimens: useful in the study of anatomy, in which 3D visualisation is key.

Method: An AR for teaching anatomy was developed using the free AR creation platform, HP Reveal. This AR programme was then compared against Virtual Reality (VR) and traditional anatomy teaching methods in an evaluation study involving junior medical students who have yet to learn anatomy, and senior students who were revising anatomy.

Results: T-tests showed no significant difference in the effectiveness of AR and VR in teaching or revising anatomy, and in imparting knowledge of both the Head & Neck and Heart anatomy, with the former considered more complicated and the latter, simple. Survey questions revealed that students' opinions of AR and VR compared to traditional teaching methods were mixed. Students perceived VR to be more user-friendly, and hence generally preferred over AR for anatomy education. However, students liked the use of physical anatomical specimens in AR, as it allowed interaction with the specimen, and observation of fine, realistic details of anatomical structures.

Conclusion: The lack of any significant difference found regarding the effectiveness of AR and VR suggests that, with further development of the AR to become more user-friendly, AR has the potential to become a more effective teaching tool than VR. Continuing work on this project should include comparing the effectiveness of traditional teaching methods against AR and VR. The AR creation process should also be automated, and the AR programmed to be able to work with any specimen of the same organ.

Take-home message: AR is a fast developing field, and future advances in the technology will make this possible.

Exploring medical students' attitudes towards anatomy teaching

Authors
Daniel Sims, Brighton & Sussex Medical School, Brighton, UK
Claire Smith, Brighton & Sussex Medical School, Brighton, UK
Jim Price, Brighton & Sussex Medical School, Brighton, UK

Presenter: Daniel Sims, Brighton & Sussex Medical School, Brighton, UK

Background: Anatomy remains a core component of all undergraduate medicine programmes and consists of a multi-modal approach to teaching. However, anatomy curricula at various medical schools differ and employ varying approaches to anatomy teaching. Quantitative research has been conducted to demonstrate the superiority of one approach over another in terms of exam results and depth of understanding. But little research has been conducted into how medical students prefer to be taught anatomy and whether there are common themes in attitudes held by medical students about the individual teaching approaches.
This study aimed to determine whether there are any common themes regarding medical students' attitudes towards the various teaching approaches in anatomy teaching, and whether these attitudes differ at varying stages of the medical degree and between different UK medical schools.
Method: This study used a mixed methods approach. The aim was to carry out three focus groups at each of the participating medical schools; one focus group each for first years, second years and final years. The results of the focus groups were analysed thematically and went on to guide the development of the 'Attitudes in Anatomy' questionnaire, which drew on ideas used in the 'Anatomy Learning Experience (ALE)' questionnaire. The questionnaire provided a quantitative insight into the differences, if any, of attitudes of medical students towards teaching approaches in anatomy. Comparisons between the teaching approaches, year groups and the four participating medical schools were collected and analysed.
Results: Results from the focus groups and questionnaire will be presented at the conference.
Studies have suggested that those who develop the anatomy curricula and those who are the primary learners from the same curricula may have conflicting attitudes and perspectives about what constitutes the best approach to teaching this core subject.
Conclusion: It is hoped these results will be able to inform possible changes to undergraduate medical school anatomy curricula.

Anatomy Education In Nigeria: The Viewpoints of Medical Students

Authors
Auwal Ahmed Musa, Usmanu Danfodiyo University, Sokoto, Nigeria
Abdullahi D. Zagga, Usmanu Danfodiyo University, Sokoto, Nigeria
Rilwanu Bello, Usmanu Danfodiyo University, Sokoto, Nigeria

Presenter: Auwal Ahmed Musa, Usmanu Danfodiyo University, Sokoto, Nigeria

Background: Adequate knowledge of anatomy is indispensable in diagnosis, interpretation of radiological investigations and safe treatment of patients. There are arguments about dissection and its significance, best methods of teaching and learning anatomy, time allocated to teaching anatomy and the nature of anatomy curriculum. Since students are at the receiving end in anatomy education, knowing their views on anatomy education can help in the design of anatomy curriculum and its teaching. There is paucity of data in Nigeria concerning the views of medical students about anatomy.
Method: This is a cross sectional study that assessed the viewpoints of medical students on anatomy as a course, dissection, methods of learning and teaching of anatomy and its method of assessment. Anatomy has a good outlook with our students, although very few among them are willing to take up a career in anatomy. Our students are seriously lagging behind in newer methods of learning anatomy. Mentoring improves students performance and interest in anatomy.
Results: Majority of the students (83.4%) enjoy anatomy course. Only 28.2% of our respondents are willing to consider anatomy as a career. Overwhelming majority of our respondents believe that dissection sessions are important avenues of teaching and learning anatomy. However, despite the popularity of the internet with students, only 39.9% of our students use it as a tool in learning and understanding anatomy. 93.3% of the respondents agree that the newly introduced mentoring programme in the department is very helpful in their learning and understanding of anatomy.
Students consider anatomy as an important subject in medical training.They agree that dissection is an important avenue of learning and teaching anatomy. There is need to increase students' interest in career in anatomy by providing mentoring programmes in Anatomy departments as only 28.2% of our respondents are willing to consider anatomy as a career. Students should be encouraged to embrace new methods of learning anatomy.
Conclusion: Students need to embrace newer methods of learning anatomy and even with the shortage of anatomy teachers, very few students are willing to take up a career in anatomy.

Stripping for anatomy: Student attitudes on the use of ultrasound in pre-clinical medical education

Authors
C Smith
A Sharp
A Dilley

Presenter: Claire Smith, University of Sussex, Brighton, UK

Background: Living anatomy with ultrasound imaging has been taught in pre-clinical medical education at Brighton and Sussex Medical School (BSMS) for several years. Handheld ultrasound is used increasingly in clinical practice and clinicians consider it important to incorporate it into early medical education. Quantitative studies have shown its value amongst medical students, however qualitative studies of student views are missing from the literature.
Method: This study set out to determine student attitudes towards living anatomy with ultrasound. At BSMS each system based module has at least one ultrasound session which is taught by faculty and anatomy demonstrators. Second, third and fourth year medical students accustomed to ultrasound anatomy teaching were invited to audio-recorded focus groups facilitated by an anatomy demonstrator. Thirteen students attended the groups. The focus groups were approved by the Research Governance and Ethics Committee at BSMS. The students gave informed consent for participation in the study. The focus groups were transcribed and analysed using thematic coding.
Results: The main themes that emerged included feelings around undressing for learning, incidental pathological findings, and transabdominal pelvic ultrasound. Themes extracted from the transcribed audio revealed an acceptable expectation that the students would undress for the sessions, frustration at those who routinely refused to undress (except for religious reasons), pressure on males to be the model (sometimes to the detriment of their education), body image worries in females and no concerns of finding pathology. Transabdominal pelvic ultrasound was acceptable to all students; the main concern being an incidentally discovered pregnancy. The findings support stronger implementation of the expectation that every student will be the ultrasound model and inclusion of pelvic ultrasound in the curriculum. The findings also recommend for a longitudinal implementation of ultrasound throughout medical education.
Conclusion: In summary, students value living anatomy and ultrasound but feel they are missing out when being the model.

4FF10 (477)
Interinstitutional Point-Of-Care Ultrasound Workshop for Enhancing Performance Capacity: Learners' perspective

Authors
Jirapa Chansangrat
Nattawut Keeratibharat

Presenter: Jirapa Chansangrat, Suranaree University of Technology, Nakhonratchasima, Thailand

Background: Point-of-care ultrasound (POCUS) is well recognized as a useful tool, a guidance for diagnosis and management decision-making in emergency setting. Due to lack of confidence in diagnosis and training experience in ultrasound, the utilization is under expected.
This study was to evaluate outcome of interstitutional POCUS workshop.
Method: Firstly, we used questionnaire to evaluate the participants about previous ultrasound experience and their perspective of POCUS course. We provided a one-day POCUS workshop, including lecture and hand on sections. The outcome was real cases discussion, which the participants encountered and performed POCUS. Each cases were validated and discussed with the POCUS instructor at ER department.
Results: There were 35 participants, age between 25-31 years. 85.7% of them indicate frequent need of POCUS. 94.3% of them reveal lack of experience in POCUS, since medical training and after graduation. All of them noticed gaining more confidence after attend the workshop. 100% of the participants suggest the course should be taken since undergraduate.
7 cases were discussed. For example, a case with RUQ abdominal pain. The POCUS was performed by one of the participant, an ER doctor, revealed a gallstone and questionable thickened gallbladder, correlated with information provided from the workshop.
The findings leaded to suspicious diagnosis of acute cholecystitis. The images were reviewed and discussed at the ER department, showed subcostal approach of the ultrasound transducer, probably the cause of difficulty in measuring the gallbladder wall. The approach was adjusted and the diagnosis of acute cholecystitis was made confidencially. The operation performed few hours later confirmed the diagnosis.
Conclusion: These findings present value of POCUS training, which helps diagnosis and management in emergency setting.
POCUS is a worthwhile procedure, frequently used after graduation. Adding POCUS in the undergraduate curriculum might be helpful.

4FF11 (3543)
Developing an objective assessment of medical students' ultrasonography skills early in the Curriculum

Authors
Ayad Al-Moslih, Qatar University, Doha, Qatar
Aftab Azad, Hamad General Hospital, Doha, Qatar
Khalid Bashir, Hamad General Hospital, Doha, Qatar
Alison Carr, Qatar University, Doha, Qatar

Presenter: Aftab Azad, Hamad Medical Corporation (HMC), Doha, Qatar

Background: A few medical schools in the Middle East have started teaching ultrasonography (US). Medical schools in Europe and America have been introducing ultrasonography earlier in the curriculum over the past decade. Designing assessment for such skills is a challenge when the taught competences are tailored to serve a new paradigm.
Method: First-year medical students at Qatar University learned ultrasonography as an adjunct to physical examination in our system-based course. They had a formative assessment during the course and summative at the end of semesters. Assessments were objective structured clinical examinations (OSCE). Evaluation of the assessment is reported here.
Results: Students, examiners, and external evaluators provided feedback. 101 of 119 students responded. 91% rated the assessed competence as fair. All examiners found students' performance to be robust. 3/4 examiners found the competence appropriate for the students' level. Evaluators highlighted strengths of the assessment encounter and provided recommendations related to training of examiners.
The OSCE checklist was based on competences aligned with the modular objectives of the curriculum. Communication, patient safety, technical skills, and interpretation were assessed. Students' feedback highlights and supports the notion of programmatic assessment and the crucial role of formative encounters as strongly recommended in assessment literature. Development of OSCE to assess US skills requires a test blueprint. Starting with a set of target competencies is crucial to the measurement of students' performance. The Value of programmatic assessment lies in the collective benefit of the different educational encounters that enhance feedback to the learners.
Conclusion: Assessment of ultrasonography skills early in the curriculum requires careful planning; to consider integration of formative occasions that follow educational encounters and precede summative assessments. Assessed constructs should align with the educational objectives and fit into the overall outcome competencies.

4FF12 (1178)
A case-based abdominal ultrasound class for German fifth-year medical students

Authors
Sabine Schneidewind, Hannover Medical School, Hannover, Germany
Philip Bintaro, Hannover Medical School, Hannover, Germany
Matthias Hofer, Heinrich-Heine-Universität Düsseldorf, Düsseldorf, Germany

Presenter: Sabine Schneidewind, Hannover Medical School, Hannover, Germany

Background: The German Catalogue of Learning Objectives (NKLM) suggests including teaching basic ultrasound skills in undergraduate medical education. In order to improve one's sonographic skills, practice as well as useful feedback of a competent teacher is needed. A crucial impeding factor is the limited availability of clinical teachers to supervise hands-on sonography classes. Furthermore, practical sonography classes usually rely on the participants to perform ultrasound on each other, thereby focusing almost entirely on physiological findings. For demonstration of pathological findings, teachers tend to rely on lectures in which the findings are presented out of the clinical context.
Method: We conceived an interactive, case-based sonography class teaching orientation, topography and typical pathological findings of the liver, gall bladder, kidneys and spleen. The class consists of two three-hour sessions with six participants per physician teacher. Each case begins with reading a clinical history and physical examination as well as laboratory results, followed by a series of screenshots of typical sonographic findings for the underlying disease. Through topographic orientation, students learn to identify the section level and to describe the pathological findings. Finally, the students reach a diagnosis through synthesis of findings in clinical presentation, laboratory and imaging.
Implementing this concept as a voluntary class for 35 students was feasible.
Results: According to preliminary data, students' confidence in their ability to identify the addressed pathological findings increased. Furthermore, students reported that orientation in a sonographic screenshot improved through repeated discussion of criteria to identify the section level.
Conclusion: Our concept might be a useful addition to sonography classes in the context of both limited resources for clinical teaching and the intention to improve students' clinical reasoning. This new concept allows students to learn about pathological sonographic findings in the realistic scenario of a clinical case, enabling them to practice their clinical reasoning skills. This concept is adaptable to larger groups and will be evaluated in a lecture format as a next step.
Take-home message: Teaching pathological sonographic findings in a case-based manner can be a useful addition to practical sonography classes.

4FF13 (2536)

Point-of-care ultrasound for Medical Education: UBI's initial experience

Authors

Eduardo Pereira, Hospital Amato Lusitano – Health Local Unit of Castelo Branco, Portugal

Assunção Vaz Patto, University of Beira Interior, Covilhã; Portugal

Miguel Castelo-Branco, University of Beira Interior, Covilhã Portugal

Presenter: Miguel Castelo-Branco, University of Beira Interior, Covilha, Portugal

Background:
Ultrasonography is today the most comprehensive of medical modalities, desired by all those involved in the different moments of the formative process, care and clinical research. The multiplicity of its applications extends from conventional comprehensive ultrasound to point-of-care ultrasound for medical teaching. The nature of its methodology allows to deepen the medical education of the basic sciences, it revalues the physical examination when being guided by image and contributes to identify great part of the pathologies. Its characteristics re-emphasize the value of the art of communicating and enhancing the patient-physician interaction.

The process of implementation of point-of-care ultrasonography for the 6th year undergraduate medical students of the University of Beira Interior is described and the interim results of the satisfaction surveys are analyzed.

Method: The students were divided into groups of 20. Each group attends a course with 20 hours, one hour dedicated to basic concepts of ultrasound and 19 hours of hands-on sessions in 4 blocks: head and neck, heart and pleuropulmonary, abdomen and genito-urinary, vascular / nervous and skeletal muscle. The course is assessed by an OSCE. We use 4 echographers and emphasise on communication and narrative observation.

Results: The students respond to an online satisfaction survey that, during an interim analysis, reveals high levels of satisfaction. Ultrasound performed by physicians who directly assist patients, deepens clinical observation, accelerates and simplifies clinical decisions, it is justified to implement medical teaching of this modality as a form of learning but also as a basic preparation for a greater differentiation during working life. We present the experimental model of ultrasound teaching to the medical students. The intensive and dedicated commitment of the teachers allows to teach the totality of students of a medical course, centered in a methodology of practical teaching. The model is well accepted by students.

Conclusion: Point-of-care ultrasound is now indispensable in modern clinical practice. Its teaching during pre-graduate training should be predominantly "hands-on", one of its objectives is the doctor-patient rapprochement through the demonstration of an examination physical and medical knowledge well structured and in depth.

4FF14 (368)

Virtual or physical? 2D or 3D? The impact of resource design on learning outcomes in veterinary anatomy and diagnostic imaging teaching

Sarah B Channon, The Royal Veterinary College, London, UK
Bethan Bryant, The Royal Veterinary College, London, UK
Fern Wilson, The Royal Veterinary College, London, UK
Sarah Nicoll, The Royal Veterinary College, London, UK
Sonya Powney, The Royal Veterinary College, London, UK
Renate Weller, The Royal Veterinary College, London, UK

Presenter: Sarah Channon, The Royal Veterinary College, London, UK

Background: Spatial understanding of anatomy is a key requirement for understanding medical images - which are essentially 2D images of 3D objects. Appropriate design and implementation of teaching methods and resources is important in terms of developing such spatial understanding and allowing students to learn to mentally apply 2D images to 3D structures and vice versa.

Summary of Work: We created a physical library of plastinated anatomical transverse sections of equine fore and hind limbs and an accompanying virtual library of matching diagnostic images (CT, MRI, ultrasound). We evaluated both resources by studying the effect of their use as part of a structured learning exercise on anatomy learning and diagnostic image interpretation. We considered the influence of student spatial ability on these outcomes. We also gathered student user feedback on the resources.

Summary of Results: The online resource is freely available via Creative Commons license for use by students and educational institutions. Our results indicate that resource type affected student learning gains in specific areas, with largest improvements in anatomical knowledge in the group using the online resource incorporating diagnostic images. 'High spatial' students appeared to benefit to a higher degree from the use of 3D physical specimens.

Discussion and Conclusions: Our results support the notion that integrating clinical relevance such as diagnostic images into anatomy teaching enhances anatomy learning outcomes. Spatial ability of students appeared to influence the degree to which a student benefitted from a particular resource. This is key in the age of personalised learning and suggests that identifying strengths and weakness in particular personal skills/attributes may assist both staff and student in the selection of appropriate resources and/or learning activities.

Take Home message: Choice of teaching method is important and 'one size' may not 'fit all' when deciding on which resources to use to support learning. A multimodal teaching approach may therefore be valuable. Staff should be mindful of ways to reduce cognitive load when students with low spatial skills are studying three dimensional structures.

Why are predictive validities of admission tests so low?

Authors
Stefan Zimmermann, UKE, Hamburg, Germany
Hubertus Meyer, UKE, Hamburg, Germany
Johanna Hissbach, UKE, Hamburg, Germany
Dietrich Klusmann, UKE, Hamburg, Germany
Wolfgang Hampe, UKE, Hamburg, Germany

Presenter: Stefan Zimmermann, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Background: Cognitive tests for admission to medical school such as the MCAT and the UKCAT are used to complement school leaving grades. However, in most studies these tests correlate poorly with study success. We analyzed the predictive validity of the German Natural Science Knowledge Test HAM-Nat for study success and the effect of its combination with school leaving grades.
Method: From 2012 to 2015 a total of 1565 medical students were enrolled at the University Medical Center Hamburg-Eppendorf (UKE). Half of them were admitted by quotas independent of admission tests ("excellent school leaving grades", "waiting list", and "foreign nation (not EU)"). The other half was selected using the HAM-Nat in which 3511 applicants participated.
Results: Within the total group of applicants the correlation between HAM-Nat and school leaving grades was virtually zero, within the group of admitted applicants it was highly negative (r=-.52) due to compensatory selection. The HAM-Nat´s relation to study success was r=.21 when school leaving grades were controlled, and r=.30 after correction for range restriction in the predictor variables. However, the simple fact of being admitted by entrance test or "excellent school leaving grades" as compared to the quotas "waiting list" and "foreign nation (not EU)" strongly predicted study success.
Discussion: The correlation between the HAM-Nat and outcome in this study is disappointingly low. We provide four possible explanations:
1. Self-selection into the pool of applicants based on self-appraisal and expectations about the test leads to a validity-effect that is not detectable with psychometrics.
2. The high selectivity causes a depletion of variance in predictor and outcome measures.
3. The need to differentiate between very good candidates provokes an overshooting test difficulty which does no longer improve predictive validity.
4. The outcome measures lacks validity.
Conclusion: The value of a test for student selection is not fully reflected in its predictive validity coefficient. The response of potential applicants to the mere existence of the test exerts a validity enhancing effect on its own. Therefore, selection tests might be underrated if judged by test-outcome-correlation alone.

4GG3 (2001)
Association of Different Medical Student Selections and Mid-term Testing in Year One of Medical School

Authors
Anant Khositseth, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand
Tantawan Awirutworakul, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand
Orapan Charooncahy, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand

Presenter: Anant Khositseth, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand

Background: Medical student selection is one of the important process in order to achieve the programme learning outcomes.
Conventionally, we select our first-year medical student through the central selection according to the high score in two sets of examination including (a) medical aptitude, ethics, and relevant thinking process (30%) along with (b) testing of basic knowledges. The top-rank score students will be enrolled in our programme. Alternatively new method of selection includes biomedical admission test (BMAT), average grade in high school, English proficiency, and multimini-interviews (MMI) was introduced to our programme.
Method: One-hundred and forty-seven first-year medical students (conventional group) were compared with 22 first-year medical students (new process group).
The entering examination scores in the conventional group was correlated with the average grade at mid-term examination, r 0.4339, p <0.0001). The results of mid-tern testing were compared in both groups. All data were shown as median and interquartile (IQR).
Results: The average grade in conventional group was not significantly different that in the new process group (3.4 (3.04 – 3.57) vs 3.47 (3.2 – 3.57). The subjects including Biology, Mathematics, Physics, Chemistry, and English were graded as A (4.0), B+ (3.5), B (3.0), C+ (2.5), C (2.0), D+ (1.5), D (1.0), and F (0). There were no significant differences in Biology [3.0 (2.5 – 3.5) vs 3.0 (2.5 – 3.5)], Mathematics [3.0 (2.5 – 3.5) vs 3 (2.5 – 3.5)] , Physics [3.0 (2.5 – 3.5) vs 3.0 (2.0 – 3.5)], and Chemistry [3.5 (3.5 – 4) vs 3.5 (3.5 – 4)]. As expected, the English score was significantly higher in the new process group [3.5 (3.5 – 4.0)] than in the conventional group [4.0 (4.0 -4.0)]. The development of the new process was intended to select the students' competencies including knowledge, inter- & intrapersonal capabilities, and critical thinking rather than the high score in knowledge. Long-term follow for the ultimate outocmes is exciting.
Knowledge testing was comparable in both groups
Conclusion: Medical selection process should not concentrate only on high score examination but other competencies is also important.

4GG4 (892)
How is first impression related to MMI-results and to OSCE- examinations two years later?

Authors
Johanna Hissbach, University Medical Center Hamburg-Eppendorf, Germany
Mirjana Knorr, University Medical Center Hamburg-Eppendorf, Germany
Janina Lackamp, University Medical Center Hamburg-Eppendorf, Germany
Dietrich Klusmann, University Medical Center Hamburg-Eppendorf, Germany
Wolfgang Hampe, University Medical Center Hamburg-Eppendorf, Germany

Presenter: Dietrich Klusmann, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Background: The first impression is a shortcut for figuring out traits like trustworthiness, dominance and competence in others. A host of social psychological studies show that first impressions emerge fast from little information and without introspection. Agreement between judges is substantial, but correlations with actual trait measures are low. In this study the proportion of variance in multiple mini-interview (MMI)-ratings explainable by the first impression of competence is estimated.
Method/Results: In an 8-station MMI for medical student selection two judges in each station answered the question "Does this applicant appear to be qualified for studying medicine?" within 30 seconds of the first encounter, subsequently they rated overall performance in the 5-minutes MMI-task. Most interesting are the cross-correlations: first impression of rater 1 with performance rating of rater 2, and vice versa, because these are only influenced by the fact that an impression rating has been made, not by within-rater dependency of the actual rating. Two outcome measures were used: OSCE stations with a psychosocial aspect and supervisor ratings based on a general practice clerkship.
First impression ratings formed a scale (α= .71), just as mean MMI-performance ratings did (α= .69). The correlation between first impression and MMI-performance was r=.46 if both ratings were made by the same rater and r=.37 if made by different raters. The correlations of both measures with two psychosocial OSCEs were about r=.20. Predictive validity of MMI-performance ratings did not improve significantly when first impression variance was controlled. Results for supervisor ratings were mixed.
Conclusion: First impressions about the qualification of applicants partly explain the consistency of the MMI-performance ratings across raters and stations. This is not an artifact of repeated measurement: Even when within-rater dependency is controlled, substantial shared variance remains. First impression information might be used for the improvement of MMI- performance ratings.
Take-home message: First impressions about the qualification of applicants are rated consistently across stations and correlate with MMI- performance ratings.

Comparing the ratings of Academic, Non-academic and Lay Person at Multiple Mini-Interview

Authors
Chew-Fei Sow
Che Siti Nurzaily Binti Abdullah
Yu Sui Chen
Verna Kar Mun Lee
Ranjit de Alwis
Allan Pau

Presenter: Chew Fei Sow, International Medical University, Kuala Lumpur, Malaysia

Background: Multiple-mini-interviews (MMI) require a large number of assessors due to the number of stations required to reach the desired reliability. Most MMI use academic as assessors. This post as a challenge to resources, cost and time. Previous study recommended using various type of assessors to increase the breadth and experience of the candidates. This study compared agreement in ratings between academic, non-academic and lay-person in assessing candidates' performance at an MMI for medical school admission.
Method: The performance of 11 candidates in 10 stations was recorded. Each station has a specific scenario to test a specific non-cognitive attribute of competent medical doctors. 10 assessors from each group then assessed the candidates individually in three different settings, using the same checklist for each station.
The Inter-rater agreement was analysed using Intraclass Correlation Coefficients (ICC) by two-way random average measure at 95% confident interval. Inter-rater agreement was done among academic, non-academic, lay-person and overall agreement of all assessors for the MMI.
Results: Academic has the highest mean score (68) with lowest standard deviation. This is followed by Non-academic (62) and Lay-person (61). The ICC of academic shows average measure of 0.79 (range 0.53-0.93). Non-academic average measure is 0.87 (range 0.70-0.96). Lay-person average measure is 0.88 (range 0.75-0.96). Overall ICC for all assessors shows an average measure of 0.95 (range 0.90-0.98).
Conclusion: The high mean score of academic indicates they are more generous in scoring compared to the other 2 groups. The low standard deviation for the academic means they mark deviations in performance quality on a finer scale than the others. The overall average of the scores for all assessors is highly reliable, suggesting that despite their apparent differences in scoring, the assessors were able to separate different level of performances. The Inter-rater agreement for academic, non-academic and lay-person shows high agreement amongst the assessors in each group regardless of the candidates. This indicates that other group of assessors besides academic, may have a role in student selections. We recommend training for calibration among them before the interviews as well as involving them in the construct of stations.

Comparison between the Multuple Mini Interviews and the conventional interview in selection of students of the Joint medical programme (between Srinakharinwirot University and University of Nottingham)

Authors

Ramida Watanapokasin
Amarin Narkwichean
Nussara Wangpitak
Nittaya Raknun
Watchareewan Thongsaard
Vince Wilson

Presenter: Ramida Watanapokasin, Srinakharinwirot University, Bangkok, Thailand

Background: The Joint Medical Programme (Srinakharinwirot University, Thailand and University of Nottingham, UK) has recruited students by direct admission since 2003. Basic medical knowledge (paper exam) and interview were used for selection process. Change from the conventional interview to multiple mini interviews (MMI) began from year entry 2016 onward. Once enrolled, the students attend the 6-month preparatory course, when they study basic science for medical for medicine I and II subjects, before commencing their preclinical study in UK.

Method: The study aims to validate the new MMI interview process against the classical interview for student admission. MMI was used to evaluate various aspects of candidate characteristics including social accountability, ethical integrity and empathy, critical and scientific thinking, communication skill, creativity and problem solving. Thirty nine students selected by conventional interview (2013-2015) and 59 students by MMI (2016-2018) were compared in term of knowledge, psychological/personality test and English ability.

Results: The results were separated into two parts, before (the entrance marks) and after the interview (post-entry marks). There was a positive correlation between pre-entry knowledge and MMI interview score $r= 0.276$, $p < 0.005$ whereas the classical interview was not. A significant improvement of the knowledge (paper exam) marks was observed in the MMI when compared to the conventional interview ($p<0.001$). The post-entry basic medical science knowledge assessed in the preparatory course was similar between both conventional and MMI cohorts. Psychological/personality test regarding emotional quotient, human relationship, responsibility, reasoning and resilience showed no significant difference. This study is beneficial to review the admission process of the Joint medical programme which is very crucial part of the programme evaluation. Overall, the student knowledge and personality was similar following the change to MMI. All students had the IELTS score higher than 7.

Conclusion: The MMI significantly correlates with pre-entry knowledge and learning skills of the students. The MMI measures different characteristics of students and is less stressful as compared to the conventional interview.

Comparison of marks in a national examination of high school students with their academic achievement at the end of a medical course in a PBL curriculum

Authors

Reinaldo Bestetti
Lucélio Couto
Milton Faria-Jr
Carolina Porto
Carmen Lopes
Alícia Ribeiro

Presenter: Reinaldo Bestetti, University of Ribeirão Preto, Brazil

Background: The National Examination of high school students (NEHS) assesses the quality of high school teaching in Brazil. Students may use the marks obtained in NEHS along with those obtained in entrance tests to enter a medical course. The academic achievement in terms of cognition, abilities, and attitudes of students at the end of the medical course who used the marks obtained in NEHS in comparison with students who only took the entrance test is unknown.

Method: We compared the marks obtained in the NEHS (n=9) with those obtained in the Organized Structured Clinical Examination (OSCE), the marks obtained in the Progress Testing (PT), and the mean marks obtained in the disciplines of the clerkship at the 12th stage of the medical course at UNAERP (n=45).

Results: The mean marks in the disciplines of the clerkship was $7 ± 0,31$ for students who used NEHS marks, and $7.3 ± 0.41$ for those who did not (p=0.042). No difference was observed regarding the mean marks in the OSCE and in the PT in the students who used the NEHS marks in comparison with those who only took the marks of the entrance test.

Conclusion: Students who used NEHS marks together with entrance test had a lower academic performance during high school, which affected academic performance at the end of the medical course in terms of abilities and attitudes.

Take-home message: Should the NEHS marks be used in entrance tests for medical courses?

4GG8 (2620)

Percentile equating of school leaving grades obtained at different school systems to enhance prediction of study success at medical school

Authors
Stefan Zimmermann, UKE, Hamburg, Germany
Norwin Kubick, UKE, Hamburg, Germany
Dietrich Klusmann, UKE, Hamburg, Germany
Wolfgang Hampe, UKE, Hamburg, Germany

Presenter: Wolfgang Hampe, University Medical Center Hamburg-Eppendorf, Hamburg, Germany

Background: Academic achievement measured as school leaving grade is the best single predictor for success at medical school. Nevertheless, the grading practice can vary between different states or school types. Therefore chances for admission do not depend solely on individual merit, but also on grading policies why the relation between grades and study success is reduced. In December 2017 the German Constitutional Court judged the practice to naively treat all school leaving grades as equivalent to be inconsistent with the constitution.
Method: We calculated percentiles for school leavers for each of the 16 German federal states which all exhibit different educational systems. Leaving grades from secondary school were rank ordered depending on the distribution of all grades within the state in which they were acquired. Thus, we took into account the states' stringency or leniency and recalculated the predictive validity of school leaving grades on study success at the University Medical Center Hamburg-Eppendorf (UKE).
Results: Without the equating procedure only 4.7% of all school leavers from the "stringent" state Lower Saxony, but 10.8% of those from the "lenient" state Hamburg were shortlisted for entrance testing at Hamburg medical school in 2015. With percentile equating 9.0% from both states would have been preselected resulting in a 33% reduction of applicants from Hamburg and a 47% increase from Lower Saxony.
The prediction of study success at Hamburg Medical School strongly depends on the state of origin. A given grade predicts higher study success when obtained in Lower Saxony as compared to Hamburg. When using percentiles instead of grades the prediction of study success was equivalent for both states.
Conclusion: Percentile equating of final grades equalizes the chance to get a placement for applicants from different states or school types. At Hamburg medical school, the use of percentiles instead of grades would ensure that grades predict study success independent of the federal state.
Take-home message: Percentile equating improves the fairness of medical school selection based on academic achievement from educational systems with different routes to the university entrance qualification and non-equivalent grading policies.

The relationship between socio-demographic factors and selection into UK postgraduate medical training programmes: a national cohort study

Authors
Kim Walker, CHERI, University of Aberdeen and NHS Education for Scotland, Aberdeen, UK
Ben Kumwenda, CHERI, University of Aberdeen, Aberdeen, UK
Gordon Prescott, University of Aberdeen, Aberdeen, UK
Peter Johnston, CHERI, University of Aberdeen and NHS Education for Scotland, Aberdeen, UK
Jen Cleland, CHERI, University of Aberdeen, Aberdeen, UK

Presenter: Kim Walker, CHERI, University of Aberdeen and NHS Education for Scotland, Aberdeen, UK

Background: Entry into medical school is the first hurdle for students who come from a widening access background. Those who graduate then face selection challenges into postgraduate education and training. To the best of our knowledge, there has been no research looking at the relationships between individual characteristics and allocation into the first stage of postgraduate medical education in the UK. To address this gap in the literature, the current study examines the relationships between applicants' socio-demographic characteristics and outcomes on the UK Foundation Training selection process.
Method: A longitudinal study of 8467 trainees who accepted a place for the first stage of UK postgraduate medical training in 2013-14 was examined using the UK Medical Education Database to access linked data from different sources, including medical school admissions, assessments, and postgraduate training. Multivariable ordinal regression analyses were used to predict the odds of applicants being allocated to their preferred Foundation schools.
Results: After adjusting for Foundation Training application score, no statistically significant effects were observed for gender, socio-economic status (as determined by income support) or whether applicants entered medical school as graduates. BME status and (UK) place of medical qualification were strong predictors of allocation to preferred Foundation school. Applicants from white ethnic backgrounds were significantly more likely to be allocated to a higher choice foundation school than Black or Asian applicants (p<0.001) (79% vs 47% and 56% first choice, respectively).
Conclusion: The Foundation School selection process does not appear to discriminate against applicants from lower socio-economic groups. However, after controlling for the effect of the application score, those from ethnic minorities appear to be disadvantaged. This finding may be linked with the geographical preferences. The foundation schools in London area and the south of England are very competitive compared with the rest of the UK. Yet a higher proportion of the UK medical student population from BME backgrounds live in London and the South-East of England. The data provide some interesting findings relating to "push-pull" factors in medical careers decision making and choice of Foundation School.

Differences in Academic Performance of Students Entering Faculty of Medicine, Universidad de Chile, Through Special and Regular Admission

Authors
Luz Salazar-Contreras, Universidad de Chile, Santiago, Chile
Sandra Flores-Alvarado, Universidad de Chile, Santiago, Chile
Camila Rojas-Muñoz, Universidad de Chile, Santiago, Chile
José Peralta-Camposano, Universidad de Chile, Santiago, Chile

Presenter: Jose Peralta Camposano, Universidad de Chile, Santiago, Chile

Background: Special admission methods contribute to increase diversity, enrich teaching-learning processes and give applicants a fair admission opportunity, contributing to equity in higher education. The Faculty of Medicine of Universidad de Chile implemented a Special Admission System in 2013, which is focused on students of high vulnerability who, even having an outstanding academic performance, do not reach the score on University Selection Test to enter via regular admission. However, as equity in access improves, conditions must be created so that those who come from socially unfavorable contexts can remain in the system and complete their professional training successfully.
Method: To define whether Special Admission students are adapting to the academic demands of the University, we analyzed the records of the academic trajectory of the students of the 8 undergraduate programs of the Faculty of Medicine of the University of Chile who entered on the 2013-2017 cohorts by Regular and Special admissions and we compared their results throughout their training. The average number of grades was analyzed descriptively by entry cohort, semester and undergraduate program in each of the entry systems and mean difference hypothesis tests were performed to evaluate the statistical significance of the observed results.
Results: The grade averages of the students that enter through Special Admission are lower in all the undergraduate programs and for all the analyzed cohorts. The differences are higher on the first semester of each undergraduate program, and the averages are leveled between 2nd and 4th semester for most programs.
Conclusion: We conclude that, although there is an important difference in academic performance of students who enter through Special and Regular Admission at the beginning of their academic trajectory, students who enter through Special Admission manage to adapt to the academic requirements of their programs.
The next step is to complement this study with qualitative analysis of the phenomenon, to see how and to what extent this transition is supported by the institution, together with the student's personal growth and effort.

Thriving in Medical School: Is it Really in the Genes?

Authors
Eiad Habib, Alfaisal University, Riyadh, Saudi Arabia
Mohamed Iesar Abdelaziz Mohamed, Alfaisal University, Riyadh, Saudi Arabia
Amany Elshaer, Alfaisal University, Riyadh, Saudi Arabia
Mayar Helaly, Alfaisal University, Riyadh, Saudi Arabia
Dalia Sriwi, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter: Eiad Habib, Alfaisal University, Riyadh, Saudi Arabia

Background: Excelling in medical school is attributed to numerous factors which have been thoroughly investigated in the literature. However, there is little data on socioeconomic conditions of students and whether these will affect academic performance. We aim to see if there is a correlation between parents' profession and the student's cGPA.
Method: 160 medical students from Year 1 to Year 5 at Alfaisal University filled out an online questionnaire. Students were asked whether any of their parents were medical doctors. Other factors including age, gender, pre-university GPA and additional socioeconomic variables (including type of high school attended and first language) were assessed.
Results: Results showed that 14% of students had both parents working as medical doctors, with an average cGPA of 3.64. 31% of students had one parent as a medical doctor with an average cGPA of 3.49. The other 55% did not have medical doctor parents, with an average cGPA of 3.42. cGPAs of students with both parents as medical doctors were significantly higher compared to those who did not have any parents in the medical field. Doctors tend to exert a supportive influence on their children due to their past experiences. Students would also look up to them as mentors.
Having one or both parents as medical doctors is associated with better academic performance in medical school, irrespective of age or gender. Nonetheless, other variables such as the level of high school students attended and the students' first language have an impact on the overall capabilities of those students.
Conclusion: Although a correlation has been discovered, this topic needs to be explored further by looking into other socioeconomic factors including ethnicity, median household income, and urban background. These results could provide valuable practical implications for student selection and academic support during medical school.

Medical demography in Spain: numerus clausus in Medical Schools and positions of Postgraduate Training

Authors
Ester Góngora, Centro de Estudios en Educación Médica, Universidad de Murcia, Spain
Noemí M. Atucha, Centro de Estudios en Educación Médica, Universidad de Murcia, Spain
Joaquín García-Estañ, Centro de Estudios en Educación Médica, Universidad de Murcia, Spain

Presenter: Joaquin García-Estañ, Universidad de Murcia, Murcia, Spain

Background: We have analyzed the admission numbers to Medicine Degree in Spain, numerus clausus (NC), and its relationship with the offer of postgraduate specialization positions (MIR).
Method: Data have been obtained from official sources (Ministry of Education, Health, Spanish Medical Doctors Association (CGCOM) and Deans National Association).
Results: In 1977, the total number of medical students was around 22,500, studying in 23 schools. In 1978, NC officially started and these numbers decreased and stabilized around 5,000 in 1990 with 25 schools. MIR positions rose from 2,000 in 1979 to 4,000 in 1990. Then, NC reached a minimum of 4,300 in 2000, with 3 more schools, whereas postgraduate positions increased up to 4,700 also in 2000. In 2006, NC increased again reaching 6,700 in 2015, while MIR positions peaked at around 6,500 in 2011 and decreased later down to 6,000 in 2015. However, 15 more medical schools were opened since 2006, most of them private. In spite of a supposed shortage of doctors, the number of people taking the MIR exam rose from 10,000 in 2001 to 13,500 in 2011, close to the 13,244 that will examine in February 2018. Foreign non-UE doctors are also allowed to enter (4%), and a number of doctors repeat the process to re-specialize (5-10%), thus diminishing net positions to newly Spanish graduates.
The high number of medical schools is causing problems in the access to hospital training when different universities have to share the same hospital for their students. Since most of the new schools are private, the equity in the access to medical studies is also in danger.
MIR positions have varied independently of NC, which suggests lack of planning from health and education authorities.
A significant number of medical graduates stay out of postgraduate specialization training because of a lower number of MIR positions.
Conclusion: While MIR positions may have reached a maximum, the lack of a national planning and the continuing opening of new medical schools is risking the obligatory postgraduate training that all medical graduates need.

4GG13 (3145)
The use of an e-assessment as an additional postgraduate selection tool for pediatrics

Authors
Jos Draaisma, Radboudumc Amalia Children's Hospital, Nijmegen, Netherlands
Ester Coolen, Radboudumc Amalia Children's Hospital, Nijmegen, Netherlands
Marije Hogeveen, Radboudumc Amalia Children's Hospital, Nijmegen, Netherlands
Jasnielle Van Alfen, Radboudumc Amalia Children's Hospital, Nijmegen, Netherlands
Aloys Klein Gunnewiek, Radboudumc, Nijmegen, Netherlands

Presenter: Jos Draaisma, Radboudumc Amalia Children's Hospital, Nijmegen, Netherlands

Background: The medical educational region East-Netherlands has developed an e-assessment as an additional tool to the letters of application and curriculum vitae for the postgraduate selection of residents in pediatrics. This e-assessment was developed in three Delphi rounds by the five directors of the pediatric residency program, three pediatric counselors, four residents, the director of pediatrics, one member of the human resource management (HRM) team and one member of an extern HRM counselor. In this study we describe the additional value of the use of this e-assessment.
Method: We quantitatively evaluated the postgraduate selection procedure since 2008, when we started to use the e-assessment as additional tool. We evaluated the strength of the e-assessment, and its additional value in the selection procedure.
Results: From 2008 till 2017 we received 279 letters of application and curricula vitae for a position as pediatric resident. Due to the first selection of these letters of application, 63 candidates dropped out. 216 candidates made an e-assessment. Of these, 118 candidates were invited for interviews, from which 52 candidates started as resident in our medical educational region. Of these 52 candidates, eight were invited for the interview because of the results by the e-assessment; from the other candidates, 41 were selected by both the letter of application as well as the e-assessment and three were selected especially by their letter of application. As well the letter of application, as the e-assessment was statistically important ($P<0.001$) for the selection of candidates for the interviews. However, neither the letter of application ($p=0.059$), nor the e-assessment ($p=0.76$) was decisive for the candidates who got the interviews.
Conclusion: An e-assessment may be an additional selection tool to the classical tools of letter of application and curriculum vitae. About 15% of the residents would not have been selected for the interviews for the application of the postgraduate residency program without the e-assessment.
Take-home message: An e-assessment may be an addition selection tool for the postgraduate training program.

4GG14 (1064)
The Importance of Clinical Shadowing: Perspectives of Admissions Committee Members

Authors
Carol Elam, University of Kentucky College of Medicine, Lexington, USA
Joe Chiles, Ohio State University Wexner Medical Center, Columbus, USA
Lauren Falvo, Indiana University School of Medicine, Indianapolis, USA

Presenter: Carol Elam, University of Kentucky College of Medicine, Lexington, USA

Background: Many premedical students shadow physicians in preparation for medical school. Admissions officers argue that adequate exposure helps students determine if medicine is the right fit for their professional interests. However, students are commonly left to their own devices to determine what kind of exposure is preferred, and how much exposure is enough. We collected admission committee members' opinions about shadowing to determine how this experience contributes to understanding applicant preparation and readiness for medical school.
Method: A 17-item survey instrument was administered to our medical school's admissions committee members regarding their definitions of shadowing goals and outcomes for the experience, and suggestions for beneficial shadowing placements. Twenty-two of 26 members completed the survey. Survey items were comprised of check boxes and narrative responses that were summarized. The project was approved by the Institutional Review Board.
Results: The most commonly specified purpose of shadowing was understanding daily responsibilities of physicians (10/22 responses). Observing physician/patient interactions was listed as a key goal of shadowing by 8 of 22 respondents. Approximately 65% of the respondents thought shadowing was important for both gaining insight into what doctors do as well as providing the necessary reality testing to determine if medicine was a good personal career choice. All respondents explored an applicant's knowledge of the profession at interview by asking a question such as "Tell me about a clinical experience. What did you learn?"
Seventy-seven percent of respondents thought shadowing should be required of all applicants, but that a requisite number of shadowing hours should not be stipulated. Instead, they advocated for demonstration of applicants' abilities to think critically about what they had seen and offer an insightful interpretation of their experience. Recommended shadowing venues included exposure to inpatient and outpatient settings in surgery, emergency medicine, and primary care specialties.
Conclusion: This project helps clarify the rationale for recommending medical exposure through shadowing to applicants. By detailing narrative responses, this project can help guide medical school applicants in their preparation for medical school.

Take-home message: Guideposts for expected outcomes of shadowing experiences should be developed for and disseminated to prospective students.

4GG15 (3479)
Medical Students as Primary School Teachers: A Widening Participation Initiative

Authors
Sarah Burge, University of Bristol, Bristol, UK
Anna Symons, University of Bristol, Bristol, UK
Josie Harrison, University of Bristol, Bristol, UK
Simon Atkinson, University of Bristol, Bristol, UK

Presenter: Sarah Burge, University of Bristol, UK

Background: Medical schools in the UK have traditionally focussed on the school years immediately prior to university entrance in their Widening Participation (WP) initiatives. There is growing evidence that professional aspiration and social capital must be developed much earlier in pupils if they are to apply successfully to medical or dental school. In line with psychology theory on ages of development of attitudes and values we determined that primary school age pupils (ages 5-11) should be targetted, and that development of their self-image as scientists, scholars and professionals would be useful as they prepared for secondary education and a greater degree of choice about their lives.
Method: Following initial approaches to the headteacher, we developed a student-led partnership with Stoke Park Primary School, an aspirational school situated in a low socio-economic status (SES) area of North Bristol. Pupils there were drawn predominantly from white UK low SES backgrounds, a group especially underrepresented at universities. Working with the Year 5 lead teacher, we used the National Curriculum to plan lessons on healthcare related subjects which addressed relevant learning objectives, and which also allowed pupils to take on investigative scientific roles and practice public speaking and presentation skills.
Results: Feedback from a pilot session involving 27 Year 5 pupils indicates that all were enthused by the sessions, particularly by opportunities to practice clinical skills, and ask questions about the subject and the experience of training as a doctor. Many expressed a desire to work in healthcare. Medical students reported that the planning, presentation and communication aspects enhanced essential skills for their own academic progress.
The curriculum-based model provides opportunities for ongoing, positive interaction with the same pupils, with the aim of reinforcing the development of a scientific, professional self-image. Further sessions have been planned accordingly to build on the pilot session. The model can also be easily expanded to other WP schools.
Conclusion: A curriculum-based, student-taught WP approaches in Primary School is a good model for effective educational and aspiration-raising outreach that also provides valuable development opportunities for medical students as educators.

Performing a Nurse-Shadowing Program for Medical Students to Learn Inter-professional Collaborations

Authors
Shu-Liu Guo
Chien-Yu Chen
Shu-Tai Sheen Hsiao

Presenter: Shu-Liu Guo, Taipei Medical University Hospital, Taipei, Taiwan

Background: Physician-nurse collaboration has been associated with the quality of patient care outcomes that they provide. Previous evidence showed that medical students' exposure to the role of nurses on the healthcare team provided a positive understanding of interprofessional collaboration. The purpose of this study was to describe the learning of interprofessional course with a Nurse-Shadowing program for five-year medical students in a teaching hospital of Northern Taiwan.
Method: A follow-up open-ended question was mailed to all medical students (n=50) who had participated in an interprofessional course with a four-hour nurse-shadowing program. The nurse-shadowing program was primarily created to nursing students to shadow practicing nurses. All 50 medical students wore the uniform of nursing student and were assigned a nurse to shadow from a variety of specialty wards (oncology, surgery, internal medicine, etc.). The nurses were given instructions to engage participants in observing and assisting nursing tasks on a regular shift, to answer any question that they had. The categorical response of the open-ended question was performed by the content analysis.
Results: All students (100%) reported that the nurse-shadowing program was an appreciated part of the medical education and an increase in their knowledge what nurses bring to the healthcare team and an increased understanding of the nurses' role. They noted the high nursing workload on the team. They learned that an increased knowledge in patient care and the interprofessional collaborations on the health care team. 48 students (98%) reported that they significantly increased their respect for the knowledge, the role, and skills of nurses. Majority (80%) reported that nurses had better communication with empathy than physicians. Some students (45%) noted the difference of the authority power from different uniforms; that they felt less respect from patients and/or caregivers when they wore nurses' uniform.
Conclusion: Finding suggested that medical students increased their understanding in the interprofessional collaboration through this program. They enhanced their reflection how to respect and work together with nurses after the program.

We will examine the longer effectiveness of this program and to determine whether it positively impacts long-term attitudes toward nurses.

4HH2 (2979)
Development of a national interprofessional communication skills and teamwork curriculum for undergraduate medical education

Authors
Maryna Gornostayeva, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Germany
Franziska Baessler, Centre for Psychosocial Medicine and Department of General Internal Medicine and Psychosomatics, University Hospital Heidelberg, Heidelberg, Germany
Claudia Einig, Institute of Public Health and Nursing Research, University of Bremen, Germany
Heike Wild, Charité - Universitätsmedizin Berlin, Institute of Health and Nursing Science, Germany
Jana Jünger, The German National Institute for State Examinations in Medicine, Pharmacy and Psychotherapy, Germany

Presenter: Maryna Gornostayeva, The German National Institute for state examinations in Medicine, Pharmacy and Psychotherapy, Mainz, Germany

Background: Effective interprofessional collaborative practice enhances the quality of patient care, promotes greater patient satisfaction and job satisfaction among members of the health care team. International Frameworks describe thesignificance of interprofessional education for inteprofessional practice. Different health policy-makers in Germany support the integration of interprofessional skills in the current curricula.
On this basis, a project was initiated that aims to support this integration and to develop a national, interprofessional communication skills and teamwork curriculum for medical students. The project is supported by the Robert Bosch Foundation.
Method: To provide a uniform framework for IPE at the medical faculties the interprofessional thematic topics for obligatory curricula integration were defined. Expert-groups representing different health care professionals, e.g. nurses, pharmacists, physiotherapists, psychotherapists, physicians and medical students identified in more than 10 workshops crucial interprofessional job-related fields in a multi-step procedure. These fields were classified according to symptoms and diseases, settings, reason for referral and problem oriented prototypes. Consecutively a blueprint was developed based on the relevant findings.
Existing best-practice examples of teaching and assessment of interprofessional skills are collected, edited following a certain standard and classified according the above-named categories.
Results: A draft curriculum was developed based on the results of the expert groups and available evidence on interprofessional practice. The draft consists of 50 teaching units distributed among 8 days á 6 teaching units and 2 teaching units for assessment. Relevant occasions

from every day job-related situations, e.g. handover, discharge management etc. were defined as a main category. These occasions were allocated to four Core Competencies: teamwork, roles and responsibilities, communication, ethic and values.

All the best-practice examples with related teaching materials and background information are uploaded on the online-platform (toolbox).

Conclusion: The draft curriculum provides the possibility to create a uniform framework of IPE for the medical faculties. The medical faculties can organize their teaching individually based on different diseases, settings and problem prototypes and place their own faculty-specific focuses. The toolbox supports the faculties and should enable lecturers to exchange best practice examples.

Exploring the experiences with student participation in the development of interprofessional health education courses

Authors
Ronja Behrend, Charité - Universitätsmedizin Berlin, Germany
Asja Maaz, Charité - Universitätsmedizin Berlin, Germany
Harm Peters, Charité - Universitätsmedizin Berlin, Germany

Presenter: Ronja Behrend, Charité - Universitätsmedizin Berlin, Germany

Background: A growing body of evidence indicates that students can contribute to the design and impact of the health education program they study in, because they hold a unique expertise in the 'curriculum in action'. The literature focusses on involvement of students in curriculum development of monoprofessional courses and is sparse in interprofessional education. Purpose of this qualitative study is to explore the experience with students´ participation during the development of interprofessional health education courses.
Method: Several interprofessional courses were jointly developed by a group of faculty teachers and students from different undergraduate health professions programs. The courses were implemented in a medical, a nursing and a physiotherapy curriculum. Two focus groups were conducted, one with involved faculty teachers (n=5) and one with the participating students (n=5). Both groups discussed separately about motivation to engage in interprofessional curriculum development, experiences they made during the process and the role of students. Transcriptions of audio-records were analysed quantitatively according to Kuckartz (2016) .
Results: The faculty teachers reported, the students enriched the discussion with their specific view and had a positive impact on the outcome of the courses planed. They also effected positively the dynamics in the interprofessional planning group and the motivation of faculty teachers. Students reported, they improved personal skills, such as communication skills and they increased self-confidence. Overall, several pre-conditions

for successful students participation were identified: e.g. 'give detailed information about the expected students activities and cultivate an atmosphere which allows students to express their opinions.
Results: Student participation benefits the design of interprofessional health education courses. The benefits range from the quality of the courses, the dynamics in the interprofessional planning groups to the professional development of the involved students. Students' view and input can contribute to the quality of the courses especially in an interprofessional context where the needs of several stakeholders should be taken into account. Involving actively students from multiple health education curricula enhances the process and outcomes of developing interprofessional health education courses.

Interprofessional student simulation training in ABCDE of Sepsis - a collaborative pilot study

Authors
Johanna Hästbacka, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Minna-Maria Mattila, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Maarit Raukola, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Otto Helve, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Patrik Nyström, Arcada UAS, Helsinki, Finland
Christoffer Ericsson, Arcada UAS, Helsinki, Finland

Presenter: Johanna Hästbacka, University of Helsinki, Finland

Background: Medical students in Helsinki have some simulation training incorporated in the curriculum. The simulations focus mostly in the medical substance despite some discussion around teamwork and communication. Since non-technical skills (NTS) are crucial in building patient safety, we aim to increase opportunities for the students to practice NTS. For that purpose, interprofessional training would be beneficial.
Method: Participants received pre-reading material about sepsis. A short introduction to non-technical skills was given, followed by a short lecture. The lecture presented sepsis definitions and an ABCDE-approach modified for sepsis. Five simulation scenarios were performed during three separate occasions. Medical students served in the roles of simulated patients and participated team simulations as doctors. The paramedics participated as ER nurses. Medical and paramedic teacher facilitated the debriefing together. Feedback with background questions and twenty Likert-scale questions concerning the lecture, simulation, debriefing and the inter-professional setup, was collected.
Results: Ten 4th to 5th-year medical students and nine 3rd to 4th-year Paramedic BSc students volunteered to participate in the pilot simulations. Of the participants 14 were female and five male, seventeen had at least some experience of simulation. Most paramedics had extensive previous experience of simulator training. Fifteen participants had had some earlier teaching concerning

sepsis. The respondents had gained new knowledge of sepsis (mean 4.89) and felt that ABCDE-approach works well in this setting (mean 4.84). All items questioning the particular value of inter-professionality were rated high (mean 5.0). Time allocated to simulation was viewed too short which created a slightly too busy atmosphere (mean 2.95).

Conclusion: All students, regardless their future profession, valued the inter-professional aspect highly. Despite great difference in previous experiences in simulations, the responses were very similar. Structured approach to diagnosing and treating sepsis seems to be easily implemented and serves as a good tool in teaching non-technical skills, given the allocated time is sufficient.

Take-home message: Both medical students and paramedics appreciate inter-professional training in simulations. Particularly non-technical skills should be increased in medical studies. Modified ABCDE approach works well in sepsis.

Application of 'Design Thinking' to foster collaborative and innovative mindsets in medical students through interprofessional education

Authors

Quankamon Dejatiwongse Na Ayudhya
Chareeya Dhammaniyom
Jakkrapat Tangsongjareon
Nonthaphat Aviphant
Galyakorn Rasdjarmrearnsook
Yodying Dangprapai

Presenter: Quankamon Dejatiwongse Na Ayudhya, Siriraj Hospital, Mahidol University, Bangkok, Thailand

Background: The quality of healthcare has not yet been improved to the same extent as the advancement of biomedical technology. This gap exists due to distinct features of the modern healthcare, including work culture. Lack of effective communication, for example, was associated with lower morale and higher work stress among healthcare personnel. We proposed that cultivation of collaborative and innovative mindsets in medical curriculum would maximize quality of patient care. Collaborative Design Learning (CDL), an intervention to foster collaborative and innovative mindsets, combines two theories which are growth mindset and constructionism. Growth mindset is the belief towards oneself that their intelligence can be improved with practice. Constructionism advocates that learning occurs most effectively when people actively connects different areas of their knowledge. These theories are brought into practice through Design Thinking, an iterative process to create inventions.

Growth mindset redirects individual's thoughts towards improvement strategy for future events. In the context of Design Thinking, students perceive failure as a prototype and, therefore, eager to take action by asking for feedback to improve their future prototypes. Constructionism also enhances learning throughout the workshop. Siriraj medical school has developed this intervention in

collaboration with Little Builders, a social enterprise also based in Bangkok.

Method: Our pilot CDL was delivered through a two-day workshop with medical students and their non-medical peers. They worked in a team of six members with two facilitators for each group to redesign patient's experience at the out-patient department.

Results: From after-workshop reflection, participants grew positive perception regarding feedback and recognized strength of team diversity. Furthermore, this workshop has gained attention from hospital administrators and had opportunity to be developed into an elective module in the medical curriculum at Siriraj Medical School.

Conclusion: This CDL has demonstrated potential to be the novel tool to cultivate collaborative and innovative mindsets in medical students.

Optimized interprofessional education and evaluation for undergraduate medical students: a case study of interprofessional collaborative practice conference in a medical center in Taiwan

Authors

Po-Kai Chan, School of Medicine, National Defense Medical Center, Taipei, Taiwan
Feng-Cheng Liu, Division of Rheumatology, Tri-Service General Hospital, Taipei, Taiwan
Tung-Wei Kao, Department of Family Medicine, Tri-Service General Hospital, Taipei, Taiwan
Wan-Ting Chen, School of Medicine, National Defense Medical Center, Taipei, Taiwan
Hsin-Hui Chen, School of Medicine, National Defense Medical Center, Taipei, Taiwan
Tai-Lung Cha, Division of Urology, Tri-Service General Hospital, Taipei, Taiwan

Presenter: Po-Kai Chan, School of Medicine, National Defense Medical Center, Taipei, Taiwan

Background: Interprofessional education (IPE) is a global trend in medical education that should be well designed and evaluated from undergraduate education to continuing professional development.

Method: Tri-service general hospital (TSGH) in Taipei, Taiwan holds interprofessional collaborative practice conference (ICPC) monthly to facilitate teamwork. This case study aimed to analyze the facilitators and barriers with the presage-process-product model adopted from BEME guidelines for current TSGH ICPC from a student's perspective.

In presage level, the ICPC was supported by the organization and multiple tools were introduced for IPE.

Results: Lack of preclinical opportunity for IPE, poor understanding of objectives and dissonance of session content made it difficult for undergraduate students to approach. In process level, the IPCP combined multiple concepts of holistic medicine and the facilitators played the Confederate role during simulation. However, the

combination of profession-specific and IPE objectives made it confusing, while lack of authentic interprofessional interaction and following up learning activities made it unrelated to undergraduate students. In product level, reaction and collaborative skills were evaluated through mobile interactive App(Zuvio) and learning profiles were designed. However, it was limited to students due to lack of instructors for reflection activity and feedback, while higher level, longitudinal, and qualitative studies were absent for outcome evaluation. Based on Learning-Oriented Teaching(LOT) model and other evidence, we proposed recommendations for IPCP to enhance motivation, to optimize curriculum content and to improve teaching-learning methods. In addition, customizing evaluation tools and qualitative studies for undergraduate students need to be carried out according to evidence and well-established guidelines. Further studies are required for verification of the effects of those optimization and evaluation tools.

Conclusion: The current TSGH ICPCs had provided great opportunities for IPE, but many works are needed for optimization so that the undergraduate students could benefit from it more. The study clarified the facilitators and barriers with the presage-process-product model for the ICPC in TSGH. The optimization for curriculum and evaluation tools based on well-established evidence and guidelines were also emphasized. To meet the needs of undergraduate students, the organization should take students' perspectives and previous evidence into consideration.

4HH10 (902)
The interprofessional training ward Zurich - a feasibility study

Authors

Gert Ulrich, Careum foundation, Department of Education Development, Zurich; University of Zurich, Faculty of Medicine; University Hospital Zurich; Careum Training Centre, Zurich; Zurich University of Applied Sciences, School of Health Professions; Institution for upp, Zurich, Switzerland

Presenter: Gert Ulrich, Careum foundation, Department of Education Development, Zurich, Switzerland

Background: Interprofessional (IP) collaboration is frequently reported as a key factor for the future healthcare delivery, and IP training on real wards plays a major role in the IP education of health professions. Herein, students from various health professions are supposed to collaborate and learn together under supervision of experienced facilitators while taking care for real patients.

Method: Since May 2017, six institutions located in the Swiss canton of Zurich (Careum foundation, Department of Education Development, Zurich; University of Zurich, Faculty of Medicine; University Hospital Zurich; Careum Training Centre, Zurich; Zurich University of Applied Sciences, School of Health Professions; Institution for upper-secondary and tertiary education in the health care fields, Canton of Zurich) cooperate to allow future students in medicine, nursing, physiotherapy and

occupational therapy to be trained side a side on a training ward. The feasibility study aims to identify general factors and to develop a concept for establishing an IP training ward in Zurich (ZIPAS) following a Scandinavian model. The project organization is structured in three levels and includes a project team, a steering group and the sponsor group.

Results: The project is structured in several work packages:
- definition of learning objectives and IP competencies
- synchronisation of the involved health professions` curricula
- designing continuing education programs for the facilitators
- modelling personal and financial resources and costs
- designing a scientific evaluation programme
- coordination and recruitment of the students and facilitators
- integration of students` visions and ideas
- integration of public relation issues

Conclusion: Identifying relevant work packages and implementing a stable organizational structure were useful during the project. At the conference the strategic approach as well as barriers and supporting factors will be presented and discussed.

Take-home message: Identifying key topics and using a work package structure is useful when evaluating the feasibility of an IP training ward.

4HH11 (3040)
Interprofessional education using One-Stop Simulation for nursing, nutrition and pharmacy to strengthen clinical reality and enhance peer learning

Authors

Lin-Man Ting, Department of Emergency/Nuring of WanFang Hospital, Center for Education in Medical Simulation Taipei Medical University, Taipei, Taiwan
Shiao-Tzu Ma, Department of Emergency/Nuring of WanFang Hospital, Center for Education in Medical Simulation Taipei Medical University, Taipei, Taiwan
Wen-Cheng Huang, Clinical skill center, Department of Emergency of WanFang Hospital, Center for Education in Medical Simulation,Taipei Medical University, Taipei, Taiwan
Kuei-Ju Cheng, Department of pharmacy, WanFang Hospital, Taipei Medical University, Taipei, Taiwan

Presenter: Shiao-Tzu Ma, Department of Emergency/Nuring of WanFang Hospital, Center for Education in Medical Simulation Taipei Medical University, Taipei, Taiwan

Background: To enhance the students' clinical care ability and increase interactions among different profession, we developed a one-stop simulation scenario for Interprofessional Education (IPE), aiming to participate and observe interdisciplinary care of patients, and we guide students to understand concepts of patient care between different professions by debriefing.

Method: For students of nursing, nutrition and pharmacy to experience interprofessional simulation scenario, our pre/post-test questionnaires to understand the students for interdisciplinary knowledge and roles. Besides, we

tried to use one-stop simulation scenarios for learners with the abilities to establish self-exploration and reflection by peer learning. It is designed at the same place of work, with the same standardized patient dealing with common clinical problem(DM patient with hypoglycemia).

Results: Twenty-four trainees compared the pre/post-test questionnaires on inter-disciplinary team learning. We found that there was a clearer understanding responsibilities and mutual cooperation in all categories through the one-stop simulation scenario. The feedbacks were impressed that students could observe peers of different professions after the same patient was treated. Finally, using debriefing to made the learning of IPE simulation more concrete. Besides, the survey showed the participants satisfied with the simulation scenario and the qualitative feedback also reported active discussion than the round-table discussion.

Conclusion: In the past, most of IPE simulation scenarios are mostly resuscitation scenarios or team discussions based on split-screen stage play. However, the design of our scenario mainly focuses on the clinical issues of nurse/nutrition/pharmacy for patients. The one-stop scenario stimulates learning motivation through peer learning and discuss in depth. In this training model, we found that students directly experience of the various types of work and roles in patients care. We also noticed students discuss actively for patients to achieve better quality of care in debriefing.

Take-home message: IPE using one-stop simulation scenario makes students directly observed and participated in to understand the patient care among different professions. The debriefing can help students to actively discuss and guide them to understand the clinical care priorities in all professions.

4HH12 (1946)
Inter-Professional Learning between Medical and Physician Associate students

Authors
Sarah Rangan
Huw Davies
Jon Morris
Wyn Harris

Presenter: Wyn Harris, Swansea University, Swansea, UK

Background: Physician Associates (PA) will graduate from Swansea University for the first time in 2018. PA's have a varied clinical role working alongside doctors and other healthcare professionals in a wide range of settings. The aim of the project was to establish a link between PA and Graduate Entry Medical (GEM) students, promoting inter-professional learning, building relationships and establishing roles prior to commencement of clinical duties.

Method: 48 participants, (33 medical students, 10 PA students and 5 clinicians) attended a voluntary collaborative education event mediated by experienced clinical supervisors in October 2017. This consisted of an introduction, icebreaker and plenary with facilitated clinical breakout discussions between PA and GEM

students. Feedback was collected from participants and analysed.

Results: There was a 100% response rate from attendees, 95% were satisfied with the quality of the session, 88% stated that the case discussions were effective and 85% felt that their understanding of junior doctors and PA's roles in clinical practice had improved. Individual feedback suggested that the relationship and understanding of roles between PA's and GEM students had grown. However, some respondents noted a variation in supervisor's approach.

Results are encouraging, however Swansea medical school has comparatively small numbers of PA and GEM students, therefore similar events in other institutions would require increased resources and planning to accommodate cohort size. Time, space and budget constraints limited the activities and scale of this session.

Increased inter-professional learning and relationship building was achieved. Key points to improve this model include supervisor standardisation, clinical simulation sessions and other allied healthcare professional's involvement. Repeat activities and further development is needed.

Conclusion: A working model for inter-professional learning between PA and GEM students has been demonstrated.

Follow up studies and inter-professional development days would be necessary to establish a link between events and successful working relationships.

As PA's become increasingly active and involved members in the clinical environment, this project suggests that early collaborative team exercises are essential to achieving better standards of multidisciplinary health care delivery.

4HH13 (1453)
Using Case Study Methodology to Understand Contextual Challenges to Interprofessional Practice Learning

Authors
Veronica O'Carroll
Linda McSwiggan
Martin Campbell

Presenter: Veronica O'Carroll, University of St Andrews, UK

Background: Interprofessional practice learning (IPPL) for students enhances university based interprofessional education. However, IPPL opportunities are often limited and can be dependent on context and a range of situational factors. Case study methodology is suited to the complex environment of healthcare organisations, enabling in-depth study of "contemporary phenomenon within its real-world context". The flexibility of this approach offers the opportunity to generate multiple forms of evidence and use each source to strengthen, verify and add validity to the other. A single, intensive, instrumental case study using mixed methods was considered a valuable research methodology to investigate health and social care professions' attitudes and perspectives of IPPL for students.

Method: The study took place within one health board and associated local authority in Scotland, UK. A purposeful

sampling strategy was used to recruit a range of professions who regularly supervised students during acute and community care practice placements. An adapted version of the Readiness for Interprofessional Learning Scale (RIPLS) was used to measure attitudes to IPPL. Semi-structured interviews were used to gain insight into participants' perspectives of enablers and barriers to IPPL within their own practice areas.

Results: Results showed that attitudes to IPPL for students was generally positive. However, insight into professions' perspectives revealed that IPPL for students was limited due to resource and space constraints; appropriateness of more than one student at one time interacting together with service users, and missed opportunities for IPPL.

The flexibility of the case study approach enabled the researcher to explore beyond objective data and explore perspectives and experiences through multiple lenses. The study provided insight into the challenges which exist at the front line of health and social care within one health board and associated local authority. The findings from this case study may be transferable to other health and social care organisations.

Conclusion: A single model of IPPL may not be applicable in all contexts. Case study methodology in interprofessional research is a valuable way of investigating what types of IPPL work well in different contexts and situations.

4HH14 (1226)
Comparison of Medical Students' Interprofessional Attitudes Before and After Second Year

Authors
Jennifer Montemayor, Rocky Vista University College of Osteopathic Medicine, Denver, CO, USA
Christopher Unrein, Rocky Vista University College of Osteopathic Medicine, Denver, CO, USA

Presenter: Jennifer Montemayor, Rocky Vista University College of Osteopathic Medicine, Denver, USA

Background: Medical graduates must possess the ability to effectively function on an interprofessional (IP) team, and recent work has been dedicated to the development of survey instruments designed to assess IP competencies, attitudes, appreciation, and values.

Method: With no prior, formal IP training, students participated in one required, observational activity during Year 2 involving an IP approach to patient case-management. A 22-question survey, adapted from the Interprofessional Attitudes Scale and the assessment tool from the Center for Health Science Interprofessional Education, Research and Practice, was administered before and after second year. IRB approval was obtained. Paired t-test analysis was performed.

Results: Approximately half of the class (n=78) responded to both pre- and post-Year 2 surveys. Results indicated positive responses which did not significantly change. Exceptions include significant increase in acknowledging the (1) value of IP training to appreciate other professionals and (2) importance of being able to anticipate needs of other team members. Two-thirds had

pre-med healthcare experience and were more likely recognize offering help to team members with their work is effective for improving team performance. There was increased reporting of prejudice about other health professions, which was further increased for females, those with pre-med healthcare experience, and those who attributed their responses to be influenced only by the required IP experience. Two-thirds reported other experiences than the required IP event influenced their responses, the majority through off-campus clinical experiences.

Pre-clinical medical students had generally positive IP attitudes which remained constant throughout Year 2. However, in a couple areas, results suggested increased appreciation for IP education and teamwork among some participants. Some of these findings were enhanced by those with pre-med healthcare experience and outside clinical experiences in Year 2. Interestingly, pre-med healthcare experience and the required IP experience appeared to increase prejudice or assumptions about other professions.

Conclusion: For curricular development considerations, other institutions may find it useful to be cognizant of the potential risk for students to develop prejudice or bias through IP education or clinical experience so that intentional opportunities may be created to address this effect.

4HH15 (2440)
Assessing Interprofessional Communication of Health Students

Authors
Wiwik Kusumawati
Salmah Orbayinah
Agam M Prabowo

Presenter: Wiwik Kusumawati, Universitas Muhammadiyah Yogyakarta, Indonesia

Background: Poor communication among health profession is one cause of medication error, so inter professional communication is important factor in conducting collaborative practice. This competency should be trained and assessed during education of health students. The aim of this study is to know the correlation between inter professional communication assessed by students (self assessment) and by Tutor.

Method: This research is a descriptive analytic study with cross-sectional approach. Sampling technique is consecutive sampling. Communication skills measured using validated questionnaires as student's self assessment and tutorial score by Tutor. Inter professional communication skills questionnaires distribute to 30 health students (consists of medical students, dentistry students and nursing students). Health students fill these questionnaires as self assessment. Assessment from Tutor using check list as tutorial score. Data were collected and analyzed using Spearman correlation test.

Results: This study revealed there is significant correlation between inter professional communication skills assessed by health students and by Tutor (p = 0.024). The strength of the correlation between the two variables is moderate

(r = 0,412). Students have tutorial score as well as inter professional communication. The score of inter professional communication of medical students is the highest among 3 health students.

Conclusion: Health students should have the same inter professional communication skills in order to give effective care of patients in the future. Tutor who have assess the students need to have capability in conducting inter professional communication too as a role model. Assessing inter professional communication by self assessment of the students have correlation with the Tutor's score.

Take-home message: Improving inter professional communication not only important for the health students but also for the Tutor as a role model.

The Effectiveness of Inter-professional Training by Flipped Teaching

Authors
Pei-Rong Li, TTMHH, Taichung, Taiwan
Yuan-Ling Chang, TTMHH, Taichung, Taiwan
Xin-Yi Guo, TTMHH, Taichung, Taiwan
I-Chen Chi, TTMHH, Taichung, Taiwan
Ann-Chen Tung, TTMHH, Taichung, Taiwan
Ching-Shiang Chi, TTMHH, Taichung, Taiwan

Presenter: Pei-Rong Li, Tungs' Taichung MetroHarbor Hospital, Taichung, Taiwan

Background: Clinical inter-professional practice can improve the quality of medical care. Inter-professional education (IPE) provides a training method for cross-professional collaboration. IPE mostly uses case lesson plan via discussion sessions. In recent years, the clinical medical education has gradually become a learner-centered teaching model. The aim of this study will be investigating the effectiveness of inter-professional training by flipped teaching in the intra-professional and inter-professional learning of different professions.
Method: The procedure of teaching activity includes 5 phases, pre-conference (provide case lesson plan and references), personal pre-test, inter-professional conference, post-test for inter-professional team, and interactive/ feedback. The "reaction evaluation" is a survey using the satisfaction questionnaire with a scale of five scales. The "learning evaluation" is the result of a pre- and post-test written examination. Differences were considered statistically significant when $P < 0.05$.
Results: Total numbers of participants were 31, including 12 dietitians, 13 nurses, 3 pharmacists and 3 doctors. The overall result of "learning evaluation" showed statistical significance, $p < 0.05$. Subjects were further allocated into three groups based on profession: dietitian, nurse, and medicine (pharmacist and doctor). The "intra-professional items (dietitian's items)" and "inter-professional items (non-dietitian's items)" in dietitians group, and "inter-professional items (non-nursing items)" in nurse group showed different statistically significance, $p < 0.05$. The overall average satisfaction for the training protocol was 96.5%.
Conclusion: Although previous studies about the effectiveness of IPE by flipped teaching reported some positive outcomes, this study could not to draw exact inferences about effectiveness due to small sample sizes. This study should be further included data collection about that provides insight into how IPE by flipped teaching affects changes in health care processes and patient outcomes. The result would provide better evidence of the impact of flipped teaching on IPE and healthcare outcomes.

Take-home messages: The inter-professional training by flipped teaching could effectively promote the medical staffs learning effectiveness.
The clinical staff felt satisfied and agreed with flipped teaching which enhance learning autonomy could contribute effectiveness of inter-professional training. It could be used as a reference for clinical education model.

4II2 (740)
Teaching to Learn: Using the 'Flipped Classroom' in Postgraduate Medical Education

Authors
Matthew Aldridge, Department of Postgraduate Medical Education, North Bristol NHS Trust, Bristol, UK
Jeremy Purdell-Lewis, Department of Postgraduate Medical Education, North Bristol NHS Trust, Bristol, UK
Katherine Finucane, Department of Postgraduate Medical Education, North Bristol NHS Trust, Bristol, UK

Presenter: Katherine Finucane, Department of Postgraduate Medical Education, North Bristol NHS Trust, Bristol, UK

Background: The peer-led 'flipped classroom' is beneficial to both learners and tutors. In this technique, learners undertake a period of self-directed study followed by delivery of a teaching session to their peers (1). This approach benefits from the informed insight of peers, and provides a supportive environment for learning (2). In addition, this gives peer tutors an opportunity to develop teaching skills, and receive constructive feedback. At North Bristol NHS Trust, second year postgraduate doctors (F2) are offered regular consultant-led teaching, delivered during themed 'Masterclass' sessions held once per month. A new peer-led teaching programme was developed to run in addition to consultant teaching.
Method: F2 doctors were asked to select topics of interest, and were allocated 30 minute teaching slots every two weeks. A senior medical educator was present during this time to provide constructive feedback to the peer tutors and quality assurance to the postgraduate education department. Feedback to tutors was given in a structured manner using a modified teaching assessment tool. Innovation in teaching style was also encouraged by offering an end-of-year prize for the best teaching session, voted for by the F2 group.
Results: Feedback from individual sessions has been very positive. The median Likert scores across all sessions were 5/5 and 4.5/5 for content and teaching style respectively. In particular, peer tutors appreciated the opportunity to teach and the comprehensive nature of feedback received on their teaching. Several responses indicated a preference for the peer-led sessions over existing consultant led teaching.
This approach offers an alternative to expert-led teaching which engages both peer tutors and learners. As part of an existing teaching programme this offers diversity and encourages development of innovative teaching skills. In particular, this provides a useful opportunity for providing structured teaching feedback.
Conclusion: The success of this programme demonstrates that peer-led teaching can be effective and highly valued in

postgraduate medical education, and we will continue to offer this scheme in addition to other regular teaching events.

4II3 (463)
Application of flipped classroom strategy in Pediatric dermatology learning: medical student attitudes

Authors
Arucha Treesirichod

Presenter: Arucha Treesirichod, Faculty of Medicine, Srinakharinwirot University, Nakhonnayok, Thailand

Background: The flipped classroom approach has been broadly applied to medical education. It reverses the traditional learning methods by providing online instruction outside the classroom and by moving activities into them. This pedagogy encourages students to engage in knowledge acquisition with the guidance of the instructor.
Method: Self-administered questionnaires were used to determine the attitudes following the pediatric dermatology class of the fourth year medical students toward the flipped classroom.
Results: Regarding the opinions of medical students toward the flipped classroom (n=205), the majority of them have agreed that it develops their self-directed learning skills (83.4%), increases their individual responsibility (81.4%), provides better retention of knowledge (81.0%) and improves the students' comprehension (80.5%). They disagree that the flipped classroom decreases the learner/teacher interpersonal relationships (62.4%) and the teachers' roles (73.1%). The majority of the students have indicated that the flipped classroom is better than conventional methods (75.2%) and should implement the flipped classroom into the clinical years (77.6%).
Conclusion: The key to the success is that students are able to take responsibility for their own learning. The positive attitudes of the student and teacher's roles are the most frequent factors which influence performance and learning in the flipped classroom. Advantages of this approach include increased opportunities for interaction between the students and teachers. The results indicate that medical students have an optimistic attitude toward the flipped classroom and can provide better opportunities in enhancing their self-directed learning skills.
Take-home message: The key purpose of the flipped classroom is student engagement, leverage technology and provide greater opportunities for active learning in class.

4II4 (553)
Using online immediate response system to promote in-class activities of flipped classroom in medical students

Authors
Yaw-Don Hsu Neurology Department, National Defence Medical Centre, Tri-Service General Hospital, Taipei, Taiwan
Jiunn-Tay Lee, Neurology Department, National Defence Medical Centre, Tri-Service General Hospital, Taipei, Taiwan
Gwo-Jen Hwang, Graduate Institute of Digital Learning and Education, National Taiwan University of Science and Technology, Taipei, Taiwan
Tai-Lung Cha, Tri-Service General Hospital, Taipei, Taiwan

Presenter: Yaw-Don Hsu, NDMCTSGH, Taipei, Taiwan

Background: Flipped classroom approach allows students to active learning. In previous studies, learners showed different ability and attitude in-class, leading to different interactive performance. To enhance learners' interest and ability in active learning, an online instant reaction system (IRS) is designed to help all students participate in-class discussions.
Method: Subjects were 32 medical students, assigned to two groups: the experimental group to learn flipped classroom with IRS in-class approach, while the control group to learn no IRS flipped classroom. Before and after class, all subjects completed a serial of questionnaires assessing motivation, attitude, satisfaction and course achievement.
Results: The t-test results showed no significant difference between the learning motivation, attitude and good course achievement of the two groups, but significant increase intrinsic motivation and attitude as well as their learning satisfaction between pre- and post-class in the experimental group.
It was found that the IRS could change learning behavior in-class of flipped classroom. It produces a good environment for all students to active to participate in teaching activity. The results show that learners are interested in participating in class discussion activities and enhance their intrinsic motivation of learning.
Flipped classroom is known as a good method for active learning, however, it is important to know how to provide a good activity and materials for learner discussion in-class. In this study, we found that using IRS in-class can effectively enhance learners' interests and communication.
Conclusion: Effective classroom interaction and discussion can let flipped classroom approach in success, and the IRS is one of good way to promote passive learner to active discussion and improve interaction behavior in-class. However, questions for discussion in short video must be well prepared before class.

The effectiveness of flipped classroom on short knowledge retention at King Saud Bin Abdulaziz University for Health Sciences: A Mixed Method Study

Authors
Mesedah Alnahdi, KSAU-HS, Jeddah, Saudi Arabia
Mubarak Almansour, KSAU-HS, Jeddah, Saudi Arabia
Muhammad Anwar Khan, KSAU-HS, Jeddah, Saudi Arabia
Sajida Agha, KSAU-HS, Riyadh, Saudi Arabia
Faisal Zaidi, KSAU-HS, Jeddah, Saudi Arabia

Presenter: Mesedah Alnahdi, King Saud Bin Abdulaziz University for Health Sciences, Jeddah, Saudi Arabia

Background: Research that investigates the effectiveness of flipped classroom (FC) compared to traditional class (TC) shows an increase in knowledge retention, while others have shown no difference. This pedagogical model was challenging for Middle East learning culture in which students are familiar with teacher-centered learning.
Method: This mix method study aims to assess the effectiveness of FC modality on short knowledge retention compared to TC and to identify the perceptions and challenges faced by students at KSAUHS, Jeddah, Saudi Arabia. We conducted this modality in Neurosciences Pharmacology course for (n=193) 3rd year medical students in 2017. An educational outcome, assessed by MCQs on the topic taught by TC and FC methods and validated questionnaire was given to FC students regarding their perception toward this method. After that, semi-structured interviews were conducted to find out the challenges students faced.
Results: The student knowledge was assess based on the result of post-test. There was a significant higher mean score of TC (4.1 ± 0.98) as compared to FC (3.6 ± 1.03) with p-value=0.01. No significant mean score difference was found within gender (p-value=0.77). The students' perception favored the flipped classroom in sharing more information, increase communication with their classmates and they considered it as a unique experience. Four themes emerged from thematic analysis of interview transcripts:(1) Perception about FC,(2) Challenges of FC,(3) Effect of Personal Characteristics, and(4) No Difference. Students performance was better on TC compared to FC particularly in interpretation and applying data (C2 level questions) with p-value<0.001. However, the perception of students for the flipped class was positive when comparing to the traditional way. The explanation for that some students noticed that it need more time and preparation to understand the learning objectives before they come to the class. Lack of students' motivation and orientation before conducting the FC could be reasons for this result. Lastly, it required sources to watch the videos and find some articles related to their objectives.
Conclusion: Future research need to focus on the way of delivering of FC and enhance students preparation to fit the aspect of in class activities.

4II7 (1728)
Effectiveness of flipped class and active class learning on undergraduate nursing student academic performance

Authors
Hawazen Rawas
Nusrat Bano

Presenter: Hawazen Rawas, King Saud bin Abdulaziz University for Health Sciences, Jeddah, Saudi Arabia

Background: Flipped class (FC) is an inclusive learning environment. Learning material is pre-assigned followed by face to face in-class sessions. Active class (AC) involves in-class discussion based on interactive sessions e.g. buzz group. In CONJ-KSAU-HS, the predominant teaching method is traditional class (TC) comprising of didactic lectures. This study was aimed to test comparative effectiveness of FC, ALC and TC on student's academic performance in Adult II course.
Method: The study conducted in CONJ-KSAU-HS, had a two groups pretest-posttest Quasi Experimental design. Students were randomly assigned in experimental group and control group. TEST 1 was held after 2 weeks teaching with traditional learning method (didactic lecture) in both groups. AC (unfolding case study with buzz group) was used in experimental group for 2 weeks followed by TEST 2. FC (pre assigned learning followed by in-class case study solving exercise) in experimental group was used for the next 2 weeks of teaching, followed by TEST 3. In the control group TC was used from week 1 to week 6 whilst covering same topics.
Results: TEST 1 scores provided baseline data. Mean scores (TEST 2 and TEST 3) were compared using ANOVA. TEST 2 scores were higher in experimental group (AC) compared to control group (TC) and the result was statistically significant ($p < 0.05$). TEST 3 scores showed no statistically significant difference in results of FC in experimental group and TC in control group.
Conclusion: It was observed that delivery of new concepts in active class session (buzz group) is well received and productive. This was reflected in higher academic performance in AC experimental group. FC on the other hand, did not yield in better academic performance. The results favor AC which is better suited in a stride to to shift teacher centered pedagogy with student centered pedagogy in a conventional teaching system.
Take-home message: Active class is more productive than Flipped class in a group of students accustomed to traditional pedagogy.

The Innovative Flipped Clinical elearning Platform Facilitates the Objective Structural Clinical Examination Preparation

Authors

Florence Mei Kuen Tang, School of Biomedical Sciences, The Chinese University of Hong Kong, Hong Kong
Heyson Chan, Department of Medicine and Therapeutics, The Chinese University of Hong Kong, Hong Kong
Tony Wing-Chung Mak, Department of Surgery, The Chinese University of Hong Kong, Hong Kong
Siew Chien Ng, Department of Medicine and Therapeutics, The Chinese University of Hong Kong, Hong Kong

Olivia Miu Yung Ngan, JC School of Public Health and Primary Care, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong

Presenter: Florence Mei Kuen Tang, The Chinese University of Hong Kong, Hong Kong

Background: Staring from the Medical Year 4 in the Medical curriculum of Bachelor of Medicine and Bachelor of Surgery program, students are regarded as the junior clerkships who participate in the first year of the clinical practice will receive the clinical training in Surgery and Internal Medicine. The transition between preclinical and clinical training can be challenging and stressful for students as they need to apply learned knowledge and find solutions to clinical problems during the bedside training. While there is a restricted resource in face-to-face teaching students the proper way to take a patient's history, carry out physician examination, and counseling skills, students may not be confidently prepared for the clinical examination.

Method/Results: Our team will build up the web-based platform in micro-module flipped classroom for training clinical skill especially for the Objective Structural Clinical Examination (OSCE), which can be applied for interactive learning during medical teaching in the Faculty of Medicine. It also aims to equip students with the accurate pre-clinical knowledge and essential clinical skills for clinical examination and consultation.

The modern pedagogical methods – flipped classroom and micro-modules – are a combination of learning processes of e-learning activities with face-to-face periods in the classroom. It can be applied to strike a balance between the clinical skills training and clinical examination (CExam) assessment, which can facilitate medical students to improve their clinical competencies. The proposed new innovative micro-modules platform called flipped classroom micro-module CExam (Flipped CExam) platform. Our team has launched the micro-modules of clinical examinations guides to Blackboard for the clerkships to flip the classroom. As the lectures were in early July, there were high accession rates within this period and students are on and off to watch the Guides even at the end of Oct 2017. Nevertheless, the focus group interview has been performed on the clinical skills in the abdominal examination with the medical clerkships. All the feedback

were positive as they can have a better understanding of OSCE.

Conclusion: Overall, the Flipped CExam can facilitate students to understand how the clinical examination to be run.

Peer Evaluation of Flipped Classroom Model Compared to Traditional Learning Method in Undergraduate Digestive System Education

Authors

Manuel Hernandez-Guerra
Zeben Gimeno
David Nicolas
Marta Carrillo
Enrique Quintero

Presenter: Manuel Hernandez-Guerra, Departamento de Medicina Interna, Dermatologia y Psiquiatria, Facultad de Medicina, Universidad de La Laguna, Tenerife, Spain

Background: Flipped classroom model (FCM) is a promising teaching approach in promoting knowledge acquisition above and beyond the traditional learning methods (TLM). However, it has been argued that there is lack of strong evidence and well-design studies for the effectiveness of this methodology in undergraduate medical teaching.

Method: In the 2017 fourth-year medical school classroom of Diseases of the Digestive System, students received FCM and TLM (23 modules each). For the FCM, students were provided on-line videos of 45 min with embedded quizzes before a face-to-face class (60 min) to discuss case-based problems using an interactive voting system (intervention). TLM was a lecture-based instruction (control). Students were evaluated at a multiple choice written test of 100 items (50% TLM modules). A minimum of 64% (>5 points of 10) of correct answers to questions were required to pass and scores were graded as A (10-8.5), B (8.4-7) and C (6.9-5). In addition, students satisfaction was assessed by an anonymous self-reported survey (Likert responses).

Results: From Sep/2017 to Jan/2018, 142 (67.6% female) students participated in the study. At the final exam, students achieved a higher number of correctly answered questions (36.8 ± 5.7 vs. 35.3 ± 6.6,p=0.04) and averaged scores (6.4 ± 1.4 vs. 6.0 ± 1.4,p=0.05) at the FCM section of the exam compared to TLM. In both sections, the number of fails were equal (17.6%), but students obtained better grades (A+B grade) at the FCM section (38% vs. 22%,p=0.02). In addition, paired t-test analysis revealed a better performance in the FCM section (p=0.001). Students (n=94) satisfaction scored better in FCM (rated excellent 47.8% vs. 8.5%, p<0.001). Students perceived that inverted learning may help them to achieve a better clinical practice performance (40.4% vs. 8.5%,p<0.001) and of benefit for professional practice (70% vs. 28%,p<0.01). The majority reported the methodology should be continued (82%).

Conclusion: Our results show that students exhibit better scores after implementation of the FCM. In addition, undergraduate medical students expressed strong

satisfaction with the implementation of the FCM, and prefer this method to TLM.

Take-home message: The FCM is an efficacious approach to achieve academic excellence in undergraduate Digestive System education.

4II10 (3671)
Conceptions of flipped learning and its relationship toward students' motivation and learning strategies

Authors
Fremen Chihchen Chou

Presenter: Fremen Chihchen Chou, China Medical University Hospital, Taichung City, Taiwan

Background: Flipped learning create a more active and competency-orientated learning context, and is now widely applied in medical education. Conceptions of learning, which are student's beliefs about knowledge and learning, are theoretically learning context specific, hierarchical and correlated to students' learning strategies and performance. A previous qualitative study revealed 7 conceptions of flipped learning (COFL) while comparing with traditional context. This study aimed to develop a questionnaire b to measure students' COFL and further explore the hierarchical relationship within the COFL and the relationship between COFL and motivation, learning strategies.
Method: We developed questionnaire items through literature review and iterative discussions with experts. 203 medical students who had experienced flipped learning participated this study to validate the COFL questionnaire, and 110 of them further responded to the established motivation and learning strategy questionnaires. Exploratory factor analysis and reliability analysis were applied to validate the COFL questionnaire. We also checked correlation between motivation and COFL, and compared low and high motivation student's COFL through ANOVA and t-test to clarify the hierarchical relationship between COFL.
Results: Exploratory factor analysis showed 6 factors were retained and one factor was deleted. The 6 factors were as the proposed COFL: learning as "preview," "review," "applying," "understanding," "extension of knowledge" and "seeing in a new way." The deleted factor was the conception "memorizing." There were significant correlations between COFL and motivations as well as learning strategies. Low motivation students had significant lower perception on high-level COFL. From low to high-level COFL were as the order we introduced the 6 factors.
"Learning as Memorizing," a low-level and passive conception of learning in literature for traditional environment could not be detected in flipped learning might reflect our expectation that flipped is more active. The hierarchical relationship within the COFL can be proved and differentiated by students' motivation. Students with higher COFL perceived better learning strategies.
Conclusion: Conceptions of learning is a worthy perspective for medical educators to investigate new models of learning context. COFL questionnaire is valid

tool to measure students' conceptions of learning in flipped learning environment.

Flipped Learning Based on Peer Instruction Process Favorably Impacts Undergraduate Digestive System Education

Authors
Enrique Quintero
Onofre Alarcon
Elena Oton
Manuel Hernandez-Guerra

Presenter: Enrique Quintero, Departamento de Medicina Interna, Dermatologia y Psiquiatria, Facultad de Medicina, Universidad de La Laguna, Tenerife, Spain

Background: Flipped classroom method (FCM) promotes learning through a self-directed-learning phase with online videos and a subsequent classroom face-to-face phase used to assimilate and implement the acquired knowledge. During this phase, peer instruction has shown to engage students during the class through activities which enhances discussion and participation. The aim of this study was to compare the impact of FCM versus traditional learning method (TLM) on undergraduate Digestive System education at different academic courses.
Method: We compared the FCM at the fourth-year medical school 2017 classroom (intervention course) with the TLM applied in the 2016 classroom (control course). Students in the intervention course were provided with online videos of 45 min length with embedded quizzes before a face-to-face class (60 min) to discuss case-based problems using an interactive voting system. Students in the control course attended the traditional lecture (60 minutes) that was given by the same professors that produced the videos in 2017. To evaluate the efficacy, in both courses students were evaluated at a multiple choice written test of 50 items. A minimum of 64% (>5 points of 10) of correct answers to questions were required to pass and scores were graded as A (8.5-10), B (7-8.4) and C (5-6.9). Statistical analysis was performed by t-test and chi-squared test.
Results: The number of students attending the face-to-face class during 2017 was higher than in 2016 (median 142 vs. 30). At the final exam, the intervention course (n=148, 67.6% female) compared to the control course students (n= 133, 52.6% females) achieved a higher number of correct answers (36.8±5.7 vs. 33.8±5.6,p<0.001) and higher mean examination scores (6.4±1.4 vs. 5.9±1.3,p<0.001). The number of fails was similar in both courses (17.6% vs 24.8%,p=0.143). However, the percentage of A and B grades were higher in the intervention course compared to the control course (38% vs 16.6%,p=0.001).
Conclusion: Our results show that the FCM engage students and facilitate students the achievement of better scores and grades at medical school.
Take-home message: FCM is an efficacious teaching approach to improve grades and therefore gain knowledge in undergraduate Digestive System education.

The experience of teacher learning community in physical therapy for ever-changing clinical educational system

Authors
Tsung-Yu Tsai, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Su Lee, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan
Chih-Liang Chou, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan
Cheng-Chang Cheng, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan
Chia-Hsin Chen, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan
Yu-Chih Lin, Kaohsiung Medical University Hospital, Kaohsiung, Taiwan

Presenter: Tsung-Yu Tsai, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Clinical teachers are crucial for the effectiveness of clinical education. However, clinical teachers' training is mostly built upon conventional lectures and workshops, which provides limited effects on building teacher's identity and organizational climate. A learning community in a clinical teaching unit would benefit teachers' development and improve the teaching culture.
Method: We started the program, teacher learning community, since 2015 with strong support from the department head and hospital administrators. We scheduled monthly activities which included lectures, workshops as well as more casual activities for teachers to interact and share. We also incorporate major educational issues such as new assessment tools (DOPS, OSCE and mini-CEX) and curriculum development into the theme of activity.
Results: The community for the clinical physical therapy teachers in our hospital has been established for over 2 years and has recruited 18 members. Questionnaires were distributed to collect comments from the members and promising feedbacks were received. Members generally thought that they were more involved and the activities effectively helped individuals to solve their issues or problems. In addition, the overall teaching climate has also been improved.
Conclusion: Compared with other traditional teaching development activities, teacher learning community enhances a proactive environment, which improves the motivation and teaching climate among participants. Thus, the establishment of teacher learning community will be a good approach for the substantial development of clinical teachers.

Take-home message: Teacher learning community would be a very effective approach for individual clinical department to improve their teaching climate and teacher's ability.

Transformation of educational philosophies and community of practice: A teacher's profile in EMI curriculum innovations

Authors
Miao Yang, Shantou University Medical College, Shantou, China

Presenter: Miao Yang, Shantou University Medical College, Shantou, People's Republic of China

Background: In higher educational institutions where English is not the first language of the students, EMI program (using English as the medium of instruction in academic subjects) is often implemented as a way to achieve internationalization and improve education. While discussions on the effectiveness of EMI programs have always focused on student learning, few research has paid attention to the experience of the EMI instructors.
Method: This ethnographic case study explores the trail of development of a novice medical teacher in an EMI medical curriculum over 10 years. It presents the teacher's profile by discussing the crucial landmarks in her professional development, based on data from encounters, conversations, observation, curriculum documents and teaching materials. To ensure an analytical description and interpretation of the case, the researcher kept research journals to remain self-critical ad reflexive. Meanwhile, the participant (the medical teacher) in the case study was asked for her feedback on the research output through the chains of conversation.
Results: It is found that the teacher has undergone profound changes on teaching philosophy, leading to great initiatives in teaching reforms in the EMI instruction. The changes first occur at interpersonal level through the mediation of faculty training and then at intrapersonal level as internalized and displayed by individual efforts in teaching practice. While the teacher enjoys autonomy as a module leader, she also has to deal with difficulties arising from the institutional structure.
The findings suggest that what is seemingly a change of Medium of Instruction (MoI) and a top-down curriculum innovation entails in fact a transforming of educational philosophies, and the remaking of the community of practice that emphasizes experience and hierarchy. It is this transformation of educational philosophies that may hopefully ensure the EMI program to achieve its ultimate objective of enhancing learning and achieving internationalization.
Conclusion: Curriculum innovation is a socially-mediated collaborative process which entails social-culturally situated learning at both personal plane and community plane. Without the remaking of the traditional community of practice, individual efforts will be limited to guarantee successful curriculum innovation in the long run.

Identification with teaching, motivations to teach, and faculty development needs of part-time teachers vs tenured faculty at a health sciences school

Authors
Abigail Grover Snook, University of Iceland, Reykjavik, Iceland
Asta B. Schram, University of Iceland, Reykjavik, Iceland
Thorarinn Sveinsson, University of Iceland, Reykjavik, Iceland

Presenter: Abigail Snook, University of Iceland, Reykjavik, Iceland

Background: Health science students rarely enter university intending to be a teacher, but many find themselves teaching students as part of their career. Little is known about part-time teachers' motivations to teach, identification with teaching, and faculty development needs.
Method: Following the AMEE Guide for developing questionnaires, a literature review and teacher interviews were used to create an online survey, which was emailed to part-time teachers (PT) and tenured faculty (TF) at a health science school at an Icelandic university. The survey consisted of a validated subscale on identification with teaching and items that assessed motivations to teach and needs with a Likert scale. The Icelandic adaptation was validated, and the subscale was verified (Cronbach's α=.80) with pilot testing. CFA, t-tests and Chi-square values were calculated.
Results: Seventy-eight TF and 160 PT completed the survey for a response rate of 37% and 25%, respectively. CFA identified two more subscales, 'connectedness' (α=.78) and 'appreciation' (α=.76), and comparative fit index was .9891 using the 3 subscales. All teachers, both part-time and tenured, were found to have similar identification with teaching, in-common motivations to teach healthcare professionals, and enjoyment of teaching. PTs desired more 'connectedness' with their colleagues (p<.001) and desired more 'appreciation' for their efforts to diversify their teaching methods (p<.05). Forty-four percent of PT strongly agreed they would have liked more pedagogical instruction before they started teaching, compared to 25% of TF (p<.05). PTs agreed or strongly agreed a teacher should invest time and energy in improving their teaching more (67% PT, 52% TF, p<.05) but admitted to never participating in teaching enhancing activities more (44% PT, 13% TF, p<.0001).
Conclusion: Healthcare professional education relies heavily on the participation of part-time teachers, who often lack pedagogical training and may feel disconnected from their university department. To engage and assist both part-time and tenured faculty to be better teachers, faculty development programs need to consider their unique as well as shared values and needs.
Take-home message: Faculty development programs need to address the common needs of faculty but also address the specific values and needs of part-time instructors.

Are you still happy and want to be a medical teacher?

Authors
Pinyok Srisansanee
Chawalit Chayangsu
Sunee Chayangsu
Jeerawat Kaewwinud

Presenter: Pinyok Srisansanee, Surin Medical Education Center, Surin, Thailand

Background: The shortage of doctors in rural areas causes the Ministry of Public Health of Thailand initiated the Collaborative Project to Increase Production of Rural Doctor (CPIRD) since 1994. All physicians in the regional center hospital have to perform the heavy duties that are both clinical practitioner and medical teacher. However, the pleasure of them has not been mentioned before.
Method: The cross-sectional study was conducted at Surin Hospital, an advanced tertiary care center and one of the main teaching hospitals in Northeastern Thailand. All 118 attending physicians were asked to complete the "Happiness in work as medical teacher questionnaire."
Results: Ninety-nine (83.9%) responded the questionnaire with 48.5% men, mean±SD ages of 42.6±7.8 years (31-62). Teaching experience was 6.5±3.2 years (0.5-16).The overall happiness of being a medical teacher was 3.26±0.83 (range1-5). Men had more happiness than women significantly (3.42±0.13 vs 3.12±0.11, p=0.03).If they have choices, 38.4% of respondents do not want to be medical teachers, especially women (58.8% vs16.7%, p<0.001). Main reasons were "overload of work/insufficient time" (60.5%) and "not good enough/lack of skills in teaching" (20.1%). However, the physicians who work in the major field like Internal medicine, Surgery, OB&GYN, Pediatrics, and Orthopedics had more desire to continue teaching than the physicians who work in the minor fields (71.9% vs 42.9%, p= 0.005).
Conclusion: Physicians at Surin hospital had a borderline happiness in being a medical teacher. Too much workload and lack of teaching skills were the main obstacles to burnout.
The appropriate assignment of regular duties and teaching work should be allocated for each physician including increasing of medical education training. Moreover, all doctors should be cooperative and supportive each other.

"You're almost frightened of the tidal wave, you know you couldn't cope if it was": The stress of balancing teaching with service in general practice

Authors
Lindsey Pope
Susan Jamieson
Jill Morrison

Presenter: Lindsey Pope, University of Glasgow, UK

Background: UK General Practice (Family Medicine) is widely reported as being in crisis. Increasing workload and a decreased workforce have led to unprecedented pressure on GPs. To address this in the long term, undergraduate teaching and postgraduate training in GP is increasing. In the short term, this potentially adds to the stress and workload of teachers in practice and this study explored how GPs balance teaching commitments with their clinical service delivery.

Method: 17 semi-structured interviews were conducted with GPs who teach in multilevel learner practices in Scotland. These were analysed using a combination of Activity Systems Analysis (ASA) (Yamagata-Lynch, 2010) and Thematic Analysis. This approach enabled the tension between teaching and service delivery to be explored and its impact on clinicians to be better understood.

Results: There was a clear tension between teaching and service. Managing this tension caused significant stress for some of the GPs and their practice teams. ASA identified how the varying intended outcomes of teaching (e.g. the energy learners bring, income, maintaining quality of care and service provision) interacted with desired clinical outcomes. Furthermore, the use of this framework facilitated consideration of where the tension within and between activity systems existed (e.g the 'rule' of protected time for teaching v the pressure due to staffing shortages – 'division of labour).

Conclusion: While much of the recent literature and policy promotes a rapid expansion of teaching in General Practice, this study demonstrates the need to consider the implications of this in the context of a recruitment and workload crisis in GP. Through better understanding of the Activity System of teaching in GP, strategies for managing the teaching-service tension were identified and areas of ongoing tension described. These strategies and tensions existed both at local level and at the interface with partner organisations (e.g. medical school, postgraduate organisations).

Take-home message: In order for the current desire to expand teaching in GP to succeed, GPs need to be supported to effectively balance the tension between teaching and service delivery.

4JJ8 (2841)
Prevalence and factors influencing burnout syndrome among medical teachers in tertiary care non-faculty hospital: a pilot survey

Authors
Thanatchanan Thodthasri
Rungnapa Pengprakhon
Yada Siriphannon
Surasak Aumkaew
Thanatpong Thienwuttiwong
Narin Chindavech

Presenter: Thanatchanan Thodthasri, Buriram Medical Education Center, Buriram, Thailand

Background: Our tertiary care non-faculty hospital is in the part of the Collaborative Project to Increase Production of Rural Doctor supported by university hospital. Mainly of physicians workload is to service both IPD and OPD patients, in addition to teaching ninety medical students in three clinical years with quality control of hospital accreditation. Because of workload, burnout syndrome may be common and underestimated among our physicians due to prolonged exposure to job stressors, emotional exhausted, and student expectation.

Method: 115 online-questionnaires were sent to medical teachers (response rate 76%). The questions consisted of baseline socio-demographic data, working hours per week, night shift work, teaching hours per week, leisure time, mindset of medical education program, working environment, partners of workload, experience in medical teacher, number of simultaneous jobs. And burnout will be assessed in three aspects of emotional exhaustion, depersonalization, decreased occupational accomplishment.

Results: Prevalence of burnout syndrome among old staffs (>40 year, 44.4%) is 42.7% more than in young staff 19.0% (< 40 year, 55.7%), male (62%) more than female (38%) with related to personality type A. Associated factors were longer years of medical service, habitual style, loss of teaching inspiration, number of simultaneous jobs. The percentage of burnout syndrome of each departments were OB-GYN 47%, medicine 31%, surgery 27%, pediatrician 20%, whereas a few in orthopedic 5.9%, rehabilitation 4%, family medicine 3.4% correlated to ratio of teachers and students, specialist stress at work. Self-reported depression was related to higher scores for all three domains. The most impact influencing factors were working hours per weeks, number of simultaneous jobs and mindset of medical education program, respectively. Burnout syndrome was common in tertiary care non-faculty hospital with multiple aggravating factors. Finding out the magnitude, causes and further exploration of these syndromes in other healthcare providers, and paramedics related to medical student may lead to improvement of medical education program, the quality of working environment and coped with emotional compromised of medical teachers.

Conclusion: Prevalence of burnout syndrome among our medical teachers is about 30% of all which maybe impact to medical education program.

Retention behind Resilience: How to cope with a hectic schedule in the medical workplace

Authors
Pei-Chun Lin, FEMH, New Taipei City, Taiwan
Ya-Ting Yang, FEMH, New Taipei City, Taiwan
Yun Chen, FEMH, New Taipei City, Taiwan

Presenter: Pei-Chun Lin, Far Eastern Memorial Hospital (FEMH), New Taipei City, Taiwan

Background: In Taiwan, clinical teachers in medical center usually have a hectic schedule involving clinical service, teaching and research. Burnout is common amongst these faculty members. We investigated the effect of resilience workshop on medical faculty members in need and hope through giving the skills can help them cope with the hectic schedule.
Method: We designed the resilience workshop as a faculty development activity placing off cites and taking half day to give a brief concepts about resilience and how Mindfulness-Based-Stress-Reduction (MBSR) can improve resilience by MRSR instructor. Questionnaire designed to approach participants' perception of mindfulness and resilience with feedbacks after workshop were collected.
Results: At first, we call for participation for those faculty members who think they are burnout. 33 faculty members from various departments including physicians, pharmacists, nurses and other paramedical staffs joined the workshop, and 85.7% are clinical-teachers. 97% of them were satisfied with their teaching performances currently, however, the most two reasons caused teaching fatigue and burnout were working and teaching time conflict (22.54%), and heavy teaching load (15.49%). Through the workshop, participants 100% agreed the skills could help them face the stress and enhancing their resilience. Moreover, providing exclusive teacher benefits such as free coffee or massage on Teacher's Day (27%), more MBSR lessons (26%), and offering career development lessons such as stress management (19%) were the most three recommended activities to enhance resilience by participants.
All participants found the resilience workshop entirely positive. It gave faculty members a space to discuss themselves, to share, and to learn from each other, subsequently increasing their sense of wellbeing and mindfulness. The workshop enabling teachers to respond positively while facing teaching fatigue.
Conclusion: Resilience is vital for medical faculty members. Burnout contributed by many factors including personal hectic schedule, individual and environmental factors. A system to provide supports in order to retain teacher's wellness and wellbeing is crucial for faculty resilience. Resilience workshop is an effective tool for faculty members to cope with hectic schedule in the workplace.
Take-home message: Practices led by MBSR instructor could enhance resilience and avoid teacher burnout.

Stress Maintained by Medical Staff, Externs and Interns Affects Medical Students' Learning Abilities at Vachira Phuket Medical Center

Authors
Pornpirun Leeyangyuen
Pimchanok Thaveesuwan
Supassarang Chanpen
Supachai Saingtong
Phanpaporn Meekaew
Pathom Yachaw

Presenter: Pornpirun Leeyangyuen, Walailak University, Phuket, Thailand

Background: Medical studies can be difficult and stressful since the students are required to tackle medical-related problems and be fully responsible for consequences. Stressful medical staffs can also be another factor that causes stress to medical students and affects their learning skills. This study aims to address the effects of stress maintained by medical staffs, externs, and interns on medical students' learning abilities.
Method: Questionnaires modified from self-stress assessment form by department of mental health of Thailand and Questionnaires about effects of medical staffs, interns and externs on medical students' GPA and learning satisfaction were distributed to 48 medical students between 4th to 6th year at Vachiraphuket medical education center. Personal data were also collected. The data was analysed by adopting one-way ANOVA (p = .05)
Results: Results showed that the participants had normal (71%) and severe stress(29%). The group that portrayed severe stress were females (=0.005) studying in 4th year (p < 0.005) majoring in Obstetrics and Gynecologic (p < 0.005). In addition, results demonstrated that stressful medical staffs negatively affect medical students' GPA and learning satisfaction (p < 0.005) while encouraging externs and interns positively affect students' learning satisfaction (p<0.005).
Conclusion: Stressful medical staffs relatively decrease students' learning satisfaction, encouragement, and GPA while stressful externs and interns do not significantly affect their learning satisfaction and GPA. On the contrary, encouraging externs and interns positively affect the students' learning satisfaction and motivate them to improve their GPAs.
Medical staffs that have reasonable and grounded stress as well as encouraging externs and interns are proper for medical students because they relatively assist in students' learning abilities and outcomes.

Faculty Motivations and Barriers to Teaching in a Clinical Academic Department

Authors
Malgorzata Rajda, Dalhousie University, Halifax, Canada
Lara Hazelton, Dalhousie University, Halifax, Canada
Cheryl Murphy, Dalhousie University, Halifax. Canada
Mark Bosma, Dalhousie University, Halifax, Canada
Sherry James, Dalhousie University, Halifax, Canada
Heather Milliken, Dalhousie University, Halifax, Canada

Presenter: Malgorzata Rajda, Dalhousie University, Department of Psychiatry, Halifax, Canada

Background: While teaching is a core activity of clinical departments in faculties of medicine, the degree to which individual faculty members self-identify as academics and/or teachers varies. Clinicians may identify only as practitioners or may be committed to teaching and other academic activities. Miller (2014) proposed a model for teacher identity formation that includes personal factors, training factors, and contextual factors (as well as reflection). The purpose of this study was to determine to what extent members of a clinical academic department self-identify with academic roles, to explore their perspectives as teachers, and to identify facilitators and barriers to teaching.
Method: 102 faculty members of the Dalhousie Department of Psychiatry in Nova Scotia, Canada, were invited to complete an Opinio survey on teaching in 2014-15 (35 completed responses) and 2017 (16 completed responses). Findings were evaluated using quantitative (frequencies) and qualitative means (thematic analysis).
Results: Although over 90% of respondents identified teaching as an important component of their work, approximately 25% of respondents did not self-identify as academic physicians despite having faculty appointments. Much of the motivation to teach arose from personal factors (sense of responsibility, enjoyment) while barriers were often contextual factors (competing service demands, tension between clinical expectations and teaching responsibilities). Respondents indicated they would benefit from practical support (such as protected time for teaching) and would value recognition and encouragement. Over half the respondents had training in medical education, and the majority were confident in their teaching skills. Approximately half of respondents expressed interest in department-supported faculty development to improve teaching skills.
Conclusion: Some clinical faculty who see teaching as integral to their professional role do not self-identify as academic physicians. Motivators for teaching were often personal factors, while contextual factors were more likely to be identified as barriers. Faculty development in teaching was valued by many, but participation was not universal. Currently, these findings are being used to address local barriers to teaching and recognize teachers more effectively.
Miller W. Developing a theory of clinical instructor identity using the experiences of medical laboratory science practitioners. Clin Lab Sci. 2014 Spring;27(2):97-104.

Dr Kathryn Jarvis, University of Liverpool, Liverpool, UK

Presenter: Catherine Gordon, University of Liverpool, UK

Background: This work discusses the final stage of an interprofessional research project, the primary aim of which was to gain insight into the expectations of preregistration nursing and radiotherapy students and the potential link to student retention.
Method: Data was initially collected using specifically designed, traditional questionnaires in order to gain an insight into the academic, clinical and practical expectations of both cohorts of students at both the beginning of year one and the beginning of year two. Having analyzed the traditional data and identified the emergent themes using the Miles Huberman approach, the pictorial data collected in parallel with the narratives also required analyzing. This work describes the various stages of development of a systematic method of analysis of the pictorial data and discusses the findings using this non-traditional method in comparison with those identified using the original, traditional methods.
Results: The findings of the first stages of the project identified three main comparable themes (support, communication and confidence) with few contrasting themes. One of the major results of this final stage of the project was the design and development of a systematic and objective method of analysis of the pictorial data. Surprisingly, the findings from the non-traditional data provided a notably different insight into the student's expectations and experience.
Conclusion: The development of a robust method of analysis of pictorial data, once tested, provides the potential for application in a range of contexts.
The team plan to test their method further in the hope that they might use the method with confidence in the future. Questionnaires are a commonly and widely used data collection method for the collection of data in response to specific questions. However, with the development of a robust and objective method of analysis, this work indicates a potential to gather a more realistic insight into students' experiences.

Productivity in medical education research: a challenge and opportunity in Thailand

Authors
Pairoj Boonluksiri, Hatyai Hospital, Songkhla, Thailand
Rajin Arora, CPIRD, Bangkok,Thailand
Nawapat Umthong, CPIRD, Bangkok, Thailand

Presenter: Pairoj Boonluksiri, Hatyai Hospital, Songkhla, Thailand

Background: Medical education research requires different ways of thinking about knowledge compared with clinical medicine. All medical schools including affiliated hospitals have to emphasize on educational research for quality assurance. In Thailand, Collaborative Project to Increase Production of Rural Doctor (CPIRD) is affiliated with universities and responsible mainly for service plus clinical and educational research. So it is a challenge and opportunity to balance these duties.
Method: Medical education researches are collected via Thai Medical Education Database during 2001-2016. Categories are publication, presentation at national and international conferences (AMEE, OTTAWA, AMEA). Themes are categorized as curriculum, teaching & learning, assessment, and others. Objective designs are classified as description (what was done?), clarification (why or how did it work?), and justification (did it work?). Data analysis is performed to compare the productivity of CPIRD and universities.
Results: There are 1,979 titles found and only 5% are published. The trend of productivity increases rapidly in 16 years. Of 1,884 presentations, 47.8% are international which 60% are presented again at national conference. AMEE (91%) is the most common which 52.8% are performed by CPIRD. The most common theme is teaching & learning in undergraduate. There are statistically different in objective designs between universities and CPIRD (66.2%vs74.5% of description, 33.1%vs23.8% of clarification, and 0.7%vs1.7% of justification respectively, p-value 0.004). By interview for the barrier, it is related to insufficient skills, experience and less familiar with methodologies than clinical research. In addition, time management is somewhat difficult and no inspiration. Most researches are supported by volunteer.
Even though CPIRD has research productivity as many as universities, quality evaluation is limited due to lack of full papers appraisal. Most researchers are familiar with teaching & learning theme. Small publication might be under-reported from publication bias. International presentation like AMEE is an enhancing factor of productivity. It can inspire inexperienced staffs to do educational research.
Conclusion: Balancing service and educational research should be considered for medical schools including affiliated hospitals. Research management to increase capacity should be continuously supported for international presentation and publication.

What factors determine academic achievement in medical education? Perspectives of Thai internists and dropout students

Authors
Navakorn Ingkapairoj ,Buriram Hospital, Buriram, Thailand
Suporn Travanichakul, King Chulalongkorn Memorial Hospital, Bangkok, Thailand
Chitsanupong Tangadurat, Buriram Hospital, Buriram, Thailand

Presenter: Navakorn Ingkapairoj, Buriam Hospital, Buriram, Thailand

Background: Although most Thai intellectual high school students select to study medicine, the academic achievement in their medical schools varies, some cannot pass the national licenses examination and drop out of their colleges. Exploring this is important for faculty development.
Method: 16 volunteer participants, all had an average high school GPA of more than 3.80 and excellent cognitive function (mean MOCA test 30, mean DSST 118 from 120 within 90 seconds), had been interviewed. 7 participants were graduated with average scores and 9 participants could not pass national license examination or passed by retest. We compared between two groups with basic vocational orientation, PHQ-9 depression screening test, Rey auditory verbal learning test (RAVLT) and their perspectives about educational obstacles.
Results: The learning skill from RAVLT between two groups was similar. Success at examination group was related to "Data" (average "Data" domain score 36.1±11.4 vs 29.0±8.1) or "Person" (average "Person" domain score 48.8±7.0 vs 41.0±9.0) type of basic vocational orientation. Meanwhile, the poorly performed medical student oriented to "Tool" (average "Tool" domain score 30.0±6.8 vs 15.0 ±7.7) type and had depressed mood (33.3% vs 14.3%). The issues like inadequate leisure time and stress were also important factors for academic achievement. Our study resonate different perspectives from other contemporary studies. The emotional wellbeing and occupational aptitude could affect academic achievement in medical students. In Thailand, six-years curriculum in medical school is required. The first three years of the curriculum aredevoted to preclinical studies and the clinical clerkship take place during the remaining three years. The effective time management skills and emotional coping skills are essential for continue academic accomplishment.
Conclusion: In addition to intellectual and learning ability, the academic achievement in medical students also depend on occupational aptitude, adequate leisure time and emotional coping skill. Because the intellectual high school students select to study medicine, this value create a culture of higher expectation and cause stress.Emphasis on the emotional wellbeing and vocational orientationis important.

Academic Risk Predictive Model in First Year Medical Students at Universidad Andrés Bello Viña del Mar Chile

Authors
Peter McColl, Universidad Andrés Bello, Viña del Mar, Chile
Verónica Silva, Universidad Andrés Bello, Viña del Mar, Chile
Jessica Goset, Universidad Andrés Bello, Viña del Mar, Chile
Carolina Pérez, Universidad Andrés Bello, Viña del Mar, Chile
Jonathan Acosta, Universidad Andrés Bello, Viña del Mar, Chile
Mariana Searle, Universidad Andrés Bello, Viña del Mar, Chile

Presenter: Peter McColl, Escuela de Medicina Universidad Andrés Bello, Viña del Mar, Chile

Background: Academic risk detection is a very important task as it allows to opportunely support students and prevent delays in curricular advancement and/or dessertion.
Objective: Create a predictive model, which detects students at academic risk in the first semester of the first year of medical school.
Method: A cross-sectional study with 38 medical students and variables first measured were math-language-science Universitary Selection Scores (USS-M, USS-L, USS-S); Ranking Score (RS), High School Final Mean (HSFM). Then informed consent obtained and the following tests applied: MSQL, motivation (MOTIV), and learning strategies (LS); Kolb´s Learning Style Inventory; a Psychosocial Questionnaire, which identified psychosocial risk (PR) and family support (FS); Reading comprehension and speed. Final semester grades mean (FSGM) obtained. Correlation and linear regression, $p<0.05$ were used.
Results: 52.63% are at psychosocial risk. Group without psychosocial risk FSGM 5.73, and group at risk FSGM 5.63 (scale 1 to 7). Students with family support FSGM: 6.07 and group without family support a 5.65.
Kolb´s convergent style (CO), has the highest FSGM (6.12), compared to the others. Reading comprehension and reading speed were not relevant.
Correlation analysis: FSGM high linear correlation with USS-S (0.437), LS (0.357) and MOTIV (0.357). Linear regression model of the FSGM explains:
FSGM = -2.486 + 0.0033HSFM + 0.0017USS-M + 0.0045USS-S + 0.14MOTIV + 0.08LS - 0.15PR+ 0.33FS + 0.53CO, p=0.00002.
Determination Coefficient is 0.6830. The model explains 68% of the variability existing in the FSGM of the first semester.
The variables studied showed the ability to predict academic performance. Variables linked to the regression model: HSFM, USS-M, USS-S, MOTIV, LS, PR, FS and CO, were able to explain the variability of academic performance close to a 70%.
Conclusion: Several challenges arise: to validate the predictive model with a new cohort; to improve the Determination Coefficient by incorporating other variables

measurements and most important, to apply an intervention plan to the detected students.

What happened to my mind?

Authors
Kanoknan Intabtim
Sukanya Rukajeekul

Presenter: Kanoknan Intabtim, Budhachinaraj Medical Center, Phitsanulok, Thailand

Background: There is a huge difference between the pre-clinical (first to third) and the clinical (fourth to sixth) years in medical school. The fourth year of medical school is one of the most challenging and important periods since a large amount of time is spent with patients in steads of attending lectures. To deal with multiple responsibilities, social expectation, intensive training programs, and a culture of blame can lead to stress, low self-esteem and depression in medical students.
The objectives of "What Happened to My Mind" were to help the fourth year medical students resolve their inner conflicts through self-reflection and introspection, to develop a positive learning environment, and to identify the at-risk students in order to provide them with support.
Method: The fourth-year medical students at Buddhachinaraj Hospital were involved in this study and the moderators were the psychiatrists. The activities were divided into three sections: the small talk; the reflective writing including the unpleasant situations which they had experienced, how they perceived them, and how their attitude was changed; sharing their experiences to others. A cross-sectional descriptive study was performed. Data of the study were reported as the percentage and qualitative analysis.
Results: Data were collected from 34 (male=11, female=23) out of 60 fourth-year medical students. The results showed that the most emotional situations for the fourth-year medical students were emotional ties with the patients and their illnesses (47.1%), their academic concerns (26.5%), and being reprimanded by staffs, residents, and interns (23.5%), respectively. The emotion categories that occurred were sadness (50%), empathy (29.4%), feelings of guilt and disappointment (20.6%). Consequently, these resulted in determining to practice self-development (82.4%); however, there were two students who were subject to suffering from depression or adjustment disorder.
Conclusion: "What Happened to My Mind" is the activity which gives the medical students a good opportunity to do a self-reflection. Not only that the students gain their self-understanding, but the instructors can help promote the students' improvement and development. This activity should be regularly encouraged for every medical student.

Stress in relation to CanMEDS roles during clinical courses: a prospective study on medical students

Authors
Sari Ponzer, Karolinska Institutet, Stockholm, Sweden
Susanne Kalén, Karolinska Institutet, Stockholm, Sweden
Hanna Lachmann, Karolinska Institutet, Stockholm, Sweden
Hans Järnbert-Pettersson, Karolinska Institutet, Stockholm, Sweden
Riitta Möller, Karolinska Institutet, Stockholm, Sweden
Tomas S Bexelius, Karolinska Institutet, Stockholm, Sweden

Presenter: Sari Ponzer, Karolinska Institutet, Stockholm, Sweden

Background: CanMEDS competency framework could be used to follow the development of medical students' professional roles. Our hypothesis was that stress and other emotions varied over time and were related to type of courses, specific CanMEDS roles, and socio-demographic factors such as age, gender and previous university degree. The aims of this study were to investigate undergraduate medical students' perceptions of stress and relate to their socio-demographic background factors and reported CANMEDs roles.
Method: Medical students participated in a prospective study and reported their experience of stress and what two CANMEDs roles they primarily had been engaged in during the last three weeks. The questionnaires were sent every third week, during the study period of 1.5 years when the students completed their courses in Internal Medicine (6th term), Scientific Project (7th term) and Surgery (8th term). Of 98 students who agreed to participate 74 were included corresponding to a response rate of 76%.
Results: The most frequently reported CanMEDS roles were 'Medical expert' (57%) and 'Scholar' (60%). Stress increased during the students' Scientific Project term coinciding with the highest proportion reported professional roles as a Scholar. No link between stress and socio-demographic factors, such as gender and age was found.
Conclusion: This study focused on undergraduate medical students' perceptions of stress during their clinical courses. The key finding was that activities related to different CanMEDS roles were more important in determining the level of stress than any socio-demographic background factor, including gender and age.
Take-home message: Students' stress was related to different learning activities rather than to their socio-demographic background factors.

4KK5 (1170)
Motivational Profiles of Thai Medical Students: Association with Exhaustion, Academic Year, and Performance

Authors
Wanna Ardonk, Buddhachinnaraj Medical Center, Phitsanulok, Thailand
Kosa Sudhom, Buddhachinnaraj Medical Center, Phitsanulok, Thailand
Pattavikorn Vaiyamoke ,Buddhachinnaraj Medical Center, Phitsanulok, Thailand

Presenter: Wanna Ardonk, Buddhachinnaraj Medical Center, Phitsanulok, Thailand

Background: Motivation is one of the driving factors for academic performance. According to self-determination theory (SDT), intrinsic motivation is driven by inherent satisfaction and is self-determined while extrinsic (controlled) motivation stems from desire status, monetary reward, and/or avoiding punishment. The study aimed to identify the motivational profiles of Thai medical students using clusters of motivation types and investigate their associated factors.
Method: Medical students from 2nd to 6th year studying medicine at Naresuan University participated in the study (n=506). Students completed the Academic Motivation Scale (without the lack-of-motivation subscale) along with the exhaustion scale (possible full score: 30) from Maslach Burnout Inventory-Student Survey (MBI-SS). Academic year, gender and GPA were recorded. The K-means cluster analysis was used to categorize the respondents into 4 clusters of motivation: High Intrinsic-High Controlled (HIHC), High Intrinsic-Low Controlled (HILC), Low Intrinsic-High Controlled (LIHC), and Low Intrinsic-Low Controlled (LILC) in order to assess the relation to exhaustion, gender, academic year, and academic performance.
Results: The HIHC, HILC, LIHC, and LILC clusters constituted of 39%, 17%, 14% and 30% of the population, respectively. The distribution of students from different year levels between the profiles was significantly different (p=0.002). The percentage of pre-clinical year students (2nd-3rd) was the highest in HIHC whereas the majority of clinical year students (4th-6th) consisted in LILC. The exhaustion scores in HIHC (13.69) and HILC (14.36) groups were significantly lower than those in LIHC (17.33) and LILC (17.15), p=<0.001. There were no differences between clusters in GPA (p=0.215) or gender (p=0.341).
There were distinct patterns of intrinsic and controlled motivation. Although grades and gender were not significantly different among the motivation groups, intrinsic motivation was found to be an essential link to lower exhaustion. The difference in motivational profiles between pre-clinical and clinical years showed that academic programs in the latter might diminish both types of motivation.
Conclusion: The faculty could enhance students' intrinsic motivation by providing a learning environment with autonomy-supportive teaching or conducting an academic intervention to improve autonomous motivation.

Medical Student Suicides in Thailand: The Analysis by Using Reported Cases in Thai Newspapers

Authors
Rungnapha Siriphonphaibool
Worasit Charoensin

Presenter: Rungnapha Siriphonphaibool, Somdejphrajaotaksinmaharaj Hospital Medical Education Center, Tak, Thailand

Background: The instruction of medical in Thailand, It can be said that the major that students confront with stress all the time. When students study in the higher year will find the content that is difficult and medical students received a high expectation from the family and society. So, medical students are more concerned and the risk of severe depression until the suicide phenomenon many time in Thailand. Therefore researcher studies the causes of suicide in medical students. It also offers the strategy to prevent suicide of medical students.
Method: This is survey research since 2007 – 2017 by searching reported cases from "Matichon E-library Online Based" and using keywords to search are "Medical Student" and "Suicide" to find a phenomenon in each year and presents results through description analysis.
Results: Thai newspapers show 6 report cases. The result found 5 medical students success suicide, male suicide than more female 83.3%. The most suicide of medical students is jump from high place and jump to river (33.3%). The most places' suicide of medical students is public area (66.6%) and the causes of medical student suicide are study problems (100%).
However, the 10 years ago have the suicide rate of 6 medical students. This is a very low number when compared with the rate of suicide in all students of countries but these phenomena should not happen because medical students will be valuable human resources for future in public health system. If the instructor or medical school has a strategy to prevent the medical student suicide can make the positive impact to students.
Conclusion: Medical schools should have a strategy to prevent medical student suicide by using "meeting advisers" technique for monitoring, following and counseling to medical students to reduce the risk of suicide.
Take-home message: Medical school should push meeting advisers technique to be activity or policy of medical student and pushing the activity at least 3 times per year.

Development and content validation of a structured scale for measuring interpersonal violence and bullying among students from health professions undergraduate programs

Authors
Matheus Francoy Alpes
Maria Paula Panúncio-Pinto
Luiz Ernesto de Almeida Troncon

Presenter: Matheus Alpes, Ribeirão Preto Medical School - University of São Paulo, Ribeirão Preto, Brazil

Background: Interpersonal violence and bullying (IPV-B) seems to be common in higher education. This has drawn the attention of educators concerned with student adjustment and mental health. IPV-B also challenges the University broad responsibility to educate citizens committed to humanistic values.
Method/Results: We developed a structured scale for measuring IPV-B among undergraduate students in the health professions. An exploratory research identified different IPV-B events, including violence due to gender, sexual orientation and personal characteristics, as well as racism and social class discrimination. These findings underpinned the construction of an initial scale version with 83 affirmative items in a 5-point Likert Scale. Ten referees with professional experience in IPV-B or scale construction evaluated this version. Concordance between referees (Content Validity Index value: >0.80) was required for item maintenance in the scale. An adjusted scale version was subsequently assessed by undergraduate students (N=20).
Referee evaluation led to the exclusion of 27 items and the adoption of a 4-point Likert Scale. Referees agreed that the remaining items were pertinent, meaningful and presented in the right order, with sufficient clarity, coherence and comprehensiveness. Language, layout and instructions for answering were also regarded as appropriate. Students agreed that the scale was fully understandable (18/20) or nearly so (2/20), with all items easy to answer. Based on referee´s judgement and student´s opinion, a 56-item final version of the IPV-B scale was composed and is ready for further work.
This study covered the steps recommended for the construction and validation of structured scales. Further work with larger number of students will allow completing validation and evaluating the scale reliability. Measuring IPV-B using a properly validated and reliable scale is important, as experiencing IPV-B situations may affect student social adjustment and adversely influence learning.
Conclusion: Construction and content validation of a structured scale for measuring interpersonal violence and bullying in health professions undergraduate programs was feasible and produced promising results. Using such a scale may help detecting these undesirable events, evaluating the educational environment and favor the development of coping strategies and the definition of preventive actions.

4KK8 (3026)
Depression Factors During Internship In Medical Students

Authors
Komcharn Prompalad
Chonnikarn Weng

Presenter: Chonnikarn Weng, Medical Education Center Phuket Hospital, Phuket, Thailand

Background: Feeling stressed for more than 2-weeks could lead to acute depression. Medical students are a high risk for depression due to high responsibility. This depression could lead to many further serious problems. To determine probable depression factors of 6th-year medical students.
Method: The Qualitative descriptive study was interpreted at medical college Maharaj Nakhonsithammarat hospital from April 2016 – April 2017. Inclusion criteria was 6th year medical students who were tested postitive with 2Q question test in Depression screening during the Internship period in major department. Questionaires were used to collect data from 6th years medical students in order to study depression factor while they were woking as interns in 6 major departments eg. Internal medicine, General surgery, Pediatric, Obstetric & Gynecology, Orthopedic & Emergency department. 2Q Depression screening question:
1. Have you been sad or depressed for the last 2 -weeks?
2. Have you been bored or not enjoying life for the last 2 -weeks?
Results: There were 89 students in the study with a mean age of 24±0.43 years old. Overall 24 (26.96%) students were depressed while they were in Internal medicine rotation which the major depression factors was The Morning-Noon conference. 20 (22.47%) students felt depressed while they were in rotation of general surgery which the major depression factor was the aggressive behavior of professors.
16(17.97%) students were depressed while they were in Emergency Department bacause of too much workload & nightshifts.
9 (10.11%) students were depressed while they were in Obstetric & Gynecology because they were not good at doing procedures eg. Amniotomy and Normal Labor. Department that had the lowest number of depressed students was Orthopedic because Students had the best life quality compared to other departments eg. kind staff, appropriate night shift, non stress case-conference.
Conclusion: Factors induced depression in medical students are different in each Department which depend on the environment for instance morning & noon conference, aggressive behavior of professors, night shifts, Co- Health providers such, free time to relax and personality factors e.g. marriage status, parents status, GPA National license examination, income.

4KK9 (509)
An active strategy of clinical skills learning - engaging students as partners in learning activities

Authors
Fazna Aishath Saleem, International Medical School, Management and Science University, Kuala Lumpur, Malaysia
Sylvia Heeneman, Maastricht University/ MUMC, Faculty of Health, Medicine and Life Sciences, Maastricht, Netherlands.

Presenter: Fazna Aishath Saleem, International Medical School, Management And Science University, Kuala Lumpur, Malaysia

Background: This study is focused on adopting an active learning strategy with a teacher-student partnership to improve the clinical skills learning in the domain of cognitive skills in an undergraduate medical curriculum. The research questions explored were (a) Does involvement of students in constructing case scenarios for their clinical skills learning sessions with the faculty improve students' knowledge domain of clinical skills? (b) What is the students' perception of this teaching method?
Method: This study was carried out in a clinical posting of 4th year undergraduate medical students. 78 students were randomly assigned to 2 groups. The intervention group was involved with the faculty in constructing case scenarios (N=40) and the control group continued with the conventional teaching methods. (N=38). A convergent parallel mixed-method design was used in this study. At the end of their clinical rotation Key-Feature-Tests were used to assess their cognitive domain of clinical skills. Qualitative data was also collected from unstructured open-ended individual interviews.
Results: A comparative analysis of the results revealed that the intervention group scored significantly higher, mean 64.77 (SD 10.06), compared to the control group mean 58.32 (SD 10.47), with a statistically significant difference (p<.007). The qualitative exploration revealed four main themes: Learning strategies, Relationship with lecturer, Cooperative learning and Student responsibilities. The study revealed that there was a relation between student engagement, partnership and effective learning and substantiated the goals of constructivist learning. The themes that emerged in the study were in line with the main characteristics of constructivist view of learning that also corresponded to a "Rich environments of active learning" (REAL). The students also perceived that their experiences provided them a good platform to contextualize their knowledge and enhanced deep learning.
Conclusion: Based on the study, constructing clinical cases had shown important aspects of student engagement. It also proved to be an effective way for active involvement in learning while building a partnership with the faculty. Co-producing case construction is suggested to be an integrated method of clinical skills learning that can be utilized to improve the knowledge domain of clinical skills.

The role of medical students in implementing a curriculum in a new branch campus

Authors
Christopher A. Dinh, Mayo Clinic School of Medicine, Rochester, MN, USA
Tanmayi S. Pai, Mayo Clinic School of Medicine, Rochester, MN, USA
Shemonti R. Hasan, Mayo Clinic School of Medicine, Rochester, MN, USA
Joseph P. Grande, MD, PhD, Mayo Clinic, Rochester, MN, USA

Presenter: Christopher Dinh, Mayo Clinic School of Medicine, Rochester, USA

Background: In July 2017, Mayo Clinic School of Medicine, Rochester, Minnesota, opened a branch campus in Scottsdale, Arizona. Arizona's inaugural first-year pathology course was implemented concurrently with Rochester's course in January 2018. The Rochester course has a tradition of utilizing third-year medical students, who have previously taken the first-year course, as teaching assistants (TAs). Three third-year students were also sent to Arizona to facilitate implementation of the new course.
Method: Students and TAs were surveyed during the last week of the course to determine the effectiveness and comparability of course implementation. Surveyed TAs included two Arizona pathology faculty members and eight third-year medical students. Fifty Rochester students and 31 Arizona students rated their agreement from 1 (strongly disagree) to 5 (strongly agree) with statements evaluating their perceptions of TA mentorship and teaching performance.
Results: Student TAs compared to consultant TAs were perceived as improving student integration into the medical community (4.4 vs. 4.1), increasing awareness of upcoming medical school expectations (4.1 vs. 3.6), improving study skills (4.0 vs. 3.5), and promoting work-life balance (3.6 vs. 3.2). However, student TAs were less effective at explaining challenging concepts (4.4 vs. 4.8). Rochester and Arizona TAs thought course implementation went equally well (4.5 vs. 4.5) and that courses were equally well organized (4.2 vs 4.0).
Conclusion: Third-year medical student TAs were uniquely positioned to transfer Rochester's existing course culture to a new branch campus with its own distinctive features. Translating methods of evaluating clinical reasoning to a new campus was challenging. However, due to their previous course experience, student TAs on both campuses were better equipped to understand student challenges and found it easier to adapt existing material to meet student needs. Because the Arizona campus only has first years, those students especially appreciated mentorship from third-year medical student TAs.
Take-home message: Medical student TAs were effective at implementing a comparable preclinical course that integrates basic science and clinical information at a new branch campus.

The Utrecht Work Engagement Scale (UWES-S-9) has good psychometric indicators in the Portuguese medical student population

Authors
Rita Neves, School of Medicine, University of Minho, Braga, Portugal
Alexandra Araujo, Department of Psychology and Education, Portucalense University, Porto, Portugal
Anouk Wouters, Department of Research in Education, VUmc School of Medical Sciences, Amsterdam, Netherlands. LEARN! Research Institute for Learning and Education. Faculty of Psychology and Education, VU University Amsterdam, Netherlands
Rashmi Kusurkar, Department of Research in Education, VUmc School of Medical Sciences, Amsterdam, Netherlands. LEARN! Research Institute for Learning and Education. Faculty of Psychology and Education, VU University Amsterdam, Netherlands
Fátima Teixeira, School of Medicine, ICVS/3B's, PT Government Associate Laboratory, Braga/Guimarães, Portugal
Manuel João Costa, School of Medicine, ICVS/3B's, PT Government Associate Laboratory, Braga/Guimarães, Portugal

Presenter: Rita Neves, School of Medicine, University of Minho, Braga, Portugal

Background: The Utrecht Work Engagement Scale (UWES) is a widely used self-report questionnaire of work and student engagement that assesses the three dimensions of the construct: vigour, dedication, and absorption. Student engagement has not been measured before in Portuguese medical students with UWES or other scales. This study evaluated the psychometric properties of the Shortened Student Version of this scale (UWES-S-9) among Portuguese medical students.
Method: Participants were Portuguese medical students from all the 6 years of undergraduate medical training who filled out the UWES-S-9 and the NEO-FFI questionnaires. The UWES-S-9 scores were analyzed for item sensitivity, reliability, and factorial, convergent, and discriminant validities. The UWES-S-9 was correlated with the NEO-FFI data for convergent validity.
Results: The response rate was 59 % (460 out of 781). Item scores proved adequate sensitivity. The subscales and total scale scores demonstrated good reliability ($\alpha \geq 0.83$), except for the subscale Absorption ($\alpha = 0.68$), where problems with item 8 ("I am immersed in my studies") were detected. A one-factor model showed adequate fit to the data (CFI = 0.95, TLI = 0.92), but both a three-factor and a second-order three-factor model demonstrated improved fit (CFI = 0.97, TLI = 0.95). However, item 8 showed lower scale and subscale loadings. Total engagement scores showed significant positive correlations with extraversion, agreeableness, and conscientiousness ($0.14 \leq r \leq 0.25$), and negative relations with neuroticism ($0.14 \leq r \leq 0.25$). No significant differences in engagement were found for gender and academic year.

Conclusion: UWES-S-9 has acceptable psychometric properties and is a useful instrument to measure student engagement, either as a one- or three-dimensional model in Portuguese medical students. The removal of item 8 would improve the overall scale properties. Therefore, we recommend a revision of item content to rephrase or remove it, or replace it by another item of the original UWES scale and further validation of the scale. Further studies with longitudinal designs could evaluate engagement stability in medical education.
Take-home message: UWES-S-9 is a suitable scale to measure engagement among Portuguese medical students.

Time and Communication: lessons learned from Year 1 student engagement team in an ASPIRE medical school

Authors
Pannathorn Nakaphan, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
Pakorn Pitakkitnukun, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
Mathurin Suwanwalaikorn, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
Manichaya Sukonpatip, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand
Danai Wangsaturaka, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand

Presenter: Mathurin Suwanwalaikorn, Faculty of Medicine, Chulalongkorn University, Bangkok, Thailand

Background: As an ASPIRE medical school, student engagement (SE) work at Faculty of Medicine Chulalongkorn University has contributed to numerous improvements, the most consequential of which is the brand-new 2017 curriculum. Having learned about this, the number of Year 1 students who decided to take part in SE work is larger than ever. This study aims to describe the journey of the Year 1 SE working group, the evaluation of our work and the differences of attributes between SE team members and the others.
Method: After the introductory workshop and recruitment, our SE team initiated three new communication channels to make the team more accessible, together with familiarizing the class with the SE concept. In order to evaluate our work, we presented what we had done to five Year 3-6 SE leaders after 4 months of working. With their suggestions, a questionnaire was developed and then distributed to 268 non-SE and 33 SE students separately.
Results: Non-SE respondents believed in SE work (48%) and would report problems to us (52%). They found that we could be easily approached (50%) and could practically solve the problems (28%). SE team was more statistically significantly enthusiastic in all four aspects.
Conclusion: At the time we launched this study, Year 1 SE team had just been working for four months and were not yet familiar with the faculty's working system. Many issues were still in the process of communication with stakeholders and had yet to be concluded. As a result, it is not surprising that only half of Year 1 students appreciated

our work. The better results from SE working team might be contributed from either the bias, the faith they had in the SE work, or both. Follow-up evaluation should be conducted when the raised issues were finalized so that success of our work can be truly identified.

Take-home messages: Some problems need more time to be resolved than students' expectation. Thus, communication to keep students informed of the ongoing process is essential.

The time of evaluation is crucial for valid result interpretation.

Student engagement at Karolinska Institutet – the role of the Medical Students' Society

Authors
Awad Smew, Karolinska Institutet, Stockholm, Sweden

Presenter: Awad Smew, Karolinska Institutet, Stockholm, Sweden

Background: The importance of student representation in medical education in Sweden is growing due to an increased need for student input, for example in regards to upcoming major national changes in medical curriculum. These higher demands on effective and reliable representation have led to larger student organisations, such as the Medical Students' Society at Karolinska Institutet – the student group currently in charge of appointing and managing all student representatives.
Method: In this descriptive study we aimed to investigate the extent and role of student representation within the medical programme at Karolinska Institutet. We gathered information on student representation by going through meeting minutes and board descriptions. We also analysed the records of the Medical Students' Society for current guidelines and statistics regarding student representation.
Results: In total, 75 student representative positions exist within the medical programme, on boards ranging from smaller working groups, to committees, and more formal decision-making bodies. In many of these, student attendance is mandatory in order for any decisions made to be valid. Apart from attending faculty meetings, student representatives also participate in Medical Students' Society meetings in order to report back to the student body, exchange ideas with one another, and gather student opinion on specific topics. Formal guidelines created by the board of the Medical Students' Society help to better introduce new student representatives to their positions.
Conclusion: The role of student representation is to represent the interest of all medical students. This is defined both by Swedish law, as well as by rules set out by the student organisations. Student representation is of great importance to the development of medical education and the day-to-day functioning of a medical programme. With higher demands and increasing numbers of student positions comes a greater responsibility for student organisations to formalise the process of electing student representatives and introducing them to their work.

Take-home messages: Engaging students as representatives helps develop the medical curriculum and provides an opportunity for professional and personal development. Formal guidelines help introduce student representatives to their positions.

Enhancing the Student Engagement with Kahoot!

Authors
Panomkorn Lhakum, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Vich Thampanya, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Nonlawan Cheumuangphan, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Chulaphong Chan-ta, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand

Presenter: Panomkorn Lhakum, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand

Background: Medical education has complexities that create some difficulties for medical students. Many studies show that learning while having fun is a good way to enhance learning in light of some of those difficulties. Kahoot! is one option for that solution.
Method: We have studied Kahoot!. It will stimulate the attention of medical students and residents by providing independent participation. It uses online codes provided to access each person's mobile phone independently without using their real name. Participants must respond within a limited time frame. Whoever responded in the least amount of time and answers correctly would be the winner by online evaluation. Then, we would collect satisfaction questionnaire.
Results: The evaluation by data interpretation from Google form shows that all 40 respondents have played Kahoot! before. 54% of them are medical students. 95% of attendants have taken part in Kahoot!.They thought that Kahoot! was a good way of studying with fun ,knowing their weak points ,helping to improve learning, taking less time and gaining more knowledge from grading as follows;77%,95%,92.5% and 95%. Most of the participants were satisfied for improved knowledge from this learning resource and agreed with its future usage.
Conclusion: Kahoot! is a promising learning tool that can easily used to promote student engagement and metacognition in higher education classrooms with limited instruction or student training required. Student responses and our own experiences using Kahoot! in graduate and undergraduate classrooms indicate that students are very open and eager to use Kahoot!. The real-time feedback and reinforcement provides opportunities for professors in various disciplines to tailor their instruction based on student understanding on quizzes, which further engages all students. Kahoot! is a learning method that can promote medical reasoning with rapid responses, but without identifying poor scores publicly.The medical students and residents can know their own weaknesses and own strengths through the use of an educational and enjoyable program.

Take-home message: Medical education should be adapted to the era in which technology is a learning aid.

4LL: Meet the Experts: Assessment Clinic

Location: Merian, 2nd Floor, Swissotel
Date: Monday 27th August
Time: 1400-1530 hrs

Experts:

Richard Fuller, Jennifer Hallam, Matthew Homer (Leeds Assessment Research Group) **@LeedsARG**

In this session we want to help you make your assessments even better, and develop your assessment research ideas. We are offering a drop-in session with the first half (1400-1445) focusing on policy and practice (e.g. methods of standard setting, assessment quality, WBA development), and the second half (1445-1530) on assessment related research. Our main areas of expertise relate to the OSCE (including quality improvement); standard-setting; the theory, design and delivery of successful sequential testing; the use of item response theory in relation to written testing; and workplace assessment, including application of assessment for learning theory. No appointment necessary - however you can tweet us in advance to book a slot, or if you can't make it, please tweet us your assessment related questions and we will get back to you.

SESSION 5: SIMULTANEOUS SESSIONS

Monday 27th August
1600-1730 hrs

5A: Symposium: Educating health professionals for the e-patient

Location: Event Hall
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters:
Lawrence Sherman, Academy for Global Interprofessional Learning and Education, USA
Ken Masters, Sultan Qaboos University, Oman
Anne Herrmann-Werner, University of Tübingen, Germany
Elizabeth Rankin, Canada
Dave de Bronkart (ePatient Dave), Society for Participatory Medicine, USA

Summary: The era of the Internet has fostered a new kind of patient: the e-patient. With access to the Internet, the e-patient takes patient engagement to a new level: e-patients perform a range of online activities, from simple Google searches to sophisticated searches in PubMed, accessing medical journals online, connecting with other patients through online communities, using email and telemedicine to communicate with health providers, viewing doctors' digital footprints, and accessing electronic medical records online.

Medical practitioners who use old-style, dismissive responses ("Stop Googling") or modern, well-meant but misguided approaches ("Use PubMed") run the risk of causing harm or doing little good. The e-patient's impact on the patient-doctor relationship can be devastating or productive, depending largely on how well-trained the doctor is to cope with the new environment. Medical students need to be trained in the new skill set required to deal with the complexities and potential of the e-patient. A small number of publications has addressed the issue (AMEE's 2017 Guide to the e-patient is one of them), but a greater awareness into the subject is required.

This symposium will present the overall issues and lay out the scope of e-patient activities. It will then highlight some practical teaching examples of preparing medical students, both pre-clinical and clinical, for the e-patient. It will then present perspectives from two e-patients, in which their paths illuminate some of the concerns and issues facing e-patients. This will provide a 360 degree insight into what is required from medical schools to train future health professionals for the e-patient.

Who should participate in the symposium? Any medical educators who wish to equip their students with the necessary tools to deal with the e-patient.

What will they gain from participating? An understanding of the activities and underlying issues and complexities introduced by the e-patient, and some insight into how to best prepare their students to work successfully with the e-patient.

5B: Symposium: How to implement IPE in medical curricula?

Location: Montreal, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters:
Elisabeth Van Gessel, University of Geneva, Switzerland
Petra Mèche, School of Health Sciences of Geneva, HES-SO, Switzerland
David Gachoud, University of Lausanne, Switzerland
Giatgen Spinas, Swiss Institute for Medical Postgraduate and Continuous Education, Switzerland
Jörg Goldhahn, Swiss Institute of Technology, Zürich, Switzerland
Christian Schirlo, University of Zürich, Faculty of Medicine, Switzerland

Summary: By the end of undergraduate training, medical students should be able to demonstrate appropriate collaborative competencies to work effectively in clinical environments. This expectation can be found in most, if not all, competency-based frameworks developed for doctors-in-training. In these circumstances, medical schools around the world should consider the integration of interprofessional education (IPE) in their curricula, since IPE can effectively prepare learners for the demands of collaborative practice. This symposium aims to examine key issues relating to how IPE can be implemented in medical curricula. To set the scene, a synthesis of the state of the research evidence about IPE implementation will be presented. IPE case studies in the form of an example of the implementation of IPE in an existing (packed) curriculum, and the implementation of IPE in a new medical curriculum will be presented. The last part will engage the audience in discussion of IPE implementation issues.

Who should participate in the symposium? Educators in the health professions interested in either implementing IPE in their curricula or setting up new IPE initiatives in their institutions.

What will they gain from participating? Participants will access the current research evidence about IPE implementation in health professions' curricula. Then, they will be presented with typical examples of IPE implementation.

5C - Simulation Education In and Across the Health Professions: It's More than Just Doctors and Nurses!

Location: Sydney, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Organised by the AMEE Simulation Committee:
Gabriel Reedy
Nancy McNaughton
Walter Eppich
Barry Quinn, King's College London, UK
Sean Cross, South London and The Maudsley NHS Foundation Trust, UK
Maria Tassone, The Michener Institute of Education at UHN, Canada
John Tegzes, Western University of Health Sciences, USA

Summary: Healthcare simulation has emerged as a powerful educational strategy, but educators often lack the expertise and perspective to maximize its potential for training and developing health professionals. Simulation represents an interactive and experiential approach that provides learners an opportunity to practice in ways that mirror their clinical work. Although simulation is often associated with acute medicine and operating theatre practice, the scope of simulation-based education continues to expand. The AMEE Simulation Committee proposes a symposium with two important dimensions. First, we will bring together perspectives not often associated with simulation-based education: mental health, allied health, dentistry, and veterinary medicine. Second, simulation fosters an approach uniquely suited to drawing together teams across professional boundaries to learn collaboratively, reflecting actual clinical practice. We will explore the value of simulation in these diverse clinical settings so educators can promote inter-professional learning.

Who should participate in the symposium? This symposium is appropriate for educators who are interested in simulation as an inter-professional educational approach, and have some experience with simulation-based education.

What will they gain from participating?

- Knowledge of a diversity of simulation applications across health professions and disciplines
- Appreciation for the variety of opportunities for simulation-based educational design across a range of disciplines and professions
- Insights from different professional and paraprofessional backgrounds the best practice techniques for learning and practicing collaboratively.

5D: AMEE Fringe 1

Location: Singapore, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

"Curriculum" - personified in a musical monologue

Authors
Ugo Caramori, UNICAMP (University of Campinas), Brazil
Rafael Madureira Costa, Pontifical Catholic University of São Paulo, Sorocaba, Brazil
Julia Brum de Mello, Pontifical Catholic University of São Paulo, Sorocaba, Brazil
Camila Pereira Barretto, Pontifical Catholic University of São Paulo, Sorocaba, Brazil
Maria Valéria Pavan, Pontifical Catholic University of São Paulo, Sorocaba, Brazil

Presenter: Ugo Caramori, UNICAMP (University of Campinas), Brazil

Abstract Text: Ladies and gentlemen, open your minds with creativity, prepare your senses and your conceptions! Today we will introduce you to mr. "Curriculum": personified, human in flesh and blood.
What would you listen if one day, the well known among medical education, "Curriculum" turned out to be a real person and could dialogue with all of you?
What are the beliefs of "Curriculum"? What are his dreams? What the world has influenced in his life? Where he wants to go to?
Come hear the story of this complex being that fascinates many educators around the world, shapes the lives of many students and is an indispensable part of the training of health professionals.
Today, "Curriculum" takes the form of a person and comes to tell his story.
And like all human beings, "Curriculum" is filled with emotions and changes that he will tell you with a lot of music and theatricality in this small monologue.

Little Poo: The Magic of Dressing as Poo in Education

Authors
Nicole Phoebe Tanner, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong.

Presenter: Nicole Phoebe Tanner, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong

Abstract Text: Poo is the universal symbol of gross, disgusting and smelly things. However, from my experiences, the disgust humans feel toward their own excrement is exactly what connects us to what a talking poo might have to say.
Last year, I was tasked with the simple task of talking about colorectal cancer to a community audience. I wanted to engage the audience in a first-person perspective into cancer, and the idea of dressing as poo struck me as both interesting and educational. As I performed, children, parents and elderly were listening with wide-eyed wonder. After the performance, I received many questions on colorectal cancer, far more than my previous talks. I realised that people were much more interested in what Little Poo had to say, as opposed to what I had to say.
As taboo as poo is, its application and use in medicine are widespread. It reflects our gut health, gives clues in cases of colorectal cancer, and provides therapeutic options. Dressing-up as poo has opened many doors to educational conversations and discussions.
In this session, I will come alive as the talking Little Poo, and give a short performance on the new cutting edge technology of eating poo – otherwise known as fecal microbiota transplantation. I will then share about my experiences dressing as Little Poo, its educational value, and the magical ability Little Poo has in attracting attention to medicine and science from people of all ages. I will show you, in this session, how dress-up can create a brand new platform for creative expression in medical education.

Creativity & Surprise. Bombs & Gambling. Teaching medicine like I would like to be taught myself

Authors
Olga Rostkowska, Medical University of Warsaw and MEDtube.net, Warsaw, Poland
Anna Pryć, Medical University of Warsaw, Warsaw, Poland
Andreas Koufas, Medical University of Warsaw, Warsaw, Poland
Sylwia Macur, Medical University of Warsaw, Warsaw, Poland
Łukasz Kowalski, Medical University of Warsaw, Warsaw, Poland
Bartek Kieroński, Medical University of Warsaw, Warsaw, Poland

Presenter: Olga Rostkowska, Medical University of Warsaw and MEDtube.net, Warsaw, Poland

Abstract Text: I'm a junior doctor and a soft-skill trainer for student organisations. During my university classes I was usually terribly bored. As a medical teacher nowadays, I want to give my students the experience of fun, excitement, surprise and thrill while learning together. This often results in unpredictable twists.
(I) I ask students to prepare at home 10-min presentations on a medical topic they pick (a lottery). There is a rule: no words included in a presentation. Pictures only. This way students must memorize and never read from slides. I would like to demonstrate some humorous art-works created in the process.
(II) I prepare A-B-C-D questions from a given field. Students are provided with monopoly money (or matches) which they must split and bet according to how probable an answer is - no need to pick only one. Based on: https://www.youtube.com/watch?v=i9txcjQdpmY
(III) While studying e.g. Murphy's or Babinski sign, students have to demonstrate it on one another. Each one studies 2-3 signs at home and performs them on a colleague of choice, teaching each other how to "act it" properly. Alternatively, a student gets a task to simulate signs and symptoms of a given disease while the group must guess the condition. We agree on a field beforehand, e.g. nephrology. A drama class at its finest.
(IV) I have a bomb-shaped timer which randomly makes an explosive sound. Before it goes off, each student in a group has to name e.g. a symptom of Graves' disease or a side-effect of steroids. The timer is then passed on. Asap. Wonderful to watch. Based on: https://www.youtube.com/watch?v=F5R5sM_YIzU
To the AMEE audience I would like to present more methods I use, including effects and reactions. I make recordings of the best classes. Especially of bloopers. My solid principle is to make surprises and nurture creativity.

What IMPACT contributes to Integrative Medicine

Authors
Robert Hage, St. George's University, St. Georges, Grenada

Presenter: Robert Hage, St. George's University, St. Georges, Grenada

The integrative medicine selective offered to basic science medical students at St. George's University, Grenada, includes sessions on yoga, Reiki, acupuncture, hypnosis, naturopathic medicine and many other topics. The aim of integrative medicine is to restore and maintain health and wellness during a person's lifetime through factors which influence body, mind, spirit and community.
Future practitioners of integrative medicine should embrace its principles and commit themselves to self-exploration and self-development. To aid in that development, improvisation, poetry, art, cartoons and talk, as in small-talk, are employed. The acronym IMPACT represents these methods and will be demonstrated in this Fringe session.
IMprovisation is reacting to others in a spontaneous scene and improves communication, cognition and teamwork. Who dares to take on this challenge this afternoon?
Poetry can sharpen listening, attentiveness and analytical skills. It allows us to express ourselves creatively and accepts vagueness. It may show empathy, mindfulness and introspection. Poetry about illness may not only address the symptoms of illness, but the experience, and emotions.
Art is used in therapy. It can help students sharpen their skills in observation and description, fosters critical thinking and improves communication skills. I will challenge you with examples.
Cartoons in medicine. Humor rhymes with tumor. Could laughter play a role in curing disease? What is the impact of humor in health care?
Talk. A few minutes of 'small talk' with a patient can strengthen the patient-physician relationship and improve quality of care. The health care worker is also much less likely to feel burn-out. Hear a few cases and decide.
IMPACT will have an impact on future providers of integrative medicine.

Presenter: Jan Kiesewetter, Institut für Didaktik und Ausbildungsforschung in der Medizin am Klinikum der LMU München, Munich, Germany

Abstract Text:
Introduction: To foster diagnostic competence with online cases in different formats has been a focus in medical education research. In a review a whole case format, presenting all information at once, is distinguished from a serial-cue case format, where the learner can access information on a patient case in a stepwise manner(1). There is a continued debate whether low prior knowledge students profit more from the whole case format or whether it is too much information for them to process. Therefore, our research question was: Which combination of case-format and prior knowledge does result in the highest diagnostic competence gain?
Methods: The study was designed as a 2x2 quasi-experimental design with case format (serial cue vs. whole case) and prior knowledge (low vs. high) as factors. Medical students from the 2nd-6th year were confronted with eight patient cases a learning environment, with half of them assigned to the whole case, half of them to the serial cue format.

In a pretest we tested for prior knowledge using a multiple choice questionnaire for declarative knowledge, a median split was performed distinguishing in low (N=59) vs. high (N=83) prior knowledge.

Diagnostic competence was operationalized as a pre- and posttest before and after the treatment through a procedural knowledge test in the key-feature format. Further, the number of correct diagnoses for the cases was interpreted as indicator for diagnostic competence. Both knowledge tests revolve around either symptoms of backpain or fever.

Results: In October 2017 N=142 medical students (Mean age=24.41; SD=4.90; 71% female) participated. The repeated measures ANOVA for procedural knowledge show no significant pre to post effect for the different case formats ($F_{(1;138)}$=.47; n.s.; Pretest:Serial Cue M=0.60; SD=.07; Whole Case M=0.61; SD=.07; Posttest:Serial Cue M=0.63; SD=.10; Whole Case M=0.64; SD=.10). The MANOVA for the number of correct diagnoses shows no significant effect for the two case formats ($F_{(1;138)}$=.78;n.s.; Serial Cue:M=3.91; SD=1.60; Whole Case:M=4.32; SD=1.92).

There was a significant interaction effect for point of measurement x prior knowledge ($F_{(1,138)}$=8.08;p.eta2=.06) with the students with high prior knowledge having a significant gain in procedural knowledge (Prettest:M=0.61, SD=.08; Posttest:M=.66; SD=.10), while low prior knowledge students did not gain procedural knowledge (Pretest:M=.60, SD=.06; Posttest =.60; SD=.10).

Further, there was a significant higher diagnostic accuracy for the students with high prior knowledge(M=4.63; SD=1.59), compared to those with low prior knowledge (M=3.40; SD=1.79) with a large effect($F_{(1;138}$=17.80; p.eta2=.11).

Discussion & Conclusion: In contrast to other studies(2), our results suggest that in fact there is no difference due to the case format, neither in the procedural knowledge gain of students, nor in diagnosing the cases themselves. High prior knowledge students did however, profit from both case formats in the same manner. Based on the results of this study, it seems that medical educators should focus on the careful design of the content of patient cases, their narrative, and a prior testing of students' actual subject specific knowledge level. Furthermore, it will be interesting to see how instructional interventions like reflection prompts, representation prompts or adaptive feedback influence cognitive load and knowledge gains in learning clinical reasoning.

Meaningful is more than memorable: Exploring what makes educational experiences "stick" to learners' memory

Authors
Kinga L. Eliasz, New York University School of Medicine, New York, USA
Heather Dumorne, New York University School of Medicine, New York, USA
Adina Kalet, New York University School of Medicine, New York, USA
Lara Varpio, Uniformed Services University of the Health Sciences, Bethesda, Maryland, USA

Presenter: Kinga L. Eliasz, New York University School of Medicine, New York, USA

Abstract Text:
Introduction: Health professions educators invest a significant amount of time and resources creating complex educational experiences for learners (1, 2). To optimize learning from these experiences, we should understand what aspects of our educational experiences are memorable for learners and why. If we can identify what makes specific learning experiences "stick" to learners' memory, we may be able to modify our educational interventions to be more "sticky" and thereby increasing their effectiveness. In this study we ask: When exposed to the same educational experience, what elements of that experience "stick" to learners' memory and why?

Methods: We investigated this question through an educational intervention called Night-onCall (NOC), which exposes learners to a variety of learning experiences, incorporating multiple activities and instructional design modalities. NOC is a 4-hour simulation during which near-graduating students act as interns during four authentic clinical scenarios. Learners communicate with nurses [standardized]; assess patients [standardized]; write notes; make an oral case presentation to an attending [standardized]; view an e-learning module addressing the content of two cases; and handoff the patients to an intern [standardized]. Nine months after NOC, we interviewed 29 participants using a semi-structured protocol, asking learners to describe what was memorable about NOC and why. Using thematic analysis, two researchers (KE, HD) iteratively coded the transcripts, borrowing open, axial, and theoretical coding processes from constructivist grounded theory. Three researchers (LV, KE, HD) met regularly to discuss evolving codes and relations between them to generate themes. Once all themes were constructed, all team researchers met for a full day to review the coding and build additional insights.

Results: Participants described four memorable activities: the e-learning module that explicitly integrated content relevant to the clinical cases; the highest urgency clinical cases with standardized patients and nurses; the oral case presentation to the attending; and handing off patients to an intern. Eight characteristics made these activities memorable: interactivity, framework, novelty, authenticity, risk-free practice, self-reflection, role exposure, and transfer. During analysis, we realized that while all students engaged in the same educational intervention, each learner had a different learning experience. Learners' "sticky" memories existed on a continuum. At one end was recall (i.e., participants could list activities they remembered). Next was memorable (i.e., participants elaborated on activities that were encoded in their memory, further informing their existing understanding of those activities). At the other end of the continuum was meaningful (i.e., participants remembered activities that promoted deeper knowledge development, generating understandings applicable to other contexts). Memorable activities landed across the continuum (e.g., the handoff could be recalled by one learner, but be a meaningful activity for another). Furthermore, the characteristics of memorable activities fell across the continuum, at different places for different participants (e.g., for some learners, risk-free practice made an activity memorable, but others said risk-free practice created meaningful experiences).

Discussion and Conclusions: Although learners identified similar memorable learning activities and reasons for these "sticky" memories, the extent to which these experiences were meaningful was highly individualized. We searched the psychology and education literatures, but we were unable to find theories exploring the recall-memorable-meaningful continuum of learning experience. We suggest the identification of this continuum is a key development from this study. It is essential to further develop a theory about this continuum so that we can understand how to construct meaningful learning experiences.

Beyond hands-on and hands-off: A model of supervisory approaches on the inpatient ward

Authors
Andrea Gingerich, Northern Medical Program, University of Northern British Columbia, Prince George, Canada
Vijay Daniels, University of Alberta, Edmonton, Canada
Laura Farrell, IMP-University of British Columbia, Victoria, Canada
Sharla-Rae Olsen, NMP-University of British Columbia, Prince George, Canada
Tara Kennedy, Dalhousie University, Fredericton, Canada
Rose Hatala, University of British Columbia, Vancouver, Canada

Presenter: Andrea Gingerich, Northern Medical Program, University of Northern British Columbia, Prince George, Canada

Abstract Text:
Introduction: The concept of entrustment was initially described for procedural specialties and has garnered significant attention in medical specialties. As research

accumulates, variability in supervision and entrustment decisions in internal medicine are common findings that need to be better understood if either are to be used as a proxy for tracking a trainee's competence for assessment purposes. There is a need to further study the enactment of supervision on inpatient medical wards to inform competency-based assessment design.

Methods: Attending physicians on clinical teaching inpatient wards were invited to describe a recent moment of enacting supervision with an internal medicine resident. Constructivist grounded theory methodology guided data collection and analysis. Interview transcripts were analysed in iterative cycles to inform data collection. Constant comparison was used to build a theory of supervision from the emerging themes.

Results: In 2016-17, 23 supervisors from 2 Canadian universities participated in 28 semi-structured interviews. Clinical supervision on the inpatient ward involves direct and substantial indirect observation to monitor for discrepancies between the supervisor's understanding of the patient and the trainee's actions or reports regarding the patient. By monitoring for discrepancies, the supervisors created an illusion of independence for the trainees on the ward because the trainees' activities were still tracked and the entrustment was incomplete. In deciding what level of supervision to provide, supervisors spontaneously used references to how 'comfortable' they felt when the trainees were performing activities. Supervisors contend with the competing roles of clinical teacher and care provider. Simultaneously, supervisors may feel personal responsibility for the ward (resulting in hands-on approaches) or shared responsibility for the ward (resulting in hands-off approaches). The Approaches to Clinical Supervision model combines these two tensions to explain four approaches to supervision. When supervisors are feeling personally responsible for the ward while focusing on patient care then patient safety is prioritized and a "micromanaging delivery of care" approach is used. When the focus shifts to clinical teaching and learner welfare is prioritized then supervisors provide learning guidance by actively "scaffolding experiences" for the trainee. As responsibility for the ward can be shared amongst others, due to the expectation that other staff and more senior members of the team are available as resources for the team and are monitoring to intervene when teaching and patient care is needed, the supervisor can use more hands-off approaches. When the focus is on patient care and ward efficiency is prioritized then a supervisor can use a "divide and conquer" approach to deliver care to the high acuity patients while the team cares for the other patients in parallel. When clinical teaching is the focus and learner autonomy is prioritized then a supervisor can monitor the ward activities to determine when to provide clinical "pearls of wisdom" to guide the trainee's learning.

Conclusions: Our study emphasizes that medical inpatient clinical supervision is predominantly performed through indirect observation, that terminology of 'comfort' is used more spontaneously by supervisors than the use of the word 'trust' and that the granting of complete entrustment is uncommon. The supervisor's approach to supervision is changed in response to competing tensions around patient care versus teaching and personal versus shared responsibility for activities on the ward. Thus, entrustability assessment approaches will need to contend with entrustment decisions being based on more than a unidimensional judgment of a trainee's competence.

Abstract Text:
Introduction: Co-occurring mental and physical health conditions account for more than 25% of the cases seen by medical practitioners. The complexity and unique needs of this population pose considerable challenges for delivering effective, person-centre care, and achieving equitable outcomes. Training in integrated care has been identified as an area of significant need, as well as an opportunity to improve outcomes, efficiency, and the patient experience. However, there is no 'one size fits all' model of integration, and implementations vary significantly across different settings; training needs to account for the institutional and cultural complexity of environments in which clinicians do their work, as well as the complexity of cases. To address this need, we sought to identify common elements of how care is coordinated through a study of collaborative and integrated care in four settings.

Methods: Using collective case study methodology (1), we explored coordination and integration in four settings: a hospital speciality clinic with an interdisciplinary team of physical- and mental-health care providers; a treatment program in a community primary care setting serving primarily low-income and marginalized individuals; two consult-liaison psychiatry services in an academic teaching hospital; and a telemedicine program which provides multidisciplinary assessments through a one-time interaction with complex patients and their primary care providers. We conducted observations including job shadowing, attendance at clinical rounds and participant-observations of treatment and support groups. Members of interdisciplinary teams at each site were interviewed about how care is provided, common challenges and barriers to effective treatment, and experiences working in integrated care. Field notes and interview transcripts were thematically analyzed iteratively by the research team.

Results: Early observations demonstrated that each site is well integrated according to standard levels and dimensions of integration (2). Nonetheless, we observed

significant variation in how integration is actually implemented, and how it impacts the work of clinicians. We shifted our attention to this variation, exploring five aspects of care provision that we observed to be integrated at each site, but in markedly different ways. These are: eligibility and access; patient self-management; engagement of patients and providers in program design and planning; role definitions and handoffs within the clinic; and coordination of supports beyond the clinic. We also explored the intersection of these five aspects of care with two cross-cutting themes that we recognized as central to the different models of care observed. These are the balance between standardization and adaptation, and advocacy, especially as it relates to stigma.

Discussion: Our analysis suggests integration at the sites we studied is aligned with standard models, and that existing competencies for medical learners were broadly relevant to the forms of collaboration we observed. However, it was the variation among that stood out in our observations, and became central to our analysis. While well-understood, standardized tools of integration such as guidelines and co-location were important, we also observed the importance of adaptability in situations where advocacy or understanding of stigma at point of care is crucial to meeting the needs of patients.

Conclusions: As system level coordination is increasingly emphasized, it is important not to lose sight of the adaptation that is crucial to clinical work. Our study illustrates the complexity of integrated care implementations. It demonstrates the importance of considering contextual variation among patients and institutions, and emphasizing the non-medical expert competency domains for medical learners.

Feedback in the context of high-stakes assessment: can summative be formative?

Authors
Christopher Harrison, Learning From Assessment, Manchester, UK
Karen Könings, Maastricht University, Netherlands
Lambert Schuwirth, Flinders University, Adelaide, Australia
Val Wass, Keele University, UK
Cees van der Vleuten, Maastricht University, Netherlands

Presenter: Christopher Harrison, Learning from Assessment, Manchester, UK

Abstract Text:
Introduction: The central theme of this thesis concerns the challenges of receiving feedback within a summative assessment context. It set out to challenge the assumption that assessments have either a formative or a summative purpose. High-stakes assessments create large amounts of data regarding learners' strengths and weaknesses, which are reduced to binary pass-fail decisions. This fails to prepare students for independent self-regulated learning. However, it was uncertain whether learners would be receptive to feedback received in this context. This thesis addressed three main research questions:

1. How do students engage with feedback in a high-stakes context?
2. What are the individual and institutional influences and barriers to feedback in this context?
3. Can we change the assessment culture to one which prioritises and supports learning from feedback? What is stopping us?

Methods: The research comprised four interconnected studies. The first study used quantitative methodology to address the first research question. Feedback after a high-stakes OSCE was delivered in a web-based format. Students' use of the website was monitored and linked with their assessment performance and responses to a questionnaire on learning-related characteristics. The second research question was addressed using qualitative methods, employing in depth interviews to explore individual barriers to feedback receptivity, while the third study sought to explore institutional influences within a medical school's assessment culture. Focus groups were held in three schools with contrasting assessment cultures. The fourth study addressed the final research question using participatory design methods to explore how a mixed group of stakeholders might attempt to change the assessment culture to one in which students make more use of post-assessment feedback.
Results: The first study demonstrated that most students visited the website, but engaged very superficially with the feedback, spending little time on each webpage. Students who had only just passed the OSCE were the least engaged. No strong links were seen with students' learning-related characteristics. In the second study, the summative assessment culture had a dominant but negative influence on the use of feedback. Assessments were? viewed as hurdles to overcome, disconnected from clinical workplace learning. In the third study, openness to feedback was promoted by offering choice and independence within assessment systems. Mentoring was vital to help learners navigate the feedback. In the final study, participants shared common beliefs about the importance of the summative assessment paradigm; as a result, changes proposed were minor and congruent with this paradigm.
Discussion and Conclusions: The challenging conclusion of this thesis is that learners are often unreceptive to feedback after high-stakes assessments. The summative context is so dominant that approaches focused on improved feedback delivery are doomed to fail. Assessment cultures have remained rooted in a behaviourist approach to education, with rewards and punishments. This thesis supports a move towards a more constructivist approach, empowering students to take a more active role. It also adds to the growing literature demonstrating the adverse effects of summative assessments on learning, and the need for a paradigm shift in the assessment and feedback culture. The results from the final study demonstrated the enormity of the challenge for those who want to bring about a change in assessment culture. Careful design of the whole assessment programme is needed, paying careful attention to its educational impact as well as the more traditional considerations of validity and reliability.

Copy But Not Paste: An exploration of crossborder medical curriculum partnerships

Authors
Dominique Waterval, Maastricht University, Maastricht, Netherlands
Erik Driessenl, Maastricht University, Maastricht, Netherlands
Janneke Frambach, Maastricht University, Maastricht, Netherlands
Albert Scherpbier, Maastricht University, Maastricht, Netherlands

Presenter: Dominique Waterval, Maastricht University, Maastricht, Netherlands

Abstract Text:
Introduction: Crossborder curriculum partnerships are a growing form of internationalisation in higher education in the medical domain. In a crossborder curriculum partnership, a curriculum developed in one institution (the home institution) is transferred across borders and implemented in another institution (the host institution). The partners offer their curriculum simultaneously and aim to provide comparable learning experiences to both groups of students. This definition includes partnerships that award the same degree to students in both locations, as well as host institutions that issue their own degree. These partnerships are challenging from a pedagogical perspective, because their purpose is to ensure that the curriculum in the host institution is as similar as possible to the curriculum in the home institution, despite differences in teaching and learning, resources, the organisational environment and cultural values. The partners seek to strike a balance between standardisation on the one hand – to ensure that the learning experience is close to identical – and adaptation on the other hand – to respect the aforementioned local factors as much as possible. These pedagogical challenges have largely been ignored in the literature. The lack of research on crossboder curriculum partnerships in the medical domain have raised the following three research questions: What are the main challenges when establishing and maintaining a crossborder medical curriculum partnership? How do crossborder medical curriculum partnerships balance standardisation and adaptation? What are the strategies for establishing and maintaining a sustainable crossborder medical curriculum partnership?
Methods: This doctoral report consists of a series of five studies that build upon each other and investigate medical crossborder curriculum partnerships from five different angles e.g. a narrative literature review of the challenges, interviews with medical programme directors of host and home institutions, a Q-study to capture the experiences and perceptions of host teachers, a survey among host students, and a case study from a home institution perceptive. In addition, the studies include multiple partnerships in order to identify case-exceeding factors.
Results: This thesis report shows the logistic complexity and educational challenges to establish a crossborder curriculum partnership. It reveals the additional challenges medical curriculum partnerships face such as organising

comparable learning experiences in the clinical phase. Nevertheless, they seem feasible not the least due to host students' flexibility to adapt to the home institutional didactical model.
Delivering standardised programs was not the aim of partners, although stakeholders indicated many similarities in medical content. In practice, different types of adaptations of the programme were made by host teachers to bridge contextual differences. Furthermore the report shows the diversity of opinions among teachers to work within such partnerships.
Discussion & Conclusions: As these partnerships are expected to grow in the medical domain as well, this study aims to be of guidance by practical tips and to well-intentioned leaders and programme directors who are on the verge of establishing similar types of partnerships. Furthermore, it touches upon a debate on whether this form of internationalisation is desirable in the first place by looking at a number of ethical arguments, e.g. brain drain, dangers of ethnocentricity. By doing so, it opens a discussion on how partnerships could be organised.

Understanding the impact of the NLE in Indonesia: The importance of context in assessment

Authors
Rachmadya Nur Hidayah
Trudie E. Roberts
Richard Fuller

Presenter: Rachmadya Nur Hidayah, Leeds Institute of Medical Education, Leeds, UK

Abstract Text:
Introduction: National licensing examinations (NLEs) have been increasingly used worldwide. In Indonesia, it has been implemented since 2007, where it serves as a method of quality assurance for both graduates' competence and medical schools. It is considered to be a high cost and resource-demanding high-stakes examination as Indonesia is as a developing country. The aim of this study was to understand the consequences of the NLE on medical education in Indonesia. What are the impact of the NLE on medical schools, teachers, and students?
Methods: This study was a qualitative study using a modified grounded theory approach to understand the consequences of NLE from multiple stakeholders' perspectives. A sampling framework was designed to capture important characteristics of Indonesian medical schools based on region, accreditation status, and ownership (public/ private). Interviews were conducted with medical schools' representatives (vice deans/ programme directors), while focus groups were conducted with teachers and students. The interviews and focus groups were audio-recorded and transcribed

verbatim. Data was analysed using open coding and thematic framework as part of the iterative process.

Results: This study used an analytical framework to look at the intended and unintended consequences of the NLE. Intended consequences were mostly related to the intended outcome of the NLE: achieving a common standard for education, improvement in education practice (including curricula, assessment, faculty development), improvement learning resources and facilities, which were prominent in new and private schools. Unintended consequences were related to the competition led by the NLE, collaboration, financial impact, and students' failure. This study revealed cross-cutting themes such as diversity in a rich context of education and the local concepts of patient safety.

Discussion: The current literature on the impact of NLEs is limited to developed countries and Western medical education systems (Archer et al., 2016), with discourse mostly based on opinion rather than evidence (Harden, 2009). This is the first study exploring the impact of the NLE in a developing country and ASEAN network. Some findings on the intended consequences of the NLE triangulated with the literature, while some others were a contrast. In Indonesia, rather than generating competition amongst schools, the NLE generated collaboration between medical schools and stakeholders. This was best explained by the concept of coopetition, which enabled medical schools to overcome challenges, make changes, and improve their quality. This study offers new evidence on how the NLE holds significant role in the improvement of medical education.

Conclusion: Context matters in the discourse of the NLE. This study demonstrates a novel approach to sampling and analysis of the NLE's impact. The evaluation of the NLE needs to consider the importance of understanding local factors and consequences. New insights were added to the literature on how the coopetition acts as a key for the impact of the NLE. Moving forward, the future of the NLE is expected to hold an important role in the development of medical education in Indonesia. This study opens opportunities for other area of research, mainly on the impact of the NLE on patient safety, collaboration of stakeholders, and students' failure.

Pioneering a near-peer surgical teaching programme in the UK

Authors
Xueying Zheng, Hinchingbrooke Hospital, Huntingdon, UK
Daniel Bowen, Hinchingbrooke Hospital, Huntingdon, UK
David Mitchell, Hinchingbrooke Hospital, Huntingdon, UK

Presenter: Xueying Zheng, Hinchingbrooke Hospital, Huntingdon, UK

Background: Studies have shown that graduates are less confident with surgical competencies than medical competencies. Other research has shown that junior doctors can play a significant and influential role in teaching and encouraging medical students to pursue surgical careers.
We hypothesised that near-peer teaching run by foundation year 1 (FY1) doctors can benefit both learners and teachers. The student will develop confidence in core skills outlined in the Royal College of Surgeons of England (RCS) undergraduate curriculum, and the educator will gain essential teaching experience whilst consolidating their surgical practice.
Method: We developed a pilot teaching programme from the undergraduate curriculum of the RCS and delivered it to 14 medical school finalists from the University of Cambridge. It comprised of small group tutorials, bedside teaching and formative assessments. The teachers completed a reflection of their experiences.
Results: Identical questionnaires using the Likert scale with each response ranged 1-9 were completed before and after the programme, assessing the confidence of the students in performing core surgical examinations and their interest in surgery as a career. The Student's t-test was used to compare the before and after responses of the students.
Valid responses were received from 12/14 students (86%). Student-reported confidence in performing surgical examinations, presenting examination findings, and planning initial management showed statistically significant improvement upon completion of the programme (p<0.001). Furthermore, 50% of the students showed increased likelihood to pursue a career in surgery. The two teachers reported that the programme increased their confidence in teaching and consolidation of their surgical knowledge.
Conclusion: We identified benefits of the near-peer teaching style. Firstly, doctors who have recently graduated can identify and relate closely to the educational needs of the students. Secondly, the combination of theory and bedside teachings consolidates learning through practice. We plan to deliver this programme to a larger student cohort in the region to validate our findings.

Take-home message: A structured, near-peer teaching program can supplement the surgical training of the medical student whilst developing teaching skills and surgical competencies for the junior doctor.

Respect Matters - RACS Building Respect Improving Patient Safety Action Plan

Authors
Stephen Tobin
Judy Finn, RACS, Melbourne Australia
John Batten, RACS, Melbourne, Australia
Cathy Ferguson, RACS, Melbourne, Australia
Mary Harney, RACS, Melbourne, Australia
John Biviano, RACS, Melbourne, Australia

Presenter: Stephen Tobin, Royal Australasian College Of Surgeons, Melbourne, Australia

Background: In 2015, the Royal Australasian College of Surgeons (RACS) came under intense media scrutiny related to a culture of bullying, discrimination and sexual harassment by surgeons, accompanied by poor standards of surgical education and opaque complaints processes. After an open external advisory group review, public apology and acceptance of 42 recommendations led to the 'Building Respect, Improving Patient Safety' action plan.
Method: The Action Plan developed eight goals, five around culture and leadership, two about surgical education and one for complaints. Media, engagement of surgeons and trainees, memoranda with health departments, hospitals and medicals schools,diversity and inclusion were espoused, mandated training about professional behaviours and education, training in leadership and centralised transparent complaints system have ensued.
Results: After two years, 84% of surgeons had done mandated on-line training around an operation room scenario about bullying and discrimination. A similar proportion had done the compulsory one-day course about surgical education (or had documented recent equivalent training). Leadership training is underway. One day training in building respect, speaking up, talking to colleagues about poor behaviours and making complaints if required has been a major effort. Complaints have increased in number and complexity.
This is about cultural change in the broader health system as well as surgeons reflecting on their own roles, especially about leadership within teams and role-modelling, all to improve patient care. It is also about collaboration in the health care system, as the issues are widespread within healthcare. The emergent #MeToo campaign reminds all about pervasive aspects of sexual harassment. Recent regulatory accreditation review of RACS has noted the important work in leading change. The works are ongoing and evaluation is established.
Conclusion: RACS has started work which has been noted by other colleges and health care systems worldwide; evaluation will enable measurement of positive change; surgeons and other healthcare workers will have safe workplaces, and patient care will be improved, meaning better quality outcomes and patient safety. Surgical

trainees will have all these better behaviours - for patient care - made explicit: generational change too.

Enhancing surgical training by audio-visual simulation with hazard cognitive training and reflection tools: a design-based study in laparoscopic cholecystectomy

Authors
Siddek Isreb
John C. McLachlan
Jan C. Illing
Hannah Hesselgreaves
Stephen Attwood

Presenter: Siddek Isreb, Durham University, Newcastle Upon tyne, UK

Background: Surgical training has become more challenging in the UK with the reduction in training time and the reduced training opportunities, making every training opportunity precious. This PhD study aims to address this curriculum challenge by enhancing surgical training and assessment in the surgical training environment.
Method: Using a design-based approach a two-step design was created. Step One involved creating an online, standalone, Cognitive Hazard Training module. It uses videos of real operations to mentally train candidates to recognise, anticipate and avoid hazards during the operation. An online example of this Module was created for laparoscopic cholecystectomy.
The second design step was a Reflective Formative Assessment. The trainee and supervisor reviewed the trainee's video-recording of a supervised-operation which involved reassessing the trainee's performance to enhance feedback and reflection.
Results: Design feasibility was tested in the Northern Deanery training environment and the feasibility study was complemented by a theatre observation study to capture the details of the complex surgical training environment. The feasibility of this two-step design was tested with 2 experts, 32 trainees and 15 trainers. Trainee and trainer qualitative feedback was collected, via semi-structured interviews. Users' feedback along with multiple additional data from the operation-recordings and video-review session were analysed and triangulated to improve the design and establish the feasibility and role of this style of video-review in the current surgical training. Observational data was also collected during live surgery in theatre to identify any factors affecting safety and training.
Conclusion: This PhD study has developed a novel approach to enhance surgical training, which has been tested and has received overwhelming support from both supervisors and their trainees. Cognitive Hazards Training steepened the learning curve and increased adherence to safety. The videoed operations were found to be an excellent teaching tool, which enhanced feedback and reflection. It increased trainees' confidence and competence by tailoring the training to their individual needs. The success of this work forms the foundation for future development and testing of this new approach to surgical skills training in the UK.

Synthesizing Quantitative Ratings and Qualitative Assessment Data from a Longitudinal Cohort of General Surgery Residents: Measuring Developmental Progress and Competencies

Authors
Ara Tekian, University of Illinois at Chicago, Chicago, USA
Yoon Soo Park, University of Illinois at Chicago, Chicago, USA

Presenter: Ara Tekian, University of Illinois at Chicago, USA

Background: Faculty use assessment data consisting of quantitative ratings and qualitative comments to provide feedback to learners and to inform the clinical competency committee (CCC) on progress toward independent practice. However, it is unclear how quantitative and qualitative information are synthesized and linked with milestones-based feedback. This study examines the alignment of quantitative and qualitative assessment data using a longitudinal five-year general surgery residency.
Method: Rotation evaluation data were extracted for 171 residents who trained between July 2011 and July 2016. Data included 6,069 rotation evaluations forms completed by 38 faculty members and 164 peer-residents. Descriptive statistics and mixed-effects regression were used to examine trends in quantitative evaluation scores; generalizability theory was used to estimate variance components and reliability. Qualitative comments mapped to general surgery milestones were coded for positive/negative feedback and quality/relevance. Themes were identified using constant comparative analysis associated with constructivist grounded theory.
Results: Evaluation scores increased significantly across the five years, $p = .010$. Milestones targeting Patient Care, Medical Knowledge, and System-Based Practice had the largest improvement over time. The reliability of rotation evaluations ratings was good, Φ-coefficient = .72. Quantitative evaluation scores were significantly correlated with positive/negative feedback indicating alignment between quantitative and qualitative feedback, $r = .52$. However, when residents received higher quantitative ratings, the quality of comment was significantly lower, $r = -.20$. Themes identified from qualitative comments included feedback on leadership, teaching contribution, medical knowledge, work ethic, patient-care, and ability to work in a team-based setting. As residents progressed in training, faculty comments became more critical, highlighting deficiencies; however, most comments were positive and predicted success by the fifth year. Faculty comments focused on technical and clinical abilities; comments from peers focused on professionalism and interpersonal relationships.
Conclusion: While there was alignment between quantitative and qualitative assessment data, we found differences in the degree of alignment and types of themes emphasized as residents progressed in their surgical training. These findings underscore the need to improve our understanding of how faculty synthesize assessment data and the types of competency-specific feedback they provide as residents progress toward independent practice.

5G5 (2398)
Using task-level feedback with achievable objectives to improve clinical competence

Authors
Karl-Heinz Merbold
Thomas Corne Postma

Presenter: Thomas Corne Postma, University of Pretoria, South Africa

Background: Task-level feedback ensures that students understand whether they are able to complete a task successfully, or not. The aim of task-level feedback is to evoke self-regulated learning for improvement purposes, especially when linked to achievable targets. The objective of this study is to test this notion in a workplace-based assessment system that aims to develop students' exodontia skills over time.
Method: Clinical supervisors graded 28,280 dental extractions, performed by fourth and fifth year dental students, rotating through the Department Maxillo-oral and Facial Surgery of the University of Pretoria (2014-2016), according to assistance received. Independent completion of a procedure was quantified as "one" while a procedure completed with physical intervention of a supervisor was quantified as "zero". Students received task-level feedback quarterly regarding their independence ratios. Based on 2014 data the Department set fourth and fifth year students minimum targets of 80% and 90% independence, respectively, as from 2015. These targets constituted a challenging yet achievable objective. The aim of the feedback was to increase the number of students that could achieve these targets. Only very low performing students were subjected to targeted intervention. Remaining students were left on their own to achieve improvement.
Results: The proportion of 2014 BChD IV students (n=42) who achieved 80% independence increased from 60% at mid-year to 81% at the end of the year. For the 2015 and 2016 cohorts (n=51 and n=62) the improvements were 67% to 86% and 56% to 97%, respectively. The proportion of 2014 BChD V students (n=58) who achieved 90% independence increased from 40% at mid-year to 48% at the end of the year. For the 2015 and 2016 cohorts (n=37 and n=51) these improvements were 57% to 65% and 82% to 88%, respectively.
Conclusion: The introduction of minimum targets in 2015/16 coincided with considerable increases in independent practice milestone achievements earlier in the year when compared to 2014 baseline data, especially in year five.
Task-level feedback should be accompanied by achievable objectives to facilitate improvement in clinical competence over time. Students should receive stronger encouragement to achieve independence targets.

The value of Crew Resource Management training in surgical departments

Authors
Wilhelmina van Grevenstein, UMCU, Utrecht, Netherlands
Joris Heetman, UMCU, Utrecht, Netherlands
Johan Lange, Erasmus MC, Rotterdam, Netherlands
Conny Dekker, University of Applied Sciences Rotterdam, Rotterdam, Netherlands
Olle ten Cate, UMCU, Utrecht, Netherlands

Presenter: Wilhelmina van Grevenstein, UMCU, Utrecht, Netherlands

Background: Crew Resource Management (CRM) courses for surgical departments are becoming popular in various formats. However, the quality and effects of such trainings for patient care have not been well established. We aimed to explore CRM trainers' views on the current state of the CRM training.
Method: We conducted semi-structured interviews, in combination with a short questionnaire study among trainers of various CRM courses for the healthcare market in Netherlands.
Results: Across all training programs, three parts can be identified: didactics, simulation-exercises, and feedback or debriefing. We found large differences in the simulation-exercise formats in part related to the background of the trainer, which could be medical, educational, or aviation, or a combination. Nearly all trainers agreed that national standards for CRM training lack, but disagreed about their envisioned content.
Respondents agreed that reducing complications and mortality is possible, but measurable improvement may take up to 15 years to achieve. All estimated that nationally implemented CRM is cost effective. It would take about three years to get investment costs returned. Most highly valued components of medical CRM were considered teamwork and (de)briefings.
The market of CRM training is increasing and the courses are extremely divers. Trainers are concerned about the effect of the diversity in medical CRM on its quality. One solution could be national standards for CRM training and accredited trainers, to ensure quality, but leaving room to tailor CRM training locally. International comparisons are possible, but suffer from differences across medical CRM markets and differences in national cultures regarding education, operative care and CRM.
Conclusion: CRM training offered commercially varies hugely. Establishing CRM standards would be one step in the direction to assure quality. Eventually CRM should become integrated in the culture of the operating theatre, at the benefit of patients, healthcare professionals and trainees. Healthcare professionals and CRM-trainers should collaboratively ensure that CRM reaches its potential.

Assessment of Meaningful-learning Behavioral and Emotional Abilities (AMBEA): Validation Study

Authors

Lucia Cadorin, CRO National Cancer Institute, Aviano, Italy
Valentina Bressan, University Hospital of Udine, Udine, Italy
Annamaria Bagnasco, University of Genoa, Genoa, Italy
Loredana Sasso, University of Genoa, Genoa, Italy
Alvisa Palese, University of Udine, Udine, Italy

Presenter: Lucia Cadorin, CRO National Cancer Institute, Aviano, Pordenone, Italy

Background: All educators want their students to be committed and motivated to learn, and thus able to achieve higher learning outcomes that will prepare them to be competent professionals and to grow both personally and professionally. Meaningful learning is an active process that promotes a greater understanding of concepts, and is the result of an interaction between new and previous knowledge that produces a long-term change in knowledge and skills. Measuring meaningful learning ability is designed to identify problems or special learning needs and is crucial in nursing education. The intent of this study was to evaluate the validity and reliability of the Assessment of Meaningful-learning Behavioral and Emotional Abilities (AMBEA) tool in three different countries.
Method: After approval was received from the Ethics Committee, the study was conducted in Bachelor of Nursing Degree programs in (1) Italy (=2), (2) Japan (=2), and (3) the US (=1). Data collection was performed using the AMBEA tool, which is comprised of 56 items subdivided into six subscales measured on a 6-point Likert scale: Foundational Knowledge; Application; Integration; Human Dimension; Caring, and Learning How to Learn. Specific procedures were followed to translate the cross-cultural instrument from English to Japanese.
Results: The study is still ongoing in Japan and the US. 344 nursing students in Italy participated in the study, and preliminarily data showed that the AMBEA demonstrated good validity and reliability. The preliminary findings of the psychometric measures will be presented at the AMEE Conference.
Meaningful learning extends beyond knowledge acquired by merely memorizing concepts or practicing skills; it fosters the ability to reflect and a sense of responsibility that all students should develop during their own learning experiences. The AMBEA tool can help educators (teachers, trainers, and tutors) identify and improve the strategies they use to supporting students' learning capability, and increase their awareness of, and/or sense of responsibility for, their learning processes.
Conclusion: Measuring meaningful learning capability is crucial in nursing education, as it allows educators to identify students' problems and/or special learning needs. Therefore, a valid and reliable instrument is required.

The contextual curriculum: Learning in and from the matrix

Authors

Brett Schrewe, University of British Columbia, Vancouver, Canada
Rachel Ellaway, University of Calgary, Calgary, Canada
Christopher Watling, Western University, London, Canada
Joanna Bates, University of British Columbia, Vancouver, Canada

Presenter: Christopher Watling, Western University, London, Canada

Background: Contemporary medical learners train in a broader range of clinical settings than ever before. While existing models of distributed medical education have focused on workforce outcomes and equivalency of academic opportunity and performance, there are growing indications that the unprecedented breadth of contextual variation that learners experience is transformative on a deeper level. There is a need, therefore, for a fundamental reappraisal of the role of context in medical education.
Method: We considered context as a matrix produced from six dynamic and intersecting patterns: patients, practices, education, locations, culture, and society. We drew on both situated learning theory to frame how trainees learn to participate competently in a specific context and the work of Martin Heidegger to understand how the effects of context on learning might go unrecognized from their perspective.
Results: Trainees' active engagement with the unique affordances offered by each context results in highly individualized learning outcomes. As such, their participation in this contextual matrix shapes what they learn, how they learn, and who they might become as physicians. Yet their inability to recognize that competent practice is critically linked to context may result in significant struggles with transition.
Drawing upon the concept of the contextual curriculum allows us to make explicit how context impacts learning outcomes and performance. Specifically, it can be used to foster reflection in trainees as a way to articulate the tacit knowledge that arises from informal learning, to differentiate between the ways in which competent practice is performed in different settings, and to learn how one might adjust to the regular recurrence of new clinical workplaces.
Conclusion: Context shapes what it means to be competent. By using the contextual curriculum, we may productively harness this understanding on both institutional and individual levels to ensure that our trainees are afforded opportunities to recognize the key role that context plays in their training, to identify how their abilities and identities are critically dependent upon contextual interaction, and to seamlessly provide safe and high-quality care around times of transition.

Liang-Shiou Ou, Chang Gung Medical Education Research Center, Department of Pediatrics, Chang Gung Memorial Hospital, Chang Gung University College of Medicine, Taipei, Taiwan

Presenter: Chien-Da Huang, Chang Gung Medical Education Research Center, Department of Thoracic Medicine, Chang Gung Memorial Hospital, Chang Gung University College of Medicine, Taipei, Taiwan

Background: Active learning – any instructional method that engages students in the learning process – has been shown to impart sustainable knowledge and performance change. We aim to develop process models of active learning to understand what works, for whom and why.
Method: Forty-eight sixth and seventh year medical students with experience of active learning methods were purposively selected to participate in ten focus group interviews. After synthesizing the data, the complex interactions around active learning were analyzed using realist evaluation framework to unpack the 'context-mechanism-outcome' (CMO) configurations.
In the context of cultural hierarchy and peer pressure, the mechanisms of confidence and fear came about, prompting students to be silent and achieve poor learning outcomes. In the contexts of assessment, teacher-student familiarity and teachers' guidance, learning motivation and self-regulation were triggered, prompting positive learning competencies. In the context of the medical environment and peer effects, the mechanisms of heightened physician identity and stress resulted in recognized active learning. These CMOs were synthesized into a process model of active learning.
Results: We identified three CMOs of medical students' experiences of active learning. The realist evaluation revealed mechanisms that could better support students' active learning. Fear derived from cultural hierarchy raised concerns as it hampered active learning. Good teachers' familiarity and guidance always triggered motivation prompting positive learning competencies. Adequate support of the professional identity of students in the medical environment prompted the recognition of active learning.
The contexts in which active learning is implemented might have important implications for medical students' experiences. The complex connections between cultural hierarchy and fear, teachers' guidance and motivation and the medical environment and professional identity can affect the quality of learning achievements. Our realist analysis is useful, revealing complex interactions in the learning environments and in learners' work.
Conclusion: The CMO configuration can explore the complex interactions around active learning, and help improve the sustainability of learned skills. The connections between cultural hierarchy and fear, teachers' guidance and motivation and the medical environment and professional identity have been shown to affect the complex interactions of learning outcomes.

Nurturing a Community of Practice for Curriculum Enhancement

Authors
Kenneth Hargreaves
Anne-Marie Reid

Presenter: Kenneth Hargreaves, University of Leeds, UK

Background: This work focuses on the development and delivery of a new multi-disciplinary professional strand (IDEALS) in an undergraduate curriculum. Twenty skilled facilitators from a variety of health professional backgrounds were recruited to deliver the curriculum. The Communities of Practice (CoP) (Lave and Wenger, 1991) framework is used to describe the evolution of the facilitator group in the early years of delivery.
Initially the facilitators, experts within their own fields, were trained to deliver core materials which had been designed by the academic team in the department. A survey at the end of the first year revealed a lack of satisfaction and a lack ownership of the materials by the facilitators. There was a desire to enhance these, some of which the curriculum lead accomplished through the formal training sessions.
Method: Facilitators started meeting informally over coffee to review and enhance materials and to share their expertise in specific topic areas. This was supplemented by an on-line chat group. The 'hub' of the practice changed from the programme leadership, to a small core group of facilitators who began to take increasing responsibility for mutual support, development of programme materials and influencing the programme leader in steering change. On realising this, the curriculum lead nurtured the development of this embryonic CoP, encouraging facilitators to deliver training sessions and mentor newcomers to the practice.
Results: The responsive and transformative leadership approach allowed the willingness, knowledge and expertise of the group to be exploited in curriculum development and delivery. The establishment of a CoP was identifiable by the 'joint enterprise, mutual engagement and shared repertoire' (Wenger 1998) developed. This resulted in an enhanced curriculum with more engaging and interactive learning sessions, greater facilitator satisfaction and higher ratings in student satisfaction.
Conclusion: Encouraging and empowering a CoP of learning facilitators, through a transformative leadership style, has capacity to create a continually improving and evolving curriculum. This pays dividends for both students

and facilitators. The approach is particularly relevant to situations where a team of professionals are delivering the same material to a whole-year cohort.

Narrative Shifts Prompt the Development of Adaptive Expertise

Authors
Anne Kawamura, Holland Bloorview Kids Rehabilitation Hospital, Toronto, Canada
Ilene Harris, University of Illinois at Chicago, Chicago, USA
Karen Thomas, Holland Bloorview Kids Rehabilitation Hospital, Toronto, Canada
Briseida Mema, Hospital for Sick Children, Toronto, Canada
Maria Mylopoulos, University of Toronto, Toronto, Canada

Presenter: Anne Kawamura, Holland Bloorview Kids Rehabilitation Hospital, Toronto, Canada

Background: The complexities of our healthcare system demand that physicians be flexible and adaptive in their use of knowledge and experience to solve problems in clinical practice. This complex problem solving is known to be an essential skill for adaptive experts and is the standard of excellence in training future health care professionals. Despite its importance for medical training, little is known about how adaptive expertise develops in medical trainees. Therefore, the purpose of this study was to explore how pediatric residents develop adaptive expertise through workplace learning.
Method: A constructivist grounded theory study was conducted, using participant observation and semi-structured interviews as the data sources and purposeful sampling of subspecialty residents from the Department of Pediatrics at the University of Toronto. We conducted 34 observations of ten residents, resulting in 102 hours of observation. Data collection and analysis occurred iteratively and themes were identified through constant comparative analysis by a team of researchers.
Results: Residents acquire a number of routine efficiencies for communicating in clinical consultations; however, difficult conversations are navigated by enabling families to express their own narratives. Residents integrate these patient and family narratives with their medical knowledge to provide care. At times, a 'narrative shift' was needed to effectively navigate the conversation. Residents use this narrative shift purposefully to inform the creation of new communication strategies, resulting in an opportunity for learning. Critically, this learning was modulated by the resident's effectivities and the constraints of the clinical setting.
Conclusion: Narrative shifts are adjustments in the physician's understanding of a patient's narrative that impacts on how clinical care is provided.   In this study, narrative shifts prompted the development of adaptive expertise in residents. They triggered residents to explore and experiment with new ways of interacting with patients and families which further developed their conceptual understanding of how their knowledge is situated within the context. The workplace learning environment provides opportunities that prepare residents for future learning through active

experimentation, deeper conceptual learning and multiple perspectives. We must ensure that these key aspects of training that promote adaptive expertise development are not lost in competency-based medical education.

Customising of medical education to allied health education: teaching and learning of basic sciences calibration

Authors
Gopalakrishnakone Pon, NUS & SIT, Singapore

Presenter: Gopalakrishnakone Pon, NUS & SIT, Singapore

Background: For more than 3 decades I have been teaching medical and dental students the subject of gross Anatomy and histology and then I made a carrier change and transition from medical education to allied health education teaching Diagnostic radiography, Physiotherapy, Occupational therapy and Nursing students. I have to change my teaching pedagogy, course contents and assessment methods to suit the allied health students requirements. The experience will be shared.
Summary of work: The course content of anatomy which was taught for medical students was completely modified and tailored to suit the allied health students. A multimedia modal content was designed using audio, video, animation, virtual reality, mixed reality and augmented reality to teach anatomy and histology.in addition to 3D modeling, rotation and annotation capabilities.
The course content was calibrated to each of the subspecialty such as physiotherapy or nursing. Lectures, practicals, tutorials, gross anatomy dissection classes, museum interactive classes were conducted. Digital soft wares to teach anatomy were also used. Assessments were done by written examination with mini essay questions, multiple choice questions, objective structured practical examination (OSPE) as well as Viva voce when needed. At the end of the module a survey form also administered to evaluate the module as well as the lecturer's efficiency.
Summary of results: The students were satisfied with the course content, pedagogy as well as the many technologies used for teaching a 3D visual subject like anatomy. They had a deep understanding of the spatial arrangements of the various vital organs of the body and how they are interrelated within a short span of time.
Discussion &Conclusion: Teaching and learning of visual subject like human anatomy needs many skills in the part of the teacher and many recent technological innovations and methodologies makes this task more simpler and make the students to be excited and imaginative in learning this subject.
Take home message: Information technology, Information Communication technology, Internet of things (IoT) as well as digital and virtual learning is radically changing the way we teach and learn

Electronic poster presentation: Future of Learning

Authors
Syeda Hanaa Fatima, Shifa College of Medicine, STMU, Islamabad, Pakistan
Sajida Naseem, Shifa College of Medicine, STMU, Islamabad, Pakistan

Presenter: Syeda Hanaa Fatima, Shifa College of Medicine, STMU, Islamabad, Pakistan

Background: Poster presentations are a significant part of conferences and allow researchers to display their preliminary findings of research. E-posters even save time as they are interactive posters. The objective of this research was to explore students perception in the learning of public health concepts in gastrointestinal tract (GIT) module through electronic poster presentation.
Method: Year 3 undergraduate medical students of SCM were asked to present an e-poster in the module of GIT, focusing on public health aspect. Students were divided into 7 groups according to their small groups comprising of 13 students each. Each group was provided with one study theme. They were provided with a template to cover all aspects of public health. All the basic scientists involving 30 faculty members were invited to judge the e-poster through a checklist. Mean score was calculated. Certificate was awarded to the group that scored the highest.A focused group interview involving one voluntary participant from each group was carried out. Thematic analysis was done manually.
Results: Different themes identified include: interactive way of disseminating information, knowledge was increased, buildup of confidence, must be used in combination with other strategies not alone, should not be close to exam,discovered own talent, was a great experience, gained knowledge while searching,making, explored hidden talents other than reading and writing. Details will be shared in AMEE 2018.
Conclusion: Students and researchers in almost every discipline will face the challenge of presenting their research findings through poster presentations. Poster presentations are generally considered less prestigious than paper sessions. But they are a significant part of conferences and allow researchers to display their preliminary findings of research. The e-posters offer huge advantages to researchers as they have minimal costs, allow researchers to add multimedia portions in the posters and have archival capabilities. are generally considered less prestigious than paper sessions
Take-home messages: Students welcome the use of innovative learning through electronic media when carried out in a relaxed environment.
Students enjoy learning through their creativity with the use of electronic media.

5I2 (1801)
Meet (Medical Education Empowered By Theater): Boal`s Forum Theater as an Active Methodology in Medical Education

Authors
Adilson Ledubino
Letícia Frutuoso
Marcia Strazzacappa
Jamiro Wanderley
Esther Helmich
Marco Antonio de Carvalho-Filho

Presenter: Marco Antonio Carvalho-Filho, School of Medical Sciences - University of Campinas / CEDAR - University of Groningen, Netherlands

Background: The final goal of medical education is to deliver to society a competent professional who is fully committed to the virtues and values of good medical practice. However, medical educators still debate on the best strategy to guarantee this important outcome. Recently, researchers in medical education agreed on the relevance of understanding and fostering medical students' professional identity development. Augusto Boal's Forum Theater was developed to activate individuals towards the consolidation of their autonomy even in situations of social oppression and unbalanced power relationships, which we believe is common within the hierarchical environment of medical education.
Method: We designed an obligatory communication course for second-year medical students (n=340) based on Boal's methodology. Students engaged in body exercises and theater games specifically designed to create emotional and relational awareness. Through theatrical improvisation, students performed scenes connected with the themes discussed during the theater classes. After the scenes students were interviewed.
Results: The new methodology encouraged reflection on emotional development and its influence on personal and professional relationships and growth. Knowledge was co-constructed in a collaborative, sensitive and meaningful way, relying on the body and its interrelationships as the main engines. The improvisational scenes revealed conscious and unconscious conflicts and several unspoken feelings, such as fear and oppression. In the interviews, students shared experiences, had insights, and became aware of the process of forming their new professional identity.
Conclusion: Boal`s Forum Theater is as an active teaching-learning methodology which fits well to professional development by fostering communication skills, providing space for personal, social and political reflection, and raising students' awareness of the inherent conflicts in the process of becoming a doctor. The results allowed us to introduce a new field of transdisciplinary study: MEET (Medical Education Empowered by Theater). MEET comprehends concepts and techniques that can be taught and learned, contributing to humanization, fostering empathy and resilience, and assuring a new space for creativity in Medical Education, all important elements of the Medical Profession.

Take-home message: Medical Education Empowered by Theater (MEET) represents a new and powerful instrument to scaffold professional development of medical students.

Serious Games in Medical Education: Current Knowledge of, Use and Perceived implementation barriers among clinical educators

Authors
Kimberly Pei Rui Chan, LKCSoM, Singapore
Nabil Zary, LKCSoM, Singapore

Presenter: Kimberly Pei Rui Chan, Lee Kong Chian School of Medicine, Singapore

Background: Serious Games (SGs) could be effective in tackling the pitfalls of traditional didactic lectures in undergraduate medical education. The educational potential of SGs in stimulating active learning and engaging students has been widely reported in literature. However, their uptake in medical education has been slower than expected and research on this aspect is limited. Therefore, this study aims to explore how much clinical educators know about SGs, their current extent of use, and perceived barriers to their implementation in undergraduate medical education in Singapore.
Method: An online validated questionnaire was sent to clinical educators of various specialties in an academic public hospital in Singapore. 51 responses were gathered and analyzed. Descriptive statistics were performed for all the data collected. One-way ANOVA tests were done to determine if the background of clinical educators and their knowledge of SGs influenced their perception of the barriers. If the ANOVA test results were statistically significant, they were followed up by calculations of the effect size and Turkey post-hoc test.
Results: 49.0% of respondents had not heard of SGs before the study. The biggest barriers reported were limited time and resources for educational development, and the lack of knowledge of available game-based learning approaches and medical educational games. SGs were perceived as less suitable ($p < 0.01$) and riskier ($p < 0.05$) by respondents without a prior knowledge of SGs, as compared to respondents with knowledge of them. Respondents without prior knowledge were also less likely to consider using SGs in their teaching ($p < 0.01$). Among specialties, there was a significant difference in the perceived suitability of SGs between at least two of the specialties ($p < 0.05$).
Conclusion: Our study shows that there is a need to increase the knowledge of SGs among clinical educators. Increased knowledge about SGs will likely foster a more positive attitude (more suitable, less risky) to SGs as an educational approach. We anticipate that such effort would contribute to an increased use of SGs in medical education.

Unexpected results of mandatory knowledge re-examinations in the pre-clinical curriculum

Authors
Inge E.T. van den Berg
Olle Th.J. ten Cate
Eugène J.F.M. Custers

Presenter: Inge van den Berg, University Medical Center Utrecht, Netherlands

Background: Complaints of physicians about students' deficiency of factual knowledge upon entering clerkships are widely known. The underlying reason is often not deficient education, but rather a lack of knowledge retention. To stimulate retention, the University Medical Center Utrecht introduced four re-examinations, (CRUX1-4)-tests, in the pre-clinical curriculum in 2016. Each CRUX-test covers the content of 3 or 4 courses; the four CRUX-tests together cover the content of 14 courses. CRUX-tests can be taken half a year or more after the exams of the initial courses. There is no limit to the number of attempts on CRUX-tests. The aim is to induce students to revisit the course material in order to reinforce knowledge acquired in the past.
Method: We evaluated the initial effects of CRUX-test implementation by asking students to report on preparation time and test results after their first attempts at CRUX1- and CRUX3-tests, using ranges as response options to safeguard anonymity. We also analysed the relationship between the cognitive level of questions according to Bloom's taxonomy and student performance at first attempts of CRUX1-4-tests. We hypothesized a negative relationship between cognitively more demanding questions and performance.
Results: Reported preparation time varied largely between students and between tests. Preparation time peaked at 10-20 hours for CRUX1, but at 0 hours for CRUX3. As expected, preparation time related positively to success. Surprisingly, for all four tests students performed worse on questions demanding factual knowledge recall than on questions requiring application of knowledge. Average p-values (corrected for guessing) of factual knowledge questions (n=130) and questions requiring application of knowledge (n=114) were 0.43 and 0.55, respectively. Within the first year of CRUX-test introduction, students increasingly show up unprepared at first attempts of subsequent CRUX tests. The relatively better performance on questions requiring application of knowledge challenges the implicit assumption of educators that students must be able to recall factual knowledge to execute higher-order cognitive skills.
Conclusion: It is not carved in stone yet that incapability to recall factual knowledge will hamper students' development as clinicians. Further research of the effects of knowledge retention tests is necessary.

Pathways to Persuasion: Cognitive and Experiential Responses to Hospice Care Education Multimedia Films

Authors
Yang-Ching Chen, Taipei City Hospital and School of Nutrition and Health Sciences, Taipei Medical University, Taipei, Taiwan
Ting-Fang Chiu, Taipei City Hospital, Taipei, Taiwan
Lin-Yang Chi, Taipei City Hospital and Faculty of Dentistry, National Yang-Ming University, Taipei, Taiwan
Oscar K. Lee, Taipei City Hospital and Institute of Clinical Medicine, National Yang-Ming University, Taipei, Taiwan
Li-Lin Kuo, Taipei City Hospital, Taipei, Taiwan

Presenter: Lin-Yang Chi, Taipei City Hospital and Faculty of Dentistry, National Yang-Ming University, Taipei, Taiwan

Background: Successful communication and education about death literacy are the critical parts in end-of-life care. Although previous multimedia films have been done on teaching the relevant communication skills, numerous questions remain as to which features of particular message makes the film effective in persuading clinicians to provide hospice care. And which processes within the clinicians after looking at the education films promoted the intentions of providing hospice home care.
Method: Since 2016-2017, Taipei City Hospital has developed a serial multimedia films on teaching hospice care. We established a multi-media education film for clinicians, "Hospice Home Care for Dying Patient", to teach clinicians how to provide near-dying symptoms management at home. The main purpose of learning in this film included (1) Recognition of the symptoms and signs of near-dying status; (2) Management of the near-dying discomfort; (3) Death preparation and Etiquette for the dead; (4) Bereavement Counseling. Participants were asked to complete a structured questionnaire regarding the cognitive (self-competence) and the experiential (emotional and self-referencing) pathway of looking at the multimedia film—being absorbed in the narrative---and its relationships to the intentions to provide hospice home care. We performed regression analysis and structural equation modeling (SEM) to explore the transportation pathways in enhancing the intention of providing hospice home care.
Results: A total of 232 trainees, including 55 physician, and 177 non-physicians have been enrolled in this multimedia film education. After looking at the film, higher levels of self-competence, emotional responses, and self-referencing of past care experiences significantly predicted the intention of providing hospice home care (p<0.05). In the SEM, self-competence directly increased the intention, and it also indirectly mediated through emotional responses to enhance the intention. Although self-competence was associated with higher self-referencing, it did not mediate through self-referencing to enhance the intention. To promote hospice home care, educational films should focus on enhancing the self-competence as well as reflecting the emotional responses from the clinicians.
Conclusion: Messages to establish self-competence and to trigger emotional responses in the multimedia films are recommended to encourage the clinicians to provide hospice home care.

Healthcare Hackathons: A Systematic Review

Authors
Mataroria P Lyndon
Stephanie Ko
Dickson Lui
Alon Dagan
Leo A Celi

Presenter: Mataroria Lyndon, Centre for Medical and Health Sciences Education, Faculty of Medical and Health Sciences, The University of Auckland, New Zealand

Background: Healthcare Hackathons are being increasingly used to generate innovation in healthcare delivery using technology and data, and as a model for cross-disciplinary education opportunities. However, few studies have measured their effectiveness with either objective. This systematic review will summarize and critically evaluate the peer-reviewed literature to characterize the educational benefits of Healthcare Hackathons, and their impact on healthcare delivery and outcomes.
Method: A systematic literature search of ten electronic databases (Psychinfo, MEDLINE, EMBASE, ABI Inform, Business Source Complete, Education Abstracts, ERIC, Health Business Elite, Inspec, Web of Science) was completed in March 2017 using the term "Hackathon." All research and non-research articles pertaining to Healthcare Hackathons were retrieved, and data extracted from articles that met inclusion criteria. A qualitative synthesis using thematic analysis was then conducted, as there was insufficient quantitative data available for quantitative synthesis.
Results: From 177 potential titles, 28 articles met inclusion criteria. Four (14%) were formal research studies, while 24 (86%) were non-research articles (editorials and descriptive case studies). Thematic analysis identified the perceived role of Healthcare Hackathons for fostering cross-disciplinary collaboration and learning, generating innovation, increasing knowledge of information communication technology, and encouraging end-user participation in the development of healthcare interventions. However, none of the studies evaluated the impact on healthcare delivery or clinical outcomes. In general, there was significant heterogeneity in study design, and the quality of existing studies is generally poor.
Conclusion: There is currently limited evidence to support the hypothesized benefits of Healthcare Hackathons for education and healthcare delivery outcomes. Future Healthcare Hackathons events should integrate more robust research and evaluation and publish these findings to develop the evidence base.

5J1 (2743)
A Best Evidence in Medical Education Systematic Review to determine the most effective teaching methods that develop reflection in medical students

Authors
Jane Uygur, RCSI, Dublin, Ireland
Ellen Stuart, RCSI, Dublin, Ireland
Muireann De Paor, RCSI, Dublin, Ireland
Emma Wallace, RCSI, Dublin, Ireland
Seamus Duffy, RCSI, Dublin, Ireland
Teresa Pawlikowska, RCSI, Dublin, Ireland

Presenter: Jane Uygur, RCSI, Dublin, Ireland

Background: Reflection has been defined as the process of engaging the self in attentive, critical, exploratory and iterative interactions with one's thoughts and actions, and their underlying conceptual frame, with a view to changing them and a view on the change itself (Nguyen et al. 2014). However, there is little concurrence about how to best teach reflection in medical education literature. The aim of this review was to determine: i) which educational interventions are currently being used to facilitate the development of reflection, ii) how is reflection being assessed, and iii) what are the most effective interventions?
Method: We focussed on undergraduate medical students who had experienced a teaching intervention to develop reflection and its assessment. We searched nine databases to identify relevant articles. Due to the heterogeneity of studies a narrative synthesis approach was adopted.
Results: Twenty-eight studies met the inclusion criteria. The interventions in these studies were heterogenous and had at least of two of the following components related to reflection: i) introduction to reflective process ii) experience as triggers, iii) reflective writing, iv) reflection process and learning guidelines, v) small group discussion to underpin/explore reflection, vi) tutor training on how to provide feedback and vii) feedback. The strongest evidence indicated that reflection and learning guidelines and feedback improved student reflection.
Discussion: It was evident that there was lack of consensus among educators regarding the definition of reflection. 'Reflection' was used to mean anything from the process of reviewing learning material to an iterative and self-analysis. In many articles students were asked to reflect without being taught how to, indicating that reflection may not be widely thought of as an acquired skill. Once the core articles were identified, it was apparent that the educational interventions were very heterogenous. This may be due to the complexity of reflection itself, the lack of consensus around the definition of reflection, variability in educators' understanding of the reflective process and the study context.

Conclusion: This review provides an understanding of the current context, the range of interventions and the quality of some components of interventions for teaching reflection to medical students.

5J2 (3701)
Patient / Service User Involvement in Medical Education: A BEME Systematic Review

Authors
Simon Gupta, Blackpool Teaching Hospitals NHS Foundation Trust, Blackpool, UK
Morris Gordon, Blackpool Teaching Hospitals NHS Foundation Trust, Blackpool, UK
Debra Thornton, Blackpool Teaching Hospitals NHS Foundation Trust, Blackpool, UK

Presenter: Simon Gupta, Blackpool Teaching Hospitals NHS Foundation Trust, Blackpool, UK

Background: Medical Licensing/Registration Bodies require the integration of patients/service users into the education, training and assessment of doctors. Education/specialist training institutions recognise this key responsibility when designing curricula to encourage patient accountability in their own care and address the need for students and trainees to recognise the person behind the disease.
Method: We conducted a BEME systematic review of literature describing the involvement of patients and service users in medical education, according to the spectrum of involvement detailed within the Taxonomy set out by Angela Towle. Particular focus was given to assessing the quality of evidence on the impact upon learning outcomes, according to Kirkpatrick's Hierarchy.
Results: 11,093 papers were identified, reduced to 198 after initial triage. 36 met the inclusion criteria for analysis. The majority of excluded papers lacked the criteria necessary to analyse i.e. learning outcomes/level of patient involvement. The quality of included studies was moderate to low, according to our assessment criteria as defined within the STORIES Statement (Gordon 2014). Varied research methodologies were used, many of which lacked robustness. Amongst key findings, details in reporting curricula and materials needed for replication is frequently insufficient.
Studies employing patients/service users in medical education follow similar patterns - often limited to the same specialities and in the same capacity (teaching examination/communication skills). Weaknesses in quality and risks of bias affect the ability to clarify the factors that such involvement can make to learner outcomes. Although they may reflect reality on the ground, little is added to the evidence base to help determine an ideal study methodology and justify this involvement. Service user involvement in medical education is increasingly used, but must be underpinned by clear and relevant theory, implemented with appropriate pedagogy and reported in a fashion that supports evidence based replication and dissemination.
Conclusion: Although more studies are being attempted, the quality of their reporting still lacks rigour, preventing any strong conclusions about the impact of service user

involvement in medical education. We encourage educators to publish more robust studies the gaps identified in order to progress this field.

5J3 (1575)
Mobile devices supporting clinical placements for health professions students (transitions and transgressions): A Best Evidence Medical Education (BEME) systematic review

Authors
Gillian Maudsley, The University of Liverpool, Department of Public Health & Policy, Liverpool, UK
David Taylor, The University of Liverpool, School of Medicine, Liverpool, UK
Omnia Allam, The University of Liverpool, School of Medicine, Liverpool, UK
Jayne Garner, The University of Liverpool, School of Medicine, Liverpool, UK
Tudor Calinici, Iuliu Hatieganu University of Medicine and Pharmacy, Medical Informatics & Biostatistics, Cluj-Napoca, Romania
Ken Linkman, The University of Liverpool, Harold Cohen Library, Liverpool, UK

Presenter: Gillian Maudsley, The University of Liverpool, UK

Background: Clinical placements (clerkships) for health professions students (pursuing primary basic qualifications) should incorporate mobile devices meaningfully to support workplace learning, but ingrained assumptions about organizing clinical placements might undermine this. It is timely to evaluate the evidence-base beyond the original focus on device details and functions, i.e. towards how devices support the complexities of student transitions in learning and professional development (and potentially improve care) on clinical placement.
Method: Effectiveness-review (1988-2016) of evidence re: "What works best for health professions students using mobile (hand-held) devices for educational support on clinical placements?" searching: Medline, ERIC (Educational Resource Information Center), Web of Science, CINAHL (Cumulative Index to Nursing and Allied Health Literature), PsycInfo, Cochrane Central, Scopus. --- Reviewer-pairs screened titles/abstracts, then one pair coded, extracted, and synthesized evidence from eligible studies, working within the pragmatism paradigm.
Results: From the 107-article scoping-review (based on screening 2,279 abstracts), 49 articles met inclusion/exclusion criteria for the effectiveness-review:-- four systematic reviews for context, 45 articles reporting primary research evidence. The primary evidence was mostly Kirkpatrick K3 (39/45, 86.7%), mixed methods (21/45, 46.7%), and S4-strength (about one-half). Mobile devices particularly supported student: assessment; communication; clinical decision-making; logbook/notetaking; and accessing information (in about two-thirds of primary studies).
Via the hidden curriculum, three main conditions affected impact on placement learning: ---concerns about: actual and perceived disapproval of peers, clinicians/educators,

and patients; confidentiality and privacy; and security aspects; ---distraction by social connectivity (or other personal use) and busy clinical settings; ---mixed messages about policy.
Discussion & Conclusion: Mobile devices provide potentially powerful educational support for students on clinical placement if ingrained assumptions are challenged and explicit policy addresses concerns about transgressions.
The underpinning research must be more creative, relevant, and rigorous though. The evidence-base here was modest, idiosyncratic, and difficult to filter and synthesize, partly due to rapid changes in technology plus disjointed research agendas. Synthesis required expertise across quantitative, qualitative, and mixed methods approaches and persistence despite confusing or suboptimal write-ups.
Take-home message: Explicit policy must tackle the hidden curriculum about how students should use mobile devices on clinical placement.

5J4
Cognitive load theory for training health professionals in the workplace: A BEME review of studies among diverse professions

Authors
Justin L. Sewell, Department of Medicine, Division of Gastroenterology, University of California San Francisco, San Francisco, CA, USA
Lauren A. Maggio Department of Medicine, Uniformed Services University of the Health Sciences, Bethesda, MD, USA
Olle ten Cate, Center for Research and Development of Education, University Medical Center Utrecht, Utrecht, Netherlands and Department of Medicine, Research and Development in Medical Education, University of California San Francisco, San Francisco, CA,
Tamara van Gog, Department of Education, Utrecht University, Netherlands
John Q. Young, Department of Psychiatry, Hofstra North Shore-LIJ School of Medicine, Hempstead, NY, USA
Patricia S. O'Sullivan, Department of Medicine, Research and Development in Medical Education, University of California San Francisco, San Francisco, CA, USA

Presenter: Justin L. Sewell, Department of Medicine, Division of Gastroenterology, University of California San Francisco, San Francisco, CA,, USA

Background: Cognitive load theory (CLT) is of interest to health professions education (HPE) researchers, and is particularly applicable to workplace settings, which are complex, involve substantial element interactivity, and have numerous sources of extraneous load. However, prior reviews of CLT have not focused on learning in authentic HPE workplaces.
Method: We performed a scoping review of studies involving cognitive load, mental effort and/or mental workload in workplace settings within health and non-health professions. We included actual and simulated workplaces and workplace tasks. Searching 8 databases, we identified 4,571 citations. Of these, 116 met inclusion

criteria (education research study performed in a workplace setting using CLT or measuring cognitive load). Studies were selected, and data were extracted, doubly. All authors participated in knowledge synthesis.

Results: 97 studies regarded health professions and 19 other professions, most commonly medicine (85), nursing (10) and aviation (9). 104 studies were quantitative; 12 were mixed-methods or qualitative. 91 studies used simulation, 25 regarded actual workplaces. Cognitive load was measured in 103 studies using various approaches. Design and scope of studies were typically focused with narrowly-defined settings. Studies in non-health professions supported and complemented studies in HPE. Studies commonly identified higher intrinsic load as associated with less prior experience and lower performance, but few studies attempted to modulate intrinsic load. Numerous studies evaluated contributors to extraneous load, including information display and technology interfaces, task standardization, the physical work environment, teacher attitudes, contextual factors, disruptions and distractions, fatigue, and negative emotions. Limited studies of germane load suggested that matching complexity of workplace learning to learner prior experience could promote germane load. Studies within diverse professions support relevance of CLT to workplace learning, including traditional conceptualizations of intrinsic and extraneous load. Germane load was rarely studied, despite its role in promoting schema formation and learning. Study synthesis generated multiple recommendations to optimize curricular design, direct teaching, learning environments, and learner metacognition within HPE workplaces.

Conclusion: Tenets of CLT inform workplace learning in HPE. Future research of CLT's role in HPE should broadly consider overall workplaces and include mixed-methods and qualitative approaches.

5J5
'Why all BEME reviews are systematic, but not systematic reviews: A viewpoint'

Authors
Morris Gordon

Presenter: Morris Gordon, UK

Background: The BEME collaboration has seen an exponential growth in activity in reviews within health education, mirroring an increase in such output in the wider literature. This has been accompanied with an increasing tapestry of review methodologies being employed. A key question this prompted is whether the convention during the first 15 years of BEME reviews to describe all output as 'systematic reviews' was appropriate and this was dropped in 2016. In this session, I will present why all BEME reviews are indeed systematic, but not systematic reviews.

Method: A range of review methodologies will be presented, including systematic review, focussed review, realist review, narrative review and scoping review.

Results: The health tradition of systematic review, as developed through the evidence based medicine

movement and organisations such as Cochrane will be considered. This will be compared and contrasted with the key characteristics of the other reviews and areas of convergence and divergence explored. The BEME process will be overlaid to highlight that key elements of that process ensure scholarly rigour and a systematic deployment of methods to find evidence, whilst still allowing synthesis in line with diverse review types and ensuring quality output that recognised the kaleidoscopic range of valuable evidence in health education.

BEME supports rigorous processes to find and synthesise evidence that are both transparent and rigorous, which in my viewpoint leads to systematic BEME reviews, but such reviews can align with a number of diverse review traditions. Authors must ensure the right review type is selected to answer their research questions and that they have the specific skills and training to perform this review type.

Conclusion: All BEME reviews are systematic, but are not limited to the systematic review tradition of organisations like Cochrane. A diverse range of review types can be considered by BEME.

Non-technical skills assessment in medical education: A BEME focussed systematic review

Authors
Morris Gordon
Jeanne Farnan
Ciaran Grafton-Clarke
Ridwaan Ahmed
Dawne Gurbutt
John McLachlan
Michelle Daniel

Presenter: Michelle Daniel

Background: Preparing students to provide safe, effective care while contributing to a culture of safety is a critical component of training. Many medical schools have implemented curricula to teach non-technical skills, yet consensus on how to assess these skills is lacking. This systematic review aimed to evaluate the evidence regarding non-technical skills assessments in undergraduate medical education (UME), to describe the strategies utilized, learning outcomes and the validity, reliability and psychometrics of the instruments.

Method: Studies describing assessment methods as either the focus of the study or having non-technical skills assessment as an outcome measure of the research were considered. A standardized search of online databases was conducted and consensus reached on included studies. Data extraction, quality assessment and content analysis were conducted per Best Evidence in Medical Education (BEME) guidelines.

Results: Nine papers met the inclusion criteria. Assessment methods broadly fell into three categories: simulated clinical scenarios, objective structured clinical examinations, and questionnaires or written assessments. Details of methodology have been synthesised to support readers developing their own materials. However, few studies explicitly referenced underlying conceptual

frameworks utilized for instrument development and even fewer rigorously assessed instrument performance. The majority of studies sat at Kirkpatrick's Level 2b, with only two studies impacting behaviour change and one changing practice.

There were clear themes in content and broad categories in methods of assessments employed. The quality of the published literature on non-technical skills assessments in undergraduate medical education was poor due to lack of theoretical underpinnings and failure to rigorously assess the psychometrics of the instruments. Whilst the current literature forms a good starting position for educators developing materials, there is a need for future work to address these weaknesses as such tools are required across health education.

Conclusion: There is a lack of theoretic underpinning within published items on non-technical skills assessment. Presented is a good starting point for educators in developing further assessment methodologies and tools.

Determining Best Practices and Barriers to Teaching Ethics in Medicine: A Scoping Review

Authors

Carrie Bernard, University of Toronto, Toronto, Canada
Eva Knifed, University of Toronto, Toronto, Canada
Nadia Incardona, University of Toronto, Toronto, Canada
Mahan Kulasegaram, University of Toronto, Toronto, Canada
Risa Freeman, University of Toronto, Toronto, Canada
Cathy Fournier, University of Toronto, Toronto, Canada

Presenter: Carrie Bernard, Department of Family and Community Medicine, University of Toronto, Canada

Background: In 2013 the Primary Care Ethics Integration Initiative (a partnership between the academic and community based organizations in Toronto) was formed to address the needs expressed by primary care clinicians for better teaching and support in the area of clinical ethics. A scoping review was undertaken to address the learning gap and to determine the best practices in integrating ethics teaching into family medicine residency training.
Method: The scoping review addressed the following questions: What methods are used to teach medical ethics in medicine? How have the teaching methods been evaluated and is there evidence of efficacy? What types of student assessments relating to teaching ethics have been employed? What is the evidence supporting their use? MEDLINE was searched for relevant articles (1947-present). 97 full text articles and abstracts were screened. 79 were included in the reviews.
Results: Although well designed trials evaluating ethics teaching are sparse, the following themes were identified: there is not agreement in the literature on best practices, learners prefer small group learning over didactic lectures, there may be benefit to integrating ethics teaching into clinical work, and many barriers exist (time constraints, lack of faculty confidence, competing learning needs) Our review revealed that teaching ethics in medicine has significant barriers and better integration of teaching in the clinical setting may be a promising solution. Further, evidence of efficacy of teaching methods and evaluation tools are limited. We are developing a program to address these deficits.
Conclusion: Although learning ethical reasoning is integral to successful family medicine practice, work needs to be done to ensure that curricula and teaching methods are effective. Methods which better integrate ethics learning into the clinical work should be a priority for evaluation.

Creating a bioethics Scholars Program for Graduate Medical Trainees

Authors

Angira Patel MD, MPH, Northwestern University Feinberg School of Medicine, Chicago, IL, USA
Joshua L. Goldstein MD, Northwestern University Feinberg School of Medicine, Chicago, IL, USA
Kelly Michelson MD, MPH, Northwestern University Feinberg School of Medicine, Chicago, IL, USA

Presenter: Angira Patel, Ann & Robert H. Lurie Children's Hospital of Chicago, Northwestern University Feinberg School of Medicine, Chicago, IL, USA

Background: Experts recognize bioethics as an important component of graduate medical trainee education. Education in bioethics promotes professionalism and provides trainees' skills to identify ethical issues encountered in medicine and develop critical analytic thinking related to clinical decision-making that considers patient and family values. However, providing bioethics education to medical trainees has challenges. The recently published Romanell report, called for more rigorous bioethics training for graduate medical trainees and laid out potential goals and objectives as well as challenges for developing a comprehensive curriculum.
Method: Using Kerns' six-step approach we developed a 2-year bioethics curriculum. Specifically, we performed a literature review, completed a needs assessment, conducted interviews of stakeholders, developed objectives and educational strategies, performed a pre-test assessment, and implemented a 2-year bioethics curriculum.
Results: Trainees participating in the program attend ten 2-hour core seminars and twelve 1-hour specialty ethics sessions of their choosing. Trainees also complete 2 longer written reflective assignments and 6 shorter written reflections, read 2 fiction/non-fiction books related to bioethics, participate in an ethics simulation, have a practical experience that may include participating in ethics meetings or institutional review board meetings, and complete a scholarly project. Graduate medical trainees applied and were accepted in summer of 2017. Currently 9 participants representing 8 different specialties comprise the first cohort of the project. Trainees who participate in this bioethics scholars program will have an in-depth exposure to bioethics theory and knowledge and the skills to be the future ethics educators, researchers, and policy leaders in medical ethics.
Conclusion: This program provides an early foundation in bioethics for interested trainees who want to include ethics as part of their future academic career. By having interaction and exposure to multiple medical bioethicists, they will have early exposure to model their future academic career in bioethics.
Take-home message: Through a bioethics scholars program, interested medical trainees can benefit from additional training and mentorship towards an academic career in medical bioethics.

5K3 (2481)
Designing bioethics curriculum for mobile learning

Authors
Azra Naseem, Aga Khan University, Karachi, Pakistan
Waqar Kashif, Jinnah Medical and Dental College, Karachi, Pakistan
Kulsoom Ghias, Aga Khan University, Karachi, Pakistan
Murad Khan, Aga Khan University, Karachi, Pakistan

Presenter: Azra Naseem, Aga Khan University, Karachi, Pakistan

Background: At AMEE 2017, we presented findings from the participatory design (PD) process of developing a mobile app for teaching of bioethics. Since that presentation, bioethics curriculum for mobile learning to be used as a part of the app has been developed using a backward design process. Here we describe the processes of designing the content, feedback from stakeholders and challenges encountered in the process.
Method: During the workshops, medical and nursing students and residents shared ethical issues encountered in clinical settings. Based on this, topics were identified for static content on the app. An eLearning design template was developed and learning outcomes determined for each topic. Topics were assigned to content experts, who took the lead in writing the first draft while others provided input by identifying additional content. A group of students and residents were invited to review the content and provide feedback.
Results: Learning outcomes are largely at the first and second levels of Bloom's taxonomy. Each topic has two real cases followed by questions for reflection, a wide variety of resources to analyze the cases and develop deeper understanding of underlying ethical issues, and an online post-quiz for self-assessment purposes. Feedback from end-users shows that content is largely relevant to their needs, although some content will require more facilitator guidance. The app is specifically designed for interactive discussions between and amongst learners and facilitators to supplement the static content.
The content development team encountered conceptual challenges such as pre-identification of resources that learners may require in future situations, and practical challenges such as the lack of time for developing online content. However, it is important to teach bioethics in the context of real cases to foster the development of ethical reasoning among health professionals.
Conclusion: Curriculum for mobile learning designed through participatory design process allows end-users to design their own learning experience, while content development by experts ensures that content is accurate and aligned with outcomes.

Ethics Education with Hong Kong Flavour: Cultivating Lasting Bioethical Awareness in Medical Students by Using Local Cases and Debates

Authors
Sara Bergstresser, The Chinese University of Hong Kong, Hong Kong
Isabel Hwang, The Chinese University of Hong Kong, Hong Kong
Shekhar Kumta, The Chinese University of Hong Kong, Hong Kong
Paul Lai, The Chinese University of Hong Kong, Hong Kong
Ho Keung Ng, The Chinese University of Hong Kong, Hong Kong
Yan Jin, The Chinese University of Hong Kong, Hong Kong

Presenter: Sara Bergstresser, The Chinese University of Hong Kong, Hong Kong

Background: Contemporary bioethics education has been developed predominately within Euro-American contexts, but other regions across the globe are increasingly joining the field, leading to a richer global understanding. Nevertheless, many standard bioethics curriculum materials retain a narrow geographic focus, with examples that are mainly drawn from experiences and debates in North America and Europe, a tendency that raises concerns about applicability to other world regions. This is of particular importance for Hong Kong, which has a history, culture, and medical system with many unique features, and most local medical graduates remain in Hong Kong to practice.
Method: A new bioethics education program for undergraduate medical students is currently under development at the Chinese University of Hong Kong (CUHK) in partnership with Columbia University, with an emphasis on cultivating lasting bioethical awareness relevant to the local Hong Kong context. Based on this partnership, standard topics of broad relevance are identified, and then these topics are augmented with local examples, producing a curriculum both consistent with global standards and distinctly relevant to Hong Kong. In the preclinical years, emphasis is placed on broad social debates, including medical cases discussed in local media, public health, and debates about health system priority setting. For the clinical years, the program incorporates ongoing ethics grand rounds, where individual local cases are discussed in great depth.
Results: For medical students, we have found that using standard case studies based on unfamiliar social, cultural, and political systems and events have been difficult for students to understand and to connect to their own futures as Hong Kong medical professionals. Preliminary observations show that the introduction of local cases and discussions has resulted in more lively discussions, with students more willing to express their own observations and opinions on topics of bioethical relevance. Since the program is still under development, further study is still needed.
Conclusion: The CUHK experience suggests that success in cultivating lasting bioethical awareness among medical students is greatly enhanced by incorporating cases and

examples that are relevant to the real world realities of
working in local medical systems.

Learning strategies don't form in a vacuum: a comparative ethnographic study

Authors
Eleonora Leopardi, School of Medicine and Public Health, The University of Newcastle, Newcastle, Australia
Caragh Brosnan, School of Humanities and Social Science, The University of Newcastle, Newcastle, Australia
Robbert Duvivier, School of Health Professions Education, Maastricht University, Maastricht, Netherlands
Martin Veysey, Hull-York Medical School, Hull, UK

Presenter: Eleonora Leopardi, University of Newcastle, Australia

Background: Self-directed learning (SDL) and self-regulated learning (SRL) are considered critical in both medical education and lifelong learning. Medical schools structure their programmes to enable students to develop SDL and SRL. However, learning environments, through the impact of their hidden curricula, often oppose the intended objectives of the formal curriculum.
A multi-sited comparative ethnographic study was conducted in the context of a joint medical programme delivered at two different medical schools. A combination of research methods was used to study the institutional construction of the learning environment and the students' learning strategies during the early years of the programme.
Method: Seventeen interviews of students, two focus groups (n=16), and 101 hours of observation of learning activities were conducted. Additionally, 18 staff interviews and 23 hours of meetings observations were completed. Thematic analysis of the data collected was used to understand the students' learning strategies and uncover the influence of the learning environment.
Results: The analysis of the learning environment revealed that, while explicit emphasis is put on SDL as the stated educational strategy, numerous cues in the programme direct the students' learning at each institution. These unspoken messages can be conveyed by course materials, assessments, learning facilitators and student organizations. Although, individually, staff members acknowledge this influence, the formal curriculum and the operational activities of the medical school underestimate the significant effect that these cues have on students.
Conclusion: The learning environment is a complex entity that influences students as they develop their learning strategies. SDL or SRL are often poorly defined and assumptions about the students' levels of self-direction and self-regulation are made, both by medical education researchers and by medical educators. Better understanding of the learning environment will assist medical educators in acknowledging implicit influences on the students' learning.

Take-home message: The institutional culture that permeates the learning environment exercises a powerful influence on students' learning strategies, and can overturn explicit educational objectives. Curriculum planners need to consider the effects of the institutional culture on their programmes.

Identifying Areas of Concern in Patient Safety through Assessment of the Clinical Learning Environment

Authors
Robin Hemphill
Sally Santen
Brian Aboff
Gregory Domson
Nital Appelbaum

Presenter: Robin Hemphill, Virginia Commonwealth University Health System, Richmond, USA

Background: Academic medical centers are grappling with ways to identify methods of internally monitoring their clinical learning environments. Our aim was to identify how internal assessments of perceived organizational support and psychological safety correlated with the items on the Patient Safety/Teamwork domain of the Accreditation Council for Graduate Medical Education (ACGME) Resident Survey. Such identification would allow residencies and health systems to internally assess aspects of the environment at various times of the academic year, allowing early intervention to improve patient safety and the clinical learning environment.
Method: In June 2017, the Office of Graduate Medical Education and Office of Quality and Safety conducted an internal survey of the residents across 19 residency programs the Perceived Organizational Support and the Psychological Safety Scale. A bivariate correlation was conducted to identify overlap between our internal assessments and the ACGME Resident survey.
Results: 322 residents (63% response rate) completed our internal assessment survey and 496 residents (96% response rate) completed the FY17 ACGME Resident Survey. Bivariate correlations revealed a strong positive correlation between perceived organizational support and psychological safety (r=.88, p<.01), overall program score (r=.75, p<.01), ACGME domain item "Culture reinforces patient safety responsibility" (r=.72, p<.01), and ACGME domain item "Effectively work in interprofessional teams" (r=.49, p<.01). Psychological safety had a strong positive correlation with overall program score (r=.57, p<.05) and ACGME domain item "Culture reinforces patient safety responsibility" (r=.53, p<.05).
Conclusion: Our internal assessment of the clinical learning environment showed positive correlational relationships with the cultural measure of the Patient Safety/Teamwork domain of the ACGME Resident Survey, as well as the measure for overall program evaluation. Both the construct and identified measures of perceived organizational support and psychological safety have powerful utility for residencies and health systems to

actively monitor and influence the clinical learning environment before the annual accreditation measures on program performance.

Take-home message: We found that our internal assessment of the clinical learning environment showed positive correlational relationships with the cultural measure of the Patient Safety/Teamwork domain of the ACGME Resident Survey, as well as the measure for overall program evaluation.

Not just resilience: Enabling undergraduates to become life long learners

Authors

Barbara Elizabeth Macpherson, Leeds Institute of Medical Education, Leeds, UK
Alison Ledger, Leeds Institute of Medical Education, Leeds, UK

Presenter: Alison Ledger, Leeds Institute of Medical Education, University of Leeds, UK

Background: Much recent attention has focussed on developing medical students' resilience for work in challenging healthcare environments (Teodorczuk et al., 2017). Educational interventions tend to be targeted at individuals and life outside rather than inside work (McKenna et al., 2016). Broader approaches are needed to facilitate positive learning environments (Teodorczuk et al., 2017).

Method: Within our intercalated medical education programme, we aim to take a comprehensive approach to identifying and developing resources for future work. A strong focus is developing students' understanding of themselves as lifelong learners, through exposing them to a range of educational theories, encouraging self-directed learning, and offering and inviting formative feedback. Personal tutoring is also key, particularly in cases where students are anxious to succeed and feel disappointed with their grades. Our approach is a solution-focussed one, in which students are encouraged to develop plans to address any issues they are experiencing. As medical teachers, we also model an enquiring attitude rather than portraying ourselves as all-knowing experts.

Results: We have observed that students become less focused on achievement as they progress and become more comfortable with uncertainty and asking for help. Evidence of impact includes students requesting on-going support on their return to medical studies.

Over the past five years, we have noted a growing need for students to process their responses to perceived failure. We see this as being especially important for understanding themselves as lifelong learners and teachers, with a strong commitment to continuing development.

Conclusion: Though we are confident our approach is helpful to students during their time on the course, we are uncertain to what extent this learning is retained as students continue into their career as doctors. We are keen to develop further scholarship about students' ongoing development and welcome discussion with others interested in this topic.

Take-home messages:
- Medical Teachers have a responsibility to support undergraduate students to become lifelong learners
- Comprehensive approaches are required to develop academic and personal resources
- There is a need for further scholarship about the process of becoming a lifelong learner in medicine

Perceived and observed learning needs of International Medical Graduates (IMGs) preparing for practice in a Canadian Setting: A mixed methods needs assessment

Authors
Lara J. Cooke
Chloe Burnett
Jean Rawling
Dana Young
Sarah Weeks
Kelly Burak

Presenter: Lara Cooke, University of Calgary, Canada

Background: It may be challenging for IMGs to adapt to a new medical system, context and culture when they transition to practice. In Alberta, IMGs must undergo a formal assessment program before entering practice. This research explored the learning needs of IMGs undergoing assessment to assist in the development of curricular programming to support their transition to practice.
Method: A sequential, exploratory mixed methods study of IMG learning needs was completed. Key-informant interviews of stakeholders and program participants were completed to learn about IMGs' observed learning. The verbatim transcripts of these semi-structured interviews were analyzed qualitatively and guided the development of a questionnaire that was distributed to Alberta IMGs to explore their self-reported perceived learning needs in relation to the health care system, context, health care delivery, and learning needs about specific medical knowledge, including the CanMEDS competencies.
Results: Eleven key-informant interviews were completed. Key themes arising from the interviews included: 1) addressing specific medical content topics (management of controlled substances, reproductive health, motivational interviewing), 2) physician identity re-formation and cultural competency and 3) topics relating to CanMEDS competencies such as Communicator, Health Advocate, and Collaborator. 143 IMGs responded to the questionnaire (29%). IMGs' perceived needs focused on practical aspects of integrating into their local context (drug names, local referral pathways, how to access local information resources). There was an observed mismatch between reported need for CanMEDS training and challenging scenarios recalled by the respondents; while CanMEDS training was deemed low priority, CanMEDS issues appeared to underlie many of the challenging scenarios the physicians recalled.
Conclusion: IMGs may undergo a sense of loss of identity and identity 're-formation'. There is a gap between the learning needs of some IMG physicians as self-reported in comparison to those observed by experienced assessors.
Take-home message: Providing IMGs with familiarity with CanMEDS competencies and principles of lifelong learning

in the Canadian context will help support their transition to practice.

5M2 (489)
How can we increase performance, retention and wellbeing of international medical graduates? Developing and refinfing theory using realist approaches

Authors
Amelia Kehoe, Newcastle University, Newcastle, UK
Jane Metcalf, University Hospital of North Tees, Stockton, UK
Madeline Carter, Newcastle University, Newcastle, UK
Jan Illing, Newcastle University, Newcastle, UK

Presenter: Amelia Kehoe, Newcastle University, Newcastle, UK

Background: Like many countries, the UK's National Health Service relies on international medical graduates (IMGs) to ensure effective healthcare delivery. This is currently of particular importance, as recruitment to medical posts remains an issue throughout the UK. Concern has also grown in recent years around the regulation and practice of IMGs. Whilst there is now recognition of the need to better support IMGS to make a successful transition to their new place of work, interventions have been implemented without sufficient exploration of what is likely to work or how much training/support is appropriate. This research has explored and evaluated interventions targeted at IMGs.
Method: A realist approach was adopted. A realist synthesis (exploration of literature and development of initial theory) was conducted. A realist evaluation was then completed to test and refine theory. The main intervention subject was the Programme for Overseas Doctors (POD) developed within one North East Trust. A comparative case study design, using mixed methods, was used (including interviews, questionnaires, researcher observation and analysis of performance data).
Results: A synthesis of the findings, including 123 interviews, illustrated that three key contextual levels; organisational, training and individual, will likely impact on the adjustment of IMGs. Levels of performance, retention, career progression and wellbeing were high where the required support was in place. One of the main outcomes of this research is a transferable, theoretical explanation of how interventions can successfully support the transition of IMGs.
Conclusion: Interventions need to be more comprehensive and broad ranging than a simple induction or one-off training programme. Interventions must focus on building an open and supportive culture, address individual needs, and include ongoing support from all staff beyond the initial intervention. This work has reviewed factors that contribute to a successful intervention and has put forward recommendations for future policy, interventions and research. A similar programme has been developed for refugee doctors.
The absence of a supportive framework, targeting social, cultural and work related issues, has led to IMGs feeling stressed, depressed, and becoming isolated. Difficulties in

career progression, retention and performance were evident.

5M3 (186)
Post-graduation migration intentions of students of Romanian medical schools: a survey study

Authors
Anca Dana Buzoianu
Codruta Alina Popescu
Soimita Mihaela Suciu

Presenter: Anca Dana Buzoianu, University of Medicine and Pharmacy ''Iuliu Hatieganu'', Cluj-Napoca, Romania

Background: Physician migration is a complex phenomenon that is intimately intertwined with medical education. There are countries that do not produce enough physicians and countries that train a surplus of physicians with the intent of supplying other countries. Migration of healthcare workers is receiving increased attention worldwide. In Europe, the creation of a border-free labor market and its expansion with the EU enlargements endowed health professionals with the right to provide services and to relocate to another EU Member State. For the Romanian doctors, the EU recognition of the medical degree has created new opportunities, while inadequate working conditions and relatively low salaries pushed many of them to search for employment abroad. As there is considerable uncertainty about the magnitude of the Romanian physicians' exodus, we performed a survey to assess the emigration intention of future Romanian doctors.
Method: The study was conducted over five consecutive years: 2013-2017 at the University of Medicine and Pharmacy "Iuliu Hatieganu" Cluj-Napoca, Romania. The self-administrated questionnaire included 19 questions regarding students' emigration intentions.
Results: All the 1596 license-degree students participated in the study. In this study, 73.8.7% of subjects planned on seeking employment abroad after graduation. A large number of the students who have participated in the study have already started preparing for emigration, 21.4% of those who wished to migrate had already performed at least one Erasmus mobility in their country of choice, 39.3% have been enrolled in a language course, and 37.8% have searched for jobs on the Internet.
Conclusion: The majority of Romanian medical students considering migration see it as a serious alternative to the continuation of their professional training. In 2016 after Brexit announcement there was a decrease in emigration intent, but in 2017 the data was similar to 2015. The findings of this study are upsetting and can impact both policy crafting and future research. Structural reforms in the healthcare provisions are needed in order to facilitate the retention of medical personnel.
Take-home message: Romanian policy makers need to devise a comprehensive national health workforce plan to deal with physician migration.

5M4 (3684)
Implementing a Standardized Global Health Training for the Largest Medical Exchange Program in the World

Authors
Tommaso Ivan Pomerani, International Federation of Medical Students' Associations, Florence, Italy
Iris Blom, International Federation of Medical Students' Associations, Amsterdam, Netherlands
Katherine Wang, International Federation of Medical Students' Associations, Oslo, Norway
Nishwa Azeem, International Federation of Medical Students' Associations, Lahore, Pakistan
Aikaterini Dima, International Federation of Medical Students' Associations, Thessaloniki, Greece

Presenter: Tommaso Ivan Pomerani, International Federation of Medical Students' Associations, Florence, Italy

Background: The International Federation of Medical Students' Associations (IFMSA) organizes the largest international medical exchange program in the world, offering more than 14000 medical students from 98 countries the opportunity to learn about Global Health and develop cultural sensitivity by experiencing clinical practice and research in a different socio-cultural context. Before their exchange, students are required to take part in a Pre-Departure and an Upon Arrival Training; nevertheless, a specific standardized Global Health-oriented educational activity was not integrated as a core component of IFMSA Exchanges until this year.
Method: IFMSA has developed a standardized Global Health Training to introduce students to the topic of Global Health and its importance in international medical exchanges. The training is based on literature review of existing trainings and courses on global health, and has the goal of encouraging students to set global health learning objectives for the exchange experience and think about how to apply global health to their everyday practice.
The training includes theoretical portions of fundamentals of global health, determinants of health, health equity, health systems and the link between global health and exchanges, as well as activities such as case studies, exercises and simulations in order to encourage critical thinking and allow the integration of concepts in an interactive environment.
The training is currently in its implementation phase. IFMSA aims at implementing the new Global Health Training in at least 80% of its National Member Organizations (NMOs) by 2020. The impact of this training on medical students' awareness of global health will be measured through a pre and post assessment form.
International exchanges are crucial in creating a new generation of health professionals who are ready to face the local and global challenges of modern medicine. However, students must be adequately prepared for this experience to maximise learning outcomes.
Conclusion: The IFMSA Global Health Training encourages students to think about how to apply global health in their roles as future health professionals, with the goal of improving people's health at the local and global level.

5M5 (3042)
Orienting medical students to clinical medicine in a different country

Authors
Stephen Ash, American University of the Caribbean, Florida, USA
Sohaib Bukhari, Ealing Hospital, London, UK
Robert Hecht, American University of the Caribbean, Florida, USA
Ian Scobie, American University of the Caribbean, Florida, USA
Joy Checa, American University of the Caribbean, Florida, USA
Kim Kirkland, American University of the Caribbean, Florida, USA

Presenter: Stephen Ash, American University of the Caribbean, Miami, USA

Background: It is not unusual for medical students to study clinical medicine in more than one country or, indeed, end up working in a different country from which they trained. American University of the Caribbean School of Medicine (AUC) is one such international medical school that offers students clinical rotations in the both the US and UK. Many students report finding the transition to studying or working in a different country bewildering and may benefit from a formal program of orientation.
Task: We looked at different ways to achieve this for students undertaking their first clinical placements in the UK who were due to return to the US for their remaining clinical attachments. Specific elements requiring attention in this orienting process included differences in:
- Terminology
- Pathology values
- Drug names
- Hospital routines
- Nomenclature and hierarchy of staff
- Billing
- Systems processes
- Record keeping
- Dress code
- Occupational health and background check requirements

We looked at various modalities to effect orienting to these elements including:
- Written information;
- Classroom presentation;
- Video discussion with students in US Hospital;
- Video discussion with AUC alumnus in a US residency program who studied in both UK and US; and
- Live teleconference link with students in an AUC-affiliated US hospital.

Results: No one modality covered all elements satisfactorily. Feedback from over 60 students reported preferences for a combination of written material and "live" video link with students at a US Hospital using a question and answer format.
Conclusion: Surprisingly, it was common to find many differences in clinical practice between US hospitals themselves. "Live" teleconferencing sessions were time-consuming for the organiser. A video recording of such a session was deemed to be almost as valuable and was less time-consuming. However, many elements of orienting changed over time, and updating orienting material is important. Students fed-back feeling more confident when starting their first rotation back in the US, and thought the orienting process provided helped them adapt swiftly to their new environment.

5M6 (1926)
Healthcare students' participation in practice during international clinical placements

Authors
Miriam Wijbenga, Amsterdam University of Applied Sciences, European School of Physiotherapy, Amsterdam, Netherlands
Robbert Duvivier, Maastricht University, Department of Educational Development and Research, Maastricht, Netherlands
Stephan Ramaekers, Amsterdam School of Applied Sciences, School of Physiotherapy, Amsterdam, Netherlands
Dale Sheehan, Medical Education Unit, Gold Coast Health, Queensland, Australia
Pim Teunissen, Maastricht University, Department of Educational Development and Research, Maastricht, Netherlands
Erik Driessen, Maastricht University, Department of Educational Development and Research, Maastricht, Netherlands

Presenter: Miriam Wijbenga, Amsterdam University of Applied Sciences, European School of Physiotherapy, Amsterdam, Netherlands

Background: Healthcare students from all disciplines increasingly engage in international placements, during which they are exposed to a wide variety of clinical settings. Workplace learning is strongly related to context, whilst influenced by social interaction with other professionals. Little is known about how preparation and communication with the local healthcare team before entering the placement helps students' adjustment into clinical practice, where a social support system is less self-evident. The purpose of this qualitative study was to explore students' participation in practice during the initiation phase of international placements.
Method: Fifteen Dutch and European undergraduate students in physiotherapy and exercise therapy at the Amsterdam University of Applied Sciences in Netherlands were interviewed before and after the first month of international placements varying between 10-20 weeks, as part of their professional training. These semi-structured interviews took between 25-50 minutes. We applied a constructivist grounded theory approach, following an iterative process of simultaneous data collection and analysis.
Results: Other than feeling professionally restricted, students indicated that cultural differences and language barriers hindered their active engagement in practice, because they influenced team involvement and patient communication. Our analysis showed several factors enabling and inhibiting student participation during the

initiation phase of their international placement. Peer support was found to help adjustment but also discouraged individual engagement with local staff.

Conclusion: The results of this study reflect different elements that influence intern participation in undergraduate allied healthcare settings worldwide. Preparation holds no guarantee to a smooth transition into the international clinical setting, as the challenges encountered by students in becoming part of the local community of practice seem to mainly depend on their social support system.

Take-home message: During the initiation of students engaging in international internships it is important to clarify expectations, local conventions and legislative limitations, thus setting the stage for workplace learning.

The effects of symptoms-and-signs-based clinical reasoning course: A pilot study

Authors
Ping-Han Hsieh, Department of Medicine, Taipei Veterans General Hospital, Taipei, Taiwan
Wen-Ting Chen, Department of Education, Taipei Medical University Hospital, Taipei, Taiwan
Kuan-Ting Chou, Department of Education, Taipei Medical University Hospital, Taipei, Taiwan
Yun-Ying He, Department of Education, Taipei Medical University Hospital, Taipei, Taiwan
Yi-No Kang, Department of Education, Taipei Medical University Hospital, Taipei, Taiwan

Presenter: Ping-Han Hsieh, Department of Medicine, Taipei Veterans General Hospital, Taipei, Taiwan

Background: Traditional instruction for clinical reasoning is case-based discussion according to real clinical situation, and the instruction provides unstructured learning content. Moreover, no evidence proves when should teach clinical reasoning for medical students, and how to teach clinical reasoning effectively in different phases of their training. Therefore, the purpose of this study was to examine the effects of case-based clinical reasoning in traditional approach, and to explore when should medical students learn clinical reasoning in structured symptoms-and-signs-based instruction(SSSBI).
Method: This study reviewed learning data from 105 medical students in the SSSBI. A medical doctor designed the SSSBI including nine common symptoms and signs according to the Harrison Manual of Medicine(18th Edition). The SSSBI performed in lecture and role play with small group. Eight to 10 students composed a small group. Knowledge was tested before and after the SSSBI, and the performance was tested after the instruction.
Results: The result from pre-test showed that no sufficient evidence supports that year-6 medical students had higher knowledge of clinical reasoning comparing to year-5($t=-0.003$, $p>.05$). All the medical students were improved in knowledge of clinical reasoning after SSSBI($t=5.134$, $p<.001$). The stratified analysis by years showed that both year-5($t=3.336$, $p=.001$) and year-6($t=4.233$, $p<.001$) medical students were improved in clinical reasoning knowledge after the course. These two tests of clinical reasoning knowledge correlated with clinical reasoning performance. However, there is only post-test of clinical reasoning knowledge that can positively predict clinical reasoning performance($Beta=.379$, $p<.001$) in multiple regression. The traditional approach showed no differences in clinical reasoning knowledge in year-5 and year-6 medical students(pre-test). However, those students were improved in clinical reasoning ability after the SSSBI. The SSSBI provides core concepts to common symptoms and

signs through analysis and problem-solving methods. With role play, the SSSBI might make students learning more efficient.
Conclusion: The SSSBI may effectively improve medical student clinical reasoning ability. Early expose to clinical reasoning in SSSBI approach might be recommended.

Validity of structured oral exam for evaluating clinical reasoning within a preclinical unit assessment programme

Authors
Isabelle Boulais, Université de Sherbrooke, Sherbrooke, Canada
Jimmy Leppink, Maastricht University, Maastricht, Netherlands
Christina St-Onge, Université de Sherbrooke, Sherbrooke, Canada
Cees van der Vleuten, Maastricht University, Maastricht, Netherlands

Presenter: Isabelle Boulais, Université de Sherbrooke, Canada

Background: The structured oral exams (SOE) is a potential assessment strategy to assess clinical reasoning (CR). SOE theoretically offer the possibility to assess knowledge more deeply and they may be more authentic. However, content specificity and inter-rater variance are reported threats to its validity. Besides, the use of SOE in a preclinical context is not well described. Therefore, the purpose of this study was to evaluate the validity of the SOE in a preclinical integrative unit programme assessment for the evaluation of CR.
Method: We used assessment data from third-year medical students at a Canadian University. Students had completed a SEO comprised of three clinical vignettes assessing: problem representation (PR), differential diagnosis (DDx) and proposed workup (PWU). We computed item difficulty (IDifCo) and discrimination (IDisCo) coefficients and Cronbach's alpha for each case. Using dis-attenuated correlations, we explored the relation of the SOE with the other assessment strategies used in the integrative unit.
Results: Data were available for 199 students (100% of the cohort). IDifCo: 0.78 to 0.80 (PR); 0.67 to 0.81 (DDx) an 0.78 to 0.86 (PWU). IDisCo: 0.05 to 0.22 (PR); 0.21 to 0.35 (DDx) and 0.12 to 0,25 (PWU). Observed Cronbach's alpha were 0.309 (case1), 0.357 (case2) and 0.423 (case3). There was a positive dis-attenuated correlation of 0.44 with OSCEs and 0.895 with written exam.
Conclusion: Our findings suggest that the SOE promising psychometric properties. Lower item difficulty coefficients might be explained by the scoring key used (superior, average, inconsistent, inferior). The positive correlation between the SOE and OSCEs might be seen as an argument that both should assess CR. The observed correlation between the SOE and written exam might be due to the SOE being highly knowledge-based, or the written exam being a good assessment of CR. Limitations are related to the small number of cases and because the project was realised at only one institution.

Take-home message: There are some arguments to support the validity of the SOE score use. Research on the consequences of this assessment strategy would enhance our understanding of its contribution to the assessment of CR.

Effects of using a serious game on clinical reasoning in medical students in different years of undergraduate education

Authors
Insa Frisch
Nikolai Schuelper
Sven Anders
Tobias Raupach

Presenter: Insa Frisch, Georg August Universität Göttingen, Germany

Background: This study investigated the effectiveness of a serious computer game simulating an A&E department with regard to clinical reasoning in two different student cohorts.
Method: Students in the 7th and the 10th semester (n = 141) played six weekly, 90-minute sessions of the serious game. The same cardiopulmonal virtual patient cases were used in both student cohorts. Clinical reasoning was assessed during the second and the sixth session by analysing written patient handoff protocols and think aloud gaming sessions. In addition, all students sat a key feature examination at the end of the final session.
Results: A significant and meaningful increase in handoff scores was noted between the second and the sixth gaming session (7th semester: effect size d = 0.87; p < 0.001; 10th semester: d = 0.62; p = 0.035). Analyses of think aloud sessions revealed specific effects of the teaching intervention on clinical reasoning. Performance in the final key feature examination was moderate in both cohorts (61.2 ⬚ 16.9% vs. 64.4 ⬚ 18.4%; p = 0.278).
Conclusion: The use of a serious game increased students' abilities to manage virtual patients; this effect was more pronounced in less advanced students. The low overall scores obtained in the final key feature examination may be due to the formative nature of the exam. Yet, the similarity of exam results in the two cohorts suggests that teaching of clinical reasoning needs to be improved between the two semesters.
Using the A&E simulation for teaching clinical reasoning might be more beneficial for less advanced students. More teaching may be needed to enhance students' clinical reasoning abilities.
Take-home message: Using a range of qualitative and quantitative methods, this prospective study demonstrated beneficial effects of playing a serious game on clinical reasoning abilities. The effect was larger in less advanced students.

5N5 (664)
Influence of the Case Narrative Design on the Clinical Reasoning Process in Virtual Patients - a randomized controlled trial

Authors
Inga Hege, Medical School,University of Augsburg & Institute for Medical Education at LMU Munich, Germany
Anita Dietl, Institute for Medical Education, University Hospital of LMU Munich, Germany
Isabel Kiesewetter, Department of Anaesthesiology, Ludwig-Maximilians-University, Munich, Germany
Jörg Schelling, Institut für Allgemeinmedizin, Ludwig-Maximilians-University, Munich, Germany
Jan Kiesewetter, Institute for Medical Education, University Hospital of LMU Munich, Germany

Presenter: Inga Hege, Medical School, University of Augsburg & Institute for Medical Education, University Hospital of LMU Munich, Augsburg, Germany

Background: Virtual Patients (VPs) are educational activities to train clinical reasoning in a safe environment based on patients' stories. To foster clinical reasoning training we combined virtual patients with a concept-mapping tool in which learners document relevant problems of the patient, differential diagnoses, necessary examinations and treatment options. Our aim was to explore the influence of the narrative design and level of difficulty on the clinical reasoning process and diagnostic accuracy.
Method: We analyzed the clinical reasoning process of 46 final year medical students in a randomized controlled trial with six VPs in three different variations: (1) patients showing a friendly behavior, (2) patients showing a disruptive behavior, and (3) a version without a patient story. The clinical reasoning process of the participants was measured with a concept-mapping tool integrated into the VPs.
Results: For easy VPs, we did not see a significant difference in diagnostic accuracy. For difficult VPs, the diagnostic accuracy was significantly higher for participants who worked on the friendly VPs compared to the other two groups. Independent from VP difficulty, participants identified significantly more problems and examinations for disruptive than for friendly VPs; time on task was comparable for these two groups. The extrinsic motivation of participants working on the VPs without a patient story was significantly lower than for the students working on the friendly VPs.
Conclusion: Our results indicate that the measured VP difficulty has a higher influence on the clinical reasoning process and diagnostic accuracy than the variations in the narratives. Patients showing a disruptive behavior will most likely be part of students' future workplace and carefully designed and integrated VPs can help to prepare students for such situations and raise awareness of the potential effects on their clinical reasoning. Moreover, our study confirms that telling a story enhances extrinsic motivation of learners, but has no significant influence on the clinical reasoning process.
Take-home messages: The design of the virtual patient representation influences the learners reasoning process,

but the difficulty of the virtual patients influences
diagnostic accuracy more than the design of the narrative.

Understanding factors that contribute to inequitable teaching & supervision experiences of undergraduate medical students across clinical clerkship sites

Authors
Naghma Naeem, College of Medicine & Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates
Margaret Elzubeir, College of Medicine & Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates
Mohammad Al-Houqani, College of Medicine & Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates
Luai Awad Ahmed, College of Medicine & Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates

Presenter: Naghma Naeem, College of Medicine & Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates

Background: The objective of this study was to explore undergraduate medical students' perception of variation in teaching and supervision at four different clinical teaching sites.
Method: This descriptive, cross-sectional study was conducted at the College of Medicine & Health Sciences, United Arab Emirates University, United Arab Emirates during 2017. A specific, online questionnaire "the Clinical Clerkship Teaching & Supervision Questionnaire (CCTSQ)" was developed by researchers after literature review and administered to all clinical students (n=178). An exploratory factor analysis was undertaken, which identified a four factor structure. The reliability of the questionnaire was 0.979.
Results: The response rate was 84.4%. Overall perception of the students about their clinical clerkship experience was positive. SKMC was rated as the best teaching site with mean rating of 3.79±0.97-4.79±0.43. The highest rated item was clinical teacher's promotion of critical thinking while the lowest rated item was the opportunity to take responsibility for patient care.
Ambulatory Care site was rated next best with mean ratings of 2.33±1.23-4.13±1.19. The highest rated item was the clinical teacher encouraging students to ask questions and participate actively. At Tawam Hospital, the mean ratings ranged between 2.65±1.64-4.31±0.86 with highest rated item being ability of the students to see cases with positive clinical findings. At the Al-Ain Hospital, the mean rating was in the range of 2.79±1.45-3.81±1.11. The item rated highest was ability of students to see cases with positive clinical findings. The lowest rated item at the above three sites was the availability of on-call rooms and lockers.

Conclusion: Significant variability was seen across training sites in the clinical teacher's ability to act as professional role models, the opportunity for students to apply their previous knowledge to patient care and to independently assess patients before discussion with the teachers. This study describes a tool that provides specific, actionable information which can be used to address deficiencies and to optimize learning for students. across clerkship teaching sites.
Take-home message: CCTSQ can be used to reduce variability in clinical teaching and supervision and to provide more equitable clinical learning experiences for undergraduate medical students.

5O2 (2525)
Quality of informed consent obtained for surgical interventions from patients in a tertiary care hospital in Sri Lanka

Authors
Hasini Gunathunga, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Poornima Hansamali, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Senani Hapuarachchi, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Chathumini Herath, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Thejani Herath, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka
Madawa Chandratilake, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka

Presenter: Hasini Gunathunga, Faculty of Medicine, University of Kelaniya, Ragama, Sri Lanka

Background: Obtaining informed-consent for medico-surgical procedures is a basic ethical principle. The guidelines in practice may be affected by socio-economic, political and cultural factors. we explored the current practices of obtaining informed consent in Sri Lankan tertiary-care setting.
Method: The study was conducted in 3 phases: A qualitative observational study to understand the workplace practices (15 encounters); a questionnaire-based study to gather the experiences of patients (n=100); and a qualitative interview-based study with intern-house officers (n=8) to clarify the issues identified in the above phases.
Results: Consent-taking was a common practice, which took place mostly on-admission for surgery, and certain aspects of the procedure were well-adhered to. However, the process was mostly 'piece meal'; gaps were observed in content, amount and nature existed in information provided; time gap between information provision and getting consent appeared inadequate for the patients to take a decision; and junior doctors were informally assigned with the task. According to patients, information is provided at different stages from first clinic visit to the last-preparatory stage of the surgery; the consent-taking process occurs in a wider-time frame and in different settings (private practice, clinics, ward, anesthetic referrals); information is mostly provided verbally and

aided with diagrams and leaflet occasionally; the tendency is to avoid the discussion about risks; patients are not keen to ask questions but expects all the details from doctors. Paraphrasing is not commonly practiced. Intern-house-officers are satisfied with the theoretical knowledge for consenting-taking but content provided by them differed with patient's intellectual capacity and seriousness of the intervention; they expected that having a family member with the patient to facilitate the consent taking process.

Conclusion: Although 'consent-taking' for surgery is followed certain underlying principles may be poorly adhered to. The reasons include not the lack of theory-knowledge among doctors, but limitations in time and recourses, and believes and expectations of patients in the local socio-cultural context.

Take-home message: Education on 'consent-taking' should focus on overcoming the challenges of recourse limitations in workplace and socio-cultural beliefs among both patients and doctors.

5O3 (2304)
Are medical students' invasive procedural skills safe for patients?

Authors
HyeRin Roh, Inje University College of Medicine, Busan, South Korea
Ji-Hyun Seo, Gyeongsang National University School of Medicine, Gyeongsang National Institute of Health Sciences, Jinju, South Korea
Hyun-Hee Kong, Dong-A University College of Medicine, Busan, South Korea
Do-Kyong Kim, Dong-A University College of Medicine, Busan, South Korea
Min-Jeong Kim, Kosin University College of Medicine, Busan, South Korea
Sunju Im, Pusan National University School of Medicine, Busan, South Korea

Presenter: HyeRin Roh, Inje University College of Medicine, Busan, South Korea

Background: Correct performance of invasive procedures is vital for patient safety. Understanding performance level of medical students in detail from patient safety perspective can help educators to which parts should be more emphasized for patient safety. However, very few articles have analyzed objectively medical students' safety competence in technical procedures. The authors aimed to analyze students' performance on invasive procedures from the perspective of patient safety. Specific research questions are (1) How well did medical students perform in invasive procedure stations of Objective Structured Assessment? (2) How safely did medical students perform to prevent major critical errors of technical procedures? (3) Which items were difficult for students to succeed?

Method: Subjects were 2,147 final-year students in Clinical Skills Assessment (CSA) of Busan-Gyeongnam Consortium from 2013 to 2017. The authors chose 12 invasive procedures and classified checklist items according to safety categories such as infection errors, technical complications, technical failures, cases involving the wrong patient and wrong procedures, and engaging with patients. The full mark of each station was calculated to be 100. The authors analyzed mean of total scores of each station according to safety category. The authors also analyzed the percentage of students who received marks on checklist items.

Results: The total score on invasive procedures was 77.6. Students' scores of technical complications (84.1) and preventing infection errors (82.8) were better than technical failure (77.9), cases involving wrong patients and wrong procedures (72.4) and engaging with patients (71.6). Only 65% of students could perform an aseptic technique during whole procedures. Fourteen percent of students checked adverse events after procedures. Only 58% of students succeeded whole procedures completely. Only 36% of students shook the tube gently to mix blood with ethylene diamine tetra-acetic acid (EDTA). Only 62% of students correctly labelled sampling bottle. Only 48% of students showed considerate manners during procedures.

Conclusion: Students' competence in the final year was not sufficient for patient safety. Educators should emphasize patient safety when teaching procedural skills and need more focus on technical failure, cases involving the wrong patient and wrong procedures, and engaging with patients during whole processes.

"The things you've seen that you didn't sign up for" – How final year Physiotherapy students deal with challenging situations in clinical education.

Authors
Kristin Lo
Alison Francis Cracknell
Sze-Ee Soh
Michael Storr

Presenter: Michael Storr, Monash University, Frankston, Australia

Background: Health professional courses involve education in clinical contexts. During clinical placements students may be involved in, or exposed to, challenging situations with staff, patients or families. While these situations can be beneficial to learning, often these situations may exceed students' capacity to cope.

Method: After finishing their under-graduate clinical education, eighty-two final year physiotherapy students attended a facilitated session on challenging situations in clinical education. Students were asked to write about these challenges which were summarised using thematic analysis. The responses were used to formulate an online survey which enabled quantitative exploration of the raised topics.

Results: The top three 'challenging' situations faced by students were clients in pain; clients with a condition that impacted significantly on their life and the life of their family; and clients with degenerative diseases. Students primarily looked for support from peers, clinical educators and family / friends.

Conclusion: Students are exposed to unplanned challenging situations in the clinical environment with peers and clinical educators the main source of support. These supports may be ill-equipped to manage these

demands and there may be strategies that can be put in place to support the needs of students' and the identified sources of support.

While education regarding appropriate resources can be put in place, there is further work to do in preparing students for the confronting nature of working as a health professional.

Take-home messages: Students are exposed to challenging scenarios in clinical education. They seek support primarily from peers and their clinical educators. Peers and educators may be ill equipped for this role.

5O5 (3370)
Innovating Physical Therapy Clinical Education

Authors
Maria Elizabeth Grageda

Presenter: Maria Elizabeth Grageda, Philippine Physical Therapy Association, Manila, Philippines

Background: Educational transformation can be achieved through the synchronous development and implementation of Institutional and Instructional Reforms and innovations. As curricular changes are happening in the Philippines with the mandatory shift to an Outcomes based approach in the tertiary level and the shift to K-12 in basic & secondary education, clinical education through training programs in various clinical training centers all over the country should take a more active stance in developing new ideas and using existing ones in new and creative ways.

Method: 80 clinical educators from all over the country participated in four simultaneous brainstorming sessions during the Clinical Education Summit of the Philippine Physical Therapy Association. In the generation phase, a round robin approach was used, followed by an evaluation phase where ideas were judged in terms of its acceptability as an innovation. The outputs of each group were synthesized into general themes in three levels: individual, institutional, and national.

Results: Three themes emerged as innovations at the individual level: Change in perspective or paradigm shift; Professional Development; and Maximizing Technology. At the organizational level, clinical educators have identified the following innovations: Establishing comprehensive evaluation systems; Standardization; Provision of venues for collaboration; Staff development, Nurturing a research environment; and Upgrading of the physical set-up of the centers. Finally at the national level, Development of Clinical Practice Guidelines; Development and implementation of Inclusive programs; Establishment of Information systems; and increasing Student involvement were suggested.

Conclusion: Clinical educators need to take action towards transformation through reforms at the individual, institutional, and national levels. Synchronized reforms at these levels through innovations focusing on Professional development, maximizing technology in education and practice, and development of standards for practice, teaching, and research, are what clinical educators commit to engage in towards transformative education.

Innovations in clinical education can be achieved at three levels: individual, institutional, and national.

Take-home message: Clinical educators can contribute in developing and maximizing these innovations based on their context to cope with the changes in PT education and practice.

The relationship between study curriculum and study conditions on subjective wellbeing among Norwegian medical students (the STUDMED project)

Authors
Christian Sletta (Faculty of Medicine and health sciences, Norwegian University of Science and Technology, Trondheim, Norway
Reidar Tyssen (University of Oslo, Norway)
Lise Løvseth (St. Olavs University Hospital, Trondheim, Norway)

Presenter: Christian Sletta, Faculty of Medicine and health sciences, Norwegian University of Science and Technology, Trondheim, Norway

Background: Though study stress among medical students can be potentially impairing, the medical study is also a time that stimulates learning, competence and growth. However, societal changes as well as continuous curriculum revisions at the medical faculties in Norway can originate new influential factors on medical students' wellbeing, than those relevant 20 years ago. It is important to increase knowledge about factors that are linked to satisfaction and subjective wellbeing, as they can affect the students' health and academic performance.
Method: The current study investigate changes in subjective wellbeing (SWB) and correlates by demographic-, individual-, curriculum-, and study environmental factors changes in students' wellbeing over time. The current results are based on survey data among all medical students at two medical faculties with different curriculums (traditional and integrated) in Norway in 2015 (STUDMED 2015). Comparison data was derived from a longitudinal survey among medical students from the same medical faculties in 1993 to 1999: the NORDOC project.
Results: Response rate 63.9% (N= 1044/1634). Preliminary analyses show a decrease in SWB compared with students 20 years ago. SWB was associated with personal factors and factors within the curriculum.
Conclusion: As subjective wellbeing is important to study satisfaction, health and performance, the faculties should pay attention to the identified factors in the study environment and curriculum. Some of these may be of importance in order to promote student wellbeing with regard to interventional efforts.

5P2 (2211)
Personality Traits, Work Engagement and Well-being in Veterinarians and Veterinary Students in Germany

Authors
Sabine Ramspott, Veterinary Department of the Ludwig-Maximilians-Universität München, Munich, Germany
Jan P. Ehlers, Universität Witten/Herdecke, Witten, Germany
Christian Gruber, Tierärztliche Hochschule Hannover, Hannover, Germany
Michaela Zupanic, Universität Witten/Herdecke, Witten, Germany

Presenter: Sabine Ramspott, Veterinary Department of the Ludwig-Maximilians-Universität München, Germany

Background: The well-being of physicians has emerged as an important topic at medical education conferences in recent years. Certain personality traits have been reported to correlate with subjective well-being, work engagement and occupational success. In Germany veterinary students were found to have the highest stress load among students and about 20% of the veterinarians feel burdened by stress. The aim of this study is to describe and compare personality traits, work engagement and subjective well-being in veterinary students and veterinarians in Germany.
Method: 291 veterinary students (87.6 % female) and 231 veterinarians (79.7 % female) filled in a questionnaire containing sociodemographic questions (including age, sex, scope of work and income), the International Personality Item Pool (IPIP) to determine the BIG-5 personality traits, the Utrecht Work Engagement Scale (UWES-9) and the World Health Organization-Five Well-Being Index (WHO-5). Descriptive statistics were performed and univariate analysis of variance was used to test for differences between the two groups for significance ($p < .005$).
Results: Veterinarians reached a higher score in the personality trait openness to experience ($F=15.1$, $p<.001$), and significantly lower scores in work engagement ($F=5.1$, $p=.025$) including the subscales dedication ($F=5.6$, $p=.019$) and absorption ($F=11.2$, $p=.001$), and subjective well-being ($F=24.2$, $p<.001$). The scores of 22 of 277 veterinary students (7.9 %) and 35 of 204 veterinarians (17.2 %) that completed the WHO-5 were below 13. 60 of 229 (26.2 %) veterinarians earned less than 26.400 € per year (recommended salary for veterinary entrants in Germany) and 71 (31%) earned more than 50.000 €.
Conclusion: Scores of 17.2 % of veterinarians were below the cut-off value of 13 in the WHO-5, which can be used as a screening for depression. The percentage is more than 3 times higher than the WHO estimate for depression in the overall population in Germany (5.2 %).
Take-home message: To safeguard well-being, resilience should be fostered not only in medical, but also in veterinary students to prepare them for their professional life.

5P3 (3503)
A Longitudinal Resilience Curriculum for Improving Medical Student Resilience

Authors
Leslie Nickell, University of Toronto, Toronto, Canada
Shayna Kulman-Lipsey, University of Toronto, Toronto, Canada
Natasha Snelgrove, University of Toronto, Toronto, Canada
Joanne Leo, University of Toronto, Toronto, Canada
Andrea Levinson, University of Toronto, Toronto, Canada

Presenter: Shayna Kulman-Lipsey, University of Toronto, Canada

Background: There is increasing global recognition of high levels of mental distress, deteriorating well-being, burnout and depressive symptoms among medical students. The resilience skills of these high achieving students are often underdeveloped and previously untested, leaving them vulnerable to increasing levels of mental distress. Medical schools are seeking to address this issue, however activities supporting the health and well-being of students are often extracurricular and therefore optional. The University of Toronto, Faculty of Medicine, has developed a core resilience curriculum fully integrated and mandatory within the medical curriculum.
Method: In 2015, medical students, faculty and Student Affairs staff co-created a Resilience Curriculum, as a core component of an entire curriculum renewal process. Key themes in year one include: stigma, imposter syndrome, expectations and measuring up, shame and guilt, and the hidden curriculum. Objectives emphasize understanding how these themes challenge resilience. Year two themes focus on transition to clinical practice: managing uncertainty, values & priorities, medical error, role of learner within the care team, prevention/recovery from burn out and compassion fatigue. Skills taught consist of: reaching out, cognitive reframing, mindfulness, awareness of spirals, and self-compassion. Development of third and fourth year resilience curriculum is underway.
Results: Both first and second year resilience curriculum has been implemented. Quantitative evaluation data indicates enhanced student engagement through the Monologues in Medicine, videos of students and residents narrating personal experiences with mental health challenges. Qualitative data and focus groups show that students found the learning objectives of the on-line modules relevant to their overall well-being.
Conclusion: The health and well-being of students is at risk during medical school. Unaddressed, this trend continues into residency training and for practicing physicians. The status quo is no longer acceptable. A Canadian medical school has an integrated resilience core curriculum, to enhance students' resilience skills, and navigate the stresses inherent in the medical profession. Early experience indicates a positive student response.
Take-home message: Skills of resilience can be taught to medical students and should be included as core medical education curriculum, thereby promoting the Can Meds competency of physician self care.

Connecting future health worker professional knowledge and identity to desired campus values and behaviour: an evaluation of bespoke sexual consent and bystander action workshops for new healthcare students

Authors
Judith Ibison, St George's University of London, London, UK
Margot Turner, St George's University of London, London, UK
Lowri Davies, St George's University of London, London, UK
Bethany Agnew, St George's University of London, London, UK
Sarah Lasoye, St George's University of London, London, UK
Gavin Taylor, St George's University of London, London, UK

Presenter: Judith Ibison, St George's University of London, UK

Background: Sexual assault and harassment is common. A 2015 UK survey of new university students found that 17% of respondents had been victims of sexual harassment during their first week and 29% and had witnessed sexual harassment. In 2017, St George's University of London, a health care and science university, developed a strategic approach to improve campus culture around these issues.
Method: Bespoke interactive workshops, which aimed to (i) increase knowledge, (ii) empower students to safely intervene in situations of sexual harassment or assault and (iii) to support victims of sexual assault, were co-created by students and University staff. Content was explicitly linked to the vocational curricula, and professional responsibilities, of students. 65 peer tutors were trained to deliver the workshops, and all new students 2017-18 were timetabled to attend. The workshop was evaluated by pre- and post- semi-structured paper questionnaires, with Likert scales questions analysed by Wilcoxon Rank test, and thematic analysis of open questions.
Results: There was a 78% (612/784) response rate. Participants rated the peer tutor delivery as excellent. There were moderate and significant increases of student knowledge of the definitions, and issues around, sexual consent (from neutral confidence to very confident). Student confidence to support victims, and to take action significantly improved to lesser extent. Themes that emerged from free text included: an appreciation of the non-judgemental atmosphere; the interactivity; excellent tutors; and engaging nature of the workshops. Students desired: more scenarios to discuss; more skills on how to gain consent; with divergent views on the desirability of single gender or mixed groups, and the feasibility of an 'online' delivery format.
Conclusion: The bespoke consent workshop, tailored to the vocational aspirations of university students, was welcomed and highly valued by participants, increasing knowledge and confidence to intervene. Coproduction and delivery by senior students magnified impact vertically through the student community.
Take-home message: There is a high prevalence of sexual harassment, and experience of sexual assault in university settings. Coproduction of sexual consent workshops is

welcomed by the student community, and effects changes in knowledge and confidence to positively intervene.

5Q: Short Communications: Postgraduate: Wellbeing & the Doctor in Difficulty

Location: Lima, Ground Floor, CCB
Date: Monday 27th August

5Q1 (2400)
"You'll probably go home and cry" – the effect of bullying on radiology specialty training

Authors
Michelle Moscova
Irina Dedova
Merribel Kyaw
Tina Hoang
Michael Hollands
Noel Young

Presenter: Michelle Moscova, University of New South Wales, Sydney, Australia

Background: Bullying in the medical profession, including bullying of registrars, has been discussed widely. Despite well documented negative effects of bullying on victims, the prevalence of bullying in healthcare remains high. However, in Australian radiology training programs the prevalence and effect of bullying on registrars is unknown.
Method: To investigate radiology registrars' experience of bullying, we conducted a two-stage study using sequential qualitative-quantitative design. The first stage consisted of semi-structured interviews with 16 radiology registrars. The second stage consisted of an electronic survey (n=83). Data from the qualitative component of the study was analysed using thematic analysis. Descriptive statistics were used for analysis of quantitative data.
Results: 1 in 7 registrars reported experiencing bullying and 1 in 5 witnessed it. Three times more females than males reported being bullied. Compared to the non-bullied cohort, registrars who experienced bullying were 8 times less likely to report patient safety concerns and 3 times less likely to discuss their mistakes with consultants. They were also 8 times more likely to discuss bullying with peers rather than with the training site. 45% of the trainees who experienced bullying did not intend to report it, 36% considered transferring to another training site and 45% considered leaving radiology altogether. Qualitative data suggested registrars lacked confidence in the reporting process and believed reporting bullying would negatively impact their career.
Bullying is prevalent in radiology training. Exposure to bullying damages work culture, so junior staff do not feel comfortable raising concerns. This can compromise the training environment and safe clinical practice. The reluctance to report bullying is mainly driven by the fear of retribution and belief that nothing would change. Current training site culture does not provide safe environment where registrars are able to raise concerns about bullying.
Conclusion: Bullying remains prevalent in radiology and has potential to negatively impact registrar training and patient safety. Trainees exposed to bullying are less likely to report patient safety concerns or discuss errors with consultants.
Take-home message: Bullying during radiology specialty training represents a significant threat to quality of training and patient safety.

5Q2 (2099)
Creating a Wellness Program for Postgraduate Medical Education in a newly accredited Medical center

Authors
John E Delzell Jr, Northeast Georgia Medical Center, Gainesville Georgia, USA
Donna Brown, Northeast Georgia Medical Center, Gainesville Georgia, USA
James Kruer, Northeast Georgia Medical Center, Gainesville Georgia, USA
Charles Richart, Northeast Georgia Medical Center, Gainesville Georgia, USA

Presenter: John Delzell, Northeast Georgia Medical Center, Gainesville Georgia, USA

Background: Northeast Georgia Medical Center (NGMC) is a 700-bed hospital system starting postgraduate training in 2019 with seven specialty programs and 175 residents. The institution has ACGME Accreditation for General Surgery and Internal Medicine. Plans are underway for Family Medicine, Emergency Medicine, Obstetrics & Gynecology, Psychiatry, and a Transitional Year. Revisions to the ACGME Common Program Requirements detail curricula for Resident well-being in the learning and working environment and include attention to scheduling, work intensity, workplace safety, and experience of being a physician. Residents must be given time to care for themselves, with attention to burnout, depression, and substance abuse. In preparation for residents, we developed a comprehensive Resident Wellness Program.
Method: New programs and their approach to wellness curricula were reviewed. The curriculum was structured around the NGMC Core Values and included elements of our Employee wellness program. The Office of GME developed a comprehensive Wellness Program that addresses integration of Residents into a new city, social network, hospital, and life stage. Metrics included meeting requirements of Section VI of the ACGME Requirements, avoiding pitfalls of peer hospitals implementing wellness programs, and integration of hospital system Core Values (Respectful Compassion, Deep Interdependence; Responsible Stewardship, and Passion for Excellence) Curriculum Goals and Objectives were developed for each aspect of the program. The Wellness Program promotes a healthy lifestyle while integrating team building, education around wellness, and work-life balance. Also included are aspects of lifelong learning, financial planning, self-reflection, empathy, and respectful communication. The program is structured to start during resident employee orientation, prior to clinical duties and then continue on a monthly basis.
Conclusion: There are many negative outcomes associated with physician burnout including impairment, substance abuse, and suicide. This comprehensive wellness initiative will establish a culture that is based on institutional core

values of the hospital and residency program. Our Wellness Program extends beyond the hospital setting and into the community and residents' social support system. It is creating a pathway to life-long balance for our residents that prepares them for a long career in medicine.

5Q3 (3074)
Residents' Wellness Program: Faculty Development for Mentors

Authors
Mary Ana Cordero Diaz, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Mariano Macías Sepulveda, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Gabriel M. Vargas Duarte, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Raul F. García Maya, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Leslie Uribe, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Presenter: Mary Ana Cordero Diaz, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico

Background: The Accreditation Council for Graduate Medical Education (ACGME) Clinical Learning Environment Review (CLER) Program expects training institutions to take steps and better address resident wellness. The purpose of the Tecnologico de Monterrey School of Medicine Residents' Wellness Program, first of its kind in Mexico, is to implement a quality initiative to improve residents' wellness and increase their commitment, educating them about wellbeing and its relationship with professionalism.
Method: As a pilot, 27 Medical Professors of the Pediatrics Residency Program were invited to become mentors in March 2018, and a specific Faculty Development Program for Mentors of the Residents' Wellness Program (FDPM) was required to be accredited previously. FDPM is divided in three modules: (1) mentoring in a wellness program, (2) strategies and tools for mental health and suicide prevention, and (3) mentoring and support services for case reference.
Results: First module was held in November 2017, with 27 future mentors attending. Contents were related to introduction to the Residents' Wellness Program, objectives and video-case discussion. Second module was held in January 2018 including the suicide prevention QPR (Question, Persuade & Refer) Gatekeeper training. Third module, will focus on mentoring interviewing techniques and identification of cases that need to be referred to support services, it will be held as a case simulation training in February 2018.
After completing their training, the mentors are intended to have one-on-one meetings with residents in which they would talk about current concerns. After identifying any problems or concerns in each of the categories, they would come up with a work plan and schedule a follow up meeting within three months. If the situation warrants it, the mentor will have the ability to refer the resident to the corresponding support department.

Conclusion: In March 2018, the first mentors of the Residents' Wellness Program will begin mentoring after completing a specific Faculty Development Program for Mentors. Mentors are intended to have one-on-one meetings with residents in which they would talk about current concerns of the resident and upon professional, emotional, physical and social wellness of the resident.

5Q4 (3497)
Wellness Matters - a new health and wellbeing course for Postgraduate Trainees - what did we find?

Authors
Alexandra St John
Blanaid Hayes
Hadas Levy

Presenter: Alexandra St John, Royal College of Physicians of Ireland, Dublin, Ireland

Background: As part of a suite of health & wellbing interventions, we introduced a new mandatory course for Higher Specialist Trainees titled "Wellness Matters". This one-day course covers the biological, physiological and psychological aspects of health, wellness, stress and ill health and covers specifically designed tools and techniques to maintain wellness and manage stressful situations during training. Higher Specialist Trainees are also supervising and training more junior trainees, interns and others, the course focuses on what they need to be aware of and do to help maintain the wellbeing of their teams.
Method: At the time this abstract is written, the first session was already delivered to a group of 10 trainees with very positive feedback. A pre and post PANAS questionnaire was administered as part of the course. The pre was completed before the course commenced and the post was completed after a meditative lunch break. The Positive and Negative Affect Schedule (PANAS) is a self-report questionnaire that consists of two 10-item scales to measure both positive and negative affect. Each item is rated on a Likert scale of 1 (not at all) to 5 (very much).
Results: By August 2018, four sessions were delivered to about 100 Higher Specialist Trainees and first and second level feedback was gathered. At the time this abstract was written preliminary findings indicate an improvement in positive affect and a reduction of negative affect. In the pre measurement we found that the highest positive affect was 'Interested' and in the post questionnaire it was found that the highest scores was observed in affects were 'attentive' and 'determined'. The highest negative affect indicated in the pre questionnaire were 'jittery, nervous, and distressed' which were all reduced – however – distressed still factored as the highest indicated affect. This will be followed up with rigorous t-test by August 2018.
Conclusion: Introducing preventative measures to reduce levels of burnout during postgraduate training is very important. In a wellness course, it is important to include essential techniques for maintaining wellness whilst promoting this as a positive culture to more junior doctors.

5Q5 (1951)

Predictors of Burnout and Career Regret among US Residents

Authors
Liselotte Dyrbye, Mayo Clinic, Rochester, MN, USA
Rachel Hardeman, University of Minnesota, Minneapolis, MN USA
Mark Yeazel, University of Minnesota, Minneapolis, MN USA
Sean Phelan, Mayo Clinic, Rochester, MN, USA
Tat Shanafelt, Stanford School of Medicine, Stanford, CA, USA
Michelle van Ryn, Oregon Health Science University School of Nursing, Portland, OR, USA

Presenter: Liselotte Dyrbye, Mayo Clinic, Rochester, USA

Background: To explore predictors of and relationship between specialty and burnout with career and specialty choice regret in a sample of U.S. residents followed longitudinally.
Method: In 2016, the authors completed a national survey of residents participating in the Cognitive Habits and Growth Evaluation (CHANGES) study since their first year of medical school. Participants had also previously completed surveys during the first (MS1) and last (MS4) year of medical school. Standard survey questions were used to measure demographic characteristics, educational debt, household income, and USMLE Step 1 score in addition to the Maslach Burnout Inventory, PROMIS anxiety, Medical Outcomes Study Social Support Measure, and Jefferson Scale of Physician Empathy. Multivariate modeling evaluated the relationship between burnout or career regret with educational debt, USLME Step 1 score, specialty, income and anxiety, empathy, and social support scores measured at MS1 or MS4 time-point. The study was IRB approved.
Results: Of 4732 eligible residents, 3588 (75.8%) responded. Overall, 45.2% had burnout, 14.1% had career choice regret, and 7.1% had specialty choice regret with differences observed by specialty. On multivariate analysis, residents in urology, neurology, emergency medicine, general surgery, and orthopedic surgery had higher odds for burnout (OR 1.54-2.5) in comparison to internal medicine residents. Female residents had higher risk for burnout than male residents (OR 1.39, 95% CI 1.18-1.62). Medical school reported levels of anxiety, empathy, and social support predicted burnout in the second year of residency. Burnout and specialty were independently associated with resident career choice regret.
Conclusion: Burnout among residents is prevalent, varies by specialty, and increases odds of career choice regret. Anxiety, empathy, and social support measured during medical school predict burnout during residency. Additional research is needed to identify interventions that promote the well-being of residents.
Take-home messages: Burnout among US residents varies by specialty, similar to physicians in-practice, as well as demographic characteristics. Individual factors (anxiety, social support, empathy), measured during medical school, predict development of burnout during residency, and burnout is an independent predictor of career and specialty choice regret among residents.

5Q6 NOT PRESENTED

5R: Round Table: Professionalism

Location: Hong Kong, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

5R1 (1963)
Qualitative outcome validation of a teaching intervention and assessment of medical professionalism in undergraduate medical education

Authors
Thomas Shiozawa, Institute of Clinical Anatomy and Cell Analysis, Tuebingen, Germany
Jan Griewatz, Competence Center for University Teaching in Medicine, Tuebingen, Germany
Bernhard Hirt, Institute of Clinical Anatomy and Cell Analysis, Tuebingen, Germany
Stephan Zipfel, Department of Internal Medicine VI - Psychosomatic Medicine and Psychotherapy, Tuebingen, Germany
Maria Lammerding-Koeppel, Competence Center for University Teaching in Medicine, Tuebingen, Germany
Anne Herrmann-Werner, Department of Internal Medicine VI - Psychosomatic Medicine and Psychotherapy, Tuebingen, Germany

Presenter: Thomas Shiozawa, Institute of Clinical Anatomy and Cell Analysis, Eberhard Karls University Tuebingen, Germany

Background: Medical professionalism is a rising issue in medical education. The dissection course is often the first place to address medical professionalism in a traditional medical curriculum. To foster reflection and explicitly teach professional behavior, Tuebingen University introduced a learning portfolio. Also, a seminar on medical professionalism led by student tutors was implemented. Aim of this research project is to assess what students actually learn about medical professionalism during dissection, and what a written reflection in a portfolio can document of that.
Method: Four seminar audio recordings and 100 portfolio reflections could be included in the study. Audio recordings were transcribed and categorized (deductive categorization). Written reflections of the portfolio were qualitatively analyzed as well. The derived categories were compared among the two formats, and correlated to established conceptual frameworks of professionalism. In the seminars, students reflect on many topics relevant for professional development, e.g. impact and handling of the situation with a dead body, difficulties at the beginning of the course, and the implications for the medical profession. They discuss behavior in the dissection room, how to suppress emotions, and their empathic ability. In the learning portfolio the students write on habituation, what alleviates the situation, the influence of their teachers and prior experience in health care. All students express their respect to the body donor and his/her decision.
Results: In terms of medical professionalism, the dissection course presents a dramatic experience for students. Qualities of medical professionalism like respect,

appraisal, compassion and communication can be documented. These are attributes also found in common definitions of professionalism (e.g. ACGME, ABIM, AAMC & NBME). Seminar discussions yield more depth than written essays. Students who participate in the seminar write more, and more elaborate in their written reflection. Interactive exchange with peers in a seminar and the individual creative process of documentation in a portfolio complement each other in competency development.
Conclusion: The dissection course can convey competencies of professionalism. A learning portfolio is suitable to document the development of these competencies. An accompanying seminar increases the depths of reflection in the portfolio.

5R2 (2330)
What Medical Students Learn About Professionalism from Early Involvement in Clinical Practice of South China

Authors
Shaoting Feng
Ming Kuang
Suqing Yang
Jingsong Wang
Haipeng Xiao
Tinghuai Wang

Presenter: Shaoting Feng, The First Affiliated Hospital of Sun Yat-sen University, Guangzhou, People's Republic of China

Background: To develop a method for shaping professionalism by getting students involved in clinical practice early in the first 2 years of medical education in South China. There has been an increasing awareness of professionalism in medical education globally. Variant teaching methods have been developed for the medical professionalism education.
Method: The project consisted of pre-clinical medical students taking the program of "early involvement in clinical practice" in the First Affiliated Hospital of Sun Yat-sen University, who were from Grade 1 or Grade 2 of medical college. In 2014, 130 students participated in this program, were arranged to observe the ordinary clinical work in their elective departments of our hospital during their winter or summer vacations. 122 narratives based on their observations were collected and each student offered his or her reflections on their own narrative. The content of the narratives and reflections were analyzed.
Results: It's shown that the majority of pre-clinical students were deeply impressed and stratified with the early involvement in clinical practice during their first two years of study. These pre-clinical observations not only illustrated students the daily work of doctors, but also exert an imperceptible influence on their mind of essential principles of medical professionalism, such as humanism, responsibility, altruism and excellence. Reinforcement on medical professionalism were shown in students' narratives and reflections.
Conclusion: Early involvement in clinical practice for pre-clinical students is a significant method for shaping professionalism in the first two years of medical education in south China. It can improve students' communication

skills, as well as better understandings for the doctor-patient relationships. Narratives and reflections written by students could deepen their understandings of the values and principles of professionalism early in their pre-clinical study.

5R3 (1003)
Raising Concerns - the potential impact on medical student professionalism

Authors
Erica Sullivan
Simon Gay
Harsh Thampy

Presenter: Erica Sullivan, University of Manchester, UK

Background: This work is representation of a Masters dissertation research project on medical students perception and experience of raising concerns and the potential impact this may have on professionalism.
This single site exploratory study consisted of face to face, semi structured interviews with 10 undergraduate medical students of years 3,4 and 5. The author wished to gain information on students' experiences, both real and perceived, of their understanding of professionalism and raising concerns and whether they actually do raise concerns. Interviews were digitally recorded and transcribed verbatim.
Method: Thematic, comparative analysis was conducted and data was sense checked by co-authors in line with the interpretevist paradigm.
Results: Data was themed and 5 broad themes emerged as follows:

- Students have a sense of professionalism both good and bad.
- Students are vulnerable in clinical environments and this is compounded by their personality traits often creating internal conflict.
- Students identify the concerns process to have positives and negatives
- Hidden curriculum is a powerful driver , namely role models and hierarchy.

A relatively unexplored finding relates to students to student concern. Students are a tight knit group who rarely raise concerns about other students even when they have significant concerns about that students future as a fit to practice doctor.
Medical students are exposed to a variety of educational and clinical settings and therefore are ideally placed to identify practice both positive and negative. There are many factors that determine whether they raise concerns or not. They also have unique insight into their close knit student community which they often do not share when concerned.
Medical educators must ensure that students understand how and when to raise concern or at the very least support students to discuss concerns with a 'go to' person
Conclusion: Professionalism is an essential concept to ensure public trust in the doctor as a professional. There needs to be more exploration of student to student concerns as students have insider knowledge of poor

professional behaviour which they often do not report about their peers.

5R4 (2467)
Does empathy lead to burnout or is it protective of doctors in training as they progress?

Authors
Katrina Anderson, Australian National University Medical School, Canberra, Australia

Presenter: Katrina Anderson, Australian National University Medical School, Canberra, Australia

Background: The development of empathy as a core attribute has been part of medical education for many years as it is clear that this is what patients want from their doctor. The "hidden curriculum" and the stressful demands of medical training often undermine the altruism and compassion that students naturally bring to patient care as they progress through their training. It has been well documented that communication skills and empathy seem to decrease during medical training as students' progress into postgraduate training and there are many factors proposed as to why this might be. However rarely does the literature consider whether it may be a protective factor and natural phenomena as a response to the stress and helplessness junior doctors can feel in the face of suffering. So the question to consider is: Can one have too much empathy as a doctor in training?

5S: Workshop: Leveraging Technology to Optimize CME, Clinical Care & Patient Engagement (1074)

Location: Wettstein, 2nd Floor, Swissotel
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters
Lisa Sullivan
Sherlyn Celone-Arnold
Alvaro Margolis
Dale Kummerle

Background: A learning and performance ecosystem enhances individual and organizational effectiveness by connecting people and supporting them with a broad range of content, processes, and technologies to drive performance.
In this workshop, the faculty will explore a model that develops a strategic approach to developing innovative CME/CPD through an eLearning and Performance Ecosystem within the workplace. Starting from an organisational performance focus, this session pulls together the problems seen and responds to the underlying causes. Throughout the session the faculty and learners will proceed through the strategic components, indicating principles, tools, examples and trade-off of this model. This will provide a systematic way of viewing the goals of elearning, which can guide in developing strategies that make sense of and integrate tactics (like asynchronous and synchronous courses, web 2.0, mobile, simulations, portals and more) into an integrated, coherent and comprehensive whole.
Who should attend: All participants already involved in or considering involvement in the planning and execution of CME/CPD/CE in the digital age.
Structure of workshop: Following brief presentations from each of the faculty the audience will be given active learning tasks which relate to how best to build an ecosystem for CPD within the workplace. Presentations will be no more than 50 minutes with 35 minutes of work shop activities with the audience.
Intended outcomes: Build and deploy rapid needs assessments to determine clinical and professional competency gaps to help align CME/CPD/CE programming; Design and manage blended learning activities that incorporate a mix of live and eLearning activities to optimize learner engagement for providers, staff and patients; Develop effective outcomes plans to measure change in knowledge, skills, competence, confidence and performance; Understand how Facebook and other social network concepts and approaches can be used to promote social learning in health care teams both for online and blended learning programmes; Recognise how increasing the use of digital technologies can enhance the level of engagement of physicians thus changing behaviours to help improve patient care?

5T: Workshop: Professionalism in Practice: The Resident Supervisor's Role in Training, Feedback, and Assessment (194)

Location: Helvetia 3, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters
Nadia Bajwa, Geneva University Hospitals, University of Geneva Faculty of Medicine, Geneva, Switzerland
Naïke Bochatay, University of Geneva Faculty of Medicine, Geneva, Switzerland
Noëlle Junod-Perron, Geneva University Hospitals, University of Geneva Faculty of Medicine, Geneva, Switzerland
Marie-Claude Audétat, University of Geneva Faculty of Medicine, Geneva, Switzerland
Anne Baroffio-Barbier, University of Geneva Faculty of Medicine, Geneva, Switzerland
Mathieu Nendaz, University of Geneva Faculty of Medicine, Geneva, Switzerland

Background: Resident physicians are often expected to already be competent in professionalism before starting their clinical training. However, the stress and pressure of training creates an environment that is prone to unprofessional behavior and conflict. This workshop explores the role of the resident supervisor in detecting, addressing, and remediating unprofessional behavior in the clinical environment. Dealing with unprofessional behaviors is a challenge for all supervisors and barriers and facilitators to this process will be identified.
Who Should Attend: This session should appeal to clinical supervisors from all levels of experience who find that addressing unprofessional behavior is a challenge and who are motivated to explore how we can foster the learning of professional behavior in the clinical environment.
Structure of Workshop: Highly interactive case-based workshop. In a large group discussion, we will identify barriers and facilitators to addressing unprofessional behavior. A brief didactic session will review available assessment methods and tools. This will be followed by small group practice using a combination of author- and audience-generated case-based scenarios. A final large group discussion will share approaches to the scenarios and consolidate a management approach.
Intended Outcomes: By the end of this workshop, participants will be able to: (1) Articulate barriers and facilitators to addressing unprofessional behaviors (2) Identify existing assessment methods and tools to detect and remediate unprofessional behavior (3) Develop an action plan for assessing and remediating unprofessional behavior (4) Apply the lessons learned to create a psychologically safe clinical environment for all trainees.
Level: All

5U: Workshop: Politeness + Hedging = errors in performance calibration: A workshop to promote clarity in performance assessment and feedback language for Health Professions Educators (4)

Location: Helvetia 4, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters

Subha Ramani, Internal Medicine Residency Program, Brigham and Women's Hospital; Harvard Macy Institute; Harvard Medical School, USA
Karen D Könings, Department of Educational Development and Research, Faculty of Health, Medicine and Life Sciences, Maastricht University, Netherlands
Shiphra Ginsburg, Department of Medicine (Respirology); Wilson Centre for Research in Education, University of Toronto, Canada

Background: Narrative comments on evaluations inform learners about their strengths and weaknesses, and facilitate performance improvement. They provide information to training directors for summative assessment, decisions about promotion and remediation. Research has shown that narrative evaluations often feature vague and non-specific language. When teachers provide feedback to learners, they also use non-specific and non-actionable language. 'Decoding' the language of assessment and feedback can lead to inaccuracies in performance calibration. Possible reasons for use of vague language include: lack of accurate knowledge about learner performance, infrequent direct observation, fear of hurting feelings or damaging learner self-esteem, and deficient assessment and feedback skills.

Structure of the workshop: In this interactive staff development workshop, we will use brief presentations, brainstorming, videos and small group exercises, to allow participants to reflect on the impact of narratives and language on interpretation of learners' performance; observe learner performance; practice writing narratives about performance and critique peer narratives for specificity and clarity. Finally, participants will practice giving specific and actionable feedback to each other, while feedback recipients critique the language used and assess its effect on motivating behaviour change. This theme emphasizes the narrative aspects of learner performance assessment and feedback conversations, which may not always be consistent with numerical ratings on assessment. These inconsistencies can lead to learners inaccurately calibrating their performance and formulating action plans. Tenets of Politeness Theory which emphasizes desire to maintain self-esteem and autonomy will be applied to the discussions.
Educators with different levels of experience will participate in the workshop, thus peer learning will serve as a key educational strategy in this interactive workshop.

Intended outcomes: As a result of this workshop, participants will:

1. Reflect on the adverse impact of vague and non-specific language use in learner assessment and feedback
2. Discuss the importance of addressing self-esteem and autonomy when providing feedback to learners
3. Improve their skills in writing specific narrative comments to assess learner performance observed in video clips
4. Enhance their skills in providing feedback to learners using specific, behaviour based and actionable language
5. Critique and provide feedback to their other workshop participant on the specificity and clarity of their written comments and feedback language

5V: Workshop: Young medical educators' workshop: Habits of Highly Successful Academicians (3526)

Location: Helvetia 5, 1st Floor, Swissotel
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters

William B. Cutrer, Vanderbilt University School of Medicine, Nashville, USA
Sören Huwendiek, University of Bern, Switzerland
Stewart Mennin, Human Systems Dynamics Institute, Minneapolis, USA
Charlotte Ringsted, University of Aarhus, Denmark
J.M.Monica van de Ridder, Michigan State University, Grand Rapids, USA

Background: Effective career development in academic medicine is vital to sustaining institutional mission and effectiveness. Even though many faculty development programs exist, focusing on career development for junior faculty requires strategies beyond the immediate skills necessary to fulfill institutional missions. Cutrer et al (2014)* have elaborated the high cost of faculty turnover, the lack of faculty career development, and sense of community as dissatisfiers among faculty. Effective strategies to promote greater networking and mentorship among colleagues could better align faculty career goals with institutional mission and effectiveness. This workshop will focus on practical habits and skills for Young Medical Educators, including the development of an "Elevator Speech" they can use to briefly summarize their academic activities to others.
*) Cutrer W, Brown R, Fleming G, et al. Junior faculty development program using facilitated peer mentoring. MedEdPORTAL Publications. 2014;10:9905.
Who should attend?
Young Medical Educators interested in developing the skills and habits to be successful in their home institutions and in their networking efforts.
Structure of the workshop: Using a combination of didactic, case-based, and small-group learning techniques, important concepts of professionalism and communication will be addressed. After an introduction in

which the session goals and learning objectives are presented (10 min), the workshop will be broken into two sections. First, we will address (10') and discuss in small and large groups (15') common practices of effective academic physician self-management as a key to success using the acronym CREDO: Communicator, Reliable, Enthusiastic, Doer, Organized as a tool for practice. The second focus of the workshop will be networking skills including an "elevator speech". This will include a demonstration of a focused overview of current activities (10'). Participants will divide into dyads to practice developing and delivering their "Elevator Speech" to each other (30'). The workshop will conclude with "take home points" and a brief question/answer period (15').

Intended outcomes:
1. Outline the attributes and habits of academic medical educators that can affect how they are perceived by their peers;
2. Review successful and unsuccessful behaviors of professional networking;
3. Practice the delivery of a successful "Elevator Speech".

Level: Beginner

5W: Workshop: Making student engagement more meaningful (2020)

Location: Helvetia 7, 1st Floor Swissotel
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters
Lara Teheux, Radboud University Medical Center, Nijmegen, Netherlands
Katerina Dima, Aristotle University of Thessaloniki, Greece
Evangelos Papageorgiou, University of Patras, Greece
Evita Peiou, National and Kapodistrian University of Athens, Greece
Marian Sedlak, Pavol Jozef Šafárik University, Košice, Slovakia

Background: In the past years there has been a growing interest in student engagement, both from the students' and the faculty members' side. It is used as an indicator for excellence in universities (ASPIRE) and is universally believed to be a fundamental aspect of the students' educational experience with growing evidence to support this claim. Although student engagement is widely supported, in reality there are many obstacles preventing meaningful student engagement.
Who should attend: Faculty members, curriculum developers, students and all others aiming to make student engagement in their schools more meaningful.
Structure of workshop: The aim of this workshop is to give participants skills and knowledge to boost student engagement in their faculty. After a brief theoretical introduction to the topic, we will establish the benefits of student engagement for the schools as well as the different existing levels of engagement. During the second section we will work in an open space format to discuss

various challenges (e.g. tokenism, hierarchy, skills gap) and to formulate possible solutions. We will conclude with a summary of various ways on how student engagement could be enhanced and inspire participants with a list of concrete actions they can take during the conference and back home.
Intended outcomes: During this workshop participants will gain competences for diagnosing the barriers and facilitator factors for student engagement in their schools and have the opportunity to exchange and learn from various experiences. At the end of this workshop, participants should expect to have a clearer idea of concrete actions they can take towards achieving meaningful student engagement in their school.
Level: Introductory

5X: Workshop: Show Us How: Assessment for Learning in Interprofessional Education and Collaboration (2109)

Location: Osaka, 3rd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters
Susan J. Wagner, Department of Speech-Language Pathology, Faculty of Medicine, University of Toronto, Canada
Brian S. Simmons, Division of Newborn and Developmental Pediatrics, Department of Pediatrics, Sunnybrook Health Sciences Centre and Department of Pediatrics, Faculty of Medicine, University of Toronto, Canada

Background: The interprofessional education (IPE) literature has expanded significantly in the past few years to provide a rich variety of evaluation studies of different IPE activities, however, efforts to produce rigorous assessment of IPE learning continue to be a challenge. At present, most IPE learning is focused on self-assessment that only provides a perception of what the learner thinks s/he may have learned. This reliance on weak forms of assessment data continue to undermine the quality of IPE assessment and fail to engage with key principles of assessment that should be adhered to in any IPE learning activity.
This workshop is intended to introduce participants to a new competency-based assessment model that addresses many of the challenges inherent in assessing IPE.
Who should attend: Health profession educators interested in assessment, evaluation, competencies and interprofessional education.
Structure of workshop: This workshop provides an exploration of key issues or challenges related to the assessment of IPE. It considers the processes of designing and implementing an IPE assessment focusing on the structure (individual), function (team) and outcome (task). This new three-pronged clinical competency continuum model is illustrated employing the concepts of milestones and entrusted professional activities (EPAs) in a performance framework.

Use of brief didactic presentations will help maximize interactive discussion and reflection, which will make up the majority of the session. Participants will also watch (DVD), a simulated IPE learning activity and consider how it could be assessed using the new assessment model. Specifically, this workshop will introduce participants to a range of key assessment concepts and ideas for consideration and implementation. This will enable them to apply strategies for application in their own contexts. As a result, the workshop will help to develop an understanding of the process of assessment and how to reconceptualize and develop assessment relevant to IPE.
Intended outcomes:
• Identify key issues related to assessing performance in IPE
• Describe a new Structure-Function-Outcome Model of IPE assessment
• Reflect on the application of milestones and entrustable professional activities (EPAs) to this model
Level: Intermediate, for those with a background in IPE

5Y: Workshop: Virtual Reality and Augmented Reality in Simulation-Based Medical Education (2563)

Location: Samarkand, 3rd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters
Jack Pottle, Oxford Medical Simulation, London, UK
Jenny Zhou, University College London Knowledge Lab, London, UK
Rebecca Robertson, Leeds University Medical School, Leeds, UK

Background: As simulation has gained widespread acceptance as a learning methodology and teaching technique, the challenge has shifted towards increasing access and improving quality to impact performance. As this shift has occurred, the increasing commercial availability of Virtual Reality (VR) and Augmented Reality (AR) provides the opportunity to deliver immersive, interactive, medical simulation scenarios in a scalable fashion.
However, questions remain about which technologies are most appropriate to deliver simulation-based education (SBE). How can VR and AR increase learner throughput, how accessible is it, and does it improve performance? This workshop aims to explore the differences between VR and AR, what they can offer, the evidence behind them, and translate this research into practical considerations for learners and instructors.
Who should attend: Educationalists, faculty and students interested in new learning methodologies, VR and AR, or evidence-based simulation both at undergraduate or postgraduate level. This workshop will provide an opportunity to try medical VR simulation and is appropriate for all levels of experience.
Structure of workshop: Introduction
- Introduction, background and aims

- Small group exercise identifying challenges in simulation
Why VR/AR?
- What are VR and AR?
- Immersion, fidelity and presence in VR
How can VR or AR be used in simulation?
- Examples and interactive VR simulation demos
- Small group exercise: VR/AR simulation design to address specific learning objectives
- Challenges and limitations of VR
What's the evidence?
- Discussion of the state of VR/AR simulation research
- Micro debate: Should simulation be gamified?
Summary
Intended Outcomes: Increased awareness of innovative learning methods and appropriateness of VR/AR for learning objectives.
Opportunities to experience VR/AR demos and brainstorm ways VR/AR may be relevant to learning and teaching.
Forum to discuss and appraise evidence around VR/AR for learning.
Increased ability to evaluate technologies in order to inform research, design, and purchasing decisions.
Level: Introductory/Intermediate (no previous experience needed)

5Z: Workshop: How faculty developers can create a path to education scholarship (2527)

Location: Guangzhou, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters
Patricia O'Sullivan, University California San Francisco, USA

Richard Hays, University of Tasmania, Australia, Hobart, Australia
Wendy Hu, Western Sydney University, Sydney, Australia

Background: Generation of educational scholarship is a hallmark of excellence in the development of faculty in health professions institutions whose careers focus on education. However, educators are often so overwhelmed with the demands of teaching and administration that they cannot muster either the time or resources to engage in educational scholarship. Other individuals face institutions disinterested in educational scholarship. Many institutions lack resources that constrain education scholarship. Those of us in faculty development propose to share with other faculty developers how we addressed these barriers and to facilitate participants building their own strategies to enable their faculty to engage in educational scholarship.
Who should attend: Faculty developers, educational leaders interested in supporting development and acceptance of innovative views of scholarship and those considering strategies to enhance their own scholarship.
Structure of Workshop: The objectives of the workshop are to 1. Advocate for the legitimacy of educational

scholarship by clarifying the definition and metrics for educational scholarship; 2. Identify and commit to local strategies to address barriers and enable scholarship; and 3. Compare approaches generated in this workshop with what is traditionally offered in faculty development. The workshop will start with an overview of how we present educational scholarship in our local institutions as a legitimate field for research activity. Participants will engage in small group work to identify alternative metrics to grants and publications which faculty developers worldwide can use when promoting educational scholarship. Following this, participants will review a list of strategies to achieve success in engaging in education scholarship. These include aligning with quality improvement initiatives, collaborations with either local or other partners, cultivating supportive leadership. Working from this list, participants will draft an action plan to identify tactics to implement one strategy pertinent to their institution. Input from other small group participants will help to refine plans. To solidify the next steps that participants will take we will discuss how these steps differ from or align with their current approaches.

Intended Outcomes: Participants will return to their institutions with approaches that they can use to advance educational scholarship within their faculty development programs.

Level: Intermediate

5AA: Workshop: How to create a competence-based medical education (CBME) event to foster active learning in continuous medical education (CME) (1173)

Location: Nairobi, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters:

Kristiina Patja, Pro Medico, Association for CPD in Finland, Helsinki Finland
Leila Niemi-Murola, Department of Anaesthesiology and Intensive Care Medicine, University of Helsinki, Helsinki Finland
Juha Pekka Turunen, Finnish Medical Society Duodecim, Helsinki Finland
Lena Sjöberg, University of Helsinki, Department of General Practice and Primary Health Care, Helsinki Finland
Anna-Kaija, Kirkkonummi Healthcenter, Kirkkonummi Finland
Eeva Pyörälä, University of Helsinki, Helsinki Finland

Background: Designing educational events starts by defining the expected outcomes as improvement of knowledge and skills desired to be achieved. Competence-based medical education has created new requirements for teaching and learning in events: learning aims by competencies. The competences embrace all aspects of working in health care, not only medical expertise but also communication, collaboration, professionalism, health

advocacy and scholarly practice. This conception of competences required from healthcare professionals is dynamic and developing over time. Designing educational events starts by defining the expected learning outcomes as improvement of competencies desired to be achieved. Incorporating non-medical competencies to learning tasks requires aligning active learning methods and assessment tools to stimulate competency-based learning.

Who should attend: This workshop is targeted to all healthcare professionals and educators, who want to create attractive and effective CME events. You may work in any field of healthcare, involved in planning, constructing and organising CME learning events. Trainees interested in CME in practice are also welcome in the workshop.

Structure of workshop: This workshop is based on real-world materials and examples of healthcare working life. Active learning methods include small group working and online tools. We briefly introduce (1) the concepts of competence in medical education, and (2) constructive alignment of learning outcomes, active learning methods and (3) assessment for learning. At the workshop, participants work in small groups re-designing an active learning event with competencies. This emphasizes the way in which education planning operationalizes the competencies into specific learning outcomes, learning activities and applied methods and tools. We will discuss the challenges and opportunities that organisers face when organising events, e.g. venues, digital learning resources and learning environments. A new tool for feedback is introduced.

Intended outcomes: After attending this workshop, the participants will be able to 1) plan and implement active continuous medical education learning events that support learners 2) use a competence-based medical education assessment form for continuous medical education events. A toolbox and a handout are provided.

Level: Introductory

5BB: Workshop: International perspectives on incorporating concepts of social determinants of health into core curricula: challenges and opportunities (1322)

Location: Mexico, 2nd Floor, CCB
Date: Monday 27th August
Time: 1600-1730 hrs

Presenters

Yuko Takeda, Juntendo University, Tokyo, Japan
Ann Wylie, King's College London, London, UK
Hossam Hamdy, Gulf Medical University, Ajman, UAE
Linda Snell, McGill University, Montreal, UK

Abstract Text: Social determinants of health (SDH) are important factors for all societies, yet translating these concepts into learning outcomes for medical curricula is a challenge. Increasing health inequalities and cultural variables impact on health, health care, health care systems and policies, migration, morbidity and mortality. Future doctors will encounter patients whose social determinants are significant influences on diagnosis and management. These doctors must be aware of the relevant SDH and utilize leadership skills in navigating pathways and advocating for patients and communities. However there is limited consensus on the role of doctors and clinical teachers in developing and teaching about SDH within core curricula for medical students and junior doctors. The sustainable development goals (SDGs) may be a useful guide to increase awareness of the importance of SDH and to provide an international perspective. Additionally, there are current examples of core curricula that effectively integrate SDH, which potentially could be adapted by other institutions and programs.

Who should attend? Curriculum leads; curriculum developers; those leading on teaching social determinants of health; interested clinical teachers

Structure: Following a general introduction and definition of terms to serve as a baseline, there will be a small group exercise to elicit how participants currently teach and assess social determinants of health (SDH) and their challenges and barriers. This will be followed by short presentations from 3 medical schools (Japan, UK, Canada) showing examples of incorporating SDH into core curricula, and introducing the sustainable development goals (SDGs). A second exercise will involve using the SDG framework to develop or enhance participants' own SDH curricula. The conclusion will elicit lessons learned and future directions.

Intended Outcomes: By the end of the workshop participants will have:

• a clear operational description of SDH and its variability in relation to different contexts and cultures;

• shared experiences and challenges around teaching SDH;

• explored options for developing and assessing SDH learning outcomes in their local context ;

• described barriers and opportunities, potential resistance and possible responses in incorporating teaching around SDH;

• describe a framework to support SDH integration and consider if it can be applied in the participants' context.

Validity and psychometric properties of a novel competence-based assessment tool for 1rst and 2nd year medical students

Authors
Ana Mafalda Fonseca, Covilhã, Portugal
Ana Isabel Gouveia, Covilhã, Portugal
Patrícia Barata, Covilhã, Portugal
Isabel Neto, Covilhã, Portugal

Presenter: Isabel Neto, Faculty of Health Sciences, University of Beira Interior (FCS-UBI), Covilhã, Portugal

Background: Medical students must acquire and master knowledge, skills, attitudes and professional behaviors to be competent professionals in the future. We found that was important to develop an instrument to assess different domains of competence in an integrated manner based in real world situations for 1rst and 2nd year medical students.
In the first two years of the medical curriculum students learn disciplines included in the domains of Biological, Humanistic and Community Health Sciences. To assess students' ability to integrate those different domains of knowledge we implemented in 2014 an OSCE-based examination. Our objective was to evaluate this novel assessment tool in terms of content validity related to the learning objectives and internal structure (item difficulty/discrimination and reliability).
We analyzed the tool for 3 consecutive academic years. Three different persons analyzed content validity of the stations (N=16-21). Knowledge domain was assessed differently in the 3 main cognitive levels: up to 13% of the stations evaluated memorization, 85% application and 17% resolution. Also, up to 20% assessed practical skills, 25% communication and 25% professional attitudes. Stations reliability (Cronbach's alpha) ranged 0.64-0.80, difficulty 0.17-0.9 and discrimination achieved a maximum of 0.26. The psychometric analysis of our competence-based as¬sessment tool demonstrated moderate item difficulty (mean=0,64), low discrimination power, and satisfactory reliability. These acceptable psychometric parameters indicate that this tool is sufficiently valid and reliable for the purposes that were planned. Also, it captured students´ attention for the importance of an integrated learning during the first 2 years of studies and strengthened the links between theoretical concepts and future application. This analysis has allowed us to see the strengths and weaknesses of the instrument in order to make improvements.
Although it is a laborious and time consuming task to implement this kind of competence-based assessment it

seems that it fulfills the goal of assessing skills not included in other tools used along the learning process.

Validity evidence for programmatic assessment in competency-based education

Authors
Harold Bok, Centre for Quality Improvement in Veterinary Education, Faculty of Veterinary Medicine, Utrecht University, Netherlands
Lubberta de Jong, Centre for Quality Improvement in Veterinary Education, Faculty of Veterinary Medicine, Utrecht University, Netherlands
Thomas O'Neill, Department of Psychology, University of Calgary, Canada
Connor Maxey, Veterinary Clinical and Diagnostic Sciences, Faculty of Veterinary Medicine, University of Calgary, Canada
Kent Hecker, Veterinary Clinical and Diagnostic Sciences, Faculty of Veterinary Medicine, University of Calgary, Canada

Presenter: Harold Bok, Faculty of Veterinary Medicine, Utrecht University, Utrecht, Netherlands

Background: Competency based education (CBE) is now pervasive in Health Professions Education. A core purpose of CBE is to assess and identify the progression of competency development. Together with emphasis on sustained evidence of professional competence this calls for new methods of teaching and assessment. A model for programmatic assessment has been proposed that simultaneously optimizes assessment for learning and high-stakes decision making.
Scores from three assessment methods were combined to assess the same and different competencies to provide a holistic overview for both formative and summative purposes. We performed a retrospective quantitative analysis using hierarchical linear modeling of individual assessment data points collected by 962 learners to assess variation in scores due to repeated measures, competency, assessment method and student.
The results showed a sigmoidal learning curve when mean scores over time were collapsed for learner, method and competency domain. Random coefficient modelling indicated that variance due to inter-student performance differences was highest (40%). The reliability coefficients of scores from assessment methods ranged from .86 to .90. Method and competency variance components were in the small-to-moderate range.
The results indicate that students start at different competency levels (scores) and scores increase over time as students advance through their clinical rotations. This finding provides supporting evidence for the program of assessment working effectively as it is designed. The current validation evidence provides cause for optimism regarding the explicit development and implementation of a program of assessment within CBE. The majority of the variance in scores appears to be student-related and reliable, supporting the psychometric properties as well as both formative and summative score applications.
We provide preliminary validation evidence from both descriptive and modeling analyses to support the explicit development and implementation of a program of

assessment meant for both student learning and summative decision purposes.

Faculty Perceptions of Grading Practices and Innovations in Medical Education

Authors
Scott W. Snyder
Anne Zinski

Presenter: Scott Snyder, University of Alabama at Birmingham, AL, USA

Background: While standardized exams remain crucial, the grades that students earn during preclinical and clinical training are essential components of evaluating medical students. Hanson et al (2013) posited, "medical education… depends more upon grading schemas than on actual assessment [of competencies] that define a competent physician." Innovations in grading practice have emerged during the past ten years, yet few studies investigate the attitudes of medical school course directors about grading or innovative grading practices. We disseminated a 50-item survey of grading practices to medical education faculty at a comprehensive medical college in the southeastern US. We received responses from 42 pre-clinical, clerkship, or co-enrolled elective course directors within the institution.
Key findings include-
• 100% agreed that grades should reflect the degree to which students mastered course objectives, and nearly half agreed that effort should also contribute
• 74% agreed that grades should be predictive of content application in "the real world"
• 79% agreed that grades mean different things depending on instructor, but 74% indicated that grades should mean the same thing across courses and instructors
• 64% agreed that improving clarity of grades' meaning would influence their decision to adopt a new grading approach
• Of respondents interested in grading innovation, the majority (%) wanted to learn more about specifications grading and standard-setting procedures to determining grade cut scores on assessments.
Results revealed challenges to achieving consensus about the meaning of grades, promoting the predictive validity of grades, and understanding attitudes toward innovation and grading. Specifications grading and Angoff-based standard setting methods were the most interesting innovations.
Expanded efforts related to developing consensus on the meaning of grades are necessary. Further investigation using a survey of this type should be implemented at this and other schools of medicine. Research and training regarding specifications- and Angoff cut-score methods warrant consideration.

A Lesson Learn from Formative Assessments

Authors
Benjamas Wongsatayanon

Presenter: Benjamas Wongsatayanon, Department of Microbiology, Srinakharinwirot university, Bangkok, Thailand

Background: In the course 'infection' of preclinical medical students, we had 2 summative assessments (S1&S2) to evaluate the student's knowledge of 2 content units. Prior to S, we gave 2 formative assessment (F1&F2) to monitor student learning. The F questions covered all the content as S's. The F scores were announced on the same day after the exams. The students gave feedback and some were interviewed after the course.
The difference between the first and second formative exams were the content, time interval on F to S exam and the explanation the answers after F1 exam but not in F2. The purpose of unexplain the answer in F2 was to stimulate the self attempt in seeking the answer. The students' score, feedback and interview were evaluated. The students (83%) liked the formative exam (83.2%) and prepared themselves before F (68.9%). They thought F helped to understand the course content (78.2%) and improved their summative scores (69.8%). The diffrerence between each F and S scores were classified as worse, same level and better. Surprisingly, we found that most of the students (69.94%) got same level of F1-S1 and same level of F2-S2; F1-S1 worse than F2-S2 scores (16.67%). These results implied non significant effect of explanation of the F answer. The students' feedback suggested that the effectiveness of F were the time inverval between the last lecture, F and S exams. In addition, the explanation of the test was good but its effect on the summative scores and improvements of learning acquisition were depended on each individual students' attitude and behavior.
Utilization the formative exam to improve the student knowledge outcome is influenced by many factors such as timing, types of exam and student attention. Students who got good grade mostly pay attention on formative exam and gain the benefits of this activity which contrast to the lower grade group.
Formative exam is a good way to improve the students' knowledge but the process is important for its benefit.

Po-Hua Su, Mackay Memorial Hospital, Taipei, Taiwan

Presenter: Chih-Chun Huang, Mackay Memorial Hospital, Taipei, Taiwan

Background: Simulation-based training is a new teaching tool for improving the performance of medical students and residents. A modified Oxford Non-Technical Skills (NOTECHS) scale (score range, 1-4) is used to evaluate resident ability of communication, leadership, teamwork, decision making, problem solving, and situational awareness. We used NOTECHS scale to assess resident performance in simulation and clinical presentation.
This study was a prospective study during October to December 2017. Simulations were conducted in a medical center-based simulation center in Taiwan. A total of 16 emergency residents (resident year 1, 2, 3 and 4) participated in 3 clinical scenarios (short of breath, altered mental status and shock). A simulation scenario was conducted in 15-20 minutes and followed by 10 minutes debriefings. NOTECHS scale (score range, 1-4) was used to assess emergency resident performance in simulation. In emergency room, we asked 6 senior attending emergency physicians to evaluate clinical performance of residents with the scale.
The clinical performances of senior residents were significantly better in communication, leadership, teamwork, decision making, problem solving, situational awareness and cumulative score. Senior residents also had higher score of teamwork, problem solving and cumulative score in simulation.
Simulation sessions may be used to evaluate the level of each individual residents in communication, leadership, teamwork, decision making, problem solving, and situational awareness.
NOTECHS score was a good tool for evaluating simulation and clinical performance of the residents. The simulation performance can reflect clinical performance of the residents.

Table 1. Emergency Resident Performance in Simulation

	R1	R2	R3	R4	P value
communication	2.5	2.5	3	3.25	0.11
leadership	2.375	2.5	2.875	3.125	0.26
teamwork	2.375	2.25	2.75	3.125	0.06
problem solving	2.125	2.375	2.875	3.125	0.02
situation awareness	2.625	2.375	2.625	3	0.26
NOTECHS* Cumulative score	12	12	14.125	16	0.03

Table 2. Emergency Resident Performance in Clinical Presentation

	R1	R2	R3	R4	P value
communication	2	2.17	2.92	2.92	0.01
leadership	2.08	2	2.67	3.25	0.01
teamwork	2.08	2.08	2.42	3.08	0.02
problem solving	2.08	2.17	2.83	3.17	0.01
situation awareness	2.08	2.25	2.83	3.33	0.01
NOTECHS* Cumulative score	10.33	10.67	13.67	15.75	0.01

Digital vs. Analog Assessment: Analyzing Students' Preferences

Authors

Saskia Füngerlings, Institut für Didaktik und Ausbildungsforschung in der Medizin, Klinikum der LMU, Munich, Germany
Thomas Brendel, Institut für Didaktik und Ausbildungsforschung in der Medizin, Klinikum der LMU, Munich, Germany
Martin R. Fischer, Institut für Didaktik und Ausbildungsforschung in der Medizin, Klinikum der LMU, Munich, Germany
Christian P. Sommerhoff, Institut für Didaktik und Ausbildungsforschung in der Medizin, Klinikum der LMU; Institut für Laboratoriumsmedizin, Klinikum der LMU, Munich, Germany

Presenter: Thomas Brendel, Institut für Didaktik und Ausbildungsforschung in der Medizin, Klinikum der LMU, Munich, Germany

Background: The German 'Masterplan Medizinstudium 2020' [1] sets the agenda towards competency-based medical education. To better meet the requirements of competency-based assessment we introduced tablet computer-based exams in our clinical curriculum to allow for new quality assurance processes and assessment formats.
In three consecutive pilot runs, students were asked to choose between paper-based and tablet computer-based exams that otherwise were identical in content and structure. Factors influencing students' preferences were assessed using a facultative questionnaire containing both Likert-scaled and free-text questions.
105 students took the three consecutive exams in pathology, human genetics and radiology. 11, 11 and 25 chose to use a tablet computer, respectively. 69 of the 105 students returned the completed questionnaire. 49/69 of students stated that they can handle tablet computers very well or well (1.85 ± 1.1, mean ± SD on a five-point Likert-scale 1=very good, 5=bad). 36/69 own a tablet computer and 66/69 own a smartphone. 44/69 students felt very well or well prepared (2.24 ± 0.75), 62/69 assumed that they mastered the exam-subject at least reasonably (2.54 ± 0.66). Primary reasons for the preference of paper-based over tablet-based exams were 1. habit, 2. possibility to use a highlighter pen and 3. lack of technical risks. Although the majority of students stated that they are proficient in handling tablet computers and own a tablet and/or a smart phone, only few chose the tablet over the classical paper-based exam. Exam subjects influenced selection as tablets were chosen more than twice as often in the radiology exam, i.e. a subject relying on images. Otherwise, as paper- and tablet-based exams were identical in structure and content, students apparently saw no benefit in using the novel tablet-based exam and went for the method they were familiar with. This can be

related to findings of other studies that the design of e-assessments should be in line with the subject area which is assessed [2, 3].

More innovative competency-based assessments formats should be used in future computer tablet-based exams, in order to clarify benefits of digital assessment to students.

Students´perceptions of online assessment with their own devices

Authors

Sanna Siirilä, Educational Technology Services, University of Helsinki, Helsinki, Finland
Jussi Merenmies, Faculty of Medicine, University of Helsinki, Helsinki, Finland
Annina Rostila, Faculty of Educational sciences, University of Helsinki, Helsinki, Finland
Tiina Härkönen, Digital Leap project, University of Helsinki, Helsinki, Finland
Eeva Pyörälä, Centre for Universtiy Teaching and Learning, University of Helsinki, Helsinki, Finland

Presenter: Sanna Siirilä, University of Helsinki, Finland

Background: The Faculty of Medicine in Helsinki has since 2013 provided the students with iPads. The survey data from the iPad project showed that students were seldom assessed online. They wished for more electronic tests and feedback. In 2017, we started a Digital leap project developing bring your own device (BYOD) online assessment. This study explores the students' perceptions of and attitudes towards online examinations. (49)
The Digital leap project started in 2017 by focusing on summative online assessment. We aimed at comparing the 1st year students' perceptions of three platforms for summative online examinations where access to the Internet and hard disk were blocked (Abitti, Inspera and UNIwise). The research data consisted of web-based and paper questionnaires, interviews and observations in 2017 and 2018. 31/200 students voluntarily participated in the pilot in high stake examinations.
Few students had experience in online assessment. 31 volunteers were pleased with electronic examinations and did not want to return to paper exams. However, they needed support in new assessment practices, especially in the BYOD context. Students who did not participate in the pilot felt safer taking examination in paper format and were afraid of technical problems. They reported that the most important aspect in digital examinations was to have an easy-to-use platform. Most of the students in both groups replied that online assessment could improve their learning results by providing instant feedback.
As modern technology is incorporated into medical education in Helsinki, assessment should not lag behind. Students' perceptions of the digital platforms piloted are important, since the shift from paper-based to electronic assessment should not cause the students additional stress nor hinder their learning.
Quality assessment is vital for students' learning. Students need support in adapting to the assessment technology. Teachers and administration require efficient technical and pedagogical support.

Technology enhanced learning requires update in assessment practices. The development of summative online assessment requires piloting and support for the teachers and administration. The students need tailored support and training for online assessment.

The Global Performance Assessment Form as a formative Workplace-Based Assessment tool in the Singapore Radiology Residency Programme –Has it been effectively utilized?

Authors

Nur Ayudia Kassim
Martin Weng Chin H'ng
Daniel En Shen Wong

Presenter: Nur Ayudia Kassim, National Healthcare Group, Singapore

Background: The American Accreditation Council for Graduate Medical Education (ACGME) Residency Program was adopted for Radiology training in Singapore beginning in 2011.It comprises 6 clinical competencies - Patient Care,Professionalism,Interpersonal&Communication Skills,Medical Knowledge,Practice-Based Learning&Improvement and Systems-Based Practice.The Global Performance Assessment (GPA) form is one of the few Workplace-Based Assessment (WBA) tools able to assess trainee doctors in all 6 dimensions.The purpose of this study is to evaluate the effective utilization of this form for all trainees belonging to one of the 3 local Radiology training centres.
The form comprised 22 specific questions.Each question used a 9-point Likert scale with a space for comments.A trainee was assessed by a single rater and completed 1 GPA form at the end of each 3 month posting.The rater was a senior doctor who may or may not be a member of the Residency faulty.Internal raters were those who belonged to the parent institution whereas external raters were those in peripheral hospitals the trainee rotated to.Data for all trainees was collated from 2011 to 2017. There were 297 GPA forms from 42 trainees.The Exploratory Factor Analysis results indicated only one latent structure underlying the 22 questions.Internal raters (M=6.0040, SD=0.80) gave significantly lower scores compared to external raters (M=6.9638, SD=0.77).There was no significant difference between scores given by faculty (M=6.49, SD=0.92) versus non-faculty (M=6.3548, SD=0.91) raters.Comments were provided only 5.4% of the time.
Raters were not able to distinguish between these 6 competencies. This may be due to the influence of the preceding British system whereby the rater would pass a trainee once he/she felt that "Total Patient Care" had been delivered.The rater would then retrospectively fill in the 6 competency scores to justify the end result.The added good intention of a WBA in providing formative feedback was under-utilized.Again, this may be related to the pervasive mindset that negative comments will affect the resident's future,wrongly assuming this to be a summative rather than formative task.

Rater training is necessary to enable them to differentiate and assess in these 6 dimensions as well as be comfortable giving qualitative feedback.

The Application of Milestone and Entrustable Professional Activity in Clinical Skills Training-the First Year Result

Authors
Chia-Chang Huang
Ying-Ying Yang
Chin-Chou Huang
Ling-Yu Yang
Jen-Feng Liang

Presenter: Chia-Chang Huang, Taipei Veterans General Hospital, Taipei City, Taiwan

Background: Clinical Skills is one of the Minimum 7 Essential Core Competences of the Institute for International Medical Education (IIME) Core Committee. In recent years, Milestone and Entrustable Professional Activity (EPA) were applied in postgraduate medical education training programs at the United States and Canada. The undergraduate year (UGY) training had the clinical skills training in the division of clinical skills training or in the ward. The Objective Structured Clinical Examination (OSCE), Direct Observation of Procedural Skills (DOPS), and Modified mini-clinical evaluation exercise (Modified mini-CEX) were used to do the assessment in clinical skills. The application of milestones and EPAs is the first attempt in UGY training programs. During January ~ March 2017, we invited 5 clinical teachers to form a "Clinical Skills Training Milestone and EPA Working Group". They listed the Milestone of procedure skills include male urinary catheterization, blood sampling and blood culture, wound dressing, and intravenous catheterization. In April 2017, we invited another 5 clinical teachers to validate the content of EPA and milestones of these 4 procedure skills. Then, we conducted a pilot test based on the EPA and milestones of the clinical skills. Finally, we collected the questionnaires from medical students about the application of Milestone and EPA in Clinical Skills Training.
We had created the good validity (1-5) EPAs and Milestone in these 4 procedure skills, include male urinary catheterization (4.13), blood sampling and blood culture (4.09), wound dressing (4.12), and intravenous catheterization (4.31). The pilot test in medical student showed the EPA's mean scores(1-9): male urinary catheterization (6.7), blood sampling and blood culture (5.6), wound dressing (5.7), and intravenous catheterization (6.0). Most of the participants' were positive feedback and suggested to demonstrate the effectiveness of clinical skills training with milestones and EPA through rigorous research
Most students had the positive attitude to face the application of Milestones and EPA in Clinical Skills Training. The application of Milestones and EPAs in Clinical Skills Training need good validity contents and pilot tests with a rigorous research to proved the effectiveness.

Satisfied students are not necessarily well educated students

Authors
Erik Hulegårdh, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden
Kerstin Landin-Wilhelmsen,Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden

Presenter: Erik Hulegårdh, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Sweden

Background: There is no correlation between the students´ assessment of the teaching and the final exam results. Other methods must be used in order to evaluate the true quality of a course and it´s teachers.
The general belief is that there is a positive correlation between the medical student´s course-evaluation and the results on the examination. It is hypothesized the students learn more if you enjoy the education, the teachers and the course as a whole. There are institutions, which use the students rating as a quality index of their university and teachers for use in grant applications.
To investigate this hypothesis, we performed a study at the 6th term course, i.e. internal medicine of the medical programme, Sahlgrenska Academy, University of Gothenburg, Sweden.
The student´s course evaluations were correlated with the results at the final written exam. The participation rate was n=91 (60%).
The correlation coefficient (Pearson) between the question "I am in general satisfied with the clinical tutoring and education and what I have learned" and the written examination score was r= 0.30 (p=0.38). The correlation between the question "The pedagogic which was used during the course facilitated the optimal learning for me" was as low as r= 0.0072 (p=0.84).
The study clearly showed that there was no correlation between the course evaluation and the results at the written examination. It is most probable that the students' subjective evaluation is not a reliable tool, neither for measuring students´ learning, nor for the quality of teaching. The results are in line with those at a technical programme at the University of Linköping, Sweden (Öberg et al.).
Hence, there is no reason to draw any firm conclusion based on the students' course evaluation and gained knowledge, or the quality of the education, academic environment or the competence of the teachers, respectively. However, it is positive to offer a programme that is well accepted by the students.

The effectiveness of OSCE mentorship for Passing on OSCE UKMPPD : an Experience from School of Universitas Muhammadiyah Yogyakarta (UMY) in Indonesia

Authors
Nur Shani Meida, UMY, Yogyakarta, Indonesia
Winny Setyonugroho, UMY, Yogyakarta, Indonesia
Galuh Suryandari, UMY, Yogyakarta, Indonesia
Akhmad Ikliludin, UMY, Yogyakarta, Indonesia

Presenter: Nur Shani Meida, UMY, Yogyakarta, Indonesia

Background: Qualified and competent doctors in Indonesia has been produced for at least six years. At the end of their study they must be assessed by A High-Stakes National level examinationcalled UKMPPD (Uji Kompetensi Mahasiswa Program Profesi Dokter) to assure national health quality services. There was many ways to enhance skills and OSCE UKMPPD passing score. One of effort from school of medicine UMY is using mentorship.This study was conducted to analize whether OSCE mentorship can be effective to pass on OSCE UKMPPD.

This study used a pre-post experimental design with 153 participants who followed OSCE UKMPPD for period Januari-Oktober 2017. Pre-test has been held 1 month before final exam with local comprehensive OSCE. The mentorship conducted in 1 month with 20 times departemental expert lectures, 40 times regulated independent learning OSCE and one time for formative simulated OSCE with direct feedback. OSCE UKMPPD result has been recorded as a post-test. The data was analized using chi-square.

There were significantly increased between pre and post test (p 78) successfully passed this exam with lower increase of pre and post result (0,52;0,73). Generally there was improvement in passing score between local comprehensive OSCE and OSCE UKMPPD which was 54% to 98%.

Students must prepare for exams. This should include preparation countdown with keydates and preparation on finals. Therefore, School of Medicine UMY has conducted mentorship and the result showed that OSCE mentorship was effectively improves for passing on OSCE UKMPPD. A small discussion group, mentorship could bring motivational environment with constructive feedback and closely relationship between mentor and mentee.
You can try this method or combination of this.

Team Work Competency Assessment (TWCA) during the first year medical school LifeStages course

Authors
Anuradha Lele Mookerjee, Cooper Medical School of Rowan University, New Jersey, USA
Susan Cavanaugh, Cooper Medical School of Rowan University, New Jersey, USA
Bradford Fischer, Cooper Medical School of Rowan University, New Jersey, USA
Vijaykumar Rajput, Ross University School of Medicine, Florida, USA

Presenter: Anuradha Lele Mookerjee, Cooper Medical School of Rowan University, New Jersey, USA

Background: Teamwork is a critical competency for health care professionals. There is lack of assessment tools to measure teamwork among medical students.

Summary of Work: We piloted Team Work Competency Assessment (TWCA) for 71 students. Nine active learning groups of eight students worked as a team for ten days to develop a clinical case with learning objectives and a structured facilitator's guide on an assigned topic from our LifeStages curriculum based on the biopsychosocial model. The case and facilitators guide were assessed by the course directors using a three-category rubric and was 40% of TWCA grade. Each active learning team conducted anonymous peer assessments using the Carnegie rubric which accounted for 20% of TWCA grade. The developed case was assigned to a different student team, charged with executing the case by developing their own learning objectives and corresponding content in a two hour CBL/PBL session. This case discussion was assessed by faculty facilitators using a 4-point rubric and was 40% of TWCA grade. A formative feedback and reflection session by the developer and executor teams closed the loop in the assessment process.

Summary of Results: The student scores ranged from 70 to 95%. Student reports showed that the challenge of case development and execution fostered a rich educational exercise in teamwork and empowered them as student teachers.

Discussion & Conclusion: The students benefited from this cooperative learning process. The students acted as cohesive team players and showed commitment to this practice. The multifaceted assessment rubric assessed higher order thinking and problem solving skills as a functional team.

Take home message: TWCA identifies communication, problem solving, and decision-making skills. Team Work exercise inspires cooperation, collaboration and partnership. Team work can be assessed in basic science courses in medical schools.

A place to grow - evaluating how a faculty development program enables improved teaching practices

Authors
Yvonne Carlsson, Sahlgrenska Academy, Gothenburg, Sweden
Matilda Liljedahl, Sahlgrenska Academy, Gothenburg, Sweden
Alwyn Louw, Stellenbosch University, Tygerberg, South Africa

Presenter: Yvonne Carlsson, Sahlgrenska Academy, Gothenburg, Sweden

Background: In higher education, teachers often lack educational qualifications. To address this issue, an increasing number of faculties offer courses, often referred to as faculty development programs, to enhance teaching skills. Qualitative evaluations of these initiatives are rare, though necessary in order to better understand its impact on the participants, and ultimately to inform faculties aiming to enhance the quality of teaching. The aim of this study was to understand how a short course on teaching, called Teaching in Health Professions (THP) at Stellenbosch University, South Africa, enabled the participants to grow as teachers. Additionally, enablers and barriers in this development were investigated.
Methods: A qualitative approach was adopted since human experiences were in focus. Data was collected through ten individual, in-depth interviews, followed by a thematic analysis where patterns and themes in the data were search for.
Results: In the teachers' experience, the course enabled them to look at teaching differently, to change their teaching in terms of becoming more student-centered, to increasingly reflect upon their teaching and to engage in scholarship. Enablers to change were the course in itself, favorable working conditions, to belong to a community and personal motivation. Barriers to change were competing tasks, unfavorable working conditions, to be stuck in one's comfort zone and barriers on a structural level.
Conclusions: This study supports faculty development programs focused on teaching skills as a method to enhance teachers' growth. Additionally, it plausible that the course had a positive impact on the students, considering that student-centered teaching has shown to result in a deeper learning process. Furthermore, to ensure that shorter teaching courses apply a practical focus and are offered early in the career of its members seems pertinent. To create an enabling environment where teachers feel supported in their practice appears to be an important factor for teachers to grow and flourish.
Take-home messages:
- Teacher trainings contribute to teachers pedagogical development
- A practical focus of the course appears beneficial to the teachers
- There is a need for this place to grow.

Developing a group based objective structured teaching evaluation program to improve clinical teaching skills for senior resident faculty and compared with an objective structured teaching evaluation program – a pilot study

Authors
Yi-Hsuan Hsiao
Yung-Sung Wen
Yi-Cheng Liao
Jhin-Long Jiang
Ching-Yi Huang
Horng-Der Tsai

Presenter: Yi-Hsuan Hsiao, Changhua Christian Hospital, Changhua, Taiwan

Background: The objective structured teaching evaluation (OSTE) is an assessment method for clinical teaching skills of faculty members and residents. We developed a group based objective structured teaching evaluation (GOSTE) program for senior resident faculty and compared with an OSTE program.
Method: Both OSTE and GOSTE programs consist of four stations, including communication (telling the bad news), clinical skills evaluation (mini-CEX evaluation), case based discussion (CbD) and One-Minute Preceptor skills. Each scenario was presented by a video for the GOSTE program group and a standardized patient with or without standardized patients for OSTE program group. Each station in GOSTE program engaged 3 to 4 senior residents to test their performances in teaching abilities. In OSTE program group, each senior resident filled the checklist individually; in GOSTE program group, the checklist was filled by each senior resident after the video played. The group members discussed to gain a concise checklist and the group leader reported to the assessor.
Results: A total of 92 senior residents in OSTE and 98 senior residents in GOSTE from 2013 through 2017 were included. The scores for OSTE and GOSTE group in test of communication (telling the bad news) were mean value 76.7 (SD, 10.0) and 86.2 (SD, 7.4) respectively; p value is <0.001. In test of clinical skills evaluation (mini-CEX evaluation), the scores for OSTE and GOSTE group were 76.7 (SD, 10.1) and 89.3 (SD, 4.7) respectively; p value is <0.001. In test of case based discussion (CbD), the scores for OSTE and GOSTE group were 78.1 (SD, 12.2) and 79.3 (SD, 11.2) respectively; p value is 0.45. In test of One-Minute Preceptor skills, the scores for OSTE and GOSTE group were 82.3 (SD, 13.4) and 87.4 (SD, 6.9) respectively; p value is <0.001.
Conclusion: In the tests of communication (telling the bad news), clinical skills evaluation (mini-CEX evaluation) and One-Minute Preceptor skills, there were significantly higher scores in the GOSTE than in OSTE group.
Using a group based objective structured teaching evaluation in faculty development program could improve medical faculty teaching skills in selective scenarios.

Diffusing the Fear and Restoring the Faith in Upward Feedback via Project Princess

Authors
Jacquelyn Lee, Tan Tock Seng Hospital, Singapore
Jasmine Kang, Tan Tock Seng Hospital, Singapore
Jamie Lim, Tan Tock Seng Hospital, Singapore

Presenter: Jacquelyn Lee, Tan Tock Seng Hospital, Singapore

Background: In Singapore, Master of Nursing graduates undergo a one-year internship as Advanced Practice Nurse Interns (APNI). To facilitate APNI training, a Faculty for APN Internship Training (FAT) comprising 7 senior APNs was set up in 2016. As part of faculty and program evaluation, trainees provided upward feedback to faculty members.

Method: We designed an online questionnaire for the APNIs to rate the faculty. Feedback was provided anonymously to maintain psychological safety for both learners and teachers. The questionnaire rated 7 domains: teaching skills (TS), clinical reasoning (CR), clinical knowledge (CK), teaching attitude (TA), provision of constructive feedback (CF), if the teachers stimulate and motivate the learners to learn (SM) and model professionalism (MP). Trainees were encouraged to provide comments.

An administrator aggregated the scores and anonymized each faculty member with a unique code name, using Disney Princesses. Anonymized scores (on 5-Point Likert scale) are presented to all FAT members. Each member is informed of her own Disney Princess identity, and can compare her scores with other faculty members' scores without feeling threatened.

Results: 10 APNIs rated the faculty. The average scores for the 7 faculty members were 4.2 (3.6-4.7) for TS, 4.3 (3.4-5.0) for CL, 4.2 (3.2-5.0) for CK, 4.4 (3.9-4.8) for TA, 4.3 (3.7-4.7) for CF, 4.3 (3.8-4.8) for SM, and 4.4 (4.0-4.7) for MP. The comments given were overwhelmingly positive and included: "she is very humble and experienced…guide us as a friend rather than a teacher", "goes the extra mile to teach students, has good teaching strategy" and "she is learning with us and always very reassuring…I had learnt a lot of communications skills from her".

Conclusion: We provided psychological safety for trainees by allowing them to feedback upwards anonymously. At the same time, we provided psychological safety for faculty and allowed them to benchmark themselves against fellow faculty by displaying the whole group's scores anonymously. This may encourage faculty to reflect on their own scores and promote self-improvement.

Take-home message: Providing a psychologically safe process of upward feedback is beneficial for both trainees and faculty.

Team Appraisal for Faculty Teams: From Effective Structures to Excellence

Authors
Caroline Groves, Wales Deanery, Cardiff University, Cardiff, UK
Kay Wilkes, Wales Deanery, Cardiff University, Cardiff, UK
Anton Saayman, Wales Deanery, Cardiff University, Cardiff, UK

Presenter: Anton Saayman, Wales Deanery, Cardiff, UK

Background: The Wales Deanery appointed Faculty Leads (for support of Trainees, Trainers and Quality) to each Local Education Provider in Wales in 2012 to work within their LEP in partnership with the Deanery to support, deliver and manage postgraduate medical training. Subsequently, 'Faculty Teams', comprising all relevant stakeholders in each locale (Faculty Leads, Assistant Medical Directors for Training, Foundation Programme Directors, Education Managers, Librarians, GP Programme Directors and SAS Tutors), were established to collaboratively support postgraduate medical training management.

Method: The Deanery introduced annual Faculty Team Appraisals in 2013 with the aim of supporting continuous improvement in Faculty structures and function. The initial objective was to understand organisational structures and systems within which Teams operated. 2014 Appraisals focused on development of Team structures and processes with performance appraised against five key elements of internal group processes. By 2016, factors impacting team function were explored aiming to measure team effectiveness through goal setting and review. 2017 Appraisals focused on identification and dissemination of best practice in Teams' operation and activity.

Results: Over five years Appraisals have facilitated seamless transition from considering organisational environments to demonstrating team effectiveness and generating excellence in training provision. Teams demonstrate increased cohesiveness and exhibit strengths including planning supported by a team approach, actively seeking opportunities for members' development, increased engagement with Deanery and local training structures and an environment in which a Team and constituent members are proactive and innovation is encouraged.

Conclusion: Outcomes include Faculty Lead participation in scholarship and professional development, stakeholder involvement in Team activity facilitating succession planning, use of training quality concerns as the basis for quality improvement projects (sometimes led by non-clinical Team members), and direct, measurable improvements in postgraduate medical training quality pursuant to achievement of Team objectives set via Appraisal. Implementation of Team Appraisals has supported the evolution of Faculty Teams from a position of uncertainty over members' roles and Team function to a mechanism for effective training support for within Local Education Providers and, increasingly, a source of excellence in postgraduate medical training management.

Use of instant messaging software to promote faculty development courses - a regional hospital experience

Authors
Kai-Hsi Lu, Department of Medical Research and Education, Cheng-Hsin General Hospital, Taipei, Taiwan, ROC
Yi-Hsien Lin, Division of Radiotherapy, Cheng-Hsin General Hospital, Taipei, Taiwan, ROC

Presenter: Kai-Hsi Lu, Department of Medical Research and Education, Cheng-Hsin General Hospital, Taipei, Taiwan

Background: Busy clinical work and lack of communication way of faculty development courses are the mean reasons why faculty development courses participation rates cannot be effectively improved, but the on-the-spot sense of the real curriculum cannot be replaced by online learning. Therefore, how to effectively increase the participants number of real curriculum is an important issue.

Method: Our institute set up faculty development center to develop programs in 2008. At the beginning of the faculty development center, faculty development courses use different ways to attract colleagues to participate in the curriculum like provided meals, posted course poster, etc. But the number of students in each course has been maintained between 20~30.

Results: After discussion, attempts to use e-mail to inform the relevant messages have not increased attendance. Until the use of instant messaging software to publish the course information and invite participants to join the course communication group, so that when the new courses are notified again.

Soon, this approach has been effective. The number of participants increased to 100 ~ 150 people, the effect is very significant. After improving and increasing the propaganda mode of the faculty development courses, the number of participants increased dramatically to 5 ~ 8 times of the original number.

Conclusion: Excellent faculty development courses are designed to train senior medical professionals as clinical instructors for graduate clinical training. Convenient notification and two-way communication platform to release the courses related information, so that more senior medical staff can receive relevant information, further acceptance of relevant training

Take-home message: Immediate and fast messaging is crucial to the promotion of faculty development courses.

A Reflective and Longitudinal Faculty Development Program (FDP): Yeditepe University, School of Medicine FDP

Authors
Serdar Özdemir, Yeditepe University, Faculty of Medicine, Department of Medical Education, İstanbul, Turkey
Güldal İzbırak, Yeditepe University, Faculty of Medicine, Department of Medical Education, İstanbul, Turkey
Özlem Tanrıöver, Yeditepe University, Faculty of Medicine, Department of Medical Education, İstanbul, Turkey
Ayşe Arzu Akalın, Yeditepe University, Faculty of Medicine, Department of Medical Education, İstanbul, Turkey
Ç Kaspar, Yeditepe University, Faculty of Medicine, Department of Medical Education, İstanbul, Turkey
Sina Ercan, Yeditepe University, Faculty of Medicine, Department of Chest Surgery, İstanbul, Turkey
Halil İbrahim Durak, Ege University, Faculty of Medicine, Department of Medical Education, İzmir, Turkey

Presenter: Serdar Özdemir, Yeditepe University, Faculty of Medicine, Department of Medical Education, İstanbul, Turkey

Background: Yeditepe University, School of Medicine FDP has been maintained since 2014, under the responsibility of the Department of Medical Education.

Method: The aim of this study is to share the development process which based on the curriculum development model, "ADDIE" and the program evaluation results of the YFDP. During the analysis phase; the strengths and weaknesses of our faculty, students' feedback results, educational needs assessment results of faculty members, learners' characteristics and educational environment are investigated. The results showed that there was a need for faculty development, especially for skills regarding the following six roles and responsibilities. 1. Teaching 2. Assessment 3. Planning and evaluation 4. Coordination skills 5. Academic counseling 6. Communication and professionalism.

At the design phase each of the above topics became an educational module. We've added as the seventh module "reflection". Adult learning principles have been taken into consideration during the process.

Instructional materials such as session plans, blog site etc are developed.

Twenty faculty members were involved into the first two modules. The program took 9 months, one unit each month.

Program evaluation covered oral and written feedback (feedback forms), evaluation of factual knowledge (pre-post tests) and applied knowledge (learning tasks). Additionally a qualitative study is aimed to evaluate at which level the participants have reflected the YFDP outcomes to their daily educational practice.

Results: The average scores of the participants regarding the written feedbacks of the first two modules were analyzed. We established that the score of "contribution of trainers to learning" (2.9) was highest. The lowest score was about "time use of instructors" (2.5) and instructional environment (2.5). The highest possible score is 3.

The average of the pre and post test scores of the participants are 46.2 and 83.4 respectively.

Conclusion: YFDP is recognized by our instutition as an essential support framework. It enhances faculty members' attitude in responding to the challenges of their multiple roles and evolving responsibilities.

Take-home message: Successful faculty development program will require attention to and efforts on observing the changing behaviors of the faculty members and giving them opportunity to reflect on their own behavior.

Investigating faculty intentions to adopt active learning methods in instructing difficult nephrology topics to immediate postgraduate medicine learners

Authors

Claude J Renaud, NHG ACGME-I, Singapore
Tracy Tan, NHG ACGME-I, Singapore
Jason Choo, SingHealth ACGME-I, Singapore
Rajat Tagore, NUHS ACGME-I, Singapore
Chua Horng Ruey, NUHS ACGME-I, Singapore
Roy Debajyoti, SingHealth ACGME-I, Singapore

Presenter: Claude Renaud, National Healthcare Group ACGME-I, Singapore

Background: Internal medicine (IM) postgraduate learners face challenges mastering complex nephrology tasks resulting in general apathy towards nephrology. Although substantial evidence points to the effectiveness of active learning (AL) in promoting learning, its adoption by nephrology faculty remains low. Further, AL adoption in an Asian and postgraduate competency-based learning context has not been well studied. In this explanatory quantitative study, the Theory of Planned Behaviour (TPB) constructs were used to examine nephrology faculty AL-behaviour.

Method: Nephrology faculty involved in teaching IM PGY1-3 at 6 sites within Singapore 3 ACGME-I programs were surveyed by purposive sampling using a 28 5-point Likert item validated questionnaire describing 12 decomposed TPB constructs. Descriptive, correlation and regression statistics were used to interpret the faculty attitudes, subjective norms (SN), perceived behavioural control (PBC) and intentions towards AL adoption.

Results: The sample (N=49; response rate 60%) comprised 43% females and 35% holding leadership role (program director or core faculty member). Median (IQR) age and experience were 39 (10) and 6 (9) years respectively. AL was interpreted as self-directed learning, interactive lectures and case-based learning by 49, 43 and, 6% respectively while 4% had no idea about it. Electrolytes and acid-base disturbances, transplantation and glomerulonephritis were deemed difficult areas by 76, 63 and 49% respectively. Only 59% taught these topics >once/year. AL behaviour was integrated by 55%, while 71, 75 and 63% harboured AL intentions, attitude and PBC. Only 26% felt SN in the form of peer influence had an impact. Faculty in leadership, with >5-year experience and teaching >once/year were better AL adopters (OR 2.44 (CI 0.93-6.41), 1.69 (CI 0.92-3.31), 2.36 (1.25-4.48) respectively). There was a strong correlation (Spearman rho >0.6) between attitude and intention but not SN and PBC. However regression analysis did not show significant attitude-intention predictability.

Conclusion: Nephrology faculty has a varied notion of AL and difficult nephrology topics. More experienced faculty and those in leadership roles are more likely AL adopters. There is a strong association between faculty attitude and AL intention.

Take-home message: AL-focused faculty development initiatives should therefore be customised to individual faculty specificities.

Early Experience with an Interactive Faculty Development Program with an OSTE

Authors

Lori Schuh, Spectrum Health, Grand Rapids, USA
Monica van de Ridder, Michigan State University College of Human Medicine, Grand Rapids, USA
Candace Smith-King, Spectrum Health Helen De Vos Children's Hospital, Grand Rapids, USA
Michael Werkema, Spectrum Health, Grand Rapids, USA
Colleen Bush, Michigan State University College of Human Medicine, Grand Rapids, USA
Angela Bush, Michigan State University College of Human Medicine, Grand Rapids, USA

Presenter: Lori Schuh, Spectrum Health, Grand Rapids, USA

Background: Tremendous changes in medical education, (e.g. Milestones), have necessitated greater emphasis on faculty development. We sought to develop a short, interactive program to meet faculty development needs of multiple specialties and study its impact.

Method: An institutional educational needs assessment was sent to teaching faculty, and learning environment surveys were sent to residents and medical students in 2016. Priorities were to effectively teach in busy settings, assessment of performance by direct observation, providing effective feedback, and procedural teaching. A 2 day course, including a half day Objective Structured Teaching Encounter (OSTE), was developed. All modules included lecture, small group discussion, role play with feedback, and self reflection. The modules were: Assessing Performance, Giving and Receiving Feedback, Difficult Feedback Conversations, One Minute Preceptor, Teaching Procedural Skills, and Coaching/Advising/Mentoring. The OSTE consisted of 3 stations. Participants completed a self-assessment of confidence in performing a variety of faculty tasks before and after completion of the course. Other assessments included post course satisfaction survey, OSTE checklists, and the development of an individualized learning plan (ILP). The pre/post self-assessment of confidence was analyzed using linear regression.

Results: To date, over 2 monthly sessions, 13 voluntary participants from a variety of specialties completed the course. Pre/post self-assessment of confidence improved significantly in the following: teaching in time compressed settings (p=0.036); providing constructive feedback (p<0.001); assessing performance based on direct observation (p<0.001); mentoring learners (p=0.025); advising learners (p=0.001); coaching learners (p=.028); developing an ILP (p=0.006); and overall (p<0.001). No change was seen in confidence at bedside teaching (p=0.36), ambulatory teaching (p=0.228), and teaching procedures (p=0.072). All participants successfully completed the 3 OSTE stations.

Conclusion: This quasi-experimental analysis of participant self-assessment of confidence in performing a variety of faculty tasks, and OSTE completion, demonstrated short term improvement after participating in a new faculty development workshop. This study was limited by a small

number of participants to date, limited short term outcome measures, and lack of a control.
Take-home message: Short term improvements in a variety of faculty tasks were seen after an interactive 2 day faculty development program with an OSTE.

Bedside teaching as an Entrustable Professional Teaching Activity?

Authors
M.J.van Dam, UMC Utrecht, Netherlands
J.M.E. van Bruggen, UMC Utrecht, Netherlands
Th.J. ten Cate, UMC Utrecht, Netherlands

Presenter: Marjel van Dam, University Medical Center Utrecht, Netherlands

Background: Teaching at the bedside is an invaluable tool in medical education. Much knowledge acquired at the ward is taught by faculty or senior residents. However, they are usually not specifically trained in delivering bedside teaching.
Method: This pilot project examined the possibilities to put the requirements for successful bedside teaching in a framework. Entrustable Professional Activities (EPA) have previously been suggested a suitable framework for teaching activities[1]. The EPA format includes title, specification and limitation, links to a competency framework, required Knowledge, Skills and Abilities, information needed to assess, level of supervision and expiry date of entrustment, but not all apply.
The literature defines bedside teaching with its basic requirements. A planned and deliberate approach promotes effective learning, and teaching should include establishing a safe learning environment, observing the learners and giving timely feedback[2]. Bedside teaching itself can consist of a broad spectrum of actions including skills in history taking and physical examination, but also how to perform a new clinical skill (eg lumbar puncture) or teaching how to use medical equipment (eg ultrasound or mechanical ventilator).
The diversity of actions makes it complicated to define an EPA encompassing all bedside teaching alike. We believe however, that every form of bedside teaching should meet with basic criteria of "bedside teaching hygiene".
Results: After selecting and informing the patient or family and obtaining consent (1), the students are informed (2). Then the bedside teaching is performed (3) followed by debriefing, preferably including provision of feedback by students and patient (4).
The bedside teacher should act as a role model for students, both in knowledge, professionalism and communication while recognizing the level of the students.
Conclusion: This reconnaissance shows that bedside teaching, although consisting of many different activities can be defined as EPA with potential benefit for faculty, students and patients. If teachers must be certified, Bedside teaching may be a suitable EPA.
Take-home message: Bedside teaching can be defined as an EPA which can lead to better teaching.

Capacity development indicators for faculty development programs: a narrative review

Authors
Mahla Salajegheh
Roghayeh Gandomkar
Azim Mirzazadeh
John Sandars

Presenter: Roghayeh Gandomkar, Tehran University of Medical Sciences, Tehran, Iran

Background: A major goal for faculty development is organizational development and one of the key processes is capacity development. Capacity development has been loosely defined as the ability of organization to use resources effectively, achieve goals and improve performance. There is a practical need to identify the indicators of capacity development in the context of faculty development programs and this narrative literature review is the first to systematically identify these indicators.
Method: A systematic search was carried out in Medline, ERIC, Web of Science, Scopus and EMBASE databases from 1980 to 2017. A total of 874 articles were initially identified, with 20 included in the review based on title/abstract and full text. In total, 230 indicators of capacity development were extracted and were categorized into subcategories and themes.
Results: Six themes were identified: developing innovations in teaching and learning; developing and advancing scholarship; developing effective leadership and management; developing clinical practice; developing linkages, collaborations and partnerships; and developing and sustaining faculty development. Innovative teaching methods, changing attitudes toward scholarship, developing policies to support faculty development were important subcategories. Indicators related to linkages, collaborations and partnerships were the most frequently mentioned indicators of capacity building in the context of faculty development programs.
Conclusion: Faculty development impacts organizational development through indicators identified in this review. Policy makers and planners may benefit of the results of this study to enhance the impact of faculty development programs on both participants and their institutions.
Take-home message: Faculty development programs must move beyond delivering content to individual faculty towards becoming a facilitator of organizational improvement.

Old dogs can learn new tricks!

Authors
Chee-Kiat Tan, Singapore General Hospital, Singapore
Pik-Eu Chang, Singapore General Hospital, Singapore

Presenter: Chee-Kiat Tan, Singapore General Hospital, Singapore

Background: Psychological studies have shown that older adults are more set in their ways and less receptive of feedback to effect changes. We studied whether changes in faculty performance in response to resident feedback were different between senior consultants (SCs) and their younger non-SC colleagues.
The hypothesis is that SCs are older and are less receptive to feedback to effect changes and thus any significant improvement in faculty performance is due to the non-SC group.
Method: We compared the mean scores of our residents' feedback assessment of the SCs and non-SCs in our faculty between 2 consecutive years. The feedback assessment consisted of 10 questions with Likert score of 1 to 5. Five questions pertained to attitude towards teaching, 3 to teaching skills and 1 to knowledge. The final question was an overall assessment.
Results: We had 9 SCs and 15 non-SCs in our faculty. Median age was 52 (range 42-60) years versus 25 (range 32-49) years in the SCs and non-SCs respectively (p<0.001). Median number of years post-graduation was 25 (range 17-36) years versus 13 (range 8-25) in the SCs and non-SCs respectively (p<0.001). There was a significant overall improvement in the feedback assessment score (4.38±0.47 vs 4.69±0.38, paired t test p=0.037) with no significant difference in the extent of improvement in the SC and non-SC groups. The individual questions in the residents' feedback assessment form encompassing the faculty's teaching attitudes, skills and knowledge all showed significant improvement (Kruskal-Wallis p<0.001).
Conclusions: The extent and areas of improvement in the performance of the SCs in response to resident feedback were similar to that of the younger non-SC faculty. Contrary to popular belief, SCs can also accept feedback and change their teaching attitudes, skills and knowledge as readily as the younger faculty members.

Integrated faculty development program on holistic care and leadership may reduce work-place burnout

Authors
Ching-Hua Chen, Office of Occupational Safety and Health office, Taichung Veterans General Hospital, Taichung, Taiwan
Mei-Feng Yang, Office of Occupational Safety and Health office, Taichung Veterans General Hospital, Taichung, Taiwan
Chao-Huan Chen, Division of Faculty Development, Department of Medical Education, Taichung Veterans General Hospital, Taichung, Taiwan
Wei-Ting Hung, Division of Faculty Development, Department of Medical Education, Taichung Veterans General Hospital, Taichung, Taiwan

Presenter: Ching-Hua Chen, Office of Occupational Safety and Health office, Taichung Veterans General Hospital, Taichung, Taiwan

Background: The education domain in our hospital for interprofessional collaborative patient centered care included professional knowledge, evidence base practice, patient safety, communication, team resource management (TRM), interprofessional collaboration (IPC), palliative care and chronic long term care. However, there was few integrated interprofessional practice educational model in the literature.
Method: We developed a two-day faculty workshop composite of mindfulness, communication, TRM, IPC and basic teaching skills in 2016. 92 participants including doctors, dentists, traditional Chinese medicine doctors, senior nurses, pharmacist, physical therapist, occupational therapist, speech therapist, medical technicians, dietitian, respiratory therapist, hearing therapist completed two-day course. After workshop, attendee was requested to give lecture upon holistic medicine at least once per year and to facilitate holistic issue discussion in case-discussion meetings at least twice per year. Furthermore, we investigated burnout level upon these clinical teachers via yearly questionnaire.
We held faculty development workshop on holistic care in 2016. 97% of attendees gave lecture and 89% of them became facilitator in holistic care discussion. Burnout level was assessed through Copenhagen Burnout Inventory during June to July every year.
Results: 81 participants completed first year questionnaire and 91 participants completed second year questionnaire.
Conclusion: The results showed nurses had the highest personal burnout scores and work-related burnout scores among physicians and other health professions. The percentage of high risk group faculty decreased in the second year.
Take-home message: Integration of mindfulness, communication, TRM, IPC and basic teaching skills not only could increase faculty's confidence education upon holistic care in daily practice, but also could reduce burnout level in high risk group.

ABEM's Faculty Development Programme

Authors
Marcia H. Sakai, ABEM-UEL, Brasilia, Brazil
Lucia C. Iochida, ABEM-UNIFESP, Brasilia, Brazil
Sigisfredo L. Brenelli, ABEM-UNICAMP, Brasilia, Brazil
Geraldo Cunha Cury, ABEM-UFMG, Brasília, Brazil
Maria Luisa Soliane, ABEM-Escola Bahiana, Brasilia, Brazil

Presenter: Marcia Sakai, ABEM-UEL, Brasilia, Brazil

Background: One key aspect in medical education is faculty development, because it is essential to support changes in medical curriculum. It is necessary to prepare teachers and physicians to act as facilitators in the learning process. Brazilian Medical Education Association (ABEM) has experience offering courses to teachers and medical doctors in many fields of Education.
Method: The purpose of this paper is to present some results of courses offered and strategies adopted to prepare preceptors (tutors and supervisors) as part of ABEM's faculty development program, since 2010. The courses were meant to prepare health professionals to be preceptors for internship of medical undergraduate courses and medical residency, and were developed both in distance education and presential meetings, in partnership with Universities, in eight regions of Brazil and in two editions. These courses had financial support of Ministry of Health and PAHO.
Results: Results of two courses were: (1) 20 Universities participated and certified the students; (2) 80 tutors (course instructors) were trained; (3) 874 health professionals (preceptors) were certified. Tutor's training was not certificate as CPD course. Database of tutors and students were fragmented in the 20 Universities. Based on results of two editions, the third one was planned to increase number of preceptors and improve the distribution of formation centers to reach all Brazilian states. The selection process of tutors, and implementation distance learning using Moodle was done by ABEM. The third course was validated by Ministry of Education and Health, PAHO, Federal Council of Medicine and Brazilian Association of University Hospitals.
Discussions & Conclusions: Teaching learning methodology of the third course was student centered and based on students needs. ABEM's Faculty Development Program is becoming more comprehensive, aiming to prepare health professionals as well as teachers of Medical Schools to act as preceptors in internship and medical residency. Faculty Development Programs are encouraged in all medical schools, by the national guidelines and are supported by ABEM.
Take-home message: Planning faculty development programs needs to be incorporated by all stakeholders of the school to improve medical courses.

5DD14 (2826)
Establishing a community of practice for a new medical curriculum

Authors
Ursula Brack, ETH Zurich, Switzerland
Jörg Goldhahn, ETH Zurich, Switzerland

Presenter: Ursula Brack, ETH Zurich Department of Health Sciences and Technology, Zurich, Switzerland

Background: For the newly developed bachelor in human medicine at ETH Zurich we have highly motivated and knowledgable lecturers. So, we focus on nurturing a community of practice to share information and experiences around the curriculum to establish a well-connected faculty.
Method: The teaching philosophy was generated together with all stakeholders. Newsletters and an online portal provide all information about the project to build up a new curriculum. The curriculum database LOOOP supports the exchange of information on the curriculum and the alignment of learning outcomes, instructional design and assessment. Informal happy hour education meetings provide opportunities to share information and inputs on innovative teaching approaches by experts in higher education. Interactive workshops between the semesters allow faculty to share experience from the past courses and ideas for the upcoming semester. There is also room to instruct faculty on new tools and resources, and to answer individual questions face-to-face.
Results: Within this first year of implementing faculty development we could already observe a growing participant rate in our regular meetings. Lecturers contribute actively in the meetings e.g. by providing feedback on their courses and by sharing experiences on educational methods and tools. As an example, the flipped classroom approach with weekly topics around a case was adopted by the nerve system team after discussing with the lecturers from musculoskeletal system during a happy hour education meeting. Our faculty is encouraged to pilot innovative teaching approaches without fear for failure, but fun for teaching e.g. with the instructional design for doctor-patient relationship or with a collaborative "eSkript" to document the results of a moderated session on diseases.
Conclusion: Instead of taking a remedial view of faculty development we feel faculty can learn from each other in a community of practice. Growing participant rate and positive first feedback shows that faculty are interested in contributing.
Take-home message: A community of practice among faculty in a curriculum can deliberately be established and nurtured.

5DD15 (2418)
From individuals to teams: A proposal to understand faculty development impact in the workplace

Authors
Kevin Tan, Department of Neurology (TTSH Campus), National Neuroscience Institute, Singapore
Jai Rao, Department of Neurosurgery, National Neuroscience Institute, Singapore
Yang-Yann Foo, Duke-NUS Medical School, Singapore
Nigel CK Tan, Department of Neurology (TTSH Campus), National Neuroscience Institute, Singapore

Presenter: Kevin Tan, Department of Neurology (TTSH Campus), National Neuroscience Institute, Singapore

Background: We present the evolution of faculty development (FD) planning at National Neuroscience Institute (NNI), Singapore. From studying FD impact on individual participants, we plan to examine FD impact on collaborative practices in the workplace.
Method: In Phase 1 (2013 to 2017) of our annual Education Day, half-day workshops involving doctors, nurses, allied health professionals, researchers, faculty and residents focused on three Academy of Medical Educators (UK) domains: Teaching and Facilitating Learning (Engage), Assessment of Learning (Assess), and Designing and Planning Learning (Design). These sessions were facilitated using Kolb's experiential learning theory and four-stage cycle of learning where participants were taught using a combination of pre-readings, didactic teaching, active experimentation and reflections.
Results: A total of 248 participants attended 2013-2017 Education Day. Participants scored 4.4/5 for "relevance of topics", 4.2/5 for "learning about medical education" and 4.5/5 for "learning about other health professionals". Participants' qualitative comments included the following: "well balance topic and good mix of people", "good interaction and teamwork", and "I have learnt through the different groups sharing". Reflections and action plans by participants included: "I will encourage pre-reading and post teaching reflections", "I will use different teaching methods depending on the learner", and "I will be more active in giving and asking for feedback".
Conclusion: Our FD program seemed to be effective for individual participants. However, to produce generalizable knowledge that can guide future FD, we need to apply Irby & O'Sullivan's expanded FD model and evaluate our program's impact on two communities of practice: the community among participants in FD programs, and how their learning together facilitates collaborative practice in the workplace. Thus, in phase 2 (2018 to 2022), we will continue to run our annual Education Day addressing the Engage, Assess, and Design domains. The difference will be that our lesson plan will utilize a conceptual framework comprising shared mental models and knowledge construction to understand how teams learn and collaborate in the workplace. Constructivist grounded theory will inform our data collection and analysis procedures.
Take-home message: Faculty development efforts need to address impact on workplace practices.

5DD16 (1487)
When clinicians become teachers: a long-term outcomes of faculty development

Authors
Kanokwan Sriruksa, Khon Kaen Medical Education Center, Khon Kaen, Thailand
Rajin Arora, The Office of Collaborative Project to Increase Production of Rural Doctor, Ministry of Public Health, Bangkok, Thailand
Usa Siriboonrit, The Office of Collaborative Project to Increase Production of Rural Doctor, Ministry of Public Health, Bangkok, Thailand

Presenter: Kanokwan Sriruksa, Khon Kaen Medical Education Center, Khon Kaen Hospital, Khon Kaen, Thailand

Background: Clinical teaching is not by default especially in the institutions where medical services used to be the primary focus. Since the implementation of the Collaborative Project to Increase Production of Rural Doctor (CPIRD) in 1995, the faculty development program was carefully planned and carried out over the 20 years period to ensure that all clinicians in the hospitals with new medical education centers (MEC) were qualified in their new roles as clinical teachers. This study aimed to report long-term outcomes of the Essential Course for Medical Educators (ECME).
Method: ECME is a year-round program comprises six 3-to 5-day workshops. The program was designed based on 3 concepts: integration of the existing courses with the new ones, feasible for busy clinical teachers, fostering in-depth knowledge. The themes were teaching and learning, curriculum development, instructional design, assessment and medical education in practice. All participants must attend at least 80% of total times and complete 12 out of 22-25 assignments to receive a certificate. The program was evaluated based on Kirkpatrick model. An online questionnaire was used to assess long-term outcomes at year 4 since the beginning of the program.
Results: Over the 5-year period since 2013, there were 183 participants from 37 MEC and 6 medical schools. The completion rate was 74%, 50%, 69% and 83% from 2013 to 2016 respectively. The program received high students' satisfaction in content delivered, lecturers and usefulness of assignments. All responders will recommend the program to their colleagues. 60% of all responders are in executive positions, 62% completed up to 6 medical education research and 87.3% created up to 10 e-learning modules and study guides. All reported that they gained knowledge and changed their teaching practices, 97% were more confident in teaching roles, 95% could be consultants to colleagues, and 84% played major roles at an institutional level in medical education. Seventy-three and 71% observed some changes at an institutional level of teaching practices and assessment process.
Conclusion: Long-term evaluation showed positive outcomes both personal and institutional levels in various aspects including leadership, changes in practices, and creating learning tools and research.

5DD17 (1832)
Impact of a 'Leaders in Higher Education' workshop at AMEE 2017

Authors
Anita Laidlaw
Lisa Rucker
Shelley Parr

Presenter: Anita Laidlaw, School of Medicine, University of St Andrews, UK

Background: Within medical education, faculty development, particularly focusing on leadership within medical education is a growing field of research. Evidence suggests that leadership training interventions are well received, however evaluation is not often theoretically grounded.

This study aims to investigate the impact of attendance at a brief career development workshop during AMEE 2017. An additional aim is to uncover whether components of the Theory of Planned Behaviour and goal setting predict whether intentions to alter behaviour formed during or immediately following the workshop are actually carried out by the individual.

Method: All attendees of a workshop during AMEE 2017 (run by Stephanie Marshall CEO of the Higher Education Academy (HEA) in the UK) were invited to complete an online questionnaire which examined attitudes towards making changes to forward their careers, what control they perceive they have over such changes and their perceptions of the views of others towards them forwarding their career. The impact of these factors, goal setting and the workshop content on their career in the 6 months following the workshop were examined. Quantitative data was analysed using appropriate statistical techniques whilst qualitative responses were analysed using thematic analysis.

It is predicted that the attitude the attendees have towards forwarding their careers, their perceived control over career changes and the perceived beliefs of those around them towards their careers will influence intention to forward their careers. It is also predicted however, that goal setting will be the major factor to predict whether any action to forward their careers has taken place.

Conclusion: The evidence presented can be used to inform the format of future faculty development workshops, specifically the value of ensuring goal setting occurs within development workshops. The evidence also highlights the importance of evaluating the impact of faculty development workshops.

Take-home message: Faculty development workshops should be evaluated to assess their impact and inform future development.

Students' and examiners' feedback of Objectively Structured Clinical Examination: a Caribbean experience

Authors

Md. Anwarul Azim Majumder, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Bridgetown, Barbados
Alok Kumar, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Bridgetown, Barbados
Bidyadhar Sa, Faculty of Medical Sciences, The University of the West Indies, St Augustine Campus, St Augustine, Trinidad and Tobago
Krishnamurthy Kandamaran, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Bridgetown, Barbados
Peter Adams, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Bridgetown, Barbados

Presenter: Md. Anwarul Azim Majumder, Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Bridgetown, Barbados

Background: Objective Structured Clinical Examination (OSCE) is used in medical education for assessing students' clinical competence in a more comprehensive, consistent and structured manner.
Method: Final year MBBS students of the Faculty of Medical Sciences, The University of the West Indies, Cave Hill Campus, Barbados, were assessed by OSCE for the clinical competencies in Medicine and Therapeutics course. At the end of clinical exam, students and examiners were provided with feedback questionnaire to obtain their views and comments about the OSCE.
Results: A total of 52 students and 22 examiners completed the questionnaire. Majority of the students provided positive views regarding the attributes (e.g. exam was fair, well administered, well-structured and well-sequenced, and wide knowledge area and clinical skills covered), quality (e.g. fully aware of the nature of the exam, instructions were clear and unambiguous, tasks asked to perform were fair and sequence of stations logical and appropriate), validity and reliability of OSCE (e.g. scores provide true measure of essential clinical skills, scores are standardized, practical and useful experience), and perceived organization of the OSCE (e.g. orientation, timetable, announcements and quality of exam rooms). Majority of the examiners also satisfied with the organization and quality of the OSCE.
Conclusion: Overall, OSCE was perceived very positively and welcomed by the students. Students mention certain negative views such as stress and difficulty, however these could be overcome through better orientation and preparation of the students.
Take-home message: Students and examiners are satisfied with the overall organization and quality of the OSCE; however, students' stress and difficulty associated with OSCE can be overcome by orientation and preparation of the students.

Assessing validity of multisource feedback in a international medical education programme in a southern Taiwan hospital

Authors

I-Ting Liu, Department of Family Medicine, Department of Medical Education E-Da Hospital/ I-Shou University, Kaohsiung, Taiwan
Chi-Wei Lin, Department of Family Medicine, Department of Medical Education E-Da Hospital/ I-Shou University, Kaohsiung, Taiwan
Ru-Yi Huang, Department of Family Medicine, Department of Medical Education E-Da Hospital/ I-Shou University, Kaohsiung, Taiwan
San-Nan Yang, Department of Pediatrics, Department of Medical Education E-Da Hospital/ I-Shou University, Kaohsiung, Taiwan
Yu-Ching Lin, Department of Family Medicine E-Da Da Chang Hospital, Kaohsiung, Taiwan
Pei-Chun Kuo, Department of Medical Education E-Da Hospital, Kaohsiung, Taiwan

Presenter: I-Ting Liu, Department of Family Medicine, Department of Medical Education E-Da Hospital/ I-Shou University, Kaohsiung, Taiwan

Background: There are increasing international medical education programmes developed to improve global health and strengthen cross-country cooperation in public health. This is the first study to assess the validity of multi-source feedback (MSF) for international medical students and assessors selection bias in a transcultural environment with significant language gap.
Method: This study is conducted with a 4 -year graduate-entry course in medical offered by a teaching hospital in Taiwan (E-DA). Students came form africa, middle/south america, caribbean, pacific islands. Chinese Sheffield Peer Review Assessment Tool was used as MSF. There are 14 assessors included faculties, residents, nurses and standard patients.
Results: 216 MSF were collected from 32 international medical students. Construct validity of MSF was proved by mutiple linear regression after adjustment for age, gender, language and nationality of the trainees. Patients (b=0.574, p=0.027) rated trainees most positively, followed by nurses (b=0.508, p=0.039), residents, faculties. MSF score was found to correlate with mini-CEX (r= 0.169, p=0.018), which shows MSF is measuring expected construct.
Conclusion: Our results showed patients tended to rate trainees most positively, followed by nurses, residents, faculty assessors which provide evidence of construct validity of MSF. Patients and nurses rated trainees significantly higher than faculties. One of potential explainations is halo effect, which is the tendency to give "global perception" rather than assessing a specific construct. Another is leniency bias which means raters'

confidence in their abilities may change their standard for scoring.

Take-home message: Our results showed patients and nurses rated trainees significantly higher than faculties, which provide evidence of construct validity of MSF in assessing international medical students with language barriers.

5EE3 (3093)
Postgraduate students' perceptions of assessment feedback: A case study of a Clinical Dermatology Masters course

Authors
Sofia Hadjieconomou
Hamish Cox
Michal Tombs

Presenter: Michal Tombs

Background: Students' perceptions on feedback have been explored by a large number of studies in recent years. The growing interest to understand students' perceptions originated from dissatisfaction scores reported on student surveys. Although undergraduate students' perceptions have been explored extensively, only a limited number of studies have been completed with postgraduates. This qualitative study explored the perceptions of taught postgraduate students enrolled on a Clinical Dermatology Masters Course.
Aims: 1) To understand students' perceptions regarding their received feedback; 2) to inform the literature on the perceptions of taught postgraduate students and; 3) to inform local stakeholders of the Masters course.
Method: Critical Incident Technique (CIT) was used via semi-structured interviews to allow an in-depth investigation of participants' perceptions. Ten students participated in the study with one dropping out, providing a total final number of 20 CITs.
Results: Content, process and outcome were the three higher-order themes that resulted from a thematic analysis. Moreover, the analysis indicated likes and dislikes expressed by students. A preference was expressed towards feedback where content was: specific and clear, used positive tone of language In terms of process, students valued feedback that reflected their grades, was individualised and delivered in a standardised format, where the marking criteria was explicit and when feedback promoted dialogue. Depending on the type of task students received feedback for, both delayed and immediate feedback was perceived as effective. Effective feedback was linked to increased confidence and improvements in future assignments. Students disliked feedback that was provided by anonymous graders, related to grammatical errors and contained personality judgements.
Conclusion: Educators and programme directors should consider the content, process and outcome of feedback when working with postgraduate students. Early recognition of students' preferences is advised to maximise their learning experience.

ARLO - Asynchronous Repetitive Learning Opportunities in a medical trainee environment

Authors
Jeremy Rezmovitz, University of Toronto, Toronto, Canada
Ian McPhee, University of Toronto, Guelph, Canada
Elizabeth Wooster, OISE/University of Toronto, Canada
Jerry Maniate, University of Toronto, Canada

Presenter: Jerry Maniate, University of Toronto, Canada

Background: Feedback plays an integral role in training environments. Feedback plays a vital role in learning and retention of knowledge. The role of formative and summative feedback has been extensively studied in undergraduate medical education and, to a lesser extent, in postgraduate medical education. The nature of feedback in undergraduate medical education has been well described (Erikson) and ranges from OSCEs and simulation to ITERS and one-on-one feedback. As training environments continue to evolve and move beyond the traditional clinic format, it is essential that forms of feedback that support these nontraditional forms of environments are also developed. During the development of these forms of feedback, it is important that multiple factors be considered. These factors include: the training environment, the level of the trainees, the type of training (face to face vs distributed), and the training topics.
Method: The purpose of this project was to describe the role and nature of feedback in the medical education continuum and how it is evolving as the medical education continuum evolves towards a competency based curriculum.
Results: The role of formative and summative feedback has been extensively studied in undergraduate medical education and, to a lesser extent, in postgraduate medical education. In terms of continuing medical education, the role and nature of feedback is less rich. In order to enrich the discussion regarding feedback in continuing medical education, experts in the field are being surveyed to see if the themes that were identified resonate and reflect the current status of the field.
Discussion & Conclusion: As medical education moves towards a competency based format and away from a traditional training environment, the role and nature feedback will need to be described and developed to complement the changing environment. It is important that medical educators create feedback modalities that compliment and support the training environments that emerge.
Take-home message: The evolution of medical education emphasizes the importance of understanding the role and nature of feedback across the continuum. This understanding is vital to ensure that feedback is used effectively to support the training environments that are developed.

5EE5 (1661)
Diversity of narrative feedback (NF) of formative comprehensive examination (FCE) in medical students in tertiary care hospital

Authors
Narin Chindavech
Rungnapa Pengprakhon
Yada Siriphannon
Surasak Aumkaew
Thanatpong Thienwuttiwong

Presenter: Narin Chindavech, Buriram Medication Education Center, Buriram, Thailand

Background: Narrative feedback (NF) referred to students comments, in writing to assess the performance. The comments could be any aspect including contents and skills, interactions with peers and professionalism. The comments should be based on individual, small groups and used in formative assessment, to improve their performance through reflection strengths and weakness. Recently, NF became more familiar used because of it opened in opinion to explore in-depth information. Combination of using NF, group NF (gNF), formal constructive questionnaires and online feedback (FQF) to reflects student assessment in post FCE compared to tradition. The context of NF included all dimensions of history taking, physical examination, counselling, communication, procedural skills, attitude.
Method: Twenty eight of 6th year medical students after complete FCE were assigned to individualized NF using A4 paper by writing their own opinion (Station 1; NF), formal constructive questionnaires and online feedback (station 2; FQF), group of three students with one A4 paper of NF (Station 3; gNF). Each station were 15 minutes. The results of three stations were analyzed in-deep appraisal in both contents and learning inspiration.
Results: The NF expressed in pictures and narrative wording of students knowledge, learning methods, in-confident, fearful and stressful in FCE, frightened with real patients, emotional stress, failure to prepare or competency, frightened and excited of the bell time of OSCE. While gNF received more details of story-telling, connection thought between other students, creativity to empower their peer. They also drawn the picture of plant grown up, in cartoons styles, sitting in the safe atmosphere and expressed in empowerment of Thai idiom, even though pressure of recent examination. Students appreciated in both NF and gNF with more satisfaction scores.
Conclusion: Various tools in feedback method can be combination used to get the more details of learners. FQF get information of trends, and numeric results, NF get more information of emotions while gNF get in-deep of power of creativity and effort the leaning groups to meet the goals.
Take-home message: Diversity of feedback methods contributed to various and different perspective views of the learners in medical evaluation.

5EE6 (2031)
Effect of Direct Feedback on Success Rate of Pediatric Intubation in Final Year Medical Students

Authors
Woranart Ratanakorn, Chonburi Hospital, Chonburi, Thailand

Presenter: Woranart Ratanakorn, Chonburi Hospital, Chonburi, Thailand

Background: Pediatric airway anatomy differs from adult anatomy in multiple significant ways, making intubation of a pediatric patient a unique challenge to medical personnel. In Thailand, last year medical students perform intubation at varying degrees of frequency and may not have access to training opportunities to reach competency in the skill. Simulation-based interaction demonstrated improvement in intubation performance, while also decreasing instances of harmful actions. Hands-on practice with pediatric mannequins with one-by-one direct feedback may ameliorate success rate on pediatric intubation.
Method: Forty final year medical students were randomly divided into two groups. First group was trained by simulation-based interaction plus one-by-one direct feedback, while second group was trained by simulation-based Interaction only. Objective Structured Clinical Examination (OSCE) and self-evaluation was used to assess efficacy of intubation skills and student's confidence respectively. Successful intubation was defined as placement of the endotracheal tube in the trachea within a duration of 30 seconds in the first-attempt.
Results: The group with direct feedback had success rate on pediatric intubation of 65% compared to 34.38% of no direct feedback group ($p < .05$). The average time to first successful intubation was 30.78 VS 43.18 second in group with and without direct feedback respectively. The group with direct feedback reported more confident significantly based on 0-2 scale (0.95 VS 0.61, $p < .05$).
Conclusion: Direct feedback is the interactive method leading to gain more experience and motivation. Using hands-on practice with one-by-one direct feedback demonstrated enhancement in first-attempt and overall pediatric intubation success.
Take-home message: Direct feedback is essential tool to promote learning.

5EE7 (347)
Peer Feedback: A Mixed Methods Analysis of Quantity, Quality and Content Over Time

Authors
Nathalie K. Zgheib
Dayane Daou
Ramzi Sabra

Presenter: Nathalie Zgheib, American University of Beirut Faculty of Medicine, Beirut, Lebanon

Background: Despite the obvious role of feedback in effective learning, a common complaint from students is that they do not receive enough helpful (or quality) feedback defined as being descriptive and not evaluative, specific, relevant to their needs, and usable. The aims of this study were to evaluate the quantity and quality of written comments provided by medical students to their peers at different time points, describe the prevailing themes, assess whether the peer feedback process is useful to students, and examine how it can be improved.
Method: Quantitative analysis of peer comments of two different medical school classes at three different time points was carried out. Prevailing themes were also extracted, and 4 focus groups were conducted.
Results: There was a notable deficiency in both the quantity and quality of the peer comments. Prevailing themes were personality traits, contribution or participation, and cognitive abilities. Several factors were identified, including some that are logistical and operational and can be corrected easily, such as timing of the assignments and the need to provide more training. Other factors stood out as major substantive limitations, and these can be summarized in three broad themes: 1) the students' misunderstanding of the meaning, purpose and process of feedback, 2) the idea that students are a cohesive group that wants to support each other, facing an Administration that they do not fully trust, and 3) the preference for either anonymously written or oral face-to-face communication.
Conclusion: This study provides important insights into the behavior and views of medical students as regards giving and receiving peer feedback. Findings suggest the need for further training and periodic reinforcement, continuous monitoring and advice from mentors, a trusting relationship with the Administration and assurance of a "safe" environment, a culture of openness, tolerance and forthrightness, and demonstration of how beneficial feedback can be.
Take-home message: Students misunderstand the meaning, purpose and process of peer feedback. They are a cohesive group that wants to support each other, facing an Administration that they do not fully trust. They prefer face-to-face oral communication over anonymously written feedback.

5EE8 (336)
Utilising a wasted resource at conferences: The Online Audience Feedback Platform

Authors
Jessica Pearce, Hull York Medical School, York, UK
Jessica Gallagher, Severn Foundation School, Bristol, UK
Clare van Hamel, Severn Foundation School, Bristol, UK

Presenter: Maisie Shrubsall, Severn Foundation, Bristol, UK

Background: People want more feedback, but often don't receive it because of the time and resources required to provide it. At conferences, there is a potential wasted resource for providing feedback to presenters: the audience.
Method: We trialled an Online Audience Feedback Platform (OAFP) for audience members to provide feedback to presenters at the National Foundation Doctors Presentation Day (NFDPD) on 13th January 2018. NFDPD is an annual conference where Foundation Doctors are invited to present research and Quality Improvement Projects they have undertaken. The online feedback platform was created on the open access website Padlet™. A homepage outlined the idea and lists the 19 oral presentations at the conference; each presentation then had an individual page where audience members can post feedback during and for 10 days following the conference. The idea and link were shared with attendees via email, flyers, posters and a presentation at the start of the conference. Quantitative and qualitative analysis of the feedback left on the platform will be undertaken. Audience members and presenters' views of the platform itself will be collected via the post-conference survey.
Results: A total of 203 comments were left on the platform across the 19 presentations. The number of comments left per presentation ranged between 3 and 27 (mode=8, mean=10.7). Qualitative analysis of the feedback left on the platform will be undertaken and the findings of the post-conference survey will be presented.
Discussion & Conclusions: The platform was well utilised and all presenters received feedback on their work. Qualitative analysis of the feedback provided for presenters, and audience members and presenters views on the OAFP itself, will be presented and used to inform how the OAFP can be improved for future conferences.
Take-home message: Presenters at conferences put a lot of time and effort into their work, but don't always receive the feedback that they want and need to improve in future. We propose that utilising the time, knowledge and experience of the audience at a conference to provide feedback for presenters will improve the experience and learning for both parties.

5EE9 (2353)
Online formative evaluation: a tool to improve learning outcome

Authors
Pakwimon Subhaluksuksakorn, Institute of Medicine, Suranaree University of Technology, Nakhon Ratchasima, Thailand
Kanala Chanvirat, Institute of Medicine, Suranaree University of Technology, Nakhon Ratchasima, Thailand

Presenter: Pakwimon Subhaluksuksakorn, Institute of Medicine, Suranaree University of Technology, Nakhon Ratchasima, Thailand

Background: Various methods of formative evaluation are developed and challenged to answer its concept. The aim of this study was to create an online formative evaluation in order to promote learning among students and to identify the correlation between formative and summative evaluation scores of students.
Method: An online formative self-assessment was developed comprising of 46 multiple choice questions (MCQ) that covered 6 classroom topics of epidemiology. Hundred and twenty third-year medical and dental students were participated in the epidemiology subject. Epidemiological handouts were provided to all students. Students performed online self-assessment before and after and got feedback after classroom on their performances both scores and contents of what they have learned for each classroom topics.
Results: Students did not read handouts before 6 classroom participation in range of 42.5%-76.7%. Mean scores of online test before and after classroom were 13.9 (SD 3.4) and 24.1 (SD 5.3) respectively and mean difference was 10.3 (SD 4.9). Mean scores of online test before classroom was higher among students who read handouts in comparing with those who did not read handouts. While mean scores of online test after classroom was not statistically different. The correlation coefficient (r) of online test before and after classroom in relationship to paper-based final examination (70 items of MCQ) were 0.32 and 0.45 with p-value < 0.01 respectively. In addition, mean scores of final examination was higher among students who read handouts before classroom in comparing with those who did not read handouts. Students were satisfied to online formative evaluation with timely feedback both scores and contents.
Conclusion: Online formative evaluation is positive, simply and timely feedback for students. However, self-study before classroom and active attending during classroom will enhance learning outcome in parallel with online formative evaluation.
Take-home message: Online formative evaluation and self-study can lead to better learning outcome for medical and dental students.

5EE10 (3263)
Using mock written exams to deliver Obstetrics & Gynaecology teaching to year 4 medical students

Authors
Siew-Veena Sahi
Pratik Solanki

Presenter: Siew-Veena Sahi, Princess Alexandra Hospital, Harlow, UK

Background: Medical school curriculum in the UK is such that written exams form a substantial part of formal assessment. The benefits of a peer-assisted mock OSCE, and its role in reducing anxieties, have been demonstrated. However, medical students have limited opportunities to practice written questions under exam conditions prior to the final exam itself. This study aims to identify how mock written exams are a valuable tool in improving confidence sitting Obstetrics & Gynaecology final exams in fourth year medical students.
Method: This project involves two parts. The first part is the creation of a mock exam consisting of single best answer (SBA) questions, and a second is a PowerPoint based teaching session to go through the questions. Prior to sitting the mock, students will first complete a pre-exam survey which evaluates baseline confidence and attitudes towards different modalities of delivering non-clinical teaching. Upon completion of the mock, there is an hour long session to mark their own paper and go through the questions & answers in detail. Finally, the students will fill in a post-exam survey to elicit any changes in confidence, perceived usefulness of the mock exam, and if the students would attend another.
Results: Using a paired T-test, mean confidence in sitting a written exam rose by 1.6 points (95% CI 0.92-2.28) from 2.2 to 3.8 with a p value of 0.0028. In the pre-course questionnaire, 100% of students expected the mock to be extremely useful, and this was unchanged post-course. 100% of students said they wanted to attend another mock exam.
Conclusion: Mock exams with answers would be useful for all specialty exams for 4th years, especially due to the difficult nature of the topics. The GMC recently published data illustrating that medical students moving from year 4 to 5 had the highest failure to progress rates, demonstrating the need to explore more teaching methods to better prepare students for specialty exams.
Take-home message: There is clearly scope for the implementation of mock written exams as a method of preparing year 4 students for formal exams in Obstetrics & Gynaecology.

5EE11 (3239)
The role of peer assessment as a learning tool in history taking and history presenting skills

Authors
Alba Bajrami
Mohammad Nazir
Zubair M. Qureshi

Presenter: Alba Bajrami, Mid Cheshire Hospitals, Crewe, UK

Background: History taking and subsequent oral case presentation is an essential skill in clinical practise. It is poorly taught and assessed in medical curricula. Yet fluent case presentations are often expected from newly qualified doctors. Peer assessment as a learning tool aims to provide students with practise and feedback.
Aim: To assess the effect of peer assessment as a learning tool for developing skills in history taking and oral presentations.
Method: Twelve medical students on clinical placements and two post-graduate faculty members as assessors, based at Leighton Hospital in May 2016. Students from different wards were paired and asked to identify suitable patients for history taking and subsequent history presentation away from the bedside. A standardised checklist was provided to aid peer assessment and feedback. Students repeated patient history to the faculty member who marked them using the same checklist to look for discrepancies in marks and provided additional feedback.
Data collection: Checklist from peer and faculty assessor. Questionnaires were provided before and after to the medical students to assess students' confidence in history taking and oral presentation before and after the assessment, and the usefulness of peer assessment in identifying areas for improvement. Discrepancies in marks between peers and faculty assessors was reduced with subsequent presentations.
Results: More than 75% of students felt more confident in presenting histories to their peers post-assessment.
All 12 students agreed a structured proforma was a useful tool in assessing their peers. 100% agreed that the peer assessment session has motivated them to improve their history taking and presenting skills further.
Conclusion: Peer assessment is a useful tool in highlighting areas for improvement and motivating students to improve history taking and oral presentations. This has been supported by a number of studies which have reported positive effects from peer assessment in medical education. Other studies have shown that peers uniformly over-rate due to lack of anonymity. However, our results show that this is reduced with subsequent presentations.

Peer-Assessment predicting learning achievement in undergraduates

Authors
Ratana Jirakalvisan, Hatyai Hospital, Songkhla, Thailand
Pairoj Boonluksiri, Hatyai Hospital, Songkhla, Thailand
Lucksamee Haura, Hatyai Hospital, Songkhla, Thailand

Presenter: Ratana Jirakalvisan, Hatyai Hospital, Songkhla, Thailand

Background: Peer-Assessment (PA) is a form of assessment, which can be designed with summative or formative goals. It provides students evaluate the academic products or performances of their peers in the realm of automated peer observation. PA should be a tool to build student to learn actively in and out classroom during the course. Objective: To determine PA as a predicting factor of learning achievement.
Method: Cross-sectional study was conducted. All of 41 Yr-4 medical students rotating to health promotion discipline in 2017 were divided into small groups of 10 and evaluated the performances of their peers in learning activities such as lectures, workshop, research project, and teamwork. Seventy-one percent are female students. PA form was developed as a part of summative assessment using 5-point rating scale including 6 aspects such as curiosity, teamwork, leadership, generosity, knowledge application, and punctuality. Multiple regression analysis was performed to determine the association between PA and learning achievement with the final grade point of discipline).
Results: Alpha reliability of PA tool was 0.98. The mean score of performances by PA was somewhat equal in all 6 aspects (4.6+0.5 to 4.7+0.4). No any aspects were associated with total performance scores. Final grade point was 3.45+/-0.38. The prediction model of learning achievement showed that teamwork, knowledge application and paper test were associated with final grade point (p-value 0.026, 0.017, and <0.001 respectively). Gender and research project were not found as predictors of learning outcome.
Conclusion: Not surprisingly, a paper test can determine the final grade point. Moreover, PA can predict learning achievement particularly in the aspect of teamwork and knowledge application. The advantage of PA is that it can be applied as a formative goal during coursework with feedback. The contents of performance assessment using PA can be modified by context.
Take-home message: Peer-Assessment is a practical tool to evaluate performance during coursework such as knowledge application with teamwork and to predict learning outcome.

5EE13 (249)
Self-prediction of exam result on a high stake MCQs examination. Can you believe your gut feeling?

Authors
Panwara Paritakul
Monton Wongwandee

Presenter: Panwara Paritakul, Faculty of Medicine, Srinakharinwirot University, Bangkok, Thailand

Background: After finishing an examination, students usually form an idea about how well they have performed. We aim to investigate how accurate are the medical students' perceptions of their performance on a high stake MCQs examination.
Method: Immediately after finishing 200 items MCQs covering clinical science subjects, which is part of an exit examination at our medical school, we asked the 6th year medical students to predict their score and to predict if they will pass or fail the exam based upon their instinct.
Results: Of the 170 students invited, 148 participated in the study. The self-predicted score has a positive correlation with the actual obtained score (R 0.45, p <0.01). 68 (46.6%) students accurately predict their score (the obtained score was within ± 10 range from the predicted score). 48 (32.9%) underestimated their score, and 30 (20.5%) overestimated their score. Among the students that believe they will pass the exam, 98.5% eventually pass the exam, and only 1.5% fail the exam. Among the students who believe they will fail, only 18.2% subsequently fail the exam, and 81.8% pass the exam.
About half of the students self-predicted their score accurately. The feeling that they will pass the exam has a high positive predictive value (98.5%), but the feeling that they will fail the exam has a low positive predictive value (18.2%).
Conclusion: A positive feeling towards passing an examination is a reliable predictor of the "pass" examination result, while a self-perception of failing the exam is not a reliable predictor of a "fail" exam result.

Self- and assessor ratings on entrustability scales in simulated advanced life support

Authors
Antje Degel, Charité Universitätsmedizin Berlin, Dept. of Cardiology and Office of Study Affairs - Central Organization of Emergency Curriculum
Ylva Holzhausen, Charité Universitätsmedizin Berlin, Dieter Scheffner Center for Medical Education and Educational Research
Harm Peters, Charité Universitätsmedizin Berlin, Dieter Scheffner Center for Medical Education and Educational Research

Presenter: Antje Degel, Charité Universitätsmedizin Berlin, Dept. of Cardiology and Office of Study Affairs - Central Organization of Emergency Curriculum, Berlin, Germany

Background: The belief in one´s competence in applying life support (ALS) has been linked to bystanders´ willingness to provide ALS in a real or hypothetical cardiac arrest scenario. Students at the end of their undergraduate studies and in their advanced emergency course are neither lay bystanders nor professional resuscitation officers. For them and their future patients, a calibration of self-perception and instructor assessment is vital. Entrustability decisions on entrustable professional activities lend an intuitive tool with high practical relevance.
Method: Medical students themselves and their instructors serving as assessors rated the performance in the 5th year emergency simulation training. Rating was based on an entrustablity scale for undergraduate medical education and reflected the assignment of a supervision level needed to carry out and lead advanced life support procedures under real-life conditions. Both ratings were compared.
Results: A total of 113 students and 13 instructors took part in the study. Levels of supervision in instructor and students´ self-rating differed. Students assessed themselves on significantly lower supervision levels than their instructors did. Students rated themselves on a mean level of 3.1 (SD 1.4) while instructors attributed them a mean level of 4.2 (SD 1.2), p<0.01.
Conclusion: Students seem to underestimate their ability in administering advanced life support. This could result in a reluctance of junior doctors to provide said help when needed with deleterious effects for their patients. Withholding mastered interventions in ALS can be as dangerous as performing unnecessary or untrained ones. External calibration of their skills in advanced life support might improve self-efficacy and patient care.

The Validity of Medical Students' Self-Assessment of Proficiency in Clinical Examination

Authors
Nazimah Idris, International Medical University, Seremban, Malaysia
Aiman Imran Mohmad Tahir, International Medical University, Seremban, Malaysia
Lim Lichyn, International Medical University, Seremban, Malaysia
Wong Ling, International Medical University, Seremban, Malaysia
Ng Li-Yen, International Medical University, Seremban, Malaysia
Faika Yuhani Shariffuddin, International Medical University, Seremban, Malaysia

Presenter: Nazimah Idris, International Medical University, Seremban, Malaysia

Background: The ability to self-assess is essential to the lifelong learning in the practice of medicine. It can identify strengths and weaknesses to promote reflection and improve of performance. However, the validity of self-assessment has not been well supported in the literature. This study intends to evaluate the validity of medical students' self-assessment of proficiency in clinical examinations.
Method: The study was conducted in the context of a clinical long case examination at the end of Obstetrics and Gynaecology rotation. The 80 students who participated in the study were all given a case each for them to work on. Both the student and examiner graded the student's performance using a standardized grading sheet, comprising the components of case presentation (four items), case discussion (four items) and professionalism and the overall approach towards patient care (two items). The self-assessment scores from the medical student and actual proficiency scores as given by the faculty were analysed for bias index and correlation coefficient to evaluate the validity of self-assessment.
Results: There was significant correlation between students' self-assessment and actual proficiency scores. The correlation coefficient was 0.307, $p<0.01$, indicating validity in self-assessment in the context of a clinical examination. Students underrated themselves in all areas with bias indexes of -0.35 in case presentation, -0.26 for case discussion and -0.35 in the professionalism and overall approach to practice. The correlation coefficients were 0.186, 0.360 and 0.170 respectively, indicating that in isolation only the component of case discussion showed significant correlation ($p<0.01$). Both high achievers and low achievers underrated themselves, but high achievers showed better correlation with the actual proficiency scores.
Conclusion: Self-assessment in clinical examination is shown to be a valid assessment method when multiple assessment items are combined. The findings of this study can be used to identify areas where students can be helped in doing self-assessment to improve their performance in clinical setting

Take-home message: Students should be encouraged to perform self-assessment of their proficiency in clinical setting.

5EE16 (496)
The Relationship between Performance on the IFOM Clinical Science Self-assessment and the IFOM Clinical Science Examination

Authors
Carol Morrison, National Board of Medical Examiners, Philadelphia, USA
Natalie Brown-Hunter, National Board of Medical Examiners, Philadelphia, USA
Beth Gallagher, National Board of Medical Examiners, Philadelphia, USA
Brownie Anderson, National Board of Medical Examiners, Philadelphia, USA

Presenter: Carol Morrison, National Board of Medical Examiners, Philadelphia, USA

Background: Self-assessments allow students to evaluate their knowledge and gauge their readiness for higher stakes assessments. Further, self-assessments may enhance learning through the process of taking a test. Research on test-enhanced learning or the testing effect has found that material is remembered better if one or more tests are included as part of the learning strategy. The web-based International Foundations of Medicine Clinical Science Self-assessment (IFOM CS SA) is available for international medical students to assess their knowledge of the clinical sciences prior to taking the International Foundations of Medicine Clinical Science Examination (IFOM CSE). Both examinations are available in international English, Spanish and Portuguese and are built to the same content specifications. Self-assessment users are provided with a table that allows them to translate their score to an approximate IFOM CSE score.
Method: The purpose of this study was to investigate use patterns for the IFOM CS SA for English and Spanish takers and to determine the strength of the relationship between performance on the IFOM CS SA and IFOM CSE for examinees who took both exams. In addition to descriptive analyses, linear regression analyses were run on English and Spanish takers separately with first IFOM CS SA score as the predictor variable and first IFOM CSE score as the dependent variable. An additional linear regression analysis based on all examinees tested whether the models were the same for the English and Spanish groups.
Results: Students generally took the self-assessment within a few days of taking IFOM CSE. IFOM CS SA scores explained 54% and 49% of the variance in IFOM CSE scores for the English and Spanish groups, respectively. The regression models were not the same for the two groups as indicated by significantly different slopes and intercepts ($p<.01$).
Conclusion: Results confirm that there is a moderate relationship between performance on IFOM CS SA and IFOM CSE. Students generally take IFOM CS SA shortly before they take IFOM CSE.

Take-home message: The IFOM CS SA provides students with a valuable learning tool to assess their clinical science knowledge and readiness to take the IFOM CSE.

The medical students will become expert nutritional advisors if they learn to cook

Authors
Pornpimon Kasemsook, Buddhachinaraj Phitsanulok Hospital Medical Education Center, Phitsanulok, Thailand

Presenter: Pornpimon Kasemsook, Buddhachinaraj Phitsanulok Hospital Medical Education Center, Phitsanulok, Thailand

Background: Uncontrolled of glucose level in diabetic patients greatly increases the risk of cardiovascular disease, the serious medical condition leading cause of death worldwide. Inappropriate eating habit is one of uncontrolled diabetes cause. To encourage the patients for changing their eating behavior is important thing as well as medication. Nutritional advice giving is necessary and should be given to people with diabetes at the earliest possible. For this reason the medical students should learn to be good nutritional advisors.
Method: In extracurricular hours, we set up cooking class for medical students. They were instructed by physician nutrition specialists and assigned to cook for diabetic patients by using the main ingredients, eggs which are cheap and easy to find but nutrient-rich. After the session, we asked them to answer the activity evaluation surveys, Likert scale and rank order questions.
Results: There was 82% rate response of questionnaires. The result showed 75.0% increased empathy with the patients, 73.8% had more nutritional understanding and 65.5% had more nutritional advising confidence. The other benefits which the students received were enjoyment, team building and planning skill respectively.
As you know, the diabetic food is limited of seasoning that makes it more tasteless than regular Thai food, spicy and extreme flavor. After this session the students realized it is not easy to change the eating habit especially for Thai people. Most of them said they empathized with the patients who have to eat this kind of food for a long time and understood why some patients cannot control their blood sugar level well. Understanding and empathy from direct experiences are important characteristics for someone who wants to be a good advisor.
Conclusion: Cooking class for medical students can help them give better nutritional advice to their patients. Doing is a good way for learning. It not only helps our students understand the medical knowledge intensely but also help them improve necessary skills which are important for being medical experts in the future.

5FF2 (2445)
Human Trafficking: A Curriculum Module for Medical Education

Authors
Laurie Dunn-Ryznyk

Presenter: Laurie Dunn-Ryznyk, Southern Illinois University School of Medicine, Carbondale, USA

Background: Human trafficking is a global problem that may encompass the sex trade, forced labor, domestic servitude, as well as other nefarious acts. This poster presentation will give an overview of core information regarding this problem, educational methods, content, and resources utilized in teaching didactic phase physician assistant students about this topic, with a focus on information about sex trafficking for clinicians. Most medical education programs do not include curriculum on recognizing and treating victims.
Method: A real patient problem-based learning module was developed and served as the anchor for the curriculum module. Lecture-learner, observation of curated videos, and reflection papers were also utilized. A flipped-classroom model helped to solidify and evaluate the richness of students' knowledge in this discipline. Content included an overview on trafficking, statistics, and information regarding the medical encounter, examination, assessment, and plan options for patients.
Results: Students satisfaction with the learning opportunities, acquisition of knowledge, and activities was positive. Reflection papers revealed a general lack of knowledge about this problem with regard to local, national and global incidence. Level of knowledge improved as evidenced by pre and post-test scores.
Conclusion: It is estimated that 80% of trafficked individuals are female and 50% of victims are minors. In the USA, it is estimated that 88% of trafficked persons have contact with health care workers at some time during their captivity. However, only 5% of health care workers have been trained in the recognition and treatment of these people. Victims of sex trafficking may present with a multitude of health concerns, including sexually transmitted infections, burns, lacerations, pregnancy, fractures, mutilation, abdominal pain, and dental complaints. Additionally, associated conditions include poor mental health, drug and alcohol dependence and abuse. Learners need to be aware of signs and symptoms common in trafficking victims, trauma-informed care, options for assisting patients, action plans for facilities, and resources available at the local, national and international levels.
Take-home message: Human trafficking awareness should be included in medical education programs.

Are doctors good enough in Sexual Medicine? - Improving Sexual Medicine Curriculum in Asian Medical Schools Based on Competency Levels of Practicing Doctors

Authors
Yi Heng Seow
Qiuli Angela Tan

Presenter: Yi Heng Seow, Lee Kong Chian School of Medicine, Nanyang Technological University-Imperial College London, Singapore

Background: Southeast Asia has the world's highest prevalence of sexual dysfunction, illustrating the need for good sexual medicine (SM) services here. Asian cultural sensitivities can make this personal topic even more difficult to teach. Studies in the West have demonstrated low competency levels amongst practicing doctors and the need for improved undergraduate curricula, but Asian data has been scarce. We aim to evaluate competency levels of Singaporean doctors in SM to explore ways to improve SM curriculum in medical schools.

Method: A cross-sectional descriptive study was conducted on practicing doctors. We developed, validated and administered a 13-item questionnaire assessing doctors' self-reported competency in SM Knowledge and Skills on a 5-point scale (Cronbach's a>0.871). Respondents' attitudes towards SM and perceptions of SM teaching were also captured.

Results: 55 responses were received from doctors across a range of specialties. Competency levels in SM knowledge (mean=3.32±0.75) and skills (mean=3.15±0.89) were low and were predicted by attitudes towards SM.

Lack of time (50.9%), irrelevance to their practice (41.8%) and sexual health (SH) being an 'awkward topic' (29.1%) were identified as barriers to approaching SH during consultations. Respondents identifying lack of time and irrelevance as barriers in consultations had lower competency levels (p=0.042, p=0.009).

90.6% reported that they would be more confident in SM if they received more undergraduate training. 58.2% and 32.7% of respondents believed supervised patient encounters and small group tutorials were the best way of learning SM respectively.

Conclusion: Our study found 'awkwardness' to be a major barrier in SH consultations, a phenomenon uncommonly observed in Western studies which may be contributed by cultural sensitivities. In these challenging settings, it is important to develop awareness, skills and confidence in SM in medical school to better prepare doctors for clinical practice.

We propose a combination of simulated patient encounters to hone students' clinical skills and interactive small group tutorials with engaging and open tutors to improve awareness and attitudes towards SH while reducing cultural barriers.

Take-home message: Sexual medicine curricula should be improved by focusing on attitudes, cultural sensitivities and clinical skills.

5FF4 (2019)

Undergraduate dermatology course to improve confidence in assessment of skin conditions

Authors
N Jegatheeswaran
SZ Imam
A Liakopoulou
P Solanki

Presenter: Nihethana Jegatheeswaran, The Princess Alexandra Hospital, Harlow, UK

Background: Dermatology is a complex speciality with over 2000 diagnoses. However, at undergraduate level, student exposure to dermatology is limited to few lectures and clinics. Our aim was to increase the confidence of medical students in dermatology, in preparation for their role as junior doctors.

Method: We designed a dermatology course for fifth year medical students, in preparation for their final exams. We ran 4 sessions with different groups of students and constant improvements were made to the course based on the student feedback. The course opened with an introductory lecture, delivered by a dermatology registrar, focusing on the dermatology knowledge required for finals. The students were then split into small groups, where tutorial and assessment style sessions were led by near-peer foundation doctors. These included how to take a dermatology history as well as examining and describing skin conditions. Students received instant feedback from the tutors. The student's confidence at the beginning and at the end of the course was assessed using the Likert scale. Also, students gave detailed feedback on each teaching session with suggestions on how it could be improved.

Results: In total, 27 students attended the course over the 4 sessions. The students were asked to rate the content and the delivery of each teaching session, from 1 to 5 (very poor to very good). The mean average ratings for the content of the three sessions were; introductory lecture: 4.89, dermatology history taking: 4.89, examination of skin: 4.92. The delivery was rated as follows; introductory lecture: 4.89, dermatology history taking: 4.89, examination of skin: 4.85. There was a 31.4% and 32.7% increase in confidence for taking a dermatology history and examination of the skin, respectively (p<0.0001). Overall, 96% of those who attended would recommend the course to a colleague.

Conclusion: The course was successful in improving student's confidence in both taking dermatology history and in examining skin conditions. The content and the delivery of the teaching sessions were rated highly by the attendees.

Take-home message: Dermatology knowledge, skills and confidence can be improved through dedicated, focused teaching courses.

5FF5 (1663)

Does the undergraduate Public Health curriculum meet the recommendations of the Association of Schools & Programmes of Public Health?

Authors

Dana Vackova, The University of Hong Hong, Hong Kong
Janice M Johnston, The University of Hong Hong, Hong Kong

Presenter: Dana Vackova, The University of Hong Kong, LKS Faculty of Medicine, School of Public Health, Hong Kong

Background: To evaluate the merit of multidisciplinary public health (PH) teaching and learning for undergraduate medical students (MBBS) in four main domains recommended by the internationally recognised Association of Schools & Programmes of Public Health (ASPPH).

Method: Undergraduate PH courses were mapped to the highest ASPPH domain: PH knowledge, skills, social responsibility and applied learning. A mixed method study with qualitative analysis of MBBS Year 4 focus group (N=20) and quantitative analysis of the questionnaires distributed to MBBS Year 1 (N=88), Year 2 (N=197) and Year 3 (N=163) were performed to evaluate PH curriculum and students' self-perceived competencies in all four domains. Kruskal Wallis and Chi-squared tests were performed to test differences among three cohorts.

Results: PH courses arrangements, workload, relevance to clinical practice and assessment methods represented the main criteria for students' focus group PH curriculum evaluation. Across three cohorts, students self-reported results showed better recognition of PH as a scientific discipline (p<.001) at the end of each school year; and better ability to perform risk communication and development of inter-professional skills with policy makers in Year 2 and 3 (p<.001).

Results brought the valuable insight into the PH curricula showing that after one year exposure to the PH, the MBBS Year 2 and 3, students were more confident to pursue tasks in higher ASPPH domains. However, the arrangement of multidisciplinary subjects and heavy workload were assessed less favourably.

The undergraduate PH curriculum offers PH knowledge, skills, and social responsibilities and applied learning as recommended by the ASPPH.

Conclusion: Careful planning of the multidisciplinary PH courses in the undergraduate medical curriculum is needed to ensure students' confidence in gaining competencies in all four main ASPPH domains. PH learning activities in the highest domains, social responsibilities and applied learning, can be offered in the preclinical years after providing a PH knowledge and skills training.

Changes in medical student attitudes towards public health following an innovative model of integrated inter-professional teaching

Authors

Samantha Chepkin, University of Buckingham Medical School, Buckingham, UK
Dilly Karunaratne, University of Buckingham Medical School, Buckingham, UK
Kathryn Hollis, University of Buckingham Medical School, Buckingham, UK
Bharathy Kumaravel, University of Buckingham Medical School, Buckingham, UK

Presenter: Samantha Chepkin, University of Buckingham Medical School, Buckingham, UK

Background: Internationally, medical students struggle to appreciate the clinical relevance of public health (Maeshiro 2010). Feedback following public health units demonstrated students at a new UK medical school shared this difficulty, despite grasping the principles of public health. Public health teaching is therefore being embedded into clinical rotations, forming a longitudinal curricular theme.

Method: In the clinical rotations, small group seminars integrating public health with clinical teaching were developed and delivered jointly by clinical and public health professionals. These seminars incorporated interactive lectures, clinical case studies, educational prescriptions and role play. Students later participated in student-led focus groups to share their experiences and perceptions of public health and the integrated teaching. These were audio-taped, transcribed verbatim and analysed using recursive abstraction.

Results: Twenty-nine students participated in the focus groups. In contrast with previous feedback, students enthusiastically recognised the clinical relevance and importance of public health, including health promotion and Evidence Based Medicine. Factors which had influenced their views included the integrated case studies, role-modelling by clinicians, clinician-directed educational tasks and joint teaching by clinicians and public health. However, students found applying their public health skills to clinical practice difficult. Barriers included low confidence and competing course priorities. Students valued activities involving guided practice, including role plays, integrated case studies and educational prescriptions, for building confidence. To encourage regular practice, students recommended prompts in each clinical placement, in the form of public health learning outcomes, mandatory exercises or work based assessments.

Conclusion: Integrated, inter-professional public health teaching, alongside increased clinical exposure, was successful in changing student attitudes about the clinical relevance of public health. Specific, transferable, factors contributing to this phenomenon were identified. Despite understanding the principles of public health and appreciating the clinical relevance, barriers to applying public health skills remained. Guided practice and regular prompts in clinical placements emerged as methods to

promote application of public health skills in clinical practice.

Take-home message: Embedding public health into clinical rotations was successful in helping students appreciate the clinical relevance of public health, overcoming a significant international challenge in public health teaching.

Changes in medical students' attitudes towards HIV/AIDS over the past decade

Authors
Greta Tam, CUHK, Hong Kong, China
Candy Wong, CUHK, Hong Kong, China
SS Lee, CUHK, Hong Kong, China

Presenter: Greta Tam, CUHK, Hong Kong

Background: HIV epidemiology has changed in the past decade and attitude towards the disease may also have changed. We conducted a survey to compare medical students' attitudes towards HIV/AIDS in the recent years (2014-2017) to a decade ago (2007-2010).

Method: From 2007-2010, we surveyed three cohorts of medical students at the end of clinical training to assess their attitudes towards HIV/AIDS. From 2014-2017, we surveyed another three cohorts of medical students finishing clinical training to compare changes in attitudes towards HIV/AIDS over a decade

Results: From 2007-2010, 546 students were surveyed and from 2014-2017, 504 students were surveyed. All participants were included in the analysis. Significantly less students in recent years were exposed to HIV patients for the first time during their HIV clinic attachment (72% vs 39%, odds ratio (OR) 0.25, 95% CI 0.18-0.34). Significantly more students planned to specialize in HIV medicine (2% vs 11%, odds ratio (OR) 9.46, 95% CI 4.75-18.84), while significantly less students prefer not to work in a field involving HIV/AIDS (17% vs 11%, odds ratio (OR) 0.57, 95% CI 0.4-0.83). Willingness of students to provide HIV care remained the same, with 22% of students unwilling to provide care.

Conclusion: Despite more positive attitudes of future doctors towards HIV/AIDS in relation to career choice, the willingness of future doctors to provide HIV care has remained unchanged in the past decade.

Take-home message: Stigma towards PLHIV from future doctors still remain, which would hinder access to care. The current medical education curriculum and approach needs to be changed in order to address the issue of stigma.

5FF8 (1242)
Development of a Model to Educate and Train the Future Adolescent Health Workforce

Authors
Patricia Kokotailo, University of Wisconsin School of Medicine and Public Health, Madison, Wisconsin, USA
Valentina Baltag, World Health Organization, Geneva, Switzerland
Susan Sawyer, The Univrsity of Melbourne, Melbourne, Victoria, Australia

Presenter: Patricia Kokotailo, University of Wisconsin School of Medicine and Public Health, Department of Pediatrics, Madison, Wisconsin, USA

Background: Unprecedented attention is now focused on adolescents with growing appreciation of their disease burden and of the opportunities of investing in adolescent health. New investments are required to build the technical capacity for policy, programming, research and clinical care across the world, especially in resource-poor countries where most adolescents live. Strategies to educate and train the future multi-disciplinary adolescent health workforce are particularly required in these countries, which have until very recently focused on the health of very young children rather than adolescents. Competency-based education and training is the standard of education in health education and medical specialty training. Competency is difficult to quantify and standardize, however, as are the processes that underpin competency-based education and training.

The primary objective of this work was to identify how quality education in adolescent health and medicine is determined. This information was used to inform the development of a conceptual framework for institutions teaching adolescent health, which can be used to assess the quality of teaching and learning and to monitor the implementation of adolescent health competencies in undergraduate and post-graduate education.

Method: Specific evidence-based teaching modalities and assessment tools used to teach adolescent health were determined to exemplify how an educational program can be delivered and assessed. A conceptual framework integrating core competencies in adolescent health developed by the World Health Organization and health education standards from the World Federation for Medical Education Global Standards for Quality Improvement is described. The framework is informed by relevant adolescent health pedagogy and standards from multidisciplinary sources including nursing and midwifery education.

Conclusion: This framework is a step towards the development of a more adolescent-competent health workforce. The model developed is multidisciplinary and is applicable in low- and middle-income countries, as well as high-income countries. Institutional support with financial and other resources to support teaching and training, including development of faculty to implement curricula and educational standards, remains a challenge.

Take-home message: This educational framework developed could serve as a model for competency-based

and multidisciplinary education in adolescent health and as a template for other subspecialty education.

5FF9 (1200)
Does medical school prepare you for difficult conversations? Assessing the impact of a palliative care study day on the confidence of final year medical students

Authors
Alice Copley, Princess Alexandra Hospital, Harlow, UK
Hannah Costelloe, Princess Alexandra Hospital, Harlow, UK
Andrew Greenhalgh, Princess Alexandra Hospital, Harlow, UK
Andrew Foster, Princess Alexandra Hospital, Harlow, UK
Pratik Solanki, Princess Alexandra Hospital, Harlow, UK

Presenter: Alice Copley, Princess Alexandra Hospital, Harlow, UK

Background: There is anecdotal evidence that final year medical students feel unprepared for the palliative care elements of their final year exams and as a junior doctor. Most new doctors will not have practiced completing a death certificate or prescribing anticipatory medications before starting work. The literature describes that breaking bad news insensitively can cause patients additional distress. There can also be consequences to the clinician including guilt, anger, anxiety and exhaustion.
Method: We organised and delivered a palliative care study day for twenty-four final year medical students. The primary aim was to improve students' confidence by building on current knowledge and facilitating communication skills practice. The course was comprised of ten practical small group teaching, simulation and OSCE-style stations. We evaluated pre- and post-course confidence, measured on a ten-point Likert scale. We also objectively explored the impact of the day by asking participants to complete a validated assessment before and after the course.
Results: The course was highly evaluated with the mean average quality and delivery rated at 4.95 out of 5. 100% of students would recommend the course to a colleague. Confidence improved in all six of the areas evaluated: end of life communication in an OSCE setting (42.2% improvement), end of life communication as a junior doctor (41.7% improvement), filling out a death certificate (43.9% improvement), knowing laws regarding advanced care and treatment withdrawal (47.2% improvement) and being able to confirm death and document clearly (43.9% improvement). All results are significant with a p-value <0.0001 on paired T-test. Likewise there was an improvement in assessment marks by 24.7% (p=0.039).
Conclusion: Palliative care is an area in which final year medical students feel unprepared when taking their final year exams and starting work as junior doctors. Our findings demonstrate that small group sessions improve confidence and promote experience in practically dealing with common palliative care situations and therefore are worthy of any medical school curriculum.
Take-home message: Palliative care is best taught via small group learning, including simulation and OSCE-style

scenarios, as students prefer practical learning and value communication skills practice.

5FF10 (606)
The comparative study of an effectiveness in Palliative care teaching methods between bedside teaching versus paper based class case study exercises in medical students

Authors
Sukhanit Promrub
Piyabut Taotip
Orathai Seabmuangsai
Weerajit Thipprasert
Napassawan Puripanpinyo
Sucheera Amornmahaphun

Presenter: Sukhanit Promrub, Roi et Hospital Medical Education Center, Roi et, Thailand

Background: Palliative medicine is is recently introduced to terminally illed patient treatment inThailand somehow none of the medical schools have added a subject into the curriculum. This research compare the effectiveness of each teaching style which will contribute to a future curriculum planning.
Method: This quasi-experimental pretest-posttest designs was conducted. We enrolled the 4th and 5th-year medical students and then divided them into 2 groups;bedside teaching (Group I) and paper based class case study exercises (Group II). Both groups took a palliative care pre-test which consists of 50 questions in 5 following modules; concept and assessment,pain management,non-pain management, final hours of life and subcutaneous drug administration, discharge planning referral system and home care then attended the lectures according to these 5 modules. After that each group was taught by a certified palliative care doctors with 2 different methods then took a post-test which is the same as pre-test.
Results: Group I consists of 22 participants while group II has 15. This study reveals that 64.9% of the participants have seen about palliative care and therefore 59.5% believe that it should be taught in medical schools. The mean pre-test score of both groups were not shown significant differences between Group I and Group II with means scores of (19.6($\pm$ 3.6)vs20.4($\pm$ 3.4); mean difference=0.76; 95%CI -1.59–3.11,P-value=0.514) respectively while post-test score shows a different result where group I had a higher overall scores but still not significant difference with mean score of 28.8($\pm$ 3.7)and27.8($\pm$ 3.4)(mean difference= -0.98; 95%CI=-3.35-1.39; Pvalue=0.406)respectively. However, after compared post-test scores in each module; group I has a significantly higher score in an assessment and final hours of life modules with the mean scores of (5.9($\pm$ 0.8)vs4.9($\pm$ 1.5); mean difference=-0.91;95%CI-1.76- -0.06; Pvalue=0.036) and (7.7($\pm$ 1.3)vs6.1($\pm$ 1.5); mean difference=-1.53; 95%CI-2.50- -0.56 Pvalue = 0.003) respectively.
Conclusion: The bedside teaching is as effective as the case study exercises.Moreover,the bedside teaching group has higher scores than case study exercise in 2 modules included;concept and assessment,final hours of

life and subcutaneous drug administration due to their direct experience with patients.

Take-home message: There should be find the new teaching methods especially on lessons regarding 3 modules as 1) pain management 2) non-pain management and 3) discharge planning referral system and home care which the students in both groups show no significant difference scores.

Learners as Educators: Education through community research

Authors

Naira Chobanyan, American University of the Caribbean School of Medicine
Dhara R Patel, American University of the Caribbean School of Medicine
Virginia Asin, American University of the Caribbean School of Medicine

Presenter: Dhara R Patel, American University of the Caribbean School of Medicine

Background: The needs of the underserved community in St. Maarten have brought forth the implementation of the "Assessment and evaluation of breast abnormalities in the population of St. Maarten" research project by AUC clinical faculty. The conclusions drawn from this project will be utilized by the local Ministry of Health (MOH) to better serve this population. The design of this project allows students and fellows to be learners in one setting and as educators of medicine in another setting.
There is currently no data for breast abnormalities and breast cancer in the Caribbean. While the aim of the project is to ultimately report the risk factors and prevalence for breast abnormalities in this population, the design of the project serves as an educational tool to cascade medical knowledge from the fellows to students who communicate this further to the community.
Design: The need for breast and health education in this community are met via AUC's "Breast and health screening events" hosted in collaboration with MOH. During the event, medical students partake in stations including consent, breast/health questionnaire, BP/BMI/vision, blood glucose/cholesterol, clinical breast exam by the oncologist and educational talk. Stations are overseen by fellows (graduated physicians in training) and the events are overseen by licensed AUC clinical faculty and the principal investigator.
Educational Components: Fellows-The fellows train students for each station and partake in conducting medical research. Medical students-The students gain exposure to patients in a clinical setting during their basic sciences. Along with interviewing and communication in various stations, the students enhance their clinical skills by performing physical exam tasks and obtaining blood glucose/cholesterol levels. Community-The events are a platform for screening and education for the local, underserved community. Students educate participants on breast health and the importance of a healthy lifestyle.
Conclusion: AUC has identified community based research as an invaluable tool for medical education through which

fellows and medical students serve as both learners and educators.

Using the integrated palliative care outcome scale (Traditional Chinese version) as teaching materials for simulation education in palliative care to junior medical students in Taiwan

Authors

Li-Lin Kuo, Taipei City Hospital, Taipei, Taiwan
Jason J Lee, Taipei City Hospital, Taipei, Taiwan
Oscar K Lee, Taipei City Hospital, Taipei, Taiwan
Sheng-Jean Huang, Taipei City Hospital, Taipei, Taiwan

Presenter: Li-Lin Kuo, Taipei City Hospital, Taipei, Taiwan

Background: Despite the broad support for palliative care training in hospitals, medical school curriculum does not include palliative care, especially for preclinical students. Also, students do not have the opportunity to learn the tool to measure patients' physical symptoms, psychological, emotional and spiritual, and information and support needs.
Method: Taipei City Hospital created a course of palliative care for first-year medical students in National Yang-Ming University. The course introduced palliative care mostly through lecturing, video watching, in-class principles discussion and real-world case study. In one class, the teacher designed a palliative care scenario and used the simulation activity to engage students in active learning, and introduced how to use the Integrated Palliative Care Outcome Scale (IPOS) to measure the outcomes. We evaluated the feedback from the students after the whole semester.
Results: Surprisingly, participating in the simulated learning activity and learning how to use the IPOS was one the most impressive classes. Students showed interests in the development history of the IPOS, how and when to use the IPOS and how to involve in palliative care through using the IPOS to improve the outcomes of the patients and their families.
Conclusion: This was the first time using the IPOS as the teaching material in the palliative care course in Taiwan. Early introducing the IPOS to the students and teaching them the aspects the IPOS covered might be important in the palliative care education. Also, translating and validating the IPOS into the traditional Chinese version is necessary and undergoing in Taiwan.
Take-home messages:
1. Palliative care education is a good material for medical humanity education.
2. Palliative care is different from general medical skills, and need special designed training.
3. Exposure to palliative care is not adequate in the past medical education, however it's tried to be earlier.
4. A curriculum combined with lecture-based learning in classroom and clinical-based learning in hospice ward and at patient's home is a good model of palliative care education for junior medical student.
5. IPOS is quite a good tool in simulation training for young medical students before their clinical observership.

Euthanasia attitude assessment in thanatology - quantitative and qualitative analysis

Authors
Shiu-Jau Chen, Mackay Medical College, New Taipei City, Taiwan
Jiun-Lu Lin, Mackay Medical College, New Taipei City, Taiwan

Presenter: Shiu-Jau Chen, Mackay Medical College, Taipei, Taiwan

Background: The euthanasia concept is important in life and death education. What is the best method to assess the learning outcomes is still a challenge. Here we propose a combination of quantitative analysis of pre- and post-test and qualitative analysis of the after-school assignments as a way to assess students' learning effectiveness.
Method: Eighteen students participated in this course. Before the course starts, we conduct pretests to understand their attitudes towards various forms of euthanasia. We make use of patients' life story and a 10-minute short film to introduce various forms of euthanasia. The students discuss the content of the video and propose their opinions about what is good death and dignity. A post-test was done at the end of the class. A homework was given to let students publish their views on euthanasia. We analyze the homework data to find meaningful words and achieve qualitative analysis.
Results: Students' acceptance of euthanasia increased significantly (69% to 94%), especially among the elderly with voluntary euthanasia (30.8% to 58.8%). The coding obtained from after-school reports includes: social consensus, autonomy, right to life, boundaries and limitation, supporting measures, pain, quality of life, professional assessment, communication, slippery slope effects, family experience, suicide, murder, etc.
Discussion: By integrating the coding data into an interpretive framework, we can summarize the students' understanding of euthanasia: This is a conflict of interests between the autonomy and the right to life. Consensus can only be reached through adequate discussion in the community. Opponents think this to be suicide, murder, and will lead to the slippery slope effects. Proponents believe that under clearly defined boundaries and detailed professional evaluation, it is acceptable for those patients who suffer extreme pain and no quality of life such as end-stage patients, vegetative persons, bed-ridden patients, etc.
Conclusion: By quantitative analysis of the pre-and post-test result, teachers get the percentage of attitude change after the class, but not why they change. With qualitative analysis of after-school assignments, teachers can know what they learn, narrow the distance between teaching and learning, and as a reference for curriculum review.

"I found myself a despicable being": Medical Students' emotional reactions to moral dilemmas and their influences on professional identity formation

Authors
Diego Ribeiro, UNICAMP, Brazil
Marcos Costa de Jesus, University Medical Center Groningen, Netherlands
Esther Helmich, University Medical Center Groningen, Netherlands
Marco Antonio Carvalho-Filho, UNICAMP, Brazil

Presenter: Diego Ribeiro, Universidade Estadual de Campinas, Brazil

Background: Medical students often face moral dilemmas during their undergraduate course, especially when they start clinical practice. Living these moral dilemmas provokes emotional reactions that can interfere with their future professional attitudes. The aim of this study was to understand these moral dilemmas and the evoked emotional responses to map their influence on professional identity development.
Method: Eight undergraduate students from a Brazilian medical school made a Rich Picture about a complex scenario in which they experienced a moral dilemma. Rich Pictures are visual tools enhancing data collection aiming at capturing the 'hard-to-put-into-words.' The researcher explored through a semi-structured interview the moral dilemmas, the emotions and the reflections of the students in relation to the experience represented in the drawing. The interviews were transcribed and a thematic analysis was performed.
Results: The relevant moral dilemmas revealed by Rich Pictures were: patient-centered medicine versus physician- or system- centered medicine; patient's needs versus system's requirements; excitement with the disease versus the suffering of the human being; patient's needs versus physicians' needs. The emotional reactions involved guilt, impotence, frustration, sadness, anger, feelings of inferiority, anguish and despair. Students valued the participation in the drawing activity as it provided several opportunities for insight and reflection on the often non-conscious influence that these experiences had on the development of their professional identities.
Conclusion: Rich Pictures allowed the identification of intricate moral dilemmas experienced by medical students during undergraduate training. In addition, it enabled students to share and explain the emotional reactions that originated from these dilemmas. Identifying moral dilemmas and accompanying emotional reactions may represent an important mechanism for nurturing a professional identity that is committed to the values of medical practice.
Take-home message: The Rich Pictures methodology helps to understand the moral dilemmas, identify

emotional reactions, and help students in their reflection process. The understanding of this process allows the idealization of pedagogical activities to help young students to maintain their commitment to good medical practice.

5GG2 (1398)
Development of scales to evaluate medical trainees' professional identity formation

Authors
Masami Tagawa, Kagoshima University, Kagoshima, Japan

Presenter: Masami Tagawa, Kagoshima University, Kagoshima, Japan

Background: Medical educators now focus on professional identity formation (PIF), and medical students' and residents' values and attitudes related to PIF have been qualitatively analyzed using reflective writing and interviews. This study aimed to develop an instrument to evaluate PIF that can be applied to a large group of medical trainees.
Method: Using Kegan's human development model as the conceptual framework, a self-administered questionnaire composed of items on a seven-point scale was created. Fourth- and 6th-year medical students and 2nd-year residents at Kagoshima University, and experienced medical doctors (instructors) in private clinics or teaching hospitals responded to the questionnaire. One scale which evaluated personal and professional development and socialization (developing scale; DS), as well as scales that evaluated four of Kegan's stages of development were developed using factor analysis and respondent group comparison.
Results: Using data from 291 respondents, a DS with 15 items was developed (alpha = 0.68). The instructor group had the highest mean score, and respondent group, but not gender, was a significant variable of DS. Kegan's stage 2, 3, and 4, and higher stage specific scales were also developed. Among the respondent groups, the student group had the highest mean score in stage 2, and the instructor group had the highest mean score in stage 4 and higher stage scales.
Discussion: Multiple scales were used to quantitate the complexity and divergent processes of PIF. One scale evaluating the overall degree of PIF combined with scales evaluating different stage-specific attributes might reveal the values and attitudes related to profession among individuals and groups. This study indicated Japanese medical students and residents were on their way towards PIF, and experiences and environments after the residency program may further PIF.
Conclusion: Assessment scales for PIF that can be applied to medical trainees were developed. These scales would provide important information about individuals, groups, and education that is different from assessment data of medical knowledge or professional skills.
Take-home message: PIF of medical trainees, which is a goal of medical education, might be quantitatively estimated by a new self-administered instrument.

Sense and sensibility: comparative analysis of students' codes of conduct

Authors
Zuzanna Nowicka, Medical University of Lodz, Lodz, Poland
Katarzyna Staniecka, Medical University of Lodz, Lodz, Poland
Janusz Janczukowicz, Medical University of Lodz, Lodz, Poland

Presenter: Zuzanna Nowicka, Medical University of Lodz, Poland

Background: Professional identity formation and development of ethical conduct are embedded in the medical curriculum. Throughout their learning process, medical students get involved in patient care and gain privileged access to patients and their clinical data. It is therefore essential that the student's behaviour justifies the trust placed in medical profession. Concerns regarding unprofessional students' behaviour may arise in several key areas that depend significantly on culture-specific context. To correctly identify and address these concerns, an explicit and implementable code of student conduct is required.
Method: Using search terms related to student conduct and ethics documents from 82 universities located on 6 continents were identified. Of these, 56 met the inclusion criteria (full text in English, document referring to medical students). 20 documents representative for diverse cultural backgrounds were further analyzed using the General Medical Council professionalism guidance for medical students as initial framework for qualitative coding performed with Atlas.ti.
Results: Selected documents varied considerably in content and precision of description. Although many codes presented the disciplinary processes and possible sanctions, the regulations were not always specific. Only two of them presented remediation strategies, student guidance and support in addition to sanctions. Many codes were based chiefly on traditional (nostalgic), Hippocratic values with less than half of the documents including statements referring to 'modern' areas of concern, like social media and electronic information. We've also identified a number of culture-specific themes, especially important in the era of students' and doctors' mobility.
Conclusion: Medical schools, due to distinctive areas of concern regarding student conduct - such as confidentiality of patient information - require specific codes of student conduct, different than general university regulations that apply to students of all faculties. Absence of regulations describing the process of addressing contemporary professional concerns (including minor professional lapses), specific sanctions, remediation and support following the disciplinary process, raises questions about applicability of the particular code.
Take-home message: Comprehensive and modern students' codes of conduct are necessary to facilitate professional identity formation, taking into account both the global standards and local cultural contexts.

Learning effects of interview with senior nurses on professional identity among first-year nursing students

Authors
Shu-Ching Chang
Chien-Da Huang

Presenter: Shu-Ching Chang, Chang Gung University, Tao-Yuan, Taiwan

Background: "Nursing History" is the core of nursing education and also the necessary learning platform for nurturing nurses. This study is to enable students to get to know the meaning of nursing work as early as possible, and to understand the roles and professional identities of senior nurses in the workplace as well as to comprehend theoretical and clinical mutual proofs through dialogues between senior nurses and students in this class.
Method: With semi-structured questionnaires and in-depth interviews as the research method, it is expected to provide a further understanding of nursing for the first - year nursing students. Nursing is a stressful and challenging profession. How to enhance the students into this career is a very important issue. In addition to provide students with the best learning outcomes through their experience, in the interview students are able to see the importance of the nursing profession and cultivate their interests in the nursing profession by exploring the future career directions through practical field interviews. Students learn knowledge, attitudes and behaviors in this process and affirm their commitment to become a professional.
Results: Through this study, It helps to understand the students' willingness to engage in nursing work and their cognition of the nursing profession. Based on the results of this study, I will provide a reference for further planning nursing courses and construct a training strategy and content.
Conclusion: Students' perceptions of nursing come from experience, media, traditional socio-cultural impressions and nursing education. In addition, experience sharing with senior nursing staff also helps students understand nursing and reduce anxiety of clinical learning as well as enhance nursing professional identity.
Take-home messages:
1. To strengthen the willingness to work in nursing.
2. To let students know what they actually encounter when they enter the workplace.

Inter-professional clinical simulation education developing professional identity and professionalism in the Japanese medical and nursing students

Authors
Yuriko Buyo
Naomi Iwane
Tetsuya Kawabe
Masato Mizukoshi
Takuzo Hano

Presenter: Takuzo Hano, Wakayama Medical University, Wakayama city, Japan

Background: In the preceding research, it is reported that professionalism education is effective for forming occupational identity. However, it was unclear that the students' experience and learning through IPE has influenced identity formation and professionalism. In this study, we conducted a multi-occupational team simulation training consisting of undergraduate students of both medical and nursing department, and clarified how professional identity and professionalism attitudes change before and after IPE education.
Study design: Forty 4th grade medical students and forty 2nd grade nursing students were enrolled and divided to educational intervention group and control participants. We use a scale of professional identity including lower four scales, a scale of professionalism including lower five scales and readiness for inter-professional learning scale (RIPLS).
Education contents: Scenario: Acute abdominal pain in the hospitalized patients with Stage IIIa colon cancer. Briefing for 10minutes, physical assessment by nursing students for 8 minutes, transmission of clinical information from nursing to medical students and physical assessment by medical student and discussion for 10 minutes, and 10minutes debriefing.
Outcome of training: Technical outcome; Take an appropriate physical assessment and clarify the sign and symptoms, finally know the cause of abdominal pain. Non-technical outcome; effective communication and ethical attitude.
Results: In medical students, IPE curriculum improved RIPLS (p=0.004), scale of professional identity (p=0.009), establishing a view on medical workers (p=0.014), and pride of what is needed for a medical career (p=0.032). In nursing students, lower scale of professionalism, formation of human qualities was elevated (p=0.015). There were no alteration of scale in control group.
Conclusion: It was suggested that multi-occupational team clinical simulation by medical and nursing students in medical university is useful for establishing professional identity and readiness for profession.
Take-home message: On the job training using simulated clinical training promote the readiness and motivation to learning as an educational model of behavior change.

Exploring professional identification with family medicine among medical students in the Kyrgyz Republic

Authors
Olivia Heller, HUG, Geneva, Switzerland
Zhyldyz Ismailova, MERproject, Bishkek, The Kyrgyz Republic
Damira Mambetalieva, IME, Bishkek, The Kyrgyz Republic
Erkin Alymbaev; KSMA, Bishkek, The Kyrgyz Republic
Nurlan Brimkulov, KSMA, Bishkek, The Kyrgyz Republic
Anne Baroffio, UDREM /UNIGE, Geneva, Switzerland

Presenter: Olivia Heller, Geneva University Hospitals, Geneva, Switzerland

Background: As part of a project on medical education reform in the Kyrgyz Republic (MER project) in which the Geneva University Hospitals and the Unit of Development and Research in Medical Education have been providing technical support since 2008, we are conducting a study to examine students' views on Family Medicine (FM) and its dynamics over the course of medical training. This study aims to shed light on the global trend of declining interest and shortage of family doctors both in urban and rural areas through a case study in Kyrgyzstan.
Method: The study consisted in an explanatory sequential mixed-methods design, which involved two consecutive and interrelated phases. The first phase explored students' perception through a quantitative survey at three key moments; (year 1, start of the pre-clinical teaching; year 4, between pre-clinical and clinical teaching; year 6, fully clinical teaching). The second phase used qualitative methods based on focus groups to assist in interpreting the findings of the first phase. The location of the study is the Kyrgyz State Medical Academy (KSMA), the main faculty of medicine in Kyrgyzstan, in Bishkek.
Results: In general, Kyrgyz medical students negatively perceived the discipline and profession of FM and found it unattractive. They identified the context and academic discourse as an influential factor. They described FM as a highly difficult profession, demanding a lot of knowledge without being coupled with correct wages or working conditions, especially in rural areas. First year students were less reluctant to the idea of being trained in family medicine, feeling better informed about the context and the objectives of the medical education reform.
Conclusion: This study hopes to inform interventions in medical education reform to render FM more attractive. Such changes may include redesigning the curriculum, involving medical associations and implementing incentives for FM employment.
Take-home message: The situation in this low and middle-income country echoes the global trend of declining interest and shortage of family doctors, this stems from lack of accurate information about this profession and the genuine working condition which prevail.

5GG7 (3116)
Cross-cultural perspective on role models for medical professional identity development

Authors
Juliana Sa, Faculty of Health Sciences, University of Beira Interior, Covilhã, Portugal
Ranya Hassan, Faculty of Medicine, Suez Canal University, Ismailia, Egypt
Ricardo Tjeng, Faculty of Health Sciences, University of Beira Interior, Covilhã, Portugal
Khalid Alsabahy, Faculty of Medicine, Suez Canal University, Ismailia, Egypt
Mahmoud Diab, Faculty of Medicine, Suez Canal University, Ismailia, Egypt
Miguel Castelo-Branco, Faculty of Health Sciences, University of Beira Interior, Covilhã, Portugal

Presenter: Juliana Sa, Faculty of Health Sciences, University of Beira Interior, Covilhã, Portugal

Background: The value of role models in professional identity development is well established in the literature. However, there is still a need for a better understanding of factors and characteristics that influence their impact and understanding. Cultural accountability seems to be particularly important in professional identity development. In this way, there should be a deeper understanding of the influence of cultural setting for role models in professional identity development.
Method: A questionnaire was created to identify medical students' role models, their perspective on expected behavior and its change from the first to the last clinical year. Topics related to clinical practice and attitude towards teaching were included. This questionnaire was applied to medical students in two medical schools, in Portugal and Egypt, and results were analyzed.
Results: Two hundred and seven students answered the survey, most of them perceived role models as very important/important for their experience in their medical school (82.1%); students from both countries considered that their main role models were clinical tutors (57%) followed by basic sciences tutors (12.5%) and residents (12%). Results on specific characteristics of role models were similar in both medical students´ groups, with higher agreement on role models' capacity to show clinical reasoning skills, demonstrate clinical competence and having a positive interaction with colleagues and other health professionals.
Conclusion: Although, professional identity development is a context specific process, role modeling seems to be universally important. In this study, we were able to identify common aspects of role models in two different countries. This can be the early approach to find shared perspectives that may contribute to further knowledge and experience on this topic. Those specific aspects that students associated with their role models can be important to find common points to promote faculty development on professionalism in different cultural settings having a common framework.
Take-home message: Promoting cultural accountability in the understanding of student's perspectives on role

models for professional development can help to promote partnered strategies for faculty development.

5GG8 (3068)
Professionalism Narratives of Kuwait's Future Physicians: Impact of the Hidden Curriculum

Authors
Jasmine Eliwa, Faculty of Medicine, Kuwait University, Kuwait
Munira Alkanderi, Mubarak Alkabeer Hospital, Kuwait
Abdulmajeed Albeloushi, Faculty of Medicine, Kuwait University, Kuwait
Abdelrahman Alashqar, Faculty of Medicine, Kuwait University, Kuwait
Amr Mohamad, Faculty of Medicine, Kuwait University, Kuwait
Mohammad Jamal, Faculty of Medicine, Kuwait University, Kuwait

Presenter: Jasmine Eliwa, Faculty of Medicine, Kuwait University, Kuwait City, Kuwait

Background: A physician's professional identity starts to develop during medical school. Medical students in Kuwait University are first exposed to professional values in the formal curriculum before witnessing the professional practices of clinical tutors in clinical settings. About 60% of Kuwait's population are expatriate who form the lower socioeconomic class, thus making it a special environment in terms of professionalisms hidden curriculum studies. This study aims to identify the impact of the hidden curriculum on medical professionalism education.
Method: Data was collected from medical students during October and November 2017. The following methods were utilised: (1) thematic analysis of 249 written narratives obtained via an online survey, (2) thematic analysis of 259 verbal narratives transcribed from focus groups interviews conducted until the point of saturation was reached, and (3) a questionnaire assessing professional attitudes via indicators of professional domains developed by the American College of Physicians and Board of Internal Medicine, distributed to a stratified random sample of 150 preclinical and clinical year students. Themes were categorised according to content and frequency.
Results: Most students (88%) recognise and agree with professional norms, especially principles regarding honesty with patients (79%), reporting medical errors (72%), and improving access to care (67%). Narratives yielded 18 themes, 2-10 subcategories in each, reflecting two main domains: medical-clinical interaction (90%) and teaching-learning environment (10%). Each theme and subcategory consists of professional and unprofessional behaviours that students witnessed. The most frequent themes are manifesting respect in clinical interactions (25%), communication skills (23%), discrimination (21%), respecting patient autonomy (18%), responsibility (7%), relevant reporting (5.5%), and managing conflicts of interest (5%). Other themes included creating a welcoming environment (3%), capitalising on teaching opportunities (2.7%), teamwork (2%), improving access to care (2%), honesty (1.5%), and confidentiality (1%). Expatriate were mostly involved in stories regarding improving access to

care (100%), discrimination (45%), respecting patient privacy (71%), and informed consent (73%), including for clinical teaching purposes.

Conclusion: Medical student narratives deepened our insight into professionalism, serving as a source of medical professionalism education evaluation. Encouraging the strengths and improving the weaknesses within Kuwait's professionalism is warranted.

Demystifying the Roles of Advanced Practice Nurse (APN) through pre-Master-nursing-Mentorship (MnM) Program

Authors
Jasmine Kang, Tan Tock Seng Hospital, Singapore
Jamie Lim, Tan Tock Seng Hospital, Singapore

Presenter: Jasmine Kang, Tan Tock Seng Hospital, Singapore

Background: Professional socialization, developing professional identity through the learning of norms, attitudes, roles and values of the profession, is a critical aspect of nursing development.

Method: Registered Nurses (RN) pursue a Masters course to become Advanced Practice Nurses (APN). Our APN faculty selects candidates using Multiple Mini Interview method one-year in advance. Some candidates have expressed unpreparedness and uncertainty about their choices. A pre-Master-nursing-Mentorship (MnM) Program was developed to help them understand the APN identity. In the MnM Program, RNs were buddied up with inflight Masters students on their clinical practicum to allow interaction with them and their preceptors (doctors and APNs). Upon completion, RNs used the Rolfe Reflective Model to guide self-reflection. They reflected on the purpose and benefits of the program and key lessons from their buddies and preceptors ("What"), clarified their own capabilities and potential to be an APN ("So what"), and how they would overcome their own limitations ("Now what").

Results: 8 RNs participated in the program from March 2015 - August 2017. Their reflective journals were analyzed and themes that emerged are broadly summarized: (1) understanding the APN role, (2) resilience needed for the journey, (3) mastery of advanced clinical knowledge/skills, and (4) importance of near-peer and peer support. Comments included: "I felt that it (MnM) has given me a head start to the Masters course…" and "It (MnM) acts as a prelude to my Masters study." All RNs subsequently enrolled in the Masters course.

A big part of professional socialization is personal socialization where the "newcomer" identifies, interacts and learns from the existing members in the social environment. Peer support and learning has a profound impact on self-development.

Conclusion: The MnM Program is a useful platform to facilitate professional socialization. Our Program was useful in providing insight to the RNs as we encouraged them to be active engineers of their own career choice. The faculty played a supportive role by engaging the stakeholders and planning the program.

Take-home message: Professional socialization programs similar to MnM can be useful in helping nurses build professional identity and direct career plans.

5GG10 (1153)
Being and becoming: Emergency physicians' conceptualisations of their roles and professional identities

Authors
Yu-Che Chang, Chang Gung Medical Education Research Center; Chang Gung Memorial Hospital, Linkou; Chang Gung University College of Medicine, Taoyuan City, Taiwan
Chung-Hsien Chaou, Chang Gung Medical Education Research Center; Chang Gung Memorial Hospital, Linkou; Chang Gung University College of Medicine, Taoyuan City, Taiwan

Hsu-Min Tseng, Department of Health Care Management, Chang Gung University, Taoyuan City, Taiwan
Cheng-Ting Hsiao, Chang Gung Memorial Hospital, Chiayi
Lynn Monrouxe, Chang Gung Medical Education Research Center; Chang Gung Memorial Hospital, Linkou

Presenter: Yu-Che Chang, Chang Gung Medical Education Research Center; Chang Gung Memorial Hospital, Linkou; Chang Gung University College of Medicine, Taoyuan City, Taiwan

Background: Emergency physicians (EPs) work in highly-stressed environments and face high levels of burnout. Coping well with these stresses can aid in the development of a sustainable professional identity (PI). However, there is a paucity of research exploring EP's PI. Our study aimed to investigate how members of the emergency medicine (EM) profession conceptualise their roles and PI, and the factors that influenced this.

Method: A semi-structured interview study with 25 EPs (6 senior residents ,19 attending physicians) was undertaken across four branches of a large hospital group in Taiwan. Interviews were recorded, transcribed, and analysed thematically.

Results: We will report our latest findings. So far, EPs consider personal traits, such as having a trustworthy character, as suitable for EM practice, to enable them to work well in teams. However, indecisiveness and sluggishness are deemed as unsuitable; hindering the EPs' ability to make decisions quickly and prioritise their work. EPs identify unique strengths in their multidisciplinary approach towards medicine, acute thinking processes and multitasking skills. They highlight how facing uncertainty and risks are characteristics of EM and therefore their ability to stabilise patients amidst these facilitates PI. PI is further enhanced through their societal role –being seen as society's 'last line of safety net' and the hospital's 'first line of contact'. Family and organisational support also contributes to EP's PI.

Conclusion: Facilitating an appropriate professional identity of EM depends on having better coping ability, quality of life, practical wisdom and professional recognition from the institution and public. The barriers included cost saving strategy of health insurance,

overcrowded working environment, facing medical disputes, lack of respect, and so on.

EM has acquired unique clinical capabilities that differentiate it from other specialties. EP's role and PI could be conceptualized through investigating their personal and professional characters whereby the facilitated and threated factors could be identified accordingly. Future research on the intervention for strengthening EP's PI is needed.

Take-home message: EP's PI is influenced by personal, professional, and institutional factors. The professionalisation of EPs' roles has led to a multifaceted development of their PI along multiple growth pathways.

Teaching Pre-Clinical Medical Students How to Think Like Doctors: A Novel Model For Early Learners to Understand Cognitive-Based Clinical Reasoning

Authors

Michael Cole, University of Michigan Medical School, Ann Arbor, Michigan USA
Sandro Cinti, University of Michigan Medical School, Ann Arbor, Michigan USA
Bella Shah, University of Michigan Medical School, Ann Arbor, Michigan USA
Douglas Gelb, University of Michigan Medical School, Ann Arbor, Michigan USA
Michelle Daniel, University of Michigan Medical School, Ann Arbor, Michigan USA

Presenter: Sandro Cinti, University of Michigan Medical School, Ann Arbor, USA

Background: Although clinical reasoning (CR) has been traditionally acquired informally during clinical rotations, with greater understanding of cognitive principles underlying CR, there is now intentional effort to teach this skill to undergraduate medical learners. However, current models cognitive-based CR models are complex and difficult for medical students to understand and apply.

Method: Based on adult learning theory, we developed a visual model of clinical reasoning focused on early learners that provides visual clarity for underlying cognitive principles. Rooted in the work of Gruppen, Norman, Mamede and Croskerry, it visually represents dual-processing and "integrative" models, as well as concepts such as hypothesis testing and application of evidence based medicine to the CR process. This model was introduced in a required CR course for pre-clinical medical students at our institution. It was developed due to poor student feedback involving CR models from published literature initially used in the course.

Results: Our clinical reasoning model has received terrific feedback from both students and faculty. Faculty report it is easy to teach and use during case-based instruction. Pre-clinical students overwhelmingly report the model is easy to learn, process and apply to patient cases and provides scaffolding to help understand "foundational science" content from other courses. Students that have finished the clinical wards report they frequently used the model as an anchor to process patients' case information.

Our CR course, centered around this model, is currently in its third year, has received the second highest student evaluation rating for the past two years (average 4.7/5) and was awarded our institution-wide Provost Teaching Innovation Prize.

Conclusion: Clinical reasoning is essential for safe and effective practice of clinical medicine. However, understanding CR is often abstract and difficult for early learners. Our CR model is rooted in cognitive theory, provides educators a tool to introduce complex CR process and allows early learners a visual method to recall and apply this important skill during clinical care.

Take-home message: Clinical reasoning is an important yet complex process. Our novel model allows pre-clinical medical students an easily accessible method to learn and apply this skill.

Coinvestigating e-professionalism and online identity with medical students via the Social Media Mentor Club

Authors

Catherine M. Hennessy
Claire F. Smith
Sue Greener
Gordon Ferns

Presenter: Catherine Hennessy, Brighton Sussex Medical School, Brighton, UK

Background: E-professionalism is more complex than applying the usual standards of professionalism to one's online activity. Professional use of social media is encouraged within medicine for networking and collaboration however the public nature and audience collapse that social media provides means that medical students have to consider how they portray themselves. Guidelines on how to use social media professionally are provided by UK governing bodies. Creating effective ways for medical students to use these guidelines for developing their online identity and awareness of e-professionalism are needed, hence the Social Media Mentor Club (SMMC) was formed.

Method: Eleven Year 1 and 2 medical students at Brighton and Sussex Medical School (BSMS) signed up to the SMMC which met weekly for 6 weeks. Club members gave written consent for their social media profiles to be searched by other club members and for their social media behaviour to be judged against the guidelines provided by UK governing bodies. Memo notes and reflective pieces on what club members were learning about managing their online identity throughout the club term were collected by the researcher. End-interviews were conducted on members to evaluate the usefulness of the club and to gather suggestions for developing methods of educating students on professional social media use. Ethical approval was granted by the Research Governance and Ethics Committee at BSMS.

Results: Thematic document analysis revealed that club members valued the peer-judging exercise as an active approach to learning about how one's online identity maybe perceived by the public. Members reported that the current guidelines are predominantly cautionary in

nature rather than advising students on how to engage with social media professionally.

Conclusion: The SMMC recommend that all medical students conduct a similar peer-judging exercise as part of the professionalism component of the medical curriculum. Members concluded that perceptions of professionalism on social media vary hugely between individuals and that there is a need to develop more practical guidance on how to use social media professionally.

Take-home message: Medical students have called for more proactive guidance on developing their online identity.

Burnout during residency: A comparison of burnout prevalence among Anaesthesiology residents and attendings in a tertiary hospital, and factors associated with burnout

Authors
Jia Yan Lim, Tan Tock Seng Hospital, Singapore
Jiayan Wee, Tan Tock Seng Hospital, Singapore
Adeline Lee, Tan Tock Seng Hospital, Singapore
Beatrice Lim, Tan Tock Seng Hospital, Singapore
Caroline Ong, Tan Tock Seng Hospital, Singapore

Presenter: Wee Jiayan, Tan Tock Seng Hospital, Singapore

Background: Burnout is a syndrome of mental and physical exhaustion related to work. Maslach characterised burnout as a triad of emotional exhaustion, depersonalization and reduced personal accomplishment. It is associated with negative consequences such as increased risk of medical errors, and detrimental effects on patient safety and personal well-being.
The prevalence of burnout among US residents has been estimated to be in the range of 27-75% (depending on specialty). Local data revealed burnout rates as high as 70-80% in internal medicine residents.
Anaesthesiologists face numerous stressors at work; yet currently there is no data on the prevalence of burnout among Anaesthesiologists in Singapore.
Method: We sought to assess the prevalence of burnout and risk factors associated with burnout among all residents and attendings in our department, using anonymised self-administered surveys that included the Maslach Burnout Inventory (MBI-HSS) and 10-item Big Five Inventory (BFI-10). The latter assesses personality traits, such as neuroticism, as possible factors contributing to burnout.
Prevalence of burnout among residents and attendings was calculated. Correlation analysis was performed for factors associated with burnout.
Results: Out of 93 residents and attendings surveyed, 68 responded. Of the respondents, 36 (52.9%) were residents and 32 (47.1%) were attendings. 24 (35.2%) were male and 44 (64.7%) were female. 38 (55.8%) respondents were found to have a high degree of burnout. High burnout risk was defined as having a high Emotional Exhaustion, high Depersonalization or low Personal Accomplishment score on the MBI.
Conclusion: Our study found that burnout rate amongst our residents and attendings is significant (55.8%) and comparable to international rates. Risk factors identified in this study should be addressed to minimise the risk of burnout. A high prevalence of burnout is a significant cause for concern as it can lead to poorer patient outcome and undermine a physician's well being. Understanding the risk factors associated with burnout will enable us to develop and implement strategies to prevent and treat burnout.

5HH2 (2224)
Black clouds for young doctors in emergency department: Myth or reality?

Authors
Süleyman Yıldız, Dicle University, Diyarbakır, Turkey
Sabahattin Ertuğrul, Dicle University, Diyarbakır, Turkey
Abdullah Yıldız, Sağlık Bilimleri University, Istanbul, Turkey
Ahmet Erkek, Bahçeşehir University, Istanbul, Turkey
Sümeyye Elçin Yıldız, Dicle University, Diyarbakır, Turkey
İlyas Yolbaş,Dicle University, Diyarbakır, Turkey

Presenter: Süleyman Yıldız, Dicle University, Diyarbakır, Turkey

Background: Although it is assumed that residents in a specific training program will have comparable experiences, residents commonly perceive that some have consistently more difficult times during the their night shifts. Many young doctors believe in the phenomenon of either being labeled a "black cloud" or "white cloud" while on night shifts. A "white cloud" physician is one who usually gets fewer and uncomplicated cases and a "black cloud" is one who often has more and complicated cases. It is unclear if the designation is only superstitious or if there is some merit. We sought to determine if these perceptions were related to differences in real work load.
Method: The workload of junior doctors who worked over 1 year in emergency department (ED) shifts was retrospectively investigated by analysing quantitative (number of patients visited during a shift) and qualitative (corresponding workload according to the severity of the diseases) parameters. We also looked for potential associations between work load and the following factors: doctors' personal characteristics, self-evaluation of their degree of fortune and outside evaluation by senior physicians.
Results: Some residents did have a black cloud; they slept less, perceived that they worked harder than average, and had a reputation for having difficult night shift experiences. Residents with a black cloud function differently from their colleagues; for example, some may be inefficient, while others may create extra work for themselves.
Conclusion: We believe that residency program directors must recognize these functional differences. All in all, it is clear that evidence for black clouds really exist in the ED. The phenomenon is rather rare and difficult to recognise, as the self- and outside perception of black clouds seems to be misleading.

5HH3 (344)
Burnout in Residents and Program Directors: A Study on Prevalence, Factors and Interventions in a Tertiary Hospital in Singapore

Authors
Sabrina Lau, Tan Tock Seng Hospital, Singapore
Selvia Kosim, National Healthcare Group Education Office, Singapore
John Hsu, Tan Tock Seng Hospital, Singapore
Lim Wen Phei, Tan Tock Seng Hospital, Singapore
Faith Chia Li-Ann, Tan Tock Seng Hospital, Singapore

Presenter: Sabrina Lau, Tan Tock Seng Hospital, Singapore

Background: Physician burnout is on the rise, with higher rates reported in residents and early-career physicians (Dyrbye, 2014). Burnout has been linked with negative outcomes including medical errors, depression and suicide. Since the inception of the Residency Program in Singapore, faculty have been concerned about an apparent rising trend of residents demonstrating signs of fatigue and burnout. This study aims to find out the prevalence of burnout among residents and program directors (PDs), identify associated factors and propose interventions to reduce clinically-significant burnout.
Method: We surveyed 174 residents from three Medical and three Surgical Residency Programs within the National Healthcare Group (NHG), as well as 27 PDs and associate PDs. Burnout was measured via the Maslach Burnout Inventory (MBI), and categorized into three subscales – Emotional Exhaustion (EE), Depersonalization (DP) and Personal Accomplishment (PA). Clinically-significant burnout was defined as a high EE or DP score (Shanafelt, 2002). Factors associated with burnout were derived from subgroup analysis on 70 Internal Medicine (IM) residents and the NHG Resident Wellness Workgroup discussion platforms.
Results: Burnout rates ranged from 46.7% to 64.3% in residents – highest in IM (64.3%) and Family Medicine (61.8%). While the difference in clinically-significant burnout between medical and surgical specialties was not great, 58.0% of medical residents reported low PA compared with 34.7% of surgical residents. PDs had the lowest burnout rates (40.7%) and reported the highest PA (33.3% high PA). Factors associated with burnout include exams, administrative tasks and inadequate breaks – although reported duty hours were within guidelines. Utilisation of institution-based support systems is poor (3.1% of IM residents).
Conclusion: Burnout rates in residents are high. Major factors include exams, administrative tasks and perceived inadequate breaks. PDs and surgical residents had the highest personal fulfilment. Greater awareness is needed on the availability of support systems and promotion of mindfulness. Future studies should look into interventions to reduce burnout, and employ methods to monitor burnout trends through residency.
Take-home message: Burnout rates in residents are high. PDs have the highest PA scores – mentorship and teaching may be a protective factor for burnout.

Variation in themes affecting junior doctor morale: survey results from a large UK teaching hospital

Authors
Raunak Singh, University Hospitals of Leicester NHS Trust, Leicester, UK
Joanne Kirtley, University Hospitals of Leicester NHS Trust, Leicester, UK
Jatinder S. Minhas, University Hospitals of Leicester NHS Trust, Leicester, UK
Dilesh Lakhani, University Hospitals of Leicester NHS Trust, Leicester, UK
Sue Carr, University Hospitals of Leicester NHS Trust, Leicester, UK

Presenter: Raunak Singh, University Hospitals of Leicester NHS Trust, Leicester, UK

Background: Junior doctor morale is crucial for the recruitment, retention, professional development and experience of both doctors in training and locally employed doctors. Health Education England (HEE) recently identified three themes affecting morale: support, autonomy and value. We aimed to identify overall responses to these themes and differences between strata of junior doctors at University Hospitals of Leicester NHS Trust.
Method: In November 2017, a structured survey, modelled on the HEE themes, was distributed to 943 junior doctors within a large UK teaching hospital. Respondents used an ordinal scale of zero (low) to ten (high) to rate: overall morale, how valued and supported they felt at work, and how much autonomy they were given. Data were analysed using non-parametric independent sampling and correlation analyses.
Results: 402 (42.6%) doctors in training and locally employed doctors responded, representing a spectrum of specialties. Median (interquartile range) for all respondents: overall morale 6(5-8), valued 6(4-8), supported 7(6-9) and autonomous 7(6-8), with respondents feeling more supported overall (n=402, χ2=85.6, p<0.0001). Feeling supported correlated with feeling better valued (r=0.617, p<0.0001) and more autonomous (r=0.591, p<0.0001). Those who expressed higher autonomy felt more valued (r=0.609, p<0.0001). Speciality trainees felt more supported (n=176, χ2=7.2, p=0.03) than core-level trainees (n=82) or foundation doctors (n=141). Those who had worked in the Trust for longer than 4 years felt more autonomous (n=46, χ2=10.9, p=0.01). There was a tendency for locally employed doctors to rate all themes higher, although this was not statistically significant.
Discussion & Conclusion: A complex relationship exists between how supported, autonomous and valued our junior doctors feel, suggesting that morale is multi-faceted and not restricted to one domain. More senior trainees felt better supported. Longer duration of employment within the Trust is associated with a higher level of autonomy. Tendency for locally employed doctors to rate higher across all themes perhaps reflects current local initiatives to improve their working experience.

We identified variations between strata of junior doctors in terms of how valued, supported and autonomous they felt, offering scope for opportunities to focus interventions to improve their morale.

Mistreatment of medical trainees: A self-reported cross-sectional observational survey

Authors
Nicole Naccache
Antoine Abi Lutfallah
Elie Nemr
Eliane Ayoub

Presenter: Nicole Naccache, Saint-Joseph University, Beirut, Lebanon

Background: Medical trainee mistreatment encompasses a wide range of behaviors including verbal, physical, and academic abuse as well as discrimination, bullying and harassment. Such conducts tend to cause emotional and health problems, and impair trainees' performance and capacity to provide optimal patient care.
Method: After Ethical Review Committee approval, a descriptive cross-sectional survey was conducted at Hôtel-Dieu de France University Hospital. A self-constructed questionnaire was conceived to identify the prevalence, risk factors, types and sources of trainees' mistreatment, and its potential consequences on victims' education and health. The study population included a 737 medical students (from third to seventh year) and residents.
Results: 259 trainees completed the questionnaire (35%). Overall, 1041 incidents perceived as mistreatments were reported. Most common type of encountered mistreatment was verbal abuse such as being spoken to in a bossy/aggressive manner (60.1%). Medical consultants were the most common source of mistreatment (30.4% of all unwanted behaviors). Consultants and senior residents shared most of the academic abuse, while senior resident were most likely to cause discrimination and sexual harassment. Female sex was significantly associated with sexual harassment (P<0.001). Out of 81% of participants who reported having experienced at least one episode of mistreatment, 32% chose not to report the incident, 52.9% had informed a friend or colleague, and only a minority notified a third party in charge of trainee affairs. The highest ranking barrier to taking action was thinking nothing would change (31.3%), while fear of reprisal accounted for 14.1%. Mistreated trainees felt decreased eagerness to work and lack of concentration (65%), unmanageable stress (60%), or considered dropping out of medical school (30%).
Conclusion: This study highlights mistreatment as a serious and potentially damaging, yet under-recognized subject, faced by a large proportion of medical trainees. Trainees should be familiar with appropriate procedures for reporting future incidents. Resulting findings will hopefully guide new strategies to reduce levels of mistreatment in our institution.
Take-home message: Medical trainee mistreatment is a worldwide phenomenon. Medical schools need to address this issue and new interventions are required urgently to tackle the problem.

5HH6 (366)
Allowing 'anticipated failure' in clinical training. Results from a critical narrative review

Authors
Jennifer M. Klasen, Kantonsspital Frauenfeld, Switzerland
Lorelei A. Lingard, CERI, London Ontario, Canada

Presenter: Jennifer Klasen, Kantonsspital Frauenfeld, Switzerland

Background: Educational domains such as pedagogy or psychology have embraced the philosophy that failure is valuable for learning. Consequently, supervisors sometimes let learners fail. During clinical training, however, this practice is not explicitly embraced because of negative implications for patients. Yet, anecdotally, clinical supervisors describe situations where they allow trainees to fail, having judged it sufficiently safe for patient care and valuable for trainee learning. Preparatory to empirical investigation of this phenomenon, we sought to understand what is currently known in the medical education literature about the supervisory practice of letting trainees fail during clinical activities.
Method: We conducted a critical narrative review with a PubMed search of literature published from 2000 to 2018, using the search terms 'medical errors', 'residency', 'internship', 'supervision' and 'feedback'. We forward-searched included articles and hand searched reference lists, which captured some relevant general education articles. Seventy-six articles were selected for analysis, including empirical and theoretical works.
Results: We found no articles that directly explored the question of supervisors allowing clinical failures as an educational strategy. A number of papers addressed related issues, such as how residents learn from errors (Fischer, 2006) (Bradley, 2013), the ongoing impact of such events and the importance of failure for developing recovery strategies (Kroll, 2008) (Scott, 2009), all which are relevant to inform future research into this practice. As well, insights from general education regarding the value of failure can guide our inquiry into the adaptation of this practice to clinical training environments (Goldstein, 2002) (Edmondson, 2011).
Supervisors anecdotally report allowing trainees to fail when they judge it to be clinically safe and educationally valuable, but there is no literature regarding the nature or extent of this practice. This review will inform empirical study of how, why and when clinical supervisors allow trainees to fail for educational purposes.
Conclusion: Using failure purposefully for learning could be a powerful educational tool for clinical supervisors, but must be handled with care. Future research needs to explore why, when and how supervisors allow failure, its pedagogical benefits/drawbacks, and its impacts on resident learning.

5HH7 (891)
Trainers' perceptions of trainees in difficulty: a survey

Authors
Minna Kaila
Anni Peura
Asta Toivonen
Arja Helin-Salmivaara

Presenter: Minna Kaila, University of Helsinki Faculty of Medicine & AMEF (Association for Medical Education in Finland), Helsinki, Finland

Background: Every now and then the trainers in specialist training face trainees in difficulties. We explored trainers' perceptions concerning these difficulties with a web-based survey.
Method: We conducted a survey to members of AMEF (Association of Medical Education in Finland, n=198 at the time) and enriched the respondent population by direct targeting of general practice and occupational health trainers in the Helsinki University hospital catchment area as well as the whole country. The survey consisted of statements concerning hypothetical difficulties and open ended questions, inviting also comments on solutions. In a short time frame, we received 114 responses.
Results: Overall, a trainee in difficulty seems to be a rarity. The most frequent issue reported was poor time management skills (annual encounter reported by 30%), closely followed by reoccurring minor deviations from agreed practices (annual encounter reported by 20%). Weak collaboration skills and difficulties related to ability to reflect on one's practice were encountered annually by 8-6% of the respondents According to the open-ended answers, the most frequently mentioned strategy to manage trainees in difficulty is discussion with the trainee either privately or in small groups. Enhancing supervision and reflection, feedback, observations and assessment were considered crucial.
Offered solutions included further education and opportunities to learn from adverse events. The trainer could act as a model for different aspects of the work. Efforts of orientation for the novices are important and clarifies practices. Sometimes adjusting trainee's duties and work schedules is necessary.
Discussion: We were surprised by the number and speed of the responses we got. This may be interpreted as a signal of a need for concerted efforts to develop and share better ways of supporting trainees. Their difficulties need to be carefully and consistently addressed bearing in mind that the main aim of any postgraduate program is a competent specialist.
Conclusion: With this explorative survey we describe trainers' perceptions of their trainees' issues and ways they reported dealing with them. The issues they had encountered related to central professional skills. Results call also for other support strategies for trainees in difficulty.

5HH8 (709)
Physician wellness in the Department of Medicine, University of Ottawa: a cross-sectional study of burnout, empathy and resilience in full-time physician faculty

Authors
Edward Spilg, University of Ottawa, Ottawa, ON, Canada
Melissa Duffy, University of South Carolina, USA
Lesley Ananny, University of Ottawa, Ottawa, ON, Canada
Ian Graham, University of Ottawa, Ottawa, ON, Canada
Philip Wells, University of Ottawa, Ottawa, ON, Canada
Vicki LeBlanc, University of Ottawa, Ottawa, ON, Canada

Presenter: Edward Spilg, Department of Medicine, University of Ottawa, ON, Canada

Background: The effect of burnout on physician wellness is well established but the complex relationship between physician burnout, empathy, resilience and compassionate care is less understood. The goal of this cross-sectional study is to better understand the relationship between physician burnout, empathy and resilience amongst full-time academic physicians.
Method: 262 full-time staff physicians from an academic Canadian Department of Medicine were invited to complete three scales: Maslach Burnout Inventory (MBI) – Human Services Survey, incorporating three sub-scales, Emotional Exhaustion (EE), Depersonalization (DP) and Personal Accomplishment (PA); Jefferson Scale of Empathy (JSE) which defines empathy as the ability to understand the inner experiences and perspectives of the patient; and Connor-Davidson Resilience Scale (CD-RISC) which is a self-report measure of one's ability to thrive in the face of adversity. 84 (32%) physicians responded and completed the JSE and CD-RISC. 49 (18.7%) completed the MBI.
Results: 19/49 (38.8%) physicians displayed high EE, 12/49 (24.5%) displayed high DP and 4/49 (8.2%) displayed low PA. 24/49 (48.98%) physicians had at least one manifestation of professional burnout (high score on DP and/or EE subscales of the MBI). A Wilcoxon-Mann-Whitney test revealed resilience was lower in those physicians who were burned out (p<0.05). In turn, correlation analyses revealed resilience and empathy were positively correlated (r=.37, p<0.01). A t-test revealed younger physicians (<46-years) reported lower resilience than older physicians (p<0.05).
Discussion: Among survey responders, physician burnout is worryingly high, with those physicians reporting lower levels of resilience. In turn, less resilient physicians displayed lower sores scores of empathy. Given that scores on the JSE have been associated with tangible patient outcomes (Hojat et al, 2017, Acad Med, 92(6), pp743-745), the results of this study have direct implications for patient care. Older physicians report feeling more resilient than their younger counterparts. Further study is required to explore reasons underlying the relationship between age and resilience.
Conclusion: These results highlight the need to better understand whether resilience-building interventions, either at the individual or system level, can affect burnout and empathy, thus improving physician wellness and the delivery of compassionate care.

5HH9 (304)
Supporting Mental Wellbeing of Foundation Year One Doctors - Perspectives of Stakeholders

Authors
Lorraine Close
Rosie Stenhouse
Janet Skinner

Presenter: Lorraine Close, University of Edinburgh Medical School, Edinburgh, UK

Background: Newly Qualified doctors suffer from higher levels of stress and anxiety than their non-medical colleagues. This has an impact on the onset of burnout symptoms which may result in a reduction in empathy for patients and compromised patient care. In complex NHS organisations supporting FY1 mental wellbeing is a relevant yet challenging issue.
Method: Critical Discourse Analysis was used to explore the discursive practices of stakeholders in FY1 wellbeing through analysis of interviews and how they offer insight into Discourse around FY1 wellbeing. Discourse refers to the way in which 'groups of people' with significant identities behave, and are ideological and therefore linked to power. Stakeholders were interviewed using semi structured individual interviews and results were analysed using Gee's (2010) approach to Critical Discourse Analysis (Gee 2010).
Results: FY1 wellbeing is impacted on by issues at a number of levels that reflect the hierarchical nature of the NHS. These include the day to day role of FY1, the complex team structures and supervisory systems that they work within, the impact of the hidden curriculum and the pervasive culture of being seen to cope and the organisational issues that are influenced by politics, policy and training programmes.
Conclusion: FY1 wellbeing is heavily impacted by socio-cultural and political factors. Power dynamics filter through the organisation. Politics and policy affect the NHS organisation and individual hospital settings which in turn affects the experience of senior medical staff and how teams function in clinical settings. This has subsequent impact on FY1 wellbeing. Interventions could focus on the inclusion of FY1s as valued members of clinical teams and offering meaningful pastoral and peer support that is separate from supervisory processes.
Take-home messages:
1. Supporting FY1 wellbeing is an important issue that affects job satisfaction, patient safety and reduces burnout
2. Focus on resilience may encourage responsibilisation, where individuals are held responsible for issues that are created by organisational culture
3. The power dynamics that exist within an NHS organisation, including the medical hierarchy and the hidden curriculum can have a considerable impact on FY1 wellbeing.

5HH10 (2890)
Perception of occupational stress by postgraduate year one doctors and the implication of resilience training

Authors
Jiun-Yi Li, MacKay Memorial Hospital, Taipei, Taiwan
Yu-Pei Fan, MacKay Memorial Hospital, Taipei, Taiwan

Presenter: Jiun-Yi Li, MacKay Memorial Hospital, Taipei, Taiwan

Background: The postgraduate year-one (PGY) doctors face the transition from medical students to clinicians and usually experience high stress from working situation, personal relationship and professional responsibility. We intend to survey the PGY doctor's perception of occupational stress to facilitate the resilience curriculum design during the transition.
Method: One hour of introduction to mindfulness based stress reduction (MBSR) was started in MacKay Memorial Hospital (MMH) to help the PGY doctors more familiar to our clinical situation since 2016. During the lecture, we used 8 questions to assess their recognition and response to stress and coping methods they used to face the stress. The answer to the questions was given anonymously.
Results: We surveyed 50 PGY doctors in 2016 and 68 in 2017. Those graduated from MacKay Memorial College (MMC) were different between 2016 and 2017 (10.4% vs. 28.8%, p = 0.005). Percentage of internship in MMH was also different (19.5% vs. 37.5%, p = 0.014). Most common source of stress was long working time, followed by workload, salary and interpersonal relationship. The degree (0 – 5) was less in 2017 PGY doctors (2.74 vs. 3.35, p = 0.014). Emotional change is their most common response, followed by loss of concentration and body symptoms. They usually chose outdoor activity to cope with stress. Only 22.6% of them think it is effective. Although 63.4% of them did not hear of MBSR, 91.5% are willing to try the technique. They wish the hospital can reduce hidden work and keep balance between work and learning.
Conclusion: The process of health care carries stress, which might lead to depression, job dissatisfaction, disrupted relationship, and psychological distress for healthcare professionals, leading to negative healthcare outcomes. The stress experienced by PGY doctors is mainly from work. Emotional change is the most common response. Their present coping techniques are not effective enough to reduce the stress.
Familiarity to the hospital environment can effectively reduce stress. Resilience training for PGY doctors and protected learning is important.
Take-home message: Resilience training to help PGY doctors reduce occupational stress and transition to hospital life is important.

5HH12 (2797)
Reflections on running resilience training for junior doctors

Authors
Rebecca Unsworth, Chelsea and Westminster Hospital, London, UK
Katrina Fordwor, Chelsea and Westminster Hospital, London, UK
Fiona McAuslan, Chelsea and Westminster Hospital, London, UK
Orhan Orhan, Chelsea and Westminster Hospital, London, UK

Presenter: Rebecca Unsworth, Chelsea and Westminster Hospital, London, UK

Background: In the first three years of training 70% of doctors experience burnout at least once. In addition, doctors often neglect their own health, with 65% reporting that they felt unable to take time off when ill. The General Medical Council has recognised a need for emotional resilience training.
We describe our experience of delivering resilience training for junior doctors.
Method: We piloted a resilience course for foundation doctors, and then adapted it for general practitioner trainees (GPTs). Both courses explored the physical and emotional challenges doctors encounter and included a presentation from the psychiatry team on mental health concerns in colleagues. A session from a "wellbeing coach" received negative feedback and was not repeated.
Results: Most attendees enjoyed sessions on sleep and how to build resilience. They requested more input from the psychiatry team, and more evidence-based practical tips for improving wellbeing. The foundation doctors enjoyed sessions on the emotional and physical demands of being a doctor, although some GPTs found this section too long.
Attendees suggested potential barriers to attending the course were service provision, unsupportive team members, finding self-reflection embarrassing and resilience training not being a high priority nor part of their curriculum.
Discussion: Is resilience training going to prevent burnout in doctors? Attendees cited elements of the working environment as causes of both physical and emotional challenges. We acknowledge that systemic change is a long process and doctors need to be supported in the short to medium term; perhaps resilience training could provide this.
Conclusion: We suggest a cultural shift in undergraduate and postgraduate medical education, with integration of wellbeing and adaptation to the working environment, in the form of a spiral curriculum where techniques are built upon throughout training, could be beneficial. Teaching adaptive strategies, such as resilience training may help doctors navigate an increasingly challenging work environment. This, as well as addressing elements of the working environment linked with disproportionate physical and emotional challenges, might reduce the rate of burnout in trainees.

5HH13 (798)
Junior Doctors Running Outpatient Clinics After a 24-Hour Shift: Effects on Patient Satisfaction and Prescription Errors

Authors
Chee Yang Chin, National Heart Centre Singapore, Singapore
Siqi Tan, DUKE-NUS School of Medicine, Singapore
Swee Leng Kui, National Heart Centre Singapore, Singapore
Jill Cheng Sim Lee, KK Women's and Children's Hospital, Singapore,
Anthea Lints, NHS Education for Scotland, Edinburgh, UK

Presenter: Siqi Tan, DUKE-NUS School of Medicine, Singapore

Background: Intuitively, sleep deprivation impacts junior doctors' performance and thus patient care. However, the literature is conflicting, with insufficient focus on patient outcomes. We studied if patient outcomes in outpatient clinics were adversely affected when patients consulted a post-call registrar versus a non-post-call registrar.
Method: This prospective, quantitative, post-positivist study was set in a large teaching hospital. Between November 2015 and February 2016, patients from all clinics run by a registrar after a continuous 24-hour shift (post-call) were recruited to the study group. Patients from non-post-call clinics run by the same registrars on a different day were recruited as controls. Outcome measures were patient satisfaction, using a validated 5-item 4-point Likert scale questionnaire, and prescribing error rate, defined as number of errors over number of orders. Between-group differences were analysed using the chi-squared test.
Results: 103 of 106 (97%) patients in 9 post-call clinics and 93 of 105 (90%) patients in 9 non-post-call clinics consented. The questionnaire completion rate was 99% in both groups. 536 prescriptions were ordered in the study group, and 526 in controls. Overall, the percentage of top-box responses (indicating greatest satisfaction) was higher in the study group versus controls (79.3% vs 62.4%, p<0.001). The percentage of top-box responses for each questionnaire item was higher in the study group. There was no significant difference in prescribing error rates between groups (1.31% vs 2.28%, p=0.23).
Discussion: Although unexpected, our findings importantly provide objective evidence that patients may safely consult a post-call registrar in clinic. Any impairment from physical or mental fatigue may possibly be mitigated by an adaptive conscious effort to be more conscientious when tired. The high patient response rate adds validity to our findings. Larger, longer term, multicentre studies will inform of these findings' generalisability to other healthcare settings. Qualitative studies of junior doctors' feelings when fatigued may shed light on the complex interaction of emotional factors that may compensate for tiredness.
Conclusion: Patient satisfaction and prescribing error rates are not detrimentally affected in post-call registrar clinics. The complex relationship between sleep deprivation and doctors' performance remains poorly understood.

The Reflective Blogger

Authors
Helen Pugsley
Lynne Allery
Michal Tombs

Presenter: Helen Pugsley, Cardiff University, Cardiff, UK

Background: The e-Certificate course in medical education based at Cardiff University is delivered via Blackboard VLE. The learning and teaching module provides an opportunity to explore educational theories and their relationship to practice. There are a variety of formative tasks to engage learners, 2 of which are via the blogs, the remaining tasks are completed on the discussion forums. The Blogs are private from other students but tutors are able to view their activity and comment if requested, the blogs provide an opportunity to gather thoughts and reflections on the module content in one place.
Method: The main aim of this project was to explore engagement with the blogs as a platform to engage in reflective practice. Thematic analyses of the blogs and metrics from the VLE shall be presented.
Results: Nearly half (49%) of the students used the blog (49 out of 100) with a range of between 1-20 posts. Thematic analyses revealed issues about the course assessment specifically, concerns about writing an academic assignment, managing time, personal development plans, complex and challenging teaching events such as managing failing students in their own environment. Of the 2 module tasks, the andragogy blog proved the most successful for stimulating a response (91 posts) compared to the behaviourism task (50 posts). More significantly the personalised reflections blog had 136 posts covering a variety of course and personal experiences.
Students who blog are self-directed and record reflections on a variety of issues which include module tasks as well as their real-world experiences (Grosseck, 2009). Some students have shared many of their blog posts within the discussion forum, supportive of a safe area to explore, draft and reflect before sharing thoughts, demonstrating flexibility of the platform.
Conclusion: There are positive implications for the use of blogs to provide a flexible, self-directed supportive area to formatively record ongoing reflection 'on action' on a post graduate medical education course (Schön, 1987).

Social Media Platform Facilitate Networking and Collaboration Between Domestic and International Emergency Medicine Residents

Authors
Ching-Hsing Lee, Chang Gung Memorial Hospital, Keelung, Taiwan
Chen-Mei Hsu, Kaohsiung Veterans General Hospital, Kaohsiung, Taiwan
Hao-Yang Lin, National Taiwan University Hospital, Taipei, Taiwan
Shao-Feng Liao, Chang Gung Memorial Hospital, Taoyuan, Taiwan
Cheng-Heng Liu, National Taiwan University Hospital, Taipei, Taiwan

Presenter: Wei-Chen Chen, Chang Gung Memorial Hospital, Keelung, Taiwan

Background: Shift work and disperse training location hinder emergency medicine (EM) residents networking, collaboration and resources sharing. In small country with small-scale training program, the challenge become more serious.
Method: Emergency Medicine Resident Network (EMRN) was created in December 5, 2015 as a Facebook group based in Taiwan to enhance resources sharing, networking, diversity and collaboration between EM residents. Daily sharing on EM topics by members are the core online activity. Resident lecture competition, interview with EM physicians during medical conferences and outreaching to international EM residents' associations are offline activities to facilitate networking. EMRN is currently operated by three volunteer attending physicians and four residents from three hospitals.
Results: EMRN Facebook group has 2532 members from 28 countries. There are 1617 posts, 2727 comments, and 41950 likes in the past two years. Two online theme sharing activities on topics of advises to young EM attending physicians and advices to first-year EM residents were held in 2016 and 2017. The first Taiwan EM residents lecture competition was hold in the 2017 Taiwan Society of Emergency Medicine (TSEM) Conference and will be held regularly every year. EMRN interview was first hosted during 2016 American College of Emergency Physicians (ACEP) Conference with the President of Emergency Medicine Residents' Association sharing experience on medical education. The second EMRN interviews were hosted during 2017 ACEP Conference and 17 Taiwan and Hong Kong emergency physicians sharing tips on making the best use of international conference. In 2017, the experience of EMRN was shared in the Hong Kong College of Emergency Medicine (HKCEM) Chapter meeting. This event bridged EMRN and HKCEM Young Fellows' Chapter which lead to the first Hong Kong and Taiwan EM Residents Forum in 2018 TSEM Conference.
Conclusion: Networking, collaboration and resources sharing are key elements in residents training. EMRN provide a success model to connect domestic and international residents in the lack of official and financial support via social media platform.

Take-home message: Social media is an easily accessible and efficient platform to establish international networking and collaboration between medical personnel.

A Multi-Institutional Study of Facebook as a Teaching Tool in the Undergraduate Medical Curriculum

Authors
Kelly Quesnelle, Western Michigan University Homer Stryker M.D. School of Medicine, Kalamazoo, USA
Jennifer Montemayor, Rocky Vista University College of Osteopathic Medicine, Denver, USA

Presenter: Kelly Quesnelle, Western Michigan University Homer Stryker M.D. School of Medicine, Kalamazoo, USA

Background: Social media is not intrinsically designed for education, yet some research exists on integration of social media into medical education. Facebook is the most utilized social media tool of both medical students and educators, but the literature on Facebook in medical education is scant. As such, it is appropriate to ask whether Facebook is an effective tool as part of formal medical curricula or better utilized as an unofficial learning tool.
Method: This study purpose was to compare Facebook data on medical student engagement between a page that was an official part of course content vs. a page supplemental to curricular materials. Two Facebook pages were created for medical education: (1) an official curricular discussion board, (2) a supplemental forum for spaced-recall questions. Pages were administered over 3-6 weeks at two different medical schools. Metric data between the two pages was compared.
Results: Peak hours of Facebook use were highly concordant between institutions (10AM-11PM). Of invited users, the formal course-content page was liked by 77% and page content reached an average of 58% vs. 58% and 48%, respectively, for the supplemental page. Despite differences in overall page likes and reach, only 8-9% of invited users engaged with the pages daily. There was no statistical difference in daily engagement between the two pages. On the individual-post level, the supplemental, spaced-recall page posts were viewed and interacted with significantly more (9%) vs. the class discussion-board posts (3%). This finding prompted a combination and examination of data from both pages by post type: statement vs. question. Question posts garnered double the engagement, likes, and comments vs. statement-making or content-sharing posts.
Conclusion: While a greater proportion of invited users liked and were reached by the formal course-content page, greater post engagement was achieved with the supplemental page. Question-type posts generated the greatest student engagement. It appears the fast-paced, anytime-/anywhere-nature of social media makes for a valuable practice-question forum, which medical students commonly request.

Take-home message: We have demonstrated that question-type posts are most likely to optimize student engagement with Facebook.

5II5 (1467)
Integrating social media interaction with case-based learning in Pediatrics clerkship training: A Way Forward for Medical Education

Authors
Zen-Kong Dai
Peih-Ying Lu
Jong-Hau Hsu
I-Chen Chen
Yin-Chih Fu
Jeng-Hsien Yen

Presenter: Yin-Chih Fu, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: Case-based learning is frequently used as a method in clinical education, which provides medical students with real clinical cases, as the vehicle to promote student learning of concepts and principles of patient care as opposed to direct presentation of facts and concepts. This study investigates whether utilizing the social media "LINE", the quick communication among clinical team members can promote together the learning effectiveness and outcome in the clerkship program, in detail.
Method: From 2017 to 2018, in Kaohsiung Medical University Hospital, the Fifth-year medical students of undergraduate medical program were arranged to complete a two-weeks rotating clerkship in Pediatric Cardiology and Pulmonology. In addition to the traditional ward teaching, students signed up "Pediatric CardioPulmonology Team Group" with the local popular social media LINE created by the researcher and composed of one attending physician, senior residents, interns and two clerks. The communicating contents included posing questions about the cases, locating the current articles targeting the caring issues and scheduling the therapeutic plans etc. In the final reports, the students were asked to summarize all the discussed issues presented.
Results: Subsequently, the enrolled students expressed higher satisfaction (near 100 %) with the learning environment, showed more confidence in dealing with numerous domains of patient care, and a stronger sense of patient-centeredness in the routine six-item survey questionnaire. Students' written feedback showed they could get more immediate feedback from the supervisors, enhanced the discussion as more time allowed, and the friendly function of bulletin board also facilitates in time uploading and reading of articles.
Conclusions: The enrolled students were in several ways better prepared than their peers, who also demonstrated richer perspectives on the course of illness, more insight into social determinants of illness and recovery, and increased commitment to patients. The novel trial indicated that integrated social media may offer students in-time learning resources and feedback, and provides more room for developing professional growth.

Educational quizzing with the QuizUp trivia game app

Authors
Gavin Stewart Dawe, Department of Pharmacology, Yong Loo Lin School of Medicine, National University of Singapore, Singapore
Chay Hoon Tan, Department of Pharmacology, Yong Loo Lin School of Medicine, National University of Singapore, Singapore

Presenter: Gavin Dawe, Department of Pharmacology, Yong Loo Lin School of Medicine, National University of Singapore, Singapore

Background: We investigated use of the QuizUp mobile trivia game and social networking app for educational quizzes. In contrast to gamification by use of educational platforms for quizzing, "educification" of the QuizUp trivia game and social network platform used by students for entertainment may eliminate the extraneous cognitive load of learning a new platform and enhance engagement. QuizUp allows for repeated practice of multiple-choice question stimulus-response pairings. The repeated isolated practice of key component knowledge to achieve fluency and automaticity facilitates the development of mastery. QuizUp may help to promote fluency and automaticity as it scores not only accuracy but also speed.
Method: Quizzes were provided on QuizUp for 299 second-year medical, 54 second-year dental, 185 first-year pharmacy, 197 second-year pharmacy, 125 first-year nursing, and 41 Master's nursing students. Quizzes covered 13 topic areas, and each contained a bank of 35 to 100 best answer multiple-choice questions. Participation was estimated from numbers of new followers registering after the announcement of the quizzes to each cohort. Qualitative comments in anonymous end-of-semester student feedback were collated.
Results: Estimated participation rates were medical: 55%, dental: 92%, first-year pharmacy: 90%, second-year pharmacy: 71%, first-year nursing: 40% and Master's nursing: 100%. Qualitative feedback was positive and suggested that QuizUp helped learning, consolidation of understanding and application of knowledge, for example: "very helpful in learning and applying the concept[s]", "promotes further learning", "allowed me to learn and revise", "love the quizzes to help us understand better", "allows us to consolidate our learning" and "very helpful in cementing concepts". Additionally, it was observed that QuizUp enabled interprofessional interaction between students from different classes playing the app with each other.
Conclusion: Presentation of multiple-choice quizzes on the QuizUp platform was well-received by students. Students believed that the quizzes helped them to consolidate and apply their learning. Further research is required to confirm whether the QuizUp quizzes enhance learning outcomes. Educification of gaming platforms used recreationally by students is accepted by students and may encourage student engagement while minimizing the extraneous cognitive load of learning new quizzing platforms.

SavingLives!: A game-based mobile application to promote Cardiopulmonary Resuscitation training and competency

Authors
Michael Nemirovski
Dan Norton
Lisa Buckley
Reid Adams
Eric Bauman

Presenter: Eric Bauman, Adtalem Global Education, Madison, WI, USA

Background: Cardiopulmonary Resuscitation (CPR) is a lifesaving skill and the foundation of basic life support (BLS), (Madden, 2005). The skill must be mastered by a broad range of healthcare providers and first responders including police, firefighters, lifeguards, coaches, emergency medical technicians, nurses and physicians. Among the skills tested during CPR/BLS training, effective chest compressions are considered one of the most important factors in achieving the return of spontaneous circulation. However, learners often achieve low scores in BLS chest compression skill demonstration (Ewy, 2007; Kellum, Kennedy, and Ewy, 2006). Although CPR/BLS recognition is a mandatory job requirement for many of these professions, regular deliberate practice is rarely performed, and CPR competency is poorly retained (Handley and Handley, 2003).
Alternative strategies including digital and game-based instruction have become a more prevalent, novel and accessible ways to promote initial training and skill retention. In addition, game-based learning may be ideal for continuing health professions education because it can provide a convenient and cost-effective tool that promotes learning anytime and anywhere (Bauman, 2016; Ricciardi & Paolis, 2014).
A review of the available digital mobile applications and games yielded a paucity of computer based games available to support for BLS education that are consistent with current American Heart Association (AHA) guidelines for proper rate of chest compression, depth of compression and allow for full chest recoil. SavingLives! is a tablet-based application that provides learners with just-in-time feedback in an authentic situated game where the patient status changes based on player performance associated with best practices in CPR.
The next steps are to study the performance of participants who used the game and who have not used the game in a simulated BLS environment to see if there is transfer to knowledge and/or skill.
This sort of access to formative and summative feedback through game-based learning may improve key competencies related to best practices in BLS/CPR.

The hurdles for adopting mobile learning devices in the clinical setting

Authors
Daniel Folger, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Jussi Merenmies, University of Helsinki, Faculty of Medicine, Helsinki, Finland
Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Helsinki, Finland

Presenter: Daniel Folger, University of Helsinki, Faculty of Medicine, Helsinki, Finland

Background: Since 2013 the University of Helsinki has given new medical students iPads for study and private use. Simultaneously, an action research on mobile learning started. In 2016, the first iPad-cohort commenced clinical studies and we observed a drop in iPad use. The aim of this study was to explore hurdles students encountered with mobile devices in the clinical setting.
Method: The data were collected with online questionnaires among 3rd and 4th year medical students in 2017. The response rate was 72% (N=86) and 90% (N=108) respectively. We examined open-ended question answers on suggestions for developing mobile device usage in clinical context by using qualitative content analysis.
Results: The main categories for development suggestions were related to bed-side teaching and the clinical learning environment. The 3rd year students reported resistance towards usage of iPads at the initiation of clinical studies. Major hurdles identified in bedside teaching were attitudes and the size of the iPad. Teachers forbade using the device on the wards and students were ambiguous about using them with patients. Some students wished for role-models for device use in the clinic. Students desired comprehensive digitalization of the learning environment, e.g. uploading and distributing materials in mobile device-compatible formats before teaching, and tests and quizzes for self-assessment. Teachers and students were concerned about the risk for infection transmission.
Discussion: We recognized similar impediments as previously reported on mobile learning in the clinic. We identified hurdles related to both bedside teaching and the clinical learning environment. Attitudes towards mobile device use in patient contact was a key hurdle, whereas problems in the learning environment centered around practical features.
Conclusion: The clinical context is prone to resistance towards mobile technology in students' learning. Attitudes and the physical format of devices appeared to be the greatest hurdles. The window opportunity for adopting novel technology and practice in learning is the initial phase of the clinical studies. Identifying the hurdles for adopting mobile learning devices in the clinical setting enables us to discover feasible ways of using these devices, for the best of the patients and future doctors.

5II11 (1017)
Developing interactive multimedia e-books for undergraduate medical students in core clinical competencies

Authors
Chih-Cheng Hsiao, Kaohsiung Chang Gung Memorial Hospital and Chang Gung University College of Medicine, Chang Gung Medical Education Research Centre, Kaohsiung, Taiwan
Yu-Ting Hsiao, Kaohsiung Chang Gung Memorial Hospital, Kaohsiung, Taiwan
Hsuan-Yin Liu, Kaohsiung Chang Gung Memorial Hospital, Kaohsiung, Taiwan
Ya-Lan Lin, Kaohsiung Chang Gung Memorial Hospital, Kaohsiung, Taiwan
Yu-Hsuan Hsiao, Taipei Medical University, Taipei, Taiwan

Presenter: Chih-Cheng Hsiao, Kaohsiung Chang Gung Memorial Hospital and Chang Gung University College of Medicine, Chang Gung Medical Education Research Centre, Kaohsiung, Taiwan

Background: Core clinical competencies consisting of basic clinical skills, basic communication skills and basic clinical attitude should be acquired by all undergraduate medical students in Taiwan. Interactive multimedia e-books were designed to help students to improve their learning in core clinical competencies and evaluate the effectiveness.
Method: We used SimMAGIC e-book software, the simple and clear editing layout, customized editing tools and various content editing functions, to create 81 interactive multimedia e-books including fields in physical examination (31), visual image interpretation (6), laboratory examination (8), procedure skills (16), therapeutic skills (14) and others (6) for learning core clinical competence. Learning outcomes were examined by pre-test and post-test. A questionnaire was used to record the students' perceptions, with rating on a 5-point Likert scale.
Results: 62 undergraduate medical students participated in the study and evaluation of e-books. With regards to how effective this e-book learning method was for students, the questionnaire scores ranged between 4 and 5, i.e. agree and strongly agree. The score in teaching material planning was the highest, scoring 4.31 out of 5, followed by self evaluation which was 4.17. Contrarily, the e-book platform had the lowest scoring at 4.08. The average score increased from 74.76± 9.87 in the pre-test to 86.60 ±11.49 in the post-test (p<0.01). Most of the students unanimously considered using e-books were effective in learning core clinical skills.
Our data supported that the interactive multimedia e-book is effective for undergraduate medical students to facilitate learning core clinical competencies. Future work should be done to improve interface function of e-book platform.
The students perceived that the e-book design was informative and useful. Interactive multimedia e-book could be taken into account as an alternative study method in learning core clinical competencies.
Conclusion: Curriculum innovation in the interactive multimedia e-book module for learning core competencies

was moderately effective and well received by the students. Furthermore, it can help undergraduate students approach patients holistically and safely.

5II12 (3660)
Taxonomies: Our superpower?

Authors
Richard Price, Health Education England, London, UK
Susan Kennedy, Health Education England, London, UK

Presenter: Richard Price, Health Education England, London, UK

Background: We possess a superpower in our pockets that we use every day without realising it. That superpower is the taxonomy, an information technology that powers the apps on our phones, the websites we browse and supports the decisions we make. Without a taxonomy, we would struggle to find much of the information we take for granted when using search engines and websites. Existing taxonomies are not always designed to support the search and discovery of education and training resources.
Method: We worked with doctors to build a prototype taxonomy to improve the way they find, access and discover learning content across digital systems and services including e-learning and e-portfolios. We took around 2000 terms from a wide range of different taxonomies such as SNOMED and MESH and mapped these words against synonyms to create a learning-specific taxonomy suitable for tagging and indexing educational resources. E-learning resources in a learning management system were tagged with the new taxonomy terms and the search tested with clinicians in a workshop to establish ease of discovery compared to existing search engines.
Results: Initial desk research indicated that existing taxonomies lack relevance when applied in a learning context. When e-learning resources were tagged and indexed against the learning-specific taxonomy, clinicians noted that learning objects were significantly easier to find compared to searching for the same materials using the default learning management system search tool.
Discussion: Existing taxonomies such as SNOMED work well for clinical coding but our research found that clinical codes were not very helpful when applied to learning materials. By building a custom taxonomy, based on crowd-sourced terms, it was possible to significantly improve the discovery of learning materials using search.
Conclusion: Taxonomies are transforming the way we share, search and discover education and training materials, turning information into an everyday superpower!

5II13 (773)
Development of Information Literacy Skills Evaluation in Preclinical Medical Students based on the American Library Association 2015 Framework: A Pilot Study

Authors
Werapat Pathanasri, Department of Anatomy, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand
Lokachet Tanasugarn, Department of Preventive and Social Medicine, Faculty of Medicine Siriraj Hospital, Mahidol University, Thailand
Kanat Chantongdee, Faculty of Medicine Siriraj Hospital, Mahidol University, Thailand
Dhanach Dhirachaikulpanich, Faculty of Medicine Siriraj Hospital, Mahidol University, Thailand
Pongsakorn Buraphat, Department of Pharmacology, Faculty of Medicine Siriraj Hospital, Mahidol University, Thailand
Mayuree Homsanit, Department of Preventive and Social Medicine, Faculty of Medicine, Siriraj Hospital, Mahidol University, Thailand
Cherdsak Iramaneerat, Department of Surgery, Faculty of Medicine Siriraj Hospital, Mahidol University, Thailand

Presenter: Werapat Pathanasri, Department of Anatomy, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand

Background: Information literacy (IL) includes recognizing information needed, searching, evaluating and applying the information. Teaching IL in preclinical students should prepare them for application in clinical periods. The recent update of IL framework in Association of College and Research Libraries (ACRL) 2015 calls for a new corresponding evaluation tool. Thus, we develop a feasible and discipline-specific IL evaluation among preclinical medical students.
Method: An evaluation comprised of three performance-based assessments with grading rubrics and twelve multiple-choice questions was developed based on the ACRL 2015 IL framework validated by experts. The evaluation session was held in a standard test center. Difficulty and discrimination indices of the test were analyzed. Differential item functioning, factor analysis, Cronbach's alpha and Spearman-Brown prophecy formula were used to gain further insight for test development. Results from test analysis and participants' feedback were used to subsequently refine the evaluation.
Results: Twenty-seven preclinical medical students participated in the session. The average difficulty and average discrimination indices were 0.83 and 0.29, respectively. Gender and grade point average has no differential effect on the score ($p \geq 0.05$). Exploratory factor analysis revealed two factors with Cronbach's alpha of 0.42 and 0.20, respectively. The multiple-choice questions have to be increased to a total of sixty-two items to obtain reliability of 0.7 based on Spearman-Brown prophecy formula.
Conclusion: This is the first study to match discipline-specific IL competency with ACRL 2015 guideline. The overall difficulty and discrimination index of the multiple-choice questions were in good range. However, the

internal consistency and reliability of the questions set was low due to small number of test questions and little variation in difficulty. Exploratory factor analysis with two extracted factors illustrated different components of the IL concept between the empiric model as compared to the ACRL 2015 framework; however, this difference was potentially due to small sample size.

Take-home messages: Discipline-based IL assessment for preclinical medical students is achievable through multiple-choice questions and performance-based evaluation.

To obtain an acceptable reliability index, the multiple-choice questions should be extended to at least 60 questions based on ACRL 2015 IL framework.

5II14 (913)
Utilization of internet resources and standard textbooks in emergency medicine questions: A comparison study in correction among medical students

Authors
Chatchawan Uacharuporn, Department of Emergency Medicine Vajira Hospital Navamindradhiraj University, Bangkok, Thailand
Chirakit Hengrasmee, Department of Emergency Medicine Vajira Hospital Navamindradhiraj University, Bangkok, Thailand

Presenter: Chirakit Hengrasmee, Department of Emergency Medicine Vajira Hospital Navamindradhiraj University, Bangkok, Thailand

Background: The use of technology is increasing rapidly and growing technological influence can be seen in modern medicine. In emergencies, precise diagnosis and timing are keys to correct crises. The decision to make a quick and proper treatment based on the right information contributes to the effectiveness of the practice in emergency medicine worldwide.

To compare the correction and duration of the responses to validated emergency medicine questions among medical students between the use of emergency medicine standard textbooks and internet resources including medical applications.

Method: A randomized investigator-blinded crossover study was conducted among 40 medical student volunteers who have recently completed the 4-week emergency medicine rotation at Faculty of Medicine Vajira Hospital Navamindradhiraj University. All emergency medicine questions were validated by the pilot study group and the difficulty index of 0.2 or less was accepted. The statistical relationship was tested by the Wilcoxon Signed Ranks Test and Spearman's correlation coefficient with statistical significant difference at p value of 0.05 or less.

Results: There was no statistical significant difference when compare between the median of correct answers using standard medical textbooks and the internet resources (p value = 0.116 with interquartile range of 2.5-4.5 and 3.0-5.0 respectively). However, the median of time spent on answering the questions using standard medical textbooks was significantly longer than using internet resources with the median of 4.285 (3.0-6.0) and 3.333 (3.0-4.017) minutes respectively (p-value < 0.001).

Additionally, there was no correlation between the correction ratio (the ratio of correct answers and all answers) and grade point average (GPA) regardless of the methods (correlation coefficient of 0.003, p-value = 0.985 and correlation coefficient of 0.247, p-value = 0.130 in standard textbooks and internet resources respectively).

Conclusion: Utilization of internet resources and medical applications which are up-to-date and referenced, is less time-consuming and able to provide correct answers in emergency medicine equivalently to standard medical textbooks regardless of individual basic medical knowledge.

5II15 (2435)
Cooperative Learning for Health Promotion within Hackathon

Authors
Yi-Hsin Elsa Hsu, Biotech EMBA & School of Healthcare Administration, Taipei Medical University, Taipei, Taiwan

Presenter: Kung-Pei Tang, Department of Education and Humanities in Medicine, School of Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan

Background: The inter-professional education has received increasing attention in the context of healthcare industry. Hackathon is an activity to induce students from different health care professions to solve problem creatively together. We arranged a Hackathon activity to engage health care professions students to propose local health promotion projects (2017-September-08 to 10). 58 undergraduates and one graduate student at Taipei Medical University participated this activity.

Method: All hackathon participants were randomly divided in 8 groups and assigned to propose a health promotion project according to cases scenarios addressed by mentors. The Positive Social Interdependence Readiness Scale (PSIRS) was employed to investigate students' perception at begin and the end of their teamwork. PSIRS comprises three factors: 1. appreciation of cooperative learning, 2. positive interdependent mindset, 3. collective efficacy. Students' learning achievement were quantified in peer assessment score. Students' project-based learning achievement was quantified in scores of peer assessment.

Results: According to paired T-test, participants' collective efficacy increased significantly. After controlled the variables age, gender and the pretest scores of PSIRS, we found that students' PSIRS posttest scores were positive correlated to their project-based learning achievement scores (β = .21, p = .05).

Conclusion: Students' appreciation of cooperative learning and their attitude toward positive interdependent relationships during teamwork haven't significantly changed because this Hackathon, but they perceived more efficient and robust in teamwork after the intensive cooperative learning. The perception of stronger collective efficacy has been reflected on the assessment scores of their group projects.

Take-home message: The Hackathon activity can enhance students' cooperative learning performance.

5JJ1 (1512)
Exploring the Relational Processes that occur within Mentorship in Academic Medicine

Authors
Charles Ho, Western University, Canada
Lorelei Lingard, Western University, Canada

Presenter: Charles Ho, Schulich School of Medicine & Dentistry - Western University, London, Canada

Background: Good mentorship provides many benefits in academic medicine. It improves career satisfaction, research output, and career development. Mentoring efficacy is strongly influenced by the quality of the relationship between the mentor and mentee. However, we lack a conceptual understanding of how the relationship between mentor and mentee unfolds. Without this understanding, we are severely limited in our ability to devise interventions that support the development of meaningful mentoring relationships.
Method: We explored how mentoring relationships in academic medicine develop through qualitative interviews with mentors and mentees. Iterative data collection and analysis followed Constructivist Grounded Theory principles. Semi-structured interviews were conducted with 16 faculty members and residents across all medical departments to explore their mentoring experiences. Participants represented a mix of mentors and mentees and we sought to sample mentor/mentee pairs where possible. Sensitizing concepts from literature on adult relationships informed our inquiry on possible processes that could be occurring in mentoring relationships. Using constant comparative analysis we approached the data both as individual interviews and as mentee/mentor pairs. All interviews are completed and analysis has moved to the theory-building stage.
Results: Initial results suggest that processes related to developing a professional and personal relationship between mentor and mentee are key to meaningful mentoring relationships. These processes included mentors and mentees understanding each other's values, adjusting to one another's interpersonal style, and perceiving each other's mentoring needs. Comparisons between meaningful mentorship and personal relationships were common. While mentors and mentees cited common factors such as work ethic or feeling valued as important for the development of the relationship, the relative value of each factor varied depending on the relationship.
Conclusion: Initial results emphasize the importance of the professional and personal relationship in mentoring and how mentors and mentees seek to understand each other's values, interpersonal style, and needs to grow the

relationship. Future work should consider whether interventions that facilitate these processes foster effective mentoring relationships in academic medicine.
Take-home message: Mentors and mentees engage in a process of understanding each other's values, interpersonal style, and needs to grow the professional and personal relationships that characterizes mentorship.

5JJ2 (3150)
Mentoring Relationships of Female Doctors in Three Different Countries: Are they Perceived as Friendships?

Authors
Heba A. Mohtady, Zagazig University, Egypt; Fakeeh College for Medical Sciences, Saudi Arabia; Maastricht University, Netherlands
Karen D. Könings, Maastricht University, Netherlands
Mohamed M. Al-Eraky, Zagazig University, Egypt -Imam Abdulrahman Bin Faisal University, Saudi Arabia; Maastricht University, Netherlands
Arno M.M. Muijtjens, Maastricht University, Netherlands
Jeroen J.G. van Merriënboer, Maastricht University, Netherlands

Presenter: Heba Mohtady, Fakeeh College for Medical Sciences, Saudi Arabia; Zagazig University, Egypt, Cairo, Egypt

Background: Female doctors have to overcome various challenges to develop their careers, especially in countries where gender roles are still undergoing a change process. These challenges include work-life balance, gender discrimination and scarcity of training opportunities. Effective mentoring may diminish some of these obstacles and protect against negative influences encountered by female doctors. Therefore, female protégées are often encouraged to take advice from a mentor within the medical field. Nevertheless, perceptions of mentorships may vary with personal factors such as age and gender. This study explores the perceptions of mentoring among female doctors. How do female mentors and protégées perceive informal mentoring with regards to friendship in comparison to male peers?
Method: Perceptions of psychosocial roles were measured in 194 participants (102 females and 92 males) from universities in Egypt, Saudi Arabia, and Pakistan using a questionnaire measuring the perceptions of informal mentoring. This abstract specifically reports on the subscale measuring perceptions of friendship (PF). The influence of Gender (male or female) and Role (mentor or protégée) on PF was investigated in a multiple regression analysis with Gender and Role as predictors of PF, while controlling for Age and Duration as potential confounders. The standardized regression coefficient was used as an indicator of effect size. Using Cohen's classification values 0.1, 0.3 and 0.5, respectively correspond to small, medium and large effects.
Results: PF (5-point scale) was found to be 3.03 for male participants in the role of protégée. For female participants PF increased by 0.26 (regression coefficient(b)=0.26, standard regression coefficient(src)=0.15, p=0.03), a small effect, and for the

role of mentor vs. protégée the increase was 0.49 (b=0.49, src=0.27, p=0.003), a medium effect.

Conclusion: PF of mentors and protégées differ according to gender. A sense of friendship is suggested to form a crucial element of the female informal mentoring relationship. Female mentors usually aspire to provide psychological support based on friendship. The effectiveness and satisfactions of the friendship aspect of mentoring relationships rely on mentors, protégées and other variables including gender.

Women value their friendliness in mentoring relationships more than men.

Mentoring medical students – a systematic review of the literature from 2008 to 2018

Authors

Elise P. Skjevik, UiT the Arctic University of Norway, Tromsø, Norway
Christian G. Brinch, University of Bergen, Bergen, Norway
Unni Ringberg, UiT the Arctic University of Norway, Tromsø, Norway
Don Boudreau, McGill University, Montreal, Canada
Edvin Schei, University of Bergen, Bergen, Norway
Eirik H. Ofstad, UiT the Arctic University of Norway, Tromsø, Norway

Presenter: Elise P. Skjevik, UiT the Arctic University of Norway, Tromsø, Norway

Background: In the last decade, the establishment of group-mentorship programs for undergraduate medical students has become a significant trend, particularly in European and North American medical schools. Two previous systematic reviews on mentorship programs for medical students limited to publications listed in Medline (1966-2002) and PubMed (2000-2008), identified and described 9 and 14 formal mentorship programs for medical students, respectively. The aim of our study was to identify new publications describing both one-to-one and group mentorship programs.

Method: We searched OVID Medline and Embase databases from January 2008 – January 2018, using a combination of relevant key words and Medical Subject Headings (MeSH). All titles and abstracts were assessed by the first and last author. Additional search strategies included manual review of references identified in the primary search and expert input. We specifically focused on articles that described (1) group mentoring; (2) one-to-one mentoring; or (3) evaluated the mentor program.

Results: The database search identified a total of 494 scientific papers, of which a mere 22 papers describe mentorship programs for undergraduate medical students. Mentorship programs exist in various formats; formal or informal; one-to-one, group-based or as a combination; implemented in the curriculum or occurring serendipitously. The aims of mentorship programs vary from facilitating career-planning, ethical discussions and communication skills training, to enhancing social support and the formation of a professional identity for medical students. Group-mentorship programs vary regarding mentor group size, number of mentors per group,

recruitment of mentors, the duration and frequency of meetings, content emphasis, financial support of the program and coordinated faculty development. Few undergraduate medical schools with existing mentorship programs have published descriptive and evaluative reports about their programs. Available evidence reports a wide variation in format and aims on how mentoring medical students can and should be done.

Conclusion: For medical schools who consider establishing mentorship programs of their own, knowledge of factors associated with experienced success, key challenges and obstacles, are essential. Medical schools with mentorship programs not described in scientific literature are encouraged to publish descriptive and evaluative reports about their programs.

The Roles of a Teacher: What does coaching add?

Authors

Bradley Barth, University of Kansas Medical Center, Kansas City, USA
Joanna Brooks, University of Kansas Medical Center, Kansas City, USA
Kat Istas, University of Kansas Medical Center, Kansas City, USA
Erica Howe, University of Kansas Medical Center, Kansas City, USA

Presenter: Brad Barth, University of Kansas Medical Center, Kansas City, USA

Background: Educators need to have a wide variety of skills. Our hypothesis is that they play roles as a teacher, mentor, coach, and supervisor. We recently developed a one-on-one clinician-student "Coach" relationship at our institution and wanted to obtain clarity around this role.

Method: We developed definitions and behavioral descriptors of each role using the literature and a modified Delphi approach. We then surveyed faculty to determine their perception of the roles, as well as their ability to identify which role a behavior best exemplified.

Results: The initial survey and modified Delphi approach had a response rate of 64% . The second survey went to teaching faculty in the Coach position and had a response rate of 84%. Agreement was higher as the definition was more clearly related to the role. (e.g. explaining oncogene function was clearly recognized as teaching, role-playing was clearly recognized as coaching). One area of high agreement between the two populations, and with the literature, surrounded the mentoring role. The faculty that had received training and were in the Coach role were more likely to assign an uncertain or unclear behavior to the coach role, whereas the expert group was more likely to assign an uncertain behavior to the role of mentor. The results of this survey highlight a need for greater collaboration between curriculum architects and operators. There were areas of agreement and disagreement between experts and faculty in the Coaching role. The results of this study will clarify the role of the Coach at our institution as iterations of curriculum reform unfold. More faculty development will be required around the roles of an Educator.

Conclusion: Coaching holds great promise in education, but at this point the definition is not clear. We need to clarify the definitions and provide faculty development for them to improve as coaches.

Teaching Mentoring for Junior Doctors

Authors
Maria Bashyam, London North West University Healthcare NHS Trust, London, UK
Misha Kabir, London North West University Healthcare NHS Trust, London, UK
Lewis Vanhinsbergh, London North West University Healthcare NHS Trust, London, UK
Amar Sharif, London North West University Healthcare NHS Trust, London, UK

Presenter: Maria Bashyam, London North West University Healthcare NHS Trust, London, UK

Background: New Year 1 Foundation doctors (FY1's) are enthusiastic about teaching but lack experience and guidance (Rodrigues 2010). We have introduced teaching mentoring to develop confidence and ability as a medical educator at a London teaching hospital.
Method: This is an interpretive study designed to explore FY1 doctors' views on the effect of a teaching mentoring scheme on their confidence as a teacher. Ethics approval was granted by our trust. Recruitment was voluntary, FY1's interested in teaching were invited to run small group tutorials for year 6 students in curriculum aligned sessions on acute care management.
Results: Mentors provided guidance to FY1's through a pre-session meeting, observing the teaching session and concluding with a post session debrief incorporating review of student feedback. The effect of this scheme was explored using a pre and post-session questionnaire, observation feedback forms and one to one debrief sessions allied with focus groups and semi structured interviews.
Quantitative and qualitative data will be analysed into themes, facilitating deep and meaningful analysis.
Six FY1's volunteered to participate in the scheme. Initial questionnaire results show maximum improved confidence in self-evaluation and feedback analysis. All participants rated the teaching observation, debrief and overall experience very useful (5/5). Focus group results to follow.
Data analysis will be completed by March 2018.
Conclusion: Teaching mentoring for FY1's helps improve the confidence in preparation, self-evaluation and delivery of teaching. Self evaluation and feedback analysis are essential skills for an educator and clinician. Improving these skills will contribute to continuing professional development and quality of teaching delivered.
FY1's enthusiasm is a helpful source of teaching. Mentoring can promote development of essential teaching skills in this group by increasing the confidence in teaching preparation, delivery, self evaluation and feedback analysis. These are transferable skills across all clinical specialties.

Understanding the e-mentoring relationship within Medicine: a thematic analysis

Authors
Chong Jia Yan
Ching Ann Hui
Yaazhini Renganathan
Ying Pin Toh
Lalit KR Krishna

Presenter: Lalit KR Krishna, Division of Supportive and Palliative Care, National Cancer Centre Singapore, Singapore

Background: E-mentoring has great potential in Medicine, but is reported to be underexplored. There are conflicting views over whether a mentoring relationship can be attained virtually, and the quality of such relationships questioned. This study aims to shine light on the e-mentoring relationship in Medicine, to evaluate current needs and gaps in e-mentoring and how strategies can be developed to facilitate the development of fruitful e-mentoring relationships.
Method: A literature search was done on PubMed, Scopus, ERIC, Google Scholar and Cochrane Database of Systematic Reviews for articles with a focus on e-mentoring in Medicine. Open coding was carried out by the authors and thematic analysis was performed.
Results: 2554 articles resulted from the initial search, 89 full texts were retrieved after review of titles and abstracts, and 14 articles were selected. Data centralized to interpersonal relationship and reflections were extracted and thematic analysis arrived at 7 themes. Themes identified include the pros and cons of e-mentoring, details of the e-mentoring relationship such as the development and the tone, the role of the mentor in initiating and maintaining the relationship, the mentees' benefits from the process, and comparison to face-to-face mentoring.
Our results show that an e-mentoring relationship can develop effectively through online platforms with complexity and depth rivalling that of traditional face-to-face mentoring. Like traditional mentoring, e-mentoring relationships are multi-faceted. It encompasses variations in tone ranging from formal to informal, communication details, purposes, process and progress starting from initiation to the ends or continuation as friendship. These relationships ultimately benefit mentees in personal development, knowledge and social bonding. In view of the geographical and chronological barriers that e-mentoring can overcome, we should focus on developing e-mentoring programs, especially on growing the mentoring relationship.
Conclusion: E-mentoring is not merely another e-learning platform. Forming a quality e-mentoring relationship is possible and brings significant benefits to the mentees. It should be a focus of current and future e-mentoring programmes.

Take-home message: Relationship is an important aspect of e-mentoring that should be explored and enforced. It is complicated and intricate, and can bring substantial benefits to the mentees' learning.

Assessing mentoring - a systematic review of mentoring assessment tools between 2000-2015

Authors
Yong Xiang Ng
Zachary Koh
Ying Pin Toh
Lalit Krishna

Presenter: Yong Xiang Ng, National University of Singapore, Singapore

Background: Mentoring's success pivots on meeting the particular needs and goals of mentees and mentors. Ensuring that these personalized mentoring relationships comply with prevailing standards of practice and codes of conduct underlines the need for comprehensive methods of evaluating mentoring processes. A dearth of assessment tools and the presence of a wide variety of mentoring practices and settings occasions the need for scrutiny of prevailing methods of assessing mentoring in the extant literature.

Method: Three reviewers carried out independent literature searches using PubMed, Scopus, Embase, ERIC and Cochrane Database of Systematic Reviews for publications on mentoring tools published between 1 January 2000 and 31 December 2015. Acknowledging mentoring's context- specific nature that makes comparisons of mentoring across different settings difficult, the reviewers carried out independent thematic analysis of included articles.

Results: 10,246 abstracts were identified,193 full text articles were retrieved, 34 articles were included and thematically analyzed. Seven themes were identified including the mentoring relationship, the mentoring process, the provision of psychosocial support, enhancing personal development, the nature, form and frequency of communication, career advice and the provision of effective feedback.

The focus of mentoring evaluations revolves around and reemphasize the importance of mentoring relationships and holistic support provided by mentoring processes. They also underline the need for longitudinal and holistic evaluation of the impact of mentoring experiences.

Conclusion: Identification of the key areas of the mentoring process to be evaluated allows for the design of more holistic appraisal tools. The data will also guide mentor training programs, the provision of support for mentees, the mentoring process and mentors. Robust and effective tools for the evaluation of mentoring also allow for the long-term benefits of mentoring programs helping to improve programs and justify funding of these projects. Identification of the key mentoring domains allows for effective and holistic evaluation of mentoring processes that are essential for the development of mentoring programs and their place within personalized medical training in formal medical curricula.

Designing a Framework to Match Mentees and Mentors Through Thematic Analysis of Mentoring Programs Between 2000 and 2015

Authors
Jia Min Hee, Yong Loo Lin School of Medicine, Singapore
Ying Li Toh, Monash University, Melbourne, Australia
Hong Wei Yap, Lee Kong Chian School of Medicine, Singapore
Ying Pin Toh, National University Health System, Singapore
Lalit Kumar Radha Krishna, National Cancer Centre, Singapore

Presenter: Jia Min Hee, Yong Loo Lin School of Medicine, Singapore

Background: Individualizing mentoring is necessary to meet the distinct goals, abilities and needs of mentees and mentors. Thus, matching has been acknowledged as key to effective mentoring relationships. However, the matching process remains poorly elucidated. This literature review aims to identify the important factors and processes in matching to lay the foundation for a consistent and reliable approach to matching.

Method: Using "matching', "mentor", "mentoring", "mentorship", "medical students", "medical school" AND "medicine" or their combinations as search terms, this review scrutinized matching medical students to senior clinicians in mentoring programs. PubMed, ERIC, Cochrane Database, OVID and ScienceDirect databases between 2000 and 2015 were searched. Thematic analyses were employed to circumvent inherent differences in practices in different settings and diverse groups of mentors and mentees.

Results: 25605 abstracts were retrieved, 162 full-text articles were reviewed and 34 articles were included. The themes identified were individual expectations and commitment, matching factors and accepting a match. Matching begins with assessing the commitment, expectations and goals of the mentee and the mentor through matching forms. Mentees may be provided with a list of potential mentors with whom they meet to discuss their specific goals. The mentee and a mentor then agree to work together, having established a working relationship. This selection has significant impact upon the mentoring approach and the mentoring environment.

Conclusion: Our results suggest an approach to matching which has effects echoing long into the mentoring relationship. The matching process, mentoring approach and mentoring environment cannot be considered as discrete entities, but rather as intimately entwined processes that must be considered and evaluated holistically and in a longitudinal manner. Thus, whilst matching, mentoring environments and processes are reported separately, how they fit together and interact should be the focus of future research.

Take-home messages:
1. Matching is pivotal to the success of a mentoring relationship
2. Careful consideration needs to be invested in creation of an effective matching process

3. Matching may be considered in 3 phases: collection of individual data of individual expectation and commitment, mentor selection, and continued evaluation of the mentoring process.

Mentoring relationships as complex adaptive systems - a study based on the Palliative Medicine Initiative mentoring program

Authors
Yap Hong Wei, Nanyang Technological University, Singapore
Zhou Yi, Singapore General Hospital, Singapore
Toh Ying Pin, National University Health System, Singapore
Lalit Krishna, Duke-NUS Graduate Medical School, Singapore

Presenter: Yap Hong Wei, Nanyang Technological University Lee Kong Chian School of Medicine, Singapore

Background: Mentoring relationships sit at the heart of mentoring's success however its evolving, entwined, adaptable, mentee-, mentor-, organizational-, relational-dependent nature has been difficult to study, compromising the effective design and oversight of mentoring programs. Similarities between mentoring's nature and complex adaptive system (CAS), described as "a collection of individual agents with freedom to act in ways that are not always totally predictable, and whose actions are interconnected so that one agent's actions changes the context for other agents" provides a hope for program designers and curriculum planners.
Method: We studied mentoring relationships within the Palliative Medicine Initiative (PMI), a mentoring program designed to generate research in Palliative Medicine and end-of-life ethics, to evaluate if mentoring's nature is a form of CAS. Purpose designed questionnaires were used in semi-structured face-to-face interviews with all mentees within the PMI program between 2013 and 2015. The 16-transcribed audio-recordings were anonymized and 'member checked' before being thematically analyzed by two independent reviewers.
Results: Seven broad themes were identified: goals, matching, roles of the mentor, characteristics of the mentee and mentor, changing nature of the relationship, organizational impact and environmental influences reaffirmed the features of mentoring's nature. They highlight the evolving nature of mentoring relationship and a variety of influences upon it.
The data suggests that mentoring relationships adapt in a nonlinear manner in response to changes in the mentee's, mentor's, organizational, relational and societal factors. The impact of change within these independent entities is complex as their influence upon the mentoring relationship is interrelated, making responses to change unpredictable. Change and adaptations is followed by self-organization with different factors playing vital roles in sustaining the relationship. It is also evident that wider societal influence also impacts the mentoring relationship, revealing the mentoring relationship as a far larger and complex system.
Conclusion: CAS better describes mentoring relationships and offers greater insights to medical educators designing and overseeing mentoring programs. Further studies are needed to follow mentoring relationships longitudinally and must include holistic appreciation of all parties involved.
Take-home message: Understanding the CAS approach is valuable to mentoring's success.

5JJ10 (2284)
The design of a novel mentoring assessment tool

Authors
Zachary Koh
Yong Xiang Ng
Ying Pin Toh
Lalit Krishna

Presenter: Zachary Koh, National University of Singapore, Singapore

Background: Mentoring is a key element of successful professional development and personalized education and pivots upon the effective nurturing of mentoring relationships. Assessing the 'health' of mentoring relationships and providing timely, holistic, individualized and appropriate to support mentoring relationships in need can be difficult in changing conditions.
A tool that could assess the needs of mentoring relationships and guide effective support would be a boon for mentors and program administrators overseeing the various relationships within the program. This review seeks to evaluate prevailing tools that assess mentoring and propose the framework for a novel mentoring relationship assessment tool.
Method: Three reviewers carried out independent literature searches focused upon articles discussing and detailing aspects of assessments of mentoring relationships published between 1 January 2000 and 31 December 2015. PubMed, Scopus, Embase, ERIC and Cochrane Database of Systematic Reviews databases were used.
Results: 10,246 abstracts were identified, 193 full-text articles were reviewed, and 34 articles were included. There were 33 mentoring tools found. Three key domains assessed were 1) Research/clinical work, 2) Career guidance and 3) Psychosocial support. The aspects evaluated in the 632 questions found focused upon the management of expectations and goals, the quality of communications within the mentoring pair, the provision of psychosocial support, career guidance, research/ clinical support provided and general mentoring experiences. These tools allow for early recognition of issues in the mentoring relationship, identify specific areas for attention and facilitate better oversight of the mentoring process. However significant gaps specifically in terms of the provision of feedback and the quality of interactions within mentoring relationships require further attention to empower both the mentor and mentee to make changes that will enhance the relationship.
Conclusion: Periodic evaluation of the mentoring process is crucial to allow mentee and mentor the opportunity to develop the mentoring relationship in meaningful ways. This also gives opportunity for stakeholders to have effective oversight of mentoring programs.

5JJ11 (495)
Medical Student Perceptions About Negative Attributes of Potential Role Models

Authors

Luiz Troncon, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Sate of Sao Paulo, Brazil
Maria de Fatima A Colares, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Sate of Sao Paulo, Brazil
Marcia B Di Stasio, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Sate of Sao Paulo, Brazil
Larissa Bernardes, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Sate of Sao Paulo, Brazil
Bernardo U Goldberg, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Sate of Sao Paulo, Brazil
Iago S Caires, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Sate of Sao Paulo, Brazil

Presenter: Luiz Troncon, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Brazil

Background: The influence of role modelling on medical student professional development has increasingly drawn the attention of medical educators. Although a relatively large number of studies have investigated the positive attributes of clinical trainers who could act as role models to students, the identification and description of negative characteristics of potential models has been less explored.
Method: Students (N=301; Years 2-5) from a six-year undergraduate program in a single institution answered to a questionnaire on role models characteristics. This included an item asking them to describe openly up to five negative attributes. Two investigators working independently codified the descriptions using a qualitative research technique for content analysis. Codified descriptions were then analyzed quantitatively.
Results: Answers on negative attributes were obtained from 291 students (96.6%) who described a median of four characteristics each and produced 898 descriptions. This allowed the identification of more than 30 different negative attributes, which were coded in five different categories: "Personal aspects" (37.2% of the 898 descriptions), "Patient management and professionalism" (27.1%), "Communication and relationship with patients" (25.3%), "Teamwork and inter-professional relationships" (8.0%) and "Teaching and relationships with students" (2.4%).
Students have defined not only attributes opposing known positive characteristics, which could suggest a response bias, but also a wide range of negative characteristics. This included many attributes already known and others not yet described. Negative attributes encompassed chiefly characteristics involved in patient care and personal qualities, with a much lesser contribution of teaching flaws. Besides the well-known categories of role model attributes ("Patient care", "Teaching" and "Personal"), students were able to identify negative characteristics pertaining to other categories ("Teamwork and inter-professional relationships"). These findings indicate that students have a clear perception of undesirable characteristics of clinical trainers, which therefore they would possibly not attempt to imitate.
Conclusion: Students appear to be able to discriminate between good and bad role modelling. Students perception on negative attributes seems to be more varied than that regarding positive characteristics. Institutional initiatives for improving role modelling should consider not only fostering model positive attributes but also inhibiting the expression of negative characteristics.

5JJ12 (2093)
Perception of final year medical students on role model and anti-role model characteristics

Authors

Arunee Tipwong, Suratthani Hospital, Suratthani, Thailand
Pranapda Chowanutsavettaku,. Suratthani Hospital, Suratthani, Thailand
Kamkarn Sriraksa, Suratthani Hospital, Suratthani, Thailand
Thanchanok Kerdnet, Suratthani Hospital, Suratthani, Thailand
Chuennapa Kaewmeesri, Suratthani Hospital, Suratthani, Thailand
Direk Ekbovonwong, Suratthani Hospital, Suratthani, Thailand

Presenter: Arunee Tipwong, Suratthani Hospital, Suratthani, Thailand

Background: Professional behaviors are parts of our ultimate outcomes required in medical trainees. As explained in an educational theory of apprenticeship, most students learn to behave professionally and vice versa from their teachers. Although students have long exposure to the same clinical environment, individual students may perceive how their teachers being a role model or anti-role model (negative role model) differently.
Method: The objective of this study was to determine the perception of final year medical students on the positive and negative role models in clinical teachers. Twenty-eight final year medical learners at Suratthani Medical Educational Center were invited to rank their perception on positive and negative professional behaviors and 5 students were randomly selected for an in-depth interview during October - November 2017. Descriptive statistics were used.
Results: Top three positive professional behaviors that students ranked the first were 'altruism,' 'good teaching and mentoring skills,' and 'excellent professional knowledge and skills' (28.6%, 28.6%, and 17.8% of all students respectively). The least favorable positive role model characteristic was 'leadership and collegiality' (21.42%). Top three negative professional behaviors that students ranked the most dislike were 'disrespecting others,' 'being rude to others,' and 'irresponsible to patient care,' (46.4%, 25%, and 14.3% of all students respectively), while 'dress improperly' was reported as the least important negative behavior (75%). According to the in-depth interview, most of the participants affirmed that role model can be strongly inspiring person to their future success, and all of them reported that they would imitate positive behaviors from their teachers, while one student was critically aware that negative behaviors can be

different in each individual teacher, given that he/she would not emulate such negativity.

Conclusion: The majority of favorable role model and detestable anti-role model characteristics were related to non-clinical skills of medical profession, in particular interpersonal skills. Moreover, learners were highly concerned about a good student-teacher relationship as an important factor on their successful clinical education.

Take-home message: Medical teachers need to be a highly clinical competent physician as well as a good professional role model.

5JJ13 (805)
Evaluating a Resident-as-Teachers workshop – the added value of student perspectives

Authors
Johanna Buechel, Women's University Hospital, Basel, Switzerland
Linda Snell, Centre for Medical Education, McGill University, Montreal, Canada

Presenter: Johanna Büchel, Women's University Hospital, Basel, Switzerland

Background: The role of residents as teachers (RaT) is crucial. RaT programs are established worldwide but residents still report feeling ill prepared to teach medical students effectively in a clinical examination course (CEC).
Method: An innovative RaT workshop was implemented to prepare residents to teach. A retrospective pre-post questionnaire was distributed to workshop participants ('trained residents'). Non-workshop participants also teaching in the CEC were considered the control group ('untrained residents'). All residents who had taught in the CEC were asked to fill out a second questionnaire about self-reported perceptions of their teaching. Medical students' perceptions were obtained using a post-course questionnaire, distinguishing between trained versus untrained resident tutors.
Results: Residents reported high satisfaction with the workshop; significant differences in their knowledge and perception were shown before and after the workshop. They also reported a change in their teaching behavior after conducting several CEC. There was no significant difference between trained and untrained residents in their self-perception as a teacher. In contrast, students blinded to the status of their residents evaluated trained resident teachers higher for the overall rating of the course, rating of the tutors, and residents' knowledge and enthusiasm.

Overall, residents were satisfied: attending a RaT workshop addressed their needs and they reported an increase in their teaching ability. However, those who did not attend the workshop also felt comfortable in teaching. As these findings just rely on self-report and could lead to the misinterpretation that the designed workshop did not show a significant difference between the groups, asking the students as recipients of resident teaching adds important information because they report a higher satisfaction with trained tutors.
Conclusion: Workshop evaluation on RaT should aim to explore more than just participants' self-report. Within a

questionnaire study with little budget, the added perspective of students helps to get additional information in advancing a workshop.

5JJ14 (2727)
Peer teaching within the North West Foundation school, introducing PiPs - the Peer Teachers in Practice network

Authors
Miriam Leach, Health Education North West, Manchester, UK
Paul Baker, Health Education England, Manchester, UK

Presenter: Miriam Leach, Health Education North West, Manchester, UK

Background: Peer teaching, if planned with a robust strategy, can be an effective way to introduce essential teaching skills and may contribute significantly to postgraduate medical education. Peer teaching activities are currently varied across the North West England Patch. Some teaching centres are facilitating strong engagement with foundation doctors in peer teaching with input to curriculum planning as well as providing regular sessions for them to teach with support for development of skills. Other centres are yet to develop such programmes for their foundation doctors in training.
Method: Peer Teachers in Practice (PiPs) was initially planned as a one off training day to support aspiring foundation peer teaching leads. This was with the aim of; providing a tool kit for designing and developing peer teaching programmes (including programme design, ensuring project longevity, interactive teaching and presentation skills); providing an opportunity for networking and sharing of ideas from around the region.
Results: The training day was well attended with leads from across the patch. It became evident on the day that there was an appetite for sustaining an ongoing network for leads across the region. Following on from the event foundation leads have had assistance to set up new programmes and an online network has been created. It is hoped that an annual PiPs day will provide training and networking opportunities for new aspiring foundation leads each year.

Foundation doctors frequently engage in informal teaching activities but training in this early stage is not always provided. Peer teaching programmes should be planned with support from admin and senior clinical staff. We provided a training day and opportunity for leads to share experience and good practice with the aim of supporting the development of programmes within an acceptable framework.
Conclusion: Peer teaching is a high impact, low resource driven activity that can be effective in supporting postgraduate medical education as well as fostering essential skills in teaching. Facilitation of the development of peer teaching programmes at all teaching centres is essential.

5JJ15 (3213)
The 'Diabetes Acute Care Hour' near peer teaching improves junior doctors' confidence, prescribing skills and inpatient diabetes care

Authors

Helen A Casey, Department of Diabetes, Endocrine and Clinical Pharmacology, Glasgow Royal Infirmary, Glasgow, UK
Fariha Naeem, Department of Diabetes, Endocrine and Clinical Pharmacology, Glasgow Royal Infirmary, Glasgow, UK
Emily F Brownson, NHS Greater Glasgow and Clyde, Queen Elizabeth University Hospital Glasgow, Glasgow, UK
Anna K Barton, NHS Greater Glasgow and Clyde, Queen Elizabeth University Hospital Glasgow, Glasgow, UK
James G Boyle, Department of Diabetes, Endocrine and Clinical Pharmacology, Glasgow Royal Infirmary, Glasgow, UK

Presenter: Helen A Casey, Department of Diabetes, Endocrine and Clinical Pharmacology, Glasgow Royal Infirmary, Glasgow, UK

Background: Prescription of medicines relating to diabetes management is one of the highest risk tasks a newly qualified doctor is expected to complete regularly without supervision. General Medical Council studies highlight anxiety experienced by Junior Doctors and lack of practical prescribing teaching. Our aim was to evaluate if a near-peer lead teaching session could increase junior doctors' confidence, prescribing skills and positively impact inpatient diabetes care.

Method: In two large central Glasgow teaching hospitals, three cohorts of doctors at the early, middle and late stages of first year post-graduate training were invited to attend a Diabetes Acute Care Hour delivered by near-peers. Participants completed a confidence rating and prescribing skills assessment (PSA) in acute diabetes care before and after the session. 8065 medical and surgical inpatients were evaluated using a series of audits before and after the session.

Results: Analysis (n=126) showed improvement in all cohorts confidence scores (early: 54% to 63.8%, p<0.001; middle: 55.7% to 74.1%, p<0.001; late: 62.91% to 76.15% p< 0.001) and mean PSA (early: 45.6% to 68.1%, p<0.001; middle: 56.5% to 76.5%, p<0.001 late: 73.77% to 79.57% p=0.027). All cohorts demonstrated a reduction in diabetes inpatient management errors following the session with statistically significant reductions in the middle and late cohorts (early: 53% reduction p=0.12; middle: 73% reduction p<0.012; late: 57.5% reduction p<0.03)

Discussion & Conclusions: Junior doctors' confidence and prescribing skills improved. A significant reduction in errors in diabetes management was demonstrated in patients cared for by the cohorts who received the session during the middle and late stages of their first year. This teaching model may need to be adapted for early trainees to enable them to reach level 4 of the Kirkpatrick model. It is postulated the accumulation of practical knowledge allows this near-peer session to be more useful to trainees with some clinical experience.

Take-home messages: Near-peer teachers are familiar with the pressure, practicalities and problems of junior colleagues. This promotes an enjoyable and effective educational environment.
This study demonstrates the 'Diabetes Acute Care Hour' improves junior doctors' confidence, prescribing skills and importantly leads to a significant improvement in inpatient care.

From Teaching to Designing – Making Residents as Teachers powerful -- Clinical ultrasound education through boot camps developed by emergency residents in Taiwan

Authors

Wen-Cheng Huang, Clinical skills center of WanFang Hospital, Center for education in Medical Simulation , Taipei Medical University, Taipei, Taiwan
Chin-Wang Hsu, Emergency, school of Medicine, College of Medicince, Taipei Medical University, Department of Emergency and Critical Medicine of WanFang Hospital, Taipei, Taiwan
Ying-Kuo Liu, Department of Emergency of WanFang Hospital ,Taipei, Taiwan

Presenter: Chin-Wang Hsu, Emergency, school of Medicine, College of Medicince, Taipei Medical University, Department of Emergency and Critical Medicine of WanFang Hospital, Taipei, Taiwan

Background: Recently, Residents as Teachers (RasT) programs are important issues in medical education. We expect our junior educators to learn how to teach students. Therefore most of junior educators may focus on practice of teaching skills. But these junior educators could have better opportunities than senior educators to develop courses suitable for learners. We would share a successful clinical ultrasound boot camps designed and developed by emergency residents.

Method: A group of emergency residents in our hospital had received ultrasound faculty training and teaching experiences. They found the clinical need for interns/postgraduate doctors. They started to set up boot camps for clinical ultrasound education. The One-Day Camps are structured by mini-lectures and many hands-on practices in the morning and ultrasound-based simulation challenges in the afternoon. During this period about 1 year, residents organized 12 times ultrasound boot camps. Totally 144 leaners participated this camps. There are also 48 medical students to be standardized patients for scanning and scenarios. After course, we used questionnaires for evaluating the boot camps.

Results: Surveys including teaching skills and design of the camps showed high satisfaction. The most important is that most of learners feedbacks mentioned "That is the course I really need ".

Discussion & Conclusion: Through this experience, we noticed the RasT programs not only focus on teaching skills but also learn to design courses based on learner-level. Actually, with this opportunity, we could train and observe educators about leadership and role modeling. Besides, we could provide different RasT programs between junior and senior residents. Therefore, it is critical to let your residents attempt to design courses based on learner's need.

Take-home messages: Skilled teaching training would be helpful for junior educators. But more importantly, designing and developing courses by residents would be effective for learners and educators simultaneously. Therefore, From Teaching to Designing – Making Residents as Teachers more powerful.

Medical student perception in different types of formative evaluation score feedback

Authors
Chadakan Yan, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Piti Phloenchaiwanit, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Daranee Intralawan, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand
Kannikar Saisawat, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand

Presenter: Chadakan Yan, Medical Education Center Chiangrai Prachanukroh Hospital, Chiangrai, Thailand

Background: Students' examination score will be ranked and shown in public. This has been used as one of the methods to give feedback on clinical knowledge in Thailand which increases stress among medical students. This study aims to assess the student perception of different methods of giving formative evaluation score feedback.
Method: In 2017, seventy clinical-year medical students completed an online anonymous survey about three scoring feedback methods including Confidential-individual score (A), Confidential-individual score with class-ranking (B) and Non-confidential score (C) feedback. Feedback stress and motivation were identified using Likert scales. Additionally, Focus-group interview was performed in ten medical students to identify perception, self-esteem, stress, and motivation of medical students toward each method.
Results: The percentage of students who prefer feedback A, B, C method was 15.7%, 77.1%, and 7.2%, respectively. Student characteristic including age, gender, GPA was not significantly different between groups. Average GPA (2.50-3.00) students tend to have higher stress from feedback than others, but they also have higher learning motivation. While below average GPA students (<2.50) were likely to have less stress and motivation. Focus group interview showed that learning goals and score expectation has correlated with their stress. Moreover, they preferred to know their individual overall performance and pitfalls rather than the scores.
The confidential-individual score with class-ranking feedback was favored because the students preferred to keep their score secret, but still want to compare their learning performance with their colleagues. Increase in learning motivation is potential benefits from this type of feedback, especially in average GPA students. We should pay more attention to below average GPA students who have less learning motivation from all feedback methods. Individual feedback and reflection, not only scores, might be an effective way to improve their learning outcome.

Conclusion: The Confidential-individual score with class-ranking feedback should be done to reflect clinical knowledge. Furthermore, giving feedback needs instructor-student interaction. Feedback on student performance is more important than examination score. The instructors need to adjust their teaching to support and enhance student learning.
Take-home message: Learning-performance feedback is important to medical students. Teacher-student participation is a key to success.

Attitude of health care staff to medical students

Authors
Savanya Nganvivattavorn, Vachira Phuket Hospital, Phuket, Thailand
Adulwit Thaneerat, Maharat Nakhon Sri Thammaratt Hospital, Nakhon Sri Thammaratt, Thailand
Thida Aurkridathikarn, Vachira Phuket Hospital, Phuket, Thailand

Presenter: Savanya Nganvivattavorn, Vachira Phuket Hospital, Phuket Town, Thailand

Background: Vachira medical education centre is a part of Vachira Phuket hospital where's established since 2008 for training medical students of 4th-6th year from Walailak University. The feedback from hospital staff is an evaluation from medical stedent's work.
Method: Data was collected from questionnaire provided by in hospital staff in main departments as obstetric and gynecologic, surgery, pediatric, internal medicine and other with using accidental sampling. Comparative analysis with Social Sciences (SPSS) version 20.0 and performed using chi-square. The p-value was less than 0.05.
Results: Regarding the statistically of correlation between age group and working period with Pros and Cons of medical student in Vachira Phuket hospital found that the age group 31-40 year old and working period 6-10 years in hospital agreed that medical students having advantages more than disadvantages significantly. And most of them satisfied the work's of medical student from Vachira Phuket hospital.
Conclusion: The hospital staff who ever work with medical students satisfied in result of working because medical student encouraged the knowledge and relationship during working time. Responsibility, Punctuality, good communication skill, focusing on patient and long life learning should be standardization for all medical students.

Alcohol and Social Integration in Medical School

Authors
Fatemeh Nokhbatolfoghahai, University of Glasgow, Glasgow, UK
Anilah Sadiq, University of Glasgow, Glasgow, UK
Emma Freij, University of Glasgow, Glasgow, UK
Rafa Abushaala, University of Glasgow, Glasgow, UK
Helen Minnis, University of Glasgow, Glasgow, UK
Fiona Turner-Halliday, University of Glasgow, Glasgow, UK

Presenter: Rafa Abushaala, University of Glasgow, UK

Background: Drinking alcohol has been found to be commonplace amongst medical students across the globe, similar to the general student population. Quantitative studies have previously measured the rates of drinking in students, however very few have taken a qualitative approach to gain a better understanding of why alcohol has been found to feature so prominently in the lives of medical students. This study aims to qualitatively analyse students' experiences and opinions on the effects of alcohol on social integration in medical school.
Method: Qualitative data was collected from four focus groups with 26 medical students and four interviews with individuals of interest including university staff and alumni. Data was analysed thematically to explore whether there were repeated patterns of perception within the data on the relationship between alcohol and social integration.
Results: Thematic analysis yielded four key themes relating to social integration/isolation: Socialisation, Drinking Culture, Social Pressure and Change. Alcohol facilitated socialisation in medical school and is the central focus of many social programmes. Although the drinking culture at medical school is embraced by some students, others are isolated by it including younger/older students, religious students and those who are recovering from alcoholism. Niche groups are often formed as a result of this social exclusion.
Alcohol is a main driving force for social integration/isolation at medical school. In addition to the existing education about negative health consequences of drinking alcohol, education about the social consequences of the medical school "drinking culture" is warranted, as is further research to determine whether our findings are generalisable to other medical schools, other student bodies, and society at large.
Conclusion: We need to understand the pressures and socialisation processes of students to understand drinking behaviour. Only then can we begin to create opportunities for change in relation to alcohol-driven social integration and isolation.

Exploring UK medical students exposure to, and opinions about, the pharmaceutical industry with the PharmAwareness Student Survey (PASS)

Authors
Nathan Cantley, NHS Highland, Inverness, UK
Matthew Quinn, University of Leicester, Leicester, UK
Manuel Martin, Imperial College London, London, UK
Kamil McClelland, Imperial College London, London, UK

Presenter: Nathan Cantley, NHS Highland, Inverness, UK

Background: The most recent systematic review on medical students and their exposure to the pharmaceutical industry was published in 2011. It demonstrated variability in acceptance of food or education from pharmaceutical representatives amongst students. However, in the field of medical education there is no published data from the UK (UK).
Method: A 30-item survey was distributed in paper and online form across all UK medical schools with assistance from local student representatives and social media. Responses were collected for 12 weeks. White space responses were analysed using a thematic qualitative analysis. Subgroup analysis using respondent demographics was also conducted.
Results: 1445 valid responses were collected from 27 universities during the study period with responses 38% male: female 62%. 49% of respondents had accepted a free lunch whilst 43% had attended a free educational event hosted by a pharmaceutical company. 93% of students were unaware of any local or national policy directing them how to interact with pharmaceutical companies. A large proportion of students thought it was appropriate for them to interact with pharmaceutical representatives whilst also demonstrating a perceived immunity to prescribing influence with 12% of students agreeing their peers prescribing could be influenced by pharmaceutical representatives but disagreeing their own practices would. Free-text answers highlighted a number of themes around vulnerability of students to influence and the lack of education on the issue.
Conclusion: Our project demonstrates UK students opinions regarding a group of individuals where summarised evidence shows that quality of prescribing is negatively affected by interacting with them. The issue of perceived immunity matches that found in similar studies. The lack of education and official policy in UK medical schools could direct advances in education around this topic. A significant proportion of medical students come into contact with pharmaceutical representatives during their time in medical school. Whilst some students think it is appropriate for them to interact with reps, others believe information from pharmaceutical representatives is inaccurate.
Take-home message: There is a perceived lack of education in uk medical school curricula on using evidence based medicine to evaluate information presented by pharmaceutical representatives.

5KK5 (2494)
Can Ginkgo Prevent Alzheimer's Disease? - Preparing Students for Caring Patients using Alternative Medicine in the Early Stage of Medical Education: A Study of Course Design

Authors
Peih-ying Lu, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan
Jer-chia Tsai, College of Medicine, Kaohsiung Medical University Hospital, Kaohsiung Medical University, Kaohsiung, Taiwan
Wen-yuan Hsieh, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan
Yun-ling Chen, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan

Presenter: Wen-yuan Hsieh, College of Medicine, Kaohsiung Medical University, Kaohsiung, Taiwan

Background: In an era of globalization, future doctors should be culturally competent in caring for patients with diverse backgrounds. Taiwanese students were found least prepared for patients who hold different health beliefs or use complementary and alternative medicine (CAM). This pilot study investigated whether the integration of CAM into a Medical English course in the early stage of medical curriculum can raise students' cultural awareness.
Method: The course included lectures focusing on medical language and related Task-based learning (TBL) or hybridized PBL activities to allow students to use the language in meaningful contexts. A two-hour TBL on CAM was designed. 150 second–year medical students participated. Each group (4 students) researched on one of the ten folk remedies randomly assigned before class. In class, each group was reassigned a new topic and discussed their first impressions. The impression group briefly presented their reaction to the topic and then the research group presented findings on mechanism of such belief/remedy and formulated possible responses to people using/believing it. Students also reflected and wrote up one other belief and responses to patients. Presentations and writing were collected, coded, and analyzed with the Grounded Theory.
Results: Qualitative analysis revealed four reoccurring themes: 1. First impression were commonly expressed with the word "ridiculous", and still relied on using evidence-based medicine in confronting folk remedies; 2. Noticed possible cultural, traditional, religious and gender difference. 3.Generated reflection on personal experience and bias; 4. Lack of communicating skills to respond to patients using CAM.
Conclusion: The activity provides students with opportunities to reflect upon bias through articulating their first impression and the need to understand some knowledge of CAM. The findings showed that integration of CAM appropriately in a general course could enhance students' awareness of different health beliefs. Students relying on using scientific evidence in persuading patients implied that more cultural competence training is needed in the later years.

Take-home message: Bringing CAM early on and integrating it into different stage of medical education may provide benefits to students' professional development and better prepare them for patients with diverse health beliefs.

The Role of Information Processing and Test Taking Strategies on Medical Student Academic Achievement

Authors
Sara Ahmed, Alfasial University, Riyadh, Saudi Arabia
Maram Alrefai, Alfaisal University, Riyadh, Saudi Arabia
Lamya Alrayes, Alfaisal University, Riyadh, Saudi Arabia
Walaa Elsekaily, Alfaisal University, Riyadh, Saudi Arabia
Mohammad Sharique Ahmad, Alfaisal University, Riyadh, Saudi Arabia
Akef Obeidat, Alfaisal University, Riyadh, Saudi Arabia

Presenter: Sara Ahmed, Alfaisal University, Riyadh, Saudi Arabia

Background: Having good study skills and test taking strategies is a cornerstone for academic success. This study's purpose is to identify the various skills that students manifest in their studying habits, along with their behaviors and attitudes, that correlate with academic performance levels.
Method: A validated online survey was administered to medical students from years 1 to 5. Answers were chosen from a 5-point Likert-scale (1 = not at all typical of me, 5 = very typical of me) on topics of study and examination skills. 18 Questions were split into sub-categories of information processing, understanding main concepts when studying, and strategies during test taking. Additionally, each participant was required to provide their gender, current GPA, and high-school education system they graduated from.
Results: A total of 109 responses were collected. Students generally are well versed (defined as either 4 or 5 on the Likert-scale) in most sub-categories of information processing (M: 75%, F: 76%) and understanding of main concepts when studying (M: 83%, F: 88%). However, test-taking strategy variables scored the lowest on average (M: 62%, F: 60%). Those who scored high on this sub-category, had a higher GPA (3.66) compared to those who did not (3.51).
Discussion & Conclusion: Appropriate study skills, including adequate information processing, the selection of relevant information, and understanding key concepts, are abilities that many medical students exhibit. However, some students cannot undertake or display these skills, especially test-taking strategies, which can explain students facing difficulty deciphering objectives of some exam questions. The lack of this skill may be due to straightforward tests in high school causing inability to understand complex questions and their requirements. Although many study skills are learned over time and through experience, they can also be taught through short courses and programs after deficiencies are identified. Educational interventions can help such students overcome these barriers. Students at our institution could

benefit from improved test taking strategies as those who are good at it perform well academically.

Measurement of Grit and Correlation to Student Academic Performance in Japanese Medical School

Authors
Katsumi Nishiya, Kansai Medical University, Osaka, Japan
Shuji Bando, Kagawa University, Kagawa, Japan
Hiroki Okada, Kagawa University, Kagawa, Japan

Presenter: Katsumi Nishiya, Kansai Medical University, Osaka, Japan

Background: When students enter Japanese medical school, their scholastic aptitude is high; however, there are increasing examples of reduced desire to learn and motivation after admission and of facing difficulties with learning, such as repeated academic years and poor performance in national medical exams. Duckworth et al. noted that for student to achieve their goals, "grit" in the form of consistency between strong efforts to achieve goals and an interest in the subject matter are more important than inherent talent. This study quantitatively measures the grit of students by using a grit scale and statistically analyzes the correlation to student academic performance in Japanese medical school.
Method: Grit was measured by using short grit scale (Grit-S) in all students from the first year to the sixth year in 2017 at Kansai Medical University. Grit-S was measured on a five-point scale, with eight items relating to consistency between strong efforts to achieve goals and an interest in the subject matter. Results were obtained by calculating the averages of these eight items. In addition, the correlation of grit was statistically analyzed for the students with the top 20 and bottom 20 academic performance in each academic year.
Results: The average grit score of students across all academic year was 3.23. The average grit score for each academic year was 3.20 (1st), 3.25 (2nd), 3.31 (3rd), 3.17 (4th), 3.26 (5th), and 3.21 (6th), successively. The average grit score of the students with the top 20 for each academic year was seen to be higher than the students with bottom 20, though there was no significant difference. The lowest grit score, 2.93, was seen among fourth-year students with the bottom 20.
Conclusion: The results suggest that grit influences academic performance in medical students. In particular, grit may influence the learning of medical students in their fourth years. It may be related that this academic year is centered on classroom lectures in our school. Future studies should consider grit and various other factors, along with elements that improve grit.
Take-home message: Grit influences academic performance in medical students.

5KK9 (1807)
The Role of Peer-reflection in Improving Students' Achievement in UKMPPD (National Examination of Medical Students)

Authors
Muchtar Hanaf, Universitas Sebelas Maret, Surakarta, Indonesia
Amandha Boy Timor Randita, Universitas Sebelas Maret, Surakarta, Indonesia

Presenter: Muchtar Hanafi, Universitas Sebelas Maret, Surakarta, Indonesia

Background: Faculty of medicine plays an important role to support students' success in passing exit exam (UKMPPD). Students who failed three times were grouped into special retaker class guided by a mentor. Peer-reflection is the method that aims to evaluate students learning process. We aimed to analyze the impact of peer-reflection to change their learning attitude and improve national exam score.
Method: Nine students participated in special retaker class for three months. They took two try-outs and one exit exam. Between the try-outs, there were peer-reflections that argued about the characters, strengths and weaknesses of individuals, and the suggestions. Between try out 2 and exit exam, self-reflection was conducted which contained their responses about the peer input. Then, try-out results were compared. We analyzed the reflection documents by content analysis and descriptive analysis for the progress of exam score.
Results: Students were more objective in self-assessment. They understood the strengths and weaknesses of their way of learning, and then implemented the peer advices. Peer-reflection method provided a sense of shared destiny, a feeling of same purpose, then developed ways of learning that promoted them to be higher motivated. Finally, 6 of 9 students passed the exam. Peer-reflection method made the students support each other and express the desire to have the same ideals namely graduation. There were non-academic problems that the lecturer never knew about. Therefore, suggestions given by peer would be memorable and be powerfully changed motivation.
Conclusion: Peer-reflection explored non-academic problems that determined the pattern and the way of how students learned. Learning is obtained from both lecturers and from peers. Suggestions from peers are more objective to judge the ability of individuals since peers often interact together. UKMPPD needs to be investigated with a comprehensive approach so that exit exam looks not only at the achievements of final competencies but also individual processes of dealing with and preparing a national examination.

5KK10 (3618)
Multiple strategy peer-taught evidence-based medicine course in a poor resource setting

Authors
Tarek Turk
Ammar Sabouni
Yamama Bdaiwi
Saad Janoudi
Lubaba Namous
Mahmoud Alkhatib

Presenter: Tarek Turk, International Federation for Medical Students' Associations, Damascus, Syria

Background: Teaching Evidence Based Medicine (EBM) is becoming a priority in the healthcare process. For young healthcare professionals, it has been proved that integrating multiple strategies in teaching EBM yields better results than a single, short-duration strategy. However, there is a lack of evidence on applying EBM educational interventions in developing countries and poor-resource settings.
Method: We aimed, through this project, to evaluate the effectiveness of a multiple strategy peer-taught online course in improving EBM awareness and skills among undergraduate and young postgraduate students in two poor-resource settings, Syria and Egypt. We conducted a prospective study with pre- and post- course assessment of 84 medical students in three universities, using the Berlin questionnaire and a set of self-reported questions which studied the students' EBM knowledge, attitude and competencies. The educational intervention was a peer-taught online course consisting of six sessions (90 min each) presented over six weeks, and integrated with assignments, group discussions, and two workshops.
Results: The mean score of pre- and post-course Berlin tests was 3.5 (95% CI: 2.94-4.06) and 5.5 (95% CI: 4.74-6.26) respectively, increasing by 2 marks (95% CI: 1.112-2.888; p-value <0.001), which indicates a statistically significant increase in students' EBM knowledge and skill, similar to a previous expert-taught face to face contact course. Self-reported confidences also increased significantly. However, our course did not have a major effect on students' attitudes toward EBM (1.9-10.8%; p-value: 0.12-0.99).
Conclusion: In order to build reliable Evidence-Based Medicine practitioners, multiple strategy peer-taught online courses are an effective approach and a comparable alternative to face to face expert-taught courses. We recommend university role models and EBM experts implement and further assess this choice to provide high quality online courses and higher EBM awareness among medical students and young postgraduates. Integrating such type of activities in the educational process of under- and post-graduate students may increase their involvement, and enhance the outcomes of their training.
Take-home message: In developing countries and poor-resource settings, multiple strategy peer-taught online courses may be an effective alternative to face-to-face expert-taught courses, especially in the short term.

5KK11 (3104)
Medical Students for Haiti: Evolving Practices in Near-Peer Education

Authors
Alison Celello, Icahn School of Medicine at Mount Sinai, New York, USA
Meghana Eswarappa, Icahn School of Medicine at Mount Sinai, New York, USA
Isaiah Levy, Icahn School of Medicine at Mount Sinai, New York, USA
Kieley O'Connor-Chapman, Icahn School of Medicine at Mount Sinai, New York, USA
Randy Sorge MD, Icahn School of Medicine at Mount Sinai, New York, USA
Dinali Fernando MD, Icahn School of Medicine at Mount Sinai, New York, USA

Presenter: Alison Celello, Icahn School of Medicine at Mount Sinai, New York, USA

Background: Medical Students for Haiti (MS4H) at the Icahn School of Medicine at Mount Sinai is a student-run organization that conducts an annual four-day, near-peer first responder course at the Université Quisqueya (UniQ) in Port-au-Prince, Haiti. This program was established in 2013 to address a UniQ-identified curricular gap after the 2010 earthquake.
Method: MS4H trainers complete an 8-week preparatory course, learning first responder skills from Mount Sinai emergency medicine residents and becoming American Heart Association-certified CPR trainers. Trainers then instruct "near-peer" medical students at UniQ through lectures and skills sessions. Pre- and post-tests are administered to ensure adequate comprehension. Curricular modifications are made annually based on data analysis and UniQ feedback, and have included creation of a printed coursebook, implementation of a disaster triage simulation, and ongoing development of a Haitian Creole CPR training video to be made publicly available online. In 2015, a "train-the-trainers" program was established to empower UniQ students to teach their peers and communities.
Results: To date, 248 UniQ students have completed the course, including 24 students additionally trained as trainers. Post-test results have shown statistically significant improvement over pre-tests annually; in 2017, the 76 students who completed the course scored an average of 42% on the pre-test and 83% on the post-test (p<0.01). A one-year retention test was also conducted for students from the 2016 course. Of the 60 original participants, 11 (18%) completed the retention test, with a statistically significant difference between pre-course (48.2%) and 1-year retention (59.5%) scores (p<0.02). To date, MS4H-trained UniQ trainers have held CPR instructional courses for over 20 peers and over 140 community members.
Conclusion: This data indicates that MS4H and UniQ students have built an effective course that promotes immediate and long-term retention of knowledge as well as sustainability via the train-the-trainers initiative. This represents a successful near-peer approach to increase

and sustain the capacity of Haitian medical students in emergency first response.

Take-home message: The near-peer teaching model empowers students to take an active role in medical education and provides a sustainable tool for educational capacity-building.

5KK12 (2149)
The Impact of Medical Students as Teachers on Underclass Students

Authors
Holly Berkley, Uniformed Services University, Bethesda, USA
Morgan Harvey, Uniformed Services University, Bethesda, USA

Presenter: Holly Berkley and Morgan Harvey, Uniformed Services University, Bethesda, USA

Background: The Medical Education Elective at the Uniformed Services University (USU) was created and implemented by two fourth year medical students, who recognized both a lack of education on teaching for students as well as isolation of the medical school classes at USU. The Medical Education Elective was established to help senior students build a foundation of medical education knowledge before they embark on careers that require participation in education at all levels of training. Furthermore, the structure of USU prevents natural integration between the classes, as most students complete clinical rotations at sites across the US. It was hypothesized that by integrating senior students into the underclass curricula as teachers, peer mentorship would be fostered, strengthening underclass students' academic experience.
Method: The Medical Education Elective is currently being piloted over 4 one-month rotations, each completed by 3-5 senior medical students. The students participate in weekly faculty discussions focused on medical education theory and methodology. Students employ the skills they learn in courses across the underclass curriculum such as integrated clinical skills, reflective practice, and military emergency medicine. Students also independently conduct teaching sessions through office hours and brown-bag lunches. The impact of the course on the underclass students was evaluated with an online survey completed by the underclass students after each teaching activity.
Results: Pilot data after one month (n=25) showed that 100% of underclass students responded "Yes" to the question "Did having an MS4 student teacher contribute positively to your learning experience?". Likert scale responses of "very frequently" in response to questions regarding the utilization of effective teaching techniques range from 84-96%. Target sample size is 123 (to be achieved by 01 MAY 2018).
Conclusion: Medical education courses not only offer an opportunity for senior students to cultivate educational theoretical knowledge and teaching skills, but also contribute positively to the learning experiences of the underclass students.
Take-home message: As medical education curricula develop in medical schools world-wide, we can be assured

that this investment has benefits not only for student teachers, but for student-bodies as a whole.

5KK13 (3630)
Impact on students of a PASREV course initially designed for professionals. Implications for medical education

Authors
Manuel Lucas, Department of Medical Education of Faculty of Medicine of the University of Lisbon, Lisbon, Portugal
Isabel Brito, Department of Medical Education of Faculty of Medicine of the University of Lisbon, Lisbon, Portugal
Miguel Miranda, Department of Medical Education of Faculty of Medicine of the University of Lisbon, Lisbon, Portugal
Madalena Patrício, Department of Medical Education of Faculty of Medicine of the University of Lisbon, Lisbon, Portugal

Presenter: Manuel Lucas, Department of Medical Education of Faculty of Medicine of the University of Lisbon, Portugal

Background: The PASREV (Practical Skills for Reviewing Evidence in Health Professions Education) courses, implemented at AMEE 2016/2017 conferences, were initially designed for healthcare/academic professionals interested in designing, implementing and reporting as well as reviewing/managing a systematic review in health professions education. In 2017, the PASREV counted on the participation of three Portuguese medical students who despite having no background on systematic reviews were highly motivated to learn more on the topic. The aim of this study is to identify the PASREV impact on students.
Method: All 12 participants were asked to fill an anonymous questionnaire after the course (course relevance, practical utility, educational approach, supportive material, opportunity for discussion, facilitators' performance, major strengths/weaknesses and suggestions). In addition students' views were identified 6 months after the course/follow-up-review.
Results: Hot review: Students and teachers' results were very good and similar, although students tend to be more critical, attributing lower scores in all parameters except in terms of 'interactivity'. The three most valued elements were 'step by step teaching', 'facilitators' quality' and 'practical work' while 'more pre-course materials, sharing the slides used in the course', 'more practical work', including time to analyse a real review' and 'less time per session' were the main suggestions for improvement. The course was seen as very useful for beginners namely to get the basic information on how to implement or review a Systematic Review. Follow-up review: Students said that attending the course together with professionals facilitated their learning and group work. Course assignment: the three students were the only participants submitting an assignment namely by registering topics for two systematic reviews.
Conclusion: PASREV appears to be highly valued by teachers and students. The fact that these were more critical, may be due to the design of the course initially foreseen for professionals or because students are usually more exigent when evaluating courses. PASREV can also be offered to students once course structure and

interaction with teachers were well received by them. Moreover, the 3 students were the only participants to submit a Systematic Review as course assignment.

Our student-centered Basic Life Support (BLS) education is improved by referring to computer-based parameters

Authors
Kagemasa Kajiwara, School of Medicine, Tokai University, Isehara, Japan
Ippei Yamato, School of Medicine, Tokai University, Isehara, Japan
Takaaki Kinoue, School of Medicine, Tokai University, Isehara, Japan
Hiroyuki Furuya, School of Medicine, Tokai University, Isehara, Japan
Satoshi Noda, School of Medicine, Tokai University, Isehara, Japan
Tetsuya Urano, School of Medicine, Tokai University, Isehara, Japan

Presenter: Kagemasa Kajiwara, Division of Basic Molecular Science and Molecular Medicine, School of Medicine, Tokai University, Isehara, Kanagawa, Japan

Background: In 2007, we established a new student-centered BLS training method, termed "Roofing Tiles Method for Undergraduates," in which clinical clerkship students who recently acquired BLS skills (CC-students) instructed first-year students (1st-students) directly. Under our "Teaching is Learning" policy, we obtained both skill acquisition in 1st-students and improved skills in CC-students.

Method: For efficient monitoring of improvements in our education system, we applied computer-based evaluation by measuring the quality of BLS training (Resusci Anne QCPR, Laerdal) during instruction of 1st-students by CC-students. However, as CC-students are not professionals, they could not make good use of the evaluation method. We therefore investigated usage suitable for them. Since the CC-students could review BLS performance by referring to computer parameters such as compression rate and depth, CC-students provided technical guidance to 1st-students more efficiently and closely than in their previous training. Therefore, improvement in our BLS training method by referring each computer parameter was shown.

Results: CC-students could not understand the computer-estimated evaluation in detail. However, CC-students could understand each key parameter of BLS skill sufficiently during their review, and could clarify the weak points of 1st-students during instruction, suggesting their instruction became more confident and more efficient than that based only on their judgment.

Conclusion: Our student-centered BLS training with computer-based parameters resulted in equivalent proficiency to our instructor-led training. Since BLS skill level of CC-students is the most important factor in the training, referring to the computer parameters was more effective for the BLS skill of CC-students. Our "Roofing Tiles Method for Undergraduates" can be upgraded by computer-based BLS parameters and applied to various

skill-up programs in clinical clerkship. We wish to acknowledge the Support Center for Medical Research and Education, Tokai University, for help with instruction.

SESSION 6: Plenary

Tuesday 28th August

0830-0945 hrs

6: Plenary: Got Resilience? Promoting Resilience, Wellbeing, & Vitality in Healthcare Professions Education & Organizations: An Integrative Approach

Location: Event Hall
Date: Tuesday 28th August
Time: 0830-0945 hrs

Hedy S Wald
Brown University; Boston Children's Hospital – Harvard Medical School, USA

Summary: Resilience. Wellbeing. Vitality. Topic du jour. And with good reason. Healthcare practitioners, educators, and trainees in the global community are at risk for stress and burnout impacting wellbeing and optimal patient care. Educators and organizations are thus challenged with implementing programs and policies to cultivate resilience-promoting environments for stress reduction/management, empathy preservation, and improved wellbeing. What then are best practices throughout the healthcare professional lifecycle for crafting a pre-emptive approach to promoting emotional and moral resilience for wellbeing? What adaptive individual and healthy workplace factors can help maintain quality of care and caring, patient safety and satisfaction, and educator/practitioner engagement, fulfillment, and retention? Flourishing? This plenary will discuss "**integrative resilience**" incorporating interventions at both individual and healthcare systems levels to foster resilience of both, ideally promoting enlightened leadership for surviving and thriving in a challenging healthcare environment.

Biography: Hedy S. Wald, PhD is Clinical Professor of Family Medicine; Warren Alpert Medical School of Brown University and Director of Resident Resilience/Wellbeing-Residency Programs in Child Neurology and Neurodevelopmental Disabilities; Boston Children's Hospital-Harvard Medical School. Dr. Wald has been recognized with Dean's Excellence in Teaching Awards, served as a Fulbright Scholar in medical education for Ben Gurion University of Health Sciences, Israel, and is a Gold Humanism Foundation Harvard-Macy Scholar. Dr. Wald has been a Visiting Professor at over 50 healthcare professions schools world-wide, presenting on promoting resilience and wellbeing in healthcare professions education and practice as well as on reflective writing-enhanced reflection supporting healthy professional identity formation. A mother of 4 and grandmother of 4, she enjoys cycling and creative writing which she publishes in literary and medical journals. *Follow her on Twitter: @hedy_wald "Mind/Body/Spirit of MedEd"*

SESSION 7: SIMULTANEOUS SESSIONS

Tuesday 28th August
1015-1200 hrs

7A: Symposium: Mind-body interventions in Health Professions Education: Challenges, Strategies for Implementations and Lessons Learned

Location: Event Hall
Date: Tuesday 28th August
Time: 1015-1200 hrs

Presenters:
Aviad Haramati, Georgetown University, USA
Raphael Bonvin, University of Fribourg, Switzerland
Craig Hassed, Monash University, Australia
Diethard Tauschel, Witten/Herdecke University, Germany
Tania Guillaume, University of Fribourg, Switzerland
Hedy Wald, Brown University; Boston Children's Hospital-Harvard Medical School, USA

Summary: Reports from many countries suggest that burnout and other mental health issues among physicians and other health professionals is a pervasive problem and a cause for concern. More than half of all physicians in practice in the US, and students and residents in training in the US and Canada, experience burnout, and this can lead to changes in the patient-practitioner relationship and can adversely impact quality of care. Data suggests that this process begins with the decline in empathy and rise in cynicism seen during medical school and post-graduate training. In response, there is increased interest among faculty, administrators and policy makers to develop individual and organizational interventions with medical students, residents and faculty and provide them with tools to address the rise in chronic stress and burnout and suboptimal resiliency. Keys to this work are themes of self-awareness and mindfulness and exploring domains of self-care and finding meaning and purpose in one's work. The ultimate goal is to create a culture of well-being within institutions and foster an environment more conducive to optimal learning.
Goal of Symposium: In this proposed symposium, speakers from various countries (Australia, Netherlands, Sweden, Switzerland and the US) who have implemented mind-body programs will share perspectives on the challenges they faced, the strategies they used to implement the program into the curriculum, the outcomes they obtained, and lessons learned. The symposium will include short (10) minute presentations, enabling at least a 30-minute discussion with audience participants. Discussant Dr. Hedy Wald will provide comments (about 6-8 minutes) on the presentations and tie the lessons to messages of her Plenary (which ideally precedes this symposium) as a springboard to engage audience participation which will follow.

Who should participate in the symposium? This symposium would interest any faculty, student or administrator who is interested in implementing curricular interventions (especially mind-body programs) to reduce stress and foster resilience and well-being.
What will they gain from participating? Learning Objectives: By the end of the session, participants will be able to:

- Describe the rationale for mind-body programs in health professions education as well as challenges and barriers to implementation of a mind-body medicine program into the curriculum
- Understand the strategies that facilitated the successful curricular implementation of mind body medicine programs
- Delineate some of the outcomes that programs have reported in their students and faculty and benefit from the lessons learned

7B: Symposium: Faculty Development for Organizational Change

Location: Montreal, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Organised by AMEE Faculty Development Committee:
Yvonne Steinert, Centre for Medical Education, Faculty of Medicine, McGill University, Canada
Miriam Boillat, Centre for Medical Education, Faculty of Medicine, McGill University, Canada

Summary: Faculty development programs and activities in the health professions have traditionally focused on individual growth and renewal. However, although individual change may result in organizational change, faculty development can also play a direct role in promoting organizational growth and development. The goal of this symposium is to review and discuss how faculty development can function as an instrument of organizational change by exploring a variety of strategies and approaches that can help to achieve this goal. Participants will also be challenged to think about the contexts in which they work and how they can focus directly on their organizations as the "client" in faculty development.

7C: Symposium: Lessons Learned: progressing knowledge by intelligently considering failures

Location: Sydney, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Organised by AMEE Research Committee:
Jennifer Cleland, University of Aberdeen, UK
Lara Varpio, Uniformed Services University of the Health Sciences, USA
Erik Driessen, Maastricht University, Netherlands
Tim Wilkinson, University of Otago, New Zealand

Summary: We've all tried things that didn't work. We've enthusiastically introduced a flipped classroom format that the learners didn't flip over. We've carefully crafted research projects only to realize that the hypothesis or research question was inadequate. We've implemented new assessment strategies that generated lots of data, but left us with little insight into student performance. We've all been there.
However, negative findings are rarely reported in academic journals and there appears to be an implicit rule in medical education that one does not admit "failure". Yet it is often our less successful ventures that lead to in-depth understanding of a phenomenon and/or a way forward. Indeed, sometimes our mistakes are more informative than our successes.
In this symposium we will share stories of mistakes and surprises from across medical education and training contexts, to illustrate how these underpinned learning and progress. We will use interactive presentation software to engage with the audience, to elicit and explore common surprises, failures and experiences. We will discuss our findings in relation to the dominant culture and discourses within medical education and training, and provide guidance on ways for individuals and teams to reposition "failure" as constructive learning.
Who should participate in the symposium? This symposium will be of interest to those involved in designing, delivering and evaluating teaching, and educational innovations.
What will they gain from participating? Participants will see respected academics and global leaders from the AMEE Research Committee admit mistakes. This positive role modelling will be used within the session to encourage audience engagement. However, our ultimate aim is to help individuals and teams work more openly, to reflect on and accept that there is often a lot to be learned when things don't go to plan. We will provide guidance for organisational change and faculty development to help achieve this goal.

7D: Symposium: Diagnostic error: from clinical reasoning to patient outcome

Location: Singapore, 2nd Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

Organised by Global Alliance for Medical Education:
Mark Graber, Society to Improve Diagnosis in Medicine, USA
Marie-Claude Audetat, Medical Education Research Group, University of Geneva, Switzerland
Hardeep Singh, Center for Innovations in Quality, Effectiveness and Safety, VA Medical Center and Department of Medicine, Section of Health Services Research, Baylor College of Medicine, USA
Laura Zwaan, Institute for Medical Education Research, Erasmus Medical Center Rotterdam, Netherlands
Wolf Hautz, Department of Emergency Medicine, Inselspital University Hospital, Berne, Switzerland

Summary: Most people will experience a diagnostic error in their lifetime, sometimes with devastating consequences. This is the conclusion from a recent report from the National Academy of Sciences in the US. This shows the impact of diagnostic error on society. Diagnostic errors are a complex error type, for example because diagnostic errors often do not result from a single source but from the interaction of physicians, their patients and the context. The field of medical education has in the past extensively explored the cognitive sources of error within a single physicians mind, while the patient safety movement was heavily investigating enabling factors in the health care system. Meanwhile, clinical medicine has identified several diseases, chief complaints and groups of patients likely to be misdiagnosed. However, these lines of inquiry have remained somewhat isolated from each other and strategies to introduce diagnostic error, error prevention and error communication at all levels of medical education remain the exception rather than the norm. The symposium brings together researchers from diverse backgrounds, all with a unique perspective on the multiple facets of diagnostic error, in an attempt to broaden the debate on clinical reasoning and diagnostic error within medical education and to ultimately strengthen the quality of our and our learners diagnoses.
Who should participate in the symposium? Everyone with an interest in clinical reasoning, the teaching and assessment of the diagnostic process as well as colleagues with an interest in patient safety.
What will they gain from participating? We will provide participants with different perspectives on diagnostic error through an interactive discussion. Participants will learn how diagnostic error and the diagnostic process are conceptualized in different fields such as medical education, human factors research and automated diagnostic decision support among others. The symposium is specifically intended to widen the perspective on diagnostic error from a focus on clinical reasoning to a more holistic perspective. Furthermore, participants will be introduced to the development of a consensus curriculum on diagnostic error for health professionals at the postgraduate level, an initiative currently underway in the United States.

7E: Research Papers: Workplace-Based Assessment & Diagnosis

Location: Delhi, Ground Floor, CCB
Date: Tuesday 28th August
Time: 1015-1200 hrs

7E1 (73)

Does Incorporating a Measure of Clinical Workload Improve Workplace-Based Assessment Scores? Insights for Measurement Precision and Longitudinal Score Growth

Authors

Yoon Soo Park, University of Illinois at Chicago, Chicago, USA
Patricia J. Hicks, University of Pennsylvania, Philadelphia, USA
Carol Carraccio, American Board of Pediatrics, Chapel Hill, USA
Melissa Margolis, National Board of Medical Examiners, Philadelphia, USA
Alan Schwartz, University of Illinois at Chicago, Chicago, USA
Pediatrics Milestones Assessment Collaborative (PMAC) M2 Study Group, National Board of Medical Examiners, Philadelphia, USA

Presenter: Yoon Soo Park, University of Illinois at Chicago, USA

Introduction: Appropriate management of clinical workload is critical for safe medical care (1). In clinical practice settings, a practitioner's workload can be influenced by perceived or experienced factors such as supervision level, number of providers per patient, experience of providers, and patient acuity and complexity. Workplace-based assessments (WBAs) that measure the skills of trainees in the authentic clinical environment provide valuable insights into trainee performance, but performance may require considering the context of the trainee's workload during the observation period (2). This study investigates the impact of incorporating observer-reported workload into the calculation of WBA scores by: (1) examining psychometric characteristics of WBA scores after adjusting for workload and (2) comparing changes in performance over time using adjusted and non-adjusted scores.

Methods: As part of a larger collaborative research project, multisource feedback (MSF) instruments were used to collect WBA data from first-year Pediatrics residents at 10 residency training programs. Observers completed items in eight subcompetencies associated with Pediatrics Milestones (PC-1, PC2, PC-5, ICS-1, ICS-4, PBLI-5, PROF-2, PPD-1). An additional item completed by faculty and resident observers assessed workload using a sliding scale ranging from low to high; all item scores were rescaled to a 1-5 scale to facilitate analysis and interpretation. Workload-adjusted WBA scores were calculated at the item level and aggregated for analysis at the competency level; workload-adjusted WBA scores were calculated by taking the difference between WBA and workload scores (= WBA Score – Workload Score). Mixed-effects regression models were used to estimate variance components and calculate reliability. Projections

in reliability and the standard error of measurement (SEM) were calculated using generalizability theory. Longitudinal growth curve analyses examined patterns of score change over time, comparing workload-unadjusted and workload-adjusted scores.

Results: Data were collected from 252 first-year residents during rotations that took place between July 2016 and May 2017. On average, residents were assessed 5.32 times (SD=3.79) by different raters during the data collection period; workload scores were provided by a total of 330 observers (faculty: n = 173, peer resident: n = 157). Adjusting for workload led to better trainee discrimination (greater trainee variability) and higher reliability (workload-unadjusted: Φ-coefficient=.60; workload-adjusted: Φ-coefficient=.65).Workload-adjusted scores resulted in a 28% reduction in the SEM when compared to workload-unadjusted scores. Longitudinal analysis showed an increase in scores over time, with a significant interaction between workload and time (month of training), $p = .034$; workload also increased significantly over time, $p = .001$ (July-September: Mean=3.58, SD=.77; October-December: Mean=3.91, SD=.83; January-May: Mean=3.83, SD=.76). Workload-unadjusted scores showed steady linear improvement throughout the data collection period, while workload-adjusted scores improved modestly during the initial months of training and began improving rapidly just after the six-month training mark (January 2017).

Discussion: This study contributes to the growing literature on the benefits of adjusting for workload when measuring resident competencies using WBA. Adjusting for workload yielded better discrimination of learner performance and higher reliability, thereby reducing measurement error by 28%. Workload-adjusted scores had greater variability of trainee performance at all levels of performance, which may prove beneficial in identifying low-performing residents. Compared to workload-adjusted scores from faculty, scores from residents only had modest improvements in reliability, perhaps indicating that these two observer groups have different perceptions of workload.

Conclusions: Incorporating a measure of observer-reported workload can improve the measurement properties and the ability to interpret workplace-based assessment scores.

Presenter: Jolien Pieters, Maastricht University, Maastricht, Netherlands

Background: The need for palliative care is increasing due to the aging population and the growing number of people with chronic diseases. Physicians working in almost all care settings will regularly be confronted with the challenges of providing palliative care and as a consequence training in palliative care should be included in undergraduate medical curricula. However, teaching tends to be fragmented, ad hoc and lacks co-ordination and focuses more on the acquisition of knowledge and skills than attitudes (Lloyd-Williams & Macleod, 2004). The goal of this study is to develop and validate an EPA framework of palliative care competencies within undergraduate medical programs.

Methods: This Delphi-study started with a review of the literature. Two palliative care competency profiles appeared to be suitable for the Dutch situation: an educational framework developed in the Netherlands (VU, 2016) and the EAPC competencies described in a white paper by the European Association for Palliative Care (EAPC, 2013). These two documents were combined by experts in education and palliative care, resulting in one EPA list. To validate this list, a Delphi study was conducted. The Delphi study included five different groups of stakeholders: Palliative care experts, healthcare professionals, nurses, curriculum coordinators and junior doctors. They scored the required level each EPA and items on a 6 point Likert scale (1= not applicable; 2= basic knowledge, skills, or attitudes; 3= integration of knowledge, skills, and attitudes; 4= simulated professional situation; 5= in professional setting with guidance; 6= in professional setting with little guidance).

Results: The EPA list that was developed based on the two earlier mentioned frameworks resulted in 6 EPA's domains, being communication, relief of suffering, end-of-life care, advance care planning, working in a multidisciplinary team and personal development. The number of items per EPA domain varied between 3 and 10, resulting in a list of 46 items. The list of 6 domains and 46 items was validated in a Delphi study. After two rounds, the shift in ratings was minimal. The response rate was 46%. No items were omitted because all experts were of the opinion that all items were applicable. Consensus was reached on 8 out of 46 items (17%) on a level of 75% and on 37 out of 46 items (80%) on a 50% consensus level. Curriculum coordinators achieved consensus on 24 out of 46 (52%) items on a level of 75% and on 21 out of 46 items on a 50% (46%) consensus level.

Discussion: The EPA framework for palliative care competencies as developed resulted in six domains that all were considered as highly relevant. The Delphi study showed that all EPAs were considered relevant. Consensus was achieved for a limited number of items when taking into account all the different experts. Consensus among curriculum coordinators was higher. The final EPA list that will be used as a basis for training of palliative care EPAs in Dutch undergraduate medical curricula.

Statistical Approaches to Improving the Quality of Observational Assessment Instrument Data

Authors:

Melissa Margolis, National Board of Medical Examiners, Philadelphia, USA
Brian Clauser, National Board of Medical Examiners, Philadelphia, USA
Marcia Winward, National Board of Medical Examiners, Philadelphia, USA
Alan Schwartz, Association of Pediatric Program Directors Longitudinal Educational Assessment Research Network (APPD LEARN), McLean, USA
Carol Carraccio, American Board of Pediatrics, Chapel Hill, USA
Patricia Hicks, The Children's Hospital of Philadelphia and Perelman School of Medicine at the University of Pennsylvania, Philadelphia, USA

Presenter: Melissa Margolis, National Board of Medical Examiners, Philadelphia, USA

Introduction: Assessment of medical and other healthcare trainee performance based on observation in the workplace provides evidence about critical skills and competencies that can both improve the specificity of formative feedback and provide support for progression decisions. Despite the value of observational assessment data, little research has investigated systematic methods for improving the quality of the instruments that are used for data collection. Multiple-choice tests commonly use item analysis procedures to provide statistical data about individual test items; these data inform decisions about item revision or deletion in order to improve the quality of test forms. Observational assessment items and instruments would benefit from use of similar item analysis approaches to inform instrument revisions (Baldwin, Fowles, & Livingston, 2008); unfortunately, we know of no research documenting that practice. The present study addresses this gap by: 1) producing and using statistical item performance data to inform review of and decisions about keeping, revising, or deleting observational assessment instrument items; and then 2) collecting data using an instrument that was revised based on the review of statistical information and comparing

overall instrument performance between the initial and revised versions.

Methods: As part of a larger collaborative research project, observational assessment instruments were developed to assess the performance of first-year pediatrics residents. Items were field tested and several statistical indices were used for analysis: scale use (proportion of responses at each scale point), within-competency item correlations, and correlations between items and an overall global score. Items identified as problematic based on these indices either were kept, revised, or deleted. Data then were collected using the revised instrument, and the same analytic procedures were used to investigate whether there was improvement in item and instrument performance following the revisions. Generalizability analysis allowed for further evaluation of the extent to which revisions led to changes in instrument reliability.

Results: For the pilot data set, statistical indices flagged eight of 40 items for review: three were deleted and five were substantially revised based on issues relating to scale use, wording, differences in item applicability across residency programs, and inability of the item to assess observable behaviors rather than inferences about trainee performance. Item performance for the revised instruments was substantially improved; all items were significantly correlated with other within-competency items and with scores on the global item from the same instrument. Results of the generalizability analysis indicate that the instrument revisions improved the precision of the resulting composite score; the generalizability coefficient increased from 0.69 for the initial data collection to 0.75 for the revised instrument.

Discussion & Conclusions: The results of this study suggest that straightforward methods of statistically evaluating the quality of observational assessment items can result in substantial improvements in item and instrument performance. Collecting data about the performance of medical/healthcare trainees in the authentic clinical environment provides critical evidence for the competency of these trainees to perform activities that are relevant to the requirements for independent practice. Despite the importance of collecting this type of observational performance data, little research has investigated methods for improving the quality of the instruments that are used for data collection. The present research indicates that simple statistical approaches can be readily used to evaluate item performance and to improve the overall quality of observational assessment instruments.

Emergency department to inpatient handoff: does language affect medical students' sense of uncertainty?

Authors
Arabella Simpkin, Massachusetts General Hospital, Boston, USA
Zachary Murphy, Massachusetts General Hospital, Boston, USA
Katrina Armstrong, Massachusetts General Hospital, Boston, USA

Presenter: Arabella Simpkin, Massachusetts General Hospital, Boston, USA

Introduction: Communication and handoff failures are common causes of 'sentinel events' in hospital. Cognitive errors have been shown to be an important source of diagnostic error in almost 75% of cases [1]. Human quest for certainty can increase likelihood of premature closure in decision-making, the most common phenomenon in misdiagnosis. This phenomenon may be particularly prevalent in settings like the emergency department (ED) where pressures on time drive the need to rapidly reduce the uncertainty in a clinical presentation to form a working diagnosis. The downstream impact of such diagnostic errors, thought to be around 15-30% in the ED [2], is particularly great if this initial diagnosis is accepted when the patient is admitted, with anchoring and confirmation biases taking hold in interpretations of the illness narrative—subconsciously seeking signs that confirm the 'diagnosis' and refuting those that do not fit. How a message is tailored, and subsequently encoded by the recipient, can affect human response to a given message, though there is little research on whether language choice in handoff communications affects sense of uncertainty in physicians, particularly in clinical settings. This study aimed to determine whether variations in language to describe the presumed diagnosis in a clinical handoff scenario would lead to higher levels of anxiety due to uncertainty and greater uncertainty about the clinical diagnosis.

Methods: This was a randomized experimental design in a large medical school in the United States. Medical students with direct clinical experience within the hospital setting (year 2 onwards) received four hypothetical clinical handoff scripts from emergency department (ED) to inpatient ward. Students were randomized to receive one of four language variations to describe the presumed diagnosis: the control language arm used the word 'diagnosis'; the experimental arms replaced this word with either 'hypothesis', 'probability of 60%', or 'working diagnosis' with a short differential. Outcome measures were anxiety due to uncertainty, and clinical uncertainty about the ED provider's presumed diagnosis.

Results: Of the 114 participants who started the survey, 88 completed all the items and were included in the analyses. Anxiety due to uncertainty was significantly higher in subjects receiving the 'hypothesis' language arm than those receiving the control 'diagnosis' language (20 vs 15.5, p<0.005). There was a trend for higher anxiety due to uncertainty in subjects who received the probability language (18 vs 15.5, p=0.16) and the 'working diagnosis' language (17 vs 15.5, p=0.57). There was no difference in items assessing clinical uncertainty after each scenario.

Discussion and Conclusion: The word 'hypothesis' resulted in higher anxiety due to uncertainty, compared to the word 'diagnosis' for identical clinical scenarios, reflecting a difference in awareness of uncertainty. This is the first study to show that the word 'diagnosis', often used while still in the clinical reasoning process, may have unintended correlations with certainty, increasing risk of premature closure and diagnostic error. This lends support to careful

consideration of the language used in healthcare settings, especially in handoff scenarios as standardized protocols are developed. Future research is needed to understand more fully what factors and processes affect anxiety to uncertainty in healthcare professionals and how language choice may affect medical decision-making and diagnostic error.

Presenter: Sarah de Bever, Department of General Practice/ GP Specialty Training Program, Academic Medical Center, University of Amsterdam, Netherlands

Introduction: Trainees learn from their patient encounters, thus an adequate patient mix is of vital importance in postgraduate medical education. However, a monitoring system that provides both reliable, and educationally relevant information on the patient mix is still lacking. Electronic patient records (EPR's) are interesting candidates for such a monitoring system, though not designed for educational purposes. The classification of EPR data (ICPC codes) into educational relevant categories could be a solution for this problem. The Dutch GP specialty curriculum is build around 10 EPA-based themes that cover the entire content of the training. This makes these themes suited to function as educational relevant themes. In this study we aimed at classifying ICPC codes into these themes with a classification method based on the prototype theory. This theory states that a category exists of objects organized around a set of exemplars or prototypes. Category membership is a matter of degree rather than a dichotomous separation between members and non-members.

Method: For the themes Chronic Care (CC) and Psychic Conditions (PC) we developed two rating scales. Both scales existed of ICPC codes from the ICPC-1 system. To downsize the number of included codes, a two-step selection was performed for CC. First, all codes with no obvious relation to chronic care were removed and second, all codes with a prevalence below 5 per 1,000 patient years were removed. For the smaller theme PC, only the second step was performed. Raters were experienced GP's, who rated each ICPC code on its prototypicality for GP care in the context of either CC of PC. Raters scored ICPC codes on a scale from 1 to 9, where 1 represented 'not at all typical' and 9 'very much typical' for care provided by the GP.

Results: In total 94 rating scales were completed, 31 for CC and 63 for PC. ICPC codes varied from being highly typical (8.44 for CC and 7.87 for PC) to moderately typical (3.24 for CC and 3.45 for PC) in both categories. As expected from the prototype theory, inter-rater variability was low for the codes with a high degree of membership, and high for codes with a low degree of membership. We found a fair correlation ($r=0.27$) for CC and a moderate correlation ($r=0.46$) for PC between prototypically and prevalence.

Discussion & Conclusion: Our findings confirm that the membership of ICPC codes to educational relevant categories is a matter of degree, with some codes being more typical than others. Therefore, the prototype theory seems suitable for this classification task. These results can be used to develop a monitoring system that can generate reliable and educationally relevant information on GP's trainee patient mix, which in turn can be used to tailor the patient mix of trainees to both individual and curricular learning goals. This study is an important first step in developing such a monitoring system.

Introduction: Shame is a powerful emotion that occurs in response to negative events such as making mistakes or experiencing mistreatment. Shame in medical residents can be debilitating and can lead to significant negative outcomes including social isolation, impaired belonging, disengagement, impaired physical wellness, unprofessional behavior, and impaired empathy.[1] Given the powerful nature of shame and its related outcomes, we seek to understand the factors that shape residents' shame experiences. Tracy and Robins's model of self-conscious emotions provides the theoretical foundation for this study and outlines the appraisals and attributions that give rise to shame.[2] Specifically, this study asks: What factors, both intrinsic to the learner (e.g. his/her thought processes, appraisals, and attributions) and extrinsic to the learner (e.g. from the learning environment), shape the way he/she experiences shame?
Methods: We used hermeneutic phenomenology to explore the shame experiences of internal medicine residents within the context of the learning environment. We recruited twelve participants from an internal medicine residency at a large teaching hospital in the United States. Data collection began with participants writing about an experience during medical training in which they felt "flawed, deficient, or unworthy," characteristics of shame described in the psychology literature. This was followed by a semi-structured interview, informed by Tracy and Robins's model, that explored participants' shame experience(s) including the factors that contributed to and influenced those experiences. In accordance with the hermeneutic method, we iteratively analyzed the data and created rich descriptions of participants' shame experiences.
Results: Participants' shame experiences were triggered by events related to patient care, academic performance, and personal goals. Factors both intrinsic and extrinsic to participants contributed to and/or amplified their shame

reactions. Intrinsic factors included frequent comparisons to others, perfectionism, excessive focus on performance, fear of judgment, impaired belonging, and self-assessing through a skewed frame of reference. Extrinsic factors included supervisors, public exposure, being in a transition period, and the culture of medicine.
Discussion: Our study shines a light on shame in medical residents, illuminating intrinsic and environmental factors that may influence how they experience shame. Our data point to numerous "risk factors" that may increase a learner's tendency to experience shame in the clinical learning environment, such as perfectionism and excessive focus on performance. For example, a learner who has linked his self-worth to objective measures of performance may be more susceptible to damaging shame reactions upon performance failures or when objective measures no longer exist. Other factors in our study appeared to amplify existing shame, including supervisors and public exposure. These so-called shame amplifiers, often extrinsic to the learner, represent worthwhile topics for faculty development training and efforts to create psychologically safe learning environments. This study is the beginning of a larger program of research investigating the concepts of shame risk factors and amplifiers and the educational interventions that might be used to address them.
Conclusion: The current study advances our understanding about the influences that shape medical residents' experiences with shame, a powerful and often hidden emotion. This understanding can be used to inform future research and training to address and mitigate the negative effects of shame in medical education.

A quest for bravery: An ethnographic account of patient safety culture in postgraduate medical training

Authors
Guusje Bressers, Maastricht University, Maastricht, Netherlands
Iris Wallenburg, Erasmus University, Rotterdam, Netherlands
Renée Stalmeijer, Maastricht University, Maastricht, Netherlands
Mirjam oude Egbrink, Maastricht University, Maastricht, Netherlands
Kiki Lombarts , AMC, Amsterdam, Netherlands

Presenter: Guusje Bressers, Maastricht Univeristy, Maastricht, Netherlands

Introduction: Patient safety is a topic of importance and debate both in the context of postgraduate medical education and health care. The training of residents regarding patient safety used to be situated in a long

socialization process within the clinical workplace. In recent years a more 'standardized' or system approach to medical training has been foregrounded (e.g. competency based education and entrustable professional activities). Sociologists have pointed out the side effects of a systematic approach to patient safety teaching and practice, elucidating how the intended use of these system solutions may conflict with residents' needs (Szymczak & Bosk 2012). As patient safety practices are typically learned in the clinical workplace, the central question of this paper is: How is patient safety taught and 'done' in the training of medical residents, and what does this teach us about how patient safety is enacted in medical care delivery?
Method: This study builds on one year of non-participant observations including informal interviews. Observations took place in the context of anesthesiology and emergency medicine departments in one academic hospital in the Netherlands. Data collection and analyses was an iterative process. Field notes where taken and worked up into detailed descriptions within 24 hours. The data analysis was informed by Habermas's concepts of system and lifeworld (Habermas, 1987). System exists of e.g. administrative responsibilities while Lifeworld is built on shared meanings and understandings, and for everyday encounters between people. This method of analyzing data enabled us to account for the discoveries in the empirical materials and permitted us to give theoretically based situational generalizations of our findings.
Results: The role of patient safety systems and how residents value it changes throughout post graduate medical training. This process can be divided into three stages: 1) Coming to grips, 2) To follow or not to follow, and 3) Mastering. 1) Coming to grips, this is in the beginning of residency training where the focus is more on getting a handle on daily practice. Here we see a distinction between residents solely trusting on systems or residents trusting on hierarchically, non-threatening colleagues (nurses) in their judgment. During this stage patient safety is still an abstract concept. 2) To follow or not to follow, in which the resident makes decisions when to uphold safety systems, for example a protocol, and when to deviate from this. In this stage patient safety becomes a normative concept. 3) Mastering where the resident is able to make decisions in light of the uncertainties surrounding daily practice, here patient safety becomes an embodied practice.
Conclusion & Discussion: Systems surrounding patient safety have different meanings throughout residency training. Residents stop trusting solely on safety systems and start making decisions also involving a lifeworld approach (i.e. through socialization). Systems can be a lifeline in the beginning of residency training. Later on these systems can become a hindrance forcing residents to create workarounds in order to ensure safe patient practice. However, as residents mature and start to oversee the complexity and uncertainty surrounding they are able to use safety systems as a constructive tool in their daily practice. There is a need for supervisors to be more explicit about their lifeworld and system considerations in teaching residents about patient safety. Doing so will enable residents to become braver in navigate uncertainties surrounding patient safety.

Exploring the concept of confidence during surgical residency training

Authors
Mackenzie Lees, University of Alberta, Edmonton, Canada
Bin Zheng, University of Alberta, Edmonton,Canada
Lia Daniels, University of Alberta, Edmonton, Canada
Jonathan White, University of Alberta, Edmonton, Canada

Presenter: Mackenzie Lees, University of Alberta, Edmonton, Canada

Introduction: Much recent work in medical education has focused on the topic of competence, and much effort has been expended on designing frameworks and tools to objectively assess the abilities of surgical graduates. We suggest that this focus on competence may overlook another important concept: surgical confidence. Most existing work on confidence is based on surveys and questionnaire data, and approaches the topic from the perspective of a "confidence crisis". Few studies have considered the phenomenon of confidence in surgical training in depth. Thus, our research goal was to explore what confidence means within surgical education and investigate how residents have experienced confidence during their surgical training.
Methods: We used methods of qualitative interpretative inquiry to explore the experiences of confidence among general surgery residents. General surgery residents from the University of Alberta were invited to participate. However, residents in their first year, final year, and research years were excluded. Seven PGY2-4 residents volunteered to participate (4 female; 3 male). Participants were sent a pre-interview activity ('fill-in-the-blank' diagram) one week prior to their interview. Interview questions were open-ended, grouped into specific domains, and included discussion of the pre-interview activity. All interviews were audio-recorded and transcribed verbatim. Each resident received a post-interview research brief that included a summary of his/her interview responses. Interview transcripts were coded and analyzed using inductive strategies to determine common categories, topics, and recurring themes.
Results: Five major themes arose to describe residents' understanding of confidence. First, participants described confidence as an internal, subjective feeling of being able to accomplish a task/set of tasks expected of oneself. This faith in one's abilities is based upon feelings of familiarity and comfort. Second, confidence was described as context- and task-specific and thus varying throughout residency. One participant stated that confidence "looks like a mountain range going up, with multiple ups and downs, but the overall trend is upwards". Third, residents described confidence as "knowing how to handle a

situation", "knowing the right answer", and "being able to rise up and overcome challenges". Fourth, confidence was described as being associated with perception. It affected a person's demeanour and how they appeared to others, being felt inwardly but expressed outwardly. Finally, participants stated that confidence was clearly distinct from competence but also described the relationship between the two concepts. As one participant explained, "confidence is feeling like I can handle it, while competence is whether I actually can handle it." Residents stated that confidence represented their internal beliefs, whereas competence represented external opinions of their abilities. Participants felt that more confident residents were perceived as more competent, were provided more opportunities during training, and earned more trust from staff surgeons.

Discussion: This study showed that "surgical confidence" is a multidimensional concept characterizing a subjective, internal feeling that one can accomplish a specific surgical task. According to participants, confidence is important during residency for overcoming challenges and developing competence, making clinical decisions and caring for patients, and also necessary for progressing through residency and becoming an independent surgeon.

Conclusion: Understanding the concept of surgical confidence is important, as it directly impacts how residents progress and improve throughout residency and ultimately become a confident, independent surgeon. More research needs to be done on the factors that affect the development of confidence during surgical training, and on the interplay between surgical confidence and competence.

Mutual trust in workplace-based medical training programs

Authors
Linda Bonnie, Academic Medical Center - University of Amsterdam, Amsterdam, Netherlands
Mechteld Visser, Academic Medical Center - University of Amsterdam, Amsterdam, Netherlands
Anneke Kramer, Leiden University, Leiden, Netherlands
Nynke van Dijk, Academic Medical Center - University of Amsterdam, Amsterdam, Netherlands

Presenter: Linda Bonnie, Academic Medical Center - University of Amsterdam, Netherlands

Introduction: Trust plays an important role in workplace-based post-graduate medical education programs (PGME-programs). Trainers have to trust their trainee in order to gradually increase the independence of the trainee while in the same time taking into account the safety of the patients. Trainees have to trust their trainer in order to experience a safe learning environment in which trainees can receive feedback, learn from experiences in the workplace, and perform their work properly. Unlike the development of trust from trainers in their trainee(1), only little is known about the development of trust from trainees in their trainer. Additionally, it remains unclear how the trust of trainers in their trainee interacts with the development of trust of trainees in their trainer. As we expected the development of trust to be an interactive process, we aimed to gain insight in the development of mutual trust between trainees and their trainer.

Methods: For this study we adopted the grounded theory methodology. Fifteen trainers and 34 trainees from the General Practice training program from the University of Amsterdam, a workplace-based PGME-program, participated in the study. After performing two focus group discussions with trainers and four focus group discussions with trainees, to share and explore the experiences and knowledge about the trust-relationship between trainers and trainees, data-saturation was reached. The focus group discussions were audio-recorded and transcribed verbatim. The verbatim transcripts were analyzed to identify emerging themes, the themes were divided into categories that informed us about the development of mutual trust.

Results: The process of trust development starts with the first impression. Trainers and trainees find it difficult to describe this process, but they refer to it as a "feeling", "click", or "gut-feeling". The first impression has a strong influence, trust-relationships that arises from the first impression are difficult to adjust. During the training period, the trust between trainers and trainees becomes more concrete. Trainers increasingly entrust trainees with performing patient care independently, taking into account the performance of the trainee in working and learning, the context in which the work is performed, and the safety of the patients. Trainees trust trainers for creating a safe learning environment, in which they feel supported by their trainer. This process is also influenced by the personal relation between trainees and their trainer. The development of mutual trust is importantly influenced by the self-confidence of the trainee.

Discussion and conclusion: Trust development between trainers and trainees is an interactive process, in which both have different goals and different means to get there. The results of this study confirm earlier results about trust of trainers in their trainee, but it also provides the new insight that trust development is a mutual process that differs between trainers and trainees. Trust development is a process that differs from person to person, and is influenced by previous experiences. Giving words to this process may be a challenge, causing participants to be able to only limitedly explain the development of trust in the training situation in focus groups. This study does, however, show that it is important for both trainers and trainees in a workplace-based PGME-program, to develop trust in each other. Since trust is an important factor in both learning and assessment of trainees, paying extra attention to the trust-relationship in a PGME-program may improve the learning outcomes for trainees.

Not just trust: Factors influencing learners' technical skill attempts on real patients

Authors

Susan Bannister, Cumming School of Medicine, University of Calgary, Calgary, Canada
Mark Dolson, University of Waterloo, Waterloo, Canada
Lorelei Lingard, University of Western Ontario, London, Canada
David Keegan, Cumming School of Medicine, University of Calgary, Calgary, Canada

Presenter: Susan Bannister, Cumming School of Medicine, University of Calgary, Canada

Introduction: As part of their training, physicians need to learn how to conduct technical skills on patients. Previous literature has revealed that this learning is complex, with many opportunities not converted into attempts by learners. This study sought to explore and understand this phenomenon better.

Methods: A multi-phased qualitative study including ethnographic observations, interviews, and focus groups was conducted to explore the factors that influence technical skill learning. Set in a tertiary paediatric emergency department (PED), staff physician preceptors, residents, nurses, and respiratory therapists were observed in technical skill provision and teaching over a three month period. A constant-comparison methodology was used to analyze the data and develop a constructivist grounded theory.

Results: We conducted 419 hours of observation, 18 interviews and 4 focus groups. We observed 287 technical skills, of which 27.5% were attempted by residents. Thematic analysis identified 14 factors, grouped into three categories, which influenced whether residents attempted technical skills on real patients. Learner factors included resident initiative, perceived need for skill acquisition, and competing priorities. Teacher factors consisted of competing priorities, interest in teaching, perceived need for residents to acquire skills, attributions about learners, assessment of competency, and trust. Environmental factors were competition from other learners, judgment that the patient was appropriate, buy-in from team members, consent from patient or caregivers, and physical environment constraints.

Discussion & Conclusions: Our findings expand upon a previous model of the factors that influence technical skill learning on real patients. Bannister et al. identified an interplay of priorities, attribution and technical skill opportunities in the NICU setting.1 The PED setting and the expanded methodology of this study offered insight into additional factors that influence whether residents are able to attempt technical skills on real patients. Our findings suggest that neither the presence of a learner in a clinical environment nor the trust of the supervisor are sufficient for an opportunity to practice technical skills on live patients to convert into an attempt. In fact, substantial opportunities for procedural learning may never convert into learner attempts. In our study, almost 80 percent of observed procedures were carried out without trainee involvement, even though the paediatric emergency department, an official teaching site, was saturated with learners.

We characterize this phenomenon as a pool of opportunities to conduct technical skills on live patients that shrinks to a much smaller pool of technical skill attempts. The pool of procedural opportunities is determined by the clinical needs of the cohort of patients present in a clinical teaching environment at a given time. In essence, this pool of opportunities is a given size that cannot be increased. The pool, however, can shrink due to learner, teacher and environmental factors, reducing the number of technical skills learners ultimately attempt.

This study presents a caution for medical educators that, in addition to acknowledging that attempts at clinical tasks or technical skills do not automatically convert into learning, they must also be aware that opportunities in the clinical workplace do not automatically convert into learner attempts. Understanding and addressing the teacher, learner and environmental factors that shrink the pool of opportunities to a smaller pool of attempts are important initial steps in developing improvements to work-based clinical learning.

Vanderbilt Immersion Phase: An adaptive post-clerkship curriculum that uses clinical context to build upon prior learning

Authors
William B. Cutrer
Kimberly Dahlman
Matthew Weinger
Saralynn Williams
Kimberly Lomis
Lourdes Estrada

Presenter: William Cutrer, Vanderbilt University School of Medicine, Nashville, USA

Background: In Educating Physicians[1], Cooke et al emphasize the importance of individualized pathways towards the attainment of standardized outcomes, an approach we implemented with the revision of our curriculum. We extended our post-clerkship phase to from one to two years to foster the graduation of more self-directed, critical thinking, expert workplace learners.
Method: Learners progress through the Immersion Phase (IP) on individualized paths as the curriculum adapts based on their competency attainment and interests.
Key IP goals include deepening foundational science knowledge, solidifying clinical skills, and ensuring readiness for internship. Students devise individualized plans under faculty guidance and informed by evidence of prior performance. They choose among a broad menu of courses designed with overall- and activity-specific learning objectives, multiple educational activities, and a multimodal competency-based assessment plan (including milestones, Entrustable Professional Activities) enables students to meet all competency and framework requirements in personalized contexts.
Results: No two students completed identical paths. Quantitative review of course evaluation data and qualitative review of student focus group responses supported three key curricular themes – the ability to tailor courses to personal interests, increased confidence in preparation for residency, and integration of foundational sciences in a meaningful clinical context. Each student in the inaugural class adapted their schedules to accomplish their career goals while achieving prescribed competency requirements. Curriculum leaders share structure and processes used during the implementation to balance students' achievement of all competency and framework requirements with meaningful individualization. Student narratives describe opportunities the IP afforded and validate the feasibility and value of the 2-year post-clerkship structure.
Conclusion: Curriculum reform at one institution focused significant efforts on improving the rigor and value of post-clerkship experiences by enhancing adaptability and individualization based upon personal aspirations and competency needs.

The Training of Medical Students' Spatial Abilities – Use of Anatomy Computer-Assisted Learning Platform

Authors
Bruno Guimarães
Stanislav Tsisar
João Firmino-Machado
Benedita Viana
Ricardo Cruz-Correia
Maria Amélia Ferreira

Presenter: Bruno Guimarães, Faculty of Medicine, University of Porto, Portugal

Background: The current medical education satus quo imposes a challenge to traditional anatomy learning methods, contributing to the introduction of new pedagogical approaches, as Computer-assisted Learning (CAL). These platforms provide insight into students' learning profiles that enhance Anatomy knowledge acquisition. To understand the influence of anatomy CAL on spatial abilities, a study was conducted.
Method: Medical students attending Musculoskeletal (MA) and Cardiovascular Anatomy (CA) courses were allocated to one of three groups (MA Group, CA Group, MA + CA Group). Students' pre-training and post-training spatial abilities were assessed through Mental Rotation Test (MRT) (score range between 0-24).
Results: After CAL training sessions, students' spatial abilities performance improved ($9,72 \pm 4,79$ vs. $17,05 \pm 4,57$, $p < 0.001$). The improvement in spatial abilities score between sessions (Delta MRT) showed correlation with Musculoskeletal Anatomy training sessions in MA Group ($r = 0.333$, $p < 0.001$) and MA + CA Group ($r = 0.342$, $p < 0.001$), and showed correlation with Cardiovascular Anatomy training sessions in CA Group ($r = 0.461$, $p = 0.001$) and MA + CA Group ($r = 0.324$, $p = 0.001$). Multiple linear regression models were used, considering as dependent variable the Delta MRT. They revealed an association between Delta MRT and the amount of CAL training and the baseline spatial abilities performance.
Discussion: The results suggest that CAL training in anatomy has positive dose-dependent effect on spatial ability performance. The inclusion of this learning methodology into anatomy curriculum can not only offer innovative and effective alternatives to traditional anatomy training, but also improve students' core characteristics for medical training.
The introduction of CAL platform into medical education allows the collection and analysis of students' profiles, having the potential to act on its vital characteristics and make medical education more proficient.
Conclusion: In a world of exponentially growing knowledge and evolution of technology, the importance of students' characterization became paramount for efficient teaching. In this context CAL shows to be a

promising tool to achieve that goal, personalizing the learning strategies accordingly to students' profiles.

Novel Learning Strategies for Students in the Basic Sciences

Authors
Aaron Brown, American University of the Caribbean, TX, USA
Emeka Ajufo, American University of the Caribbean, FL, USA
Cecil Cone, American University of the Caribbean, AL, USA
Mark Quirk, American University of the Caribbean, MA, USA

Presenter: Aaron Brown, American University of the Caribbean, San Antonio, Texas, USA

Background: Lectures still form the basis of medical student learning, despite advances in educational technology. The value of asynchronous audio experience to enhance learning has been well documented yet underutilized. Research has demonstrated that it is at least equal to classroom-based education in improving knowledge. With this background, we proposed that students who use audio lectures to supplement didactic lectures will have a significant increase in performance on MCQ assessments compared to students who study using written class required material.

Method: Second year medical students were randomly assigned to preview four consecutive class lectures: a. using traditional slides and written handouts; or b. using previously recorded audio lectures through the mobile app LectureKeepr (LK) which was developed by one of the authors (AB). Controls on the app allow students to replay, pause, skip back 5 seconds and play the lecture material. Analytics programmed into LK reported the precise timestamp that students identified lecture material to return to using a novel "SkipBack" feature. Students' knowledge was assessed using standardized exam questions before and after the intervention. Pre and post-test items consisted of challenging NBME-style questions. Attitudes were assessed with Likert-scales and free text.

Results: Sixty seven students completed the protocol. Paired t-tests revealed that students assigned to the intervention group demonstrated a higher mean score on the post-test compared to students who studied using traditional means (Traditional: 65.83% ± 7.64; LectureKeeper 81.03% ± 4.31; P = .05). Eighty-three percent (83%) of students stated that LK was a valuable tool to enhance learning.

Discussion: LectureKeeper allows students to adapt their learning environment (content, setting, time) and content needs. This method is not applicable to every student but our research shows that for most students who previously were unaware of the benefits or lacked the capabilities to do so, audio learning can enhance their educational performance.

Conclusion: This study showed that there is a potential to enhance learning in studies by priming them for upcoming lectures using an audio based mobile application.

Preparing Medical Students for Future Learning using 'New' Basic Sciences Integrated Instruction

Authors
Maria Mylopoulos, University of Toronto, Toronto, Canada
Zarah Chaudary, University of Toronto, Toronto, Canada
Michael Hawkins, University of Toronto, Toronto, Canada
Rachael Barnett, University of Toronto, Toronto, Canada
Sanjeev Socklingam, University of Toronto, Toronto, Canada
Nicole N. Woods, University of Toronto, Toronto, Canada

Presenter: Maria Mylopoulos, WIlson Centre/University of Toronto, Canada

Background: Instruction that deliberately integrates basic science biomedical knowledge with clinical features has been shown to lead to better diagnostic performance and preparation for future learning (PFL), a key capability of adaptive expertise. In addition to traditional biomedical knowledge, it has been suggested that integration of 'new' forms of basic science (e.g. behavioural, social and health system processes) is necessary for effective care. This study compared the effect of integrated instruction using 'new' basic sciences (NBS) to clinical-features only instruction (CF) on diagnostic performance and a PFL assessment (PFLA).

Method: 33 first-year medical students were randomly assigned to the NBS or CF instructional method to learn medical psychiatry disorders. Initial Assessment (IA) consisted of diagnosing 14 clinical vignettes. In a second learning phase (PFL) all students learned how to evaluate integrated health care needs using the same 4-part framework. In the PFLA, students were asked to 1) prioritize the most important variables in addressing patients' health needs and 2) rate (0-3) clinical significance of independent variables from the framework.

Results: There was no difference between the NBS and CO groups on memory retention for both Initial ($t(30)=0.567$, $p= 0.575$) or PFL instruction ($t(30)= 1.203$, $p= 0.238$). The two groups (NBS: (M= 20.13, SD= 3.96); CO: (M= 20.86, SD= 2.85)) also had comparable performance on Initial Assessment at diagnosing clinical vignettes ($t(28)= .573$, $p= 0.571$). For PFLA, the NBS group outperformed the CO group in evaluating integrated health care needs using the framework they learned. In rating the clinical significance of independent variables from this framework, the NBS group (M= 131.76, SD= 8.97) scored significantly higher than the CO group (M= 122.4, SD= 10.63), $t(30)= 2.70$, $p= 0.011$. A higher score indicates better performance and consistency with expert ratings whereas a lower score indicates deviance from expert ratings.

Conclusion: Our data suggest that using an expanded definition of basic sciences for integrated instruction supports the development of PFL. This work has implications for designing effective instruction that supports development of adaptive expertise.

Relational learning and a novel learning engagement system leads to better outcomes

Authors
R. Lance Miller, Inquizica, Philadelphia, USA
Ryan Palmer, American University of the Caribbean, USA
Mark Quirk, American University of the Caribbean, USA

Presenter: Lance Miller, Inquizica, Philadelphia, USA

Background: Adaptive learning improves creative problem-solving skills, fosters metacognition, and teaches students to become independent learners. However, adoption of adaptive learning techniques remains low among medical students, because: 1) concepts are often presented in isolation rather than in relational units that build upon each other; and 2) adaptive learning strategies must be explicitly supported, as most students do not have direct experience with them and do not implement them on their own.
Method: First, we explicitly taught relational learning to students in small group sessions. We provided clinical scenarios and taught students how to identify the relationship between clinical features and basic mechanisms, using widely respected educational resources they could access independently. We measured each student's ability to identify relevant material, generate their own hypothetical test questions, and then provided hands-on exercises with feedback. We also used a novel learning engagement system (Inquizica) to push formative assessments to student's smartphones to promote rapid engagement, with appropriate spacing and interleaving, and with analytics so students could track their performance.
Results: Participation was significantly higher when strategies were presented early on in the semester as part of the instructional experience, rather than later in the semester to students who were struggling (30% v. >70%). Students showed higher rates of subsequent independent use of educational resources, improved performance on formative assessments, and improved accuracy of self-identified knowledge gaps. Student satisfaction was also high, with comments like "This approach taught me how to think," and "I wished I learned this approach on Day One."
Discussion: Students valued our relational learning approach and the adaptive learning strategies, and together these elements led to greater content knowledge and test performance. These strategies required time and training, suggesting schools should consider including this as an explicit part of the medical school curriculum.
Conclusion: Our relational learning approach, coupled with technology-driven adaptive learning strategies led to higher satisfaction, content knowledge, and test performance.
Take-home message: : This pilot study illustrates the value of explicitly teaching students how to use a relational learning approach, coupled with technology that makes adaptive learning strategies easy to implement.

Presenter: Fernanda Patrícia Soares Souto Novaes, FAIMER, IMIP, UNIVASF, INSS, Petrolina, Brazil

Background: Guidelines value training physicians capable of building relationships with patients, dealing with emotions, and teamwork. Medical educators, however, know little about new concepts in medical education and replicate the models they have received. The elective "Communication in Healthcare" course is an intervention that introduces active methods into a traditional Brazilian medical school. The increased number of participants posed difficulties to work with active methodologies.
Method: The course promotes supervised student-teaching practices, working with active methods communication skills adapted to local needs and carrying out OSCEs with few resources. The educational model is a hybrid, combining face-to-face and online, using flipped classroom and the following Doc.ComBrasil modules: Building a Relationship, Obtaining and Sharing Information, Dealing with Emotions, Sexuality, Bad News, End of Life, Boundaries and Professional Teams. Students take part in seminars, such as Project-Based Learning (PjBL). The challenge of working with active methodologies in large groups was solved by subdividing into small groups, in accordance with the concept of Team Based Learning (TBL). We exchanged traditional chairs for cushions and mats in a thematic room. We used collective embrace, affectivity dynamics, and feedback.
Results: 1-The process was entitled Reflection-Based Learning (RBL), inspired by qualitative research, meaningful, collaborative learning, and art, in order to consolidate medical identity. The educational choreography includes 10 steps: 1-Class Project, 2-Discussion Circle, 3-Reflection, 4-Categorization, 5-Articles, 6-Integrative Dynamics, 7-DocCom.Brasil, 8-Student Videos, 9- Dramatization, 10-Conclusion with Art.
2. Kirkpatrick's program evaluation revealed good results at level 1, satisfaction, demonstrated by the increased number of participants over 6 terms: 4, 17, 20, 24, 48, and 52. The presence of Medicine, Pharmacy, Psychology and Nursing students reinforced interprofessionalism and medical course accreditation criteria. The educational experience received a Brazilian Medical Education Prize.
Conclusion: Teaching practices prepared students for educational change in healthcare and developed future facilitators. Student collaboration makes it possible to conduct OSCE with few resources. RBL transforms each class into a publishable experience. s: This is an innovative, easily replicable educational process that guarantees

space for speech, creativity, and humanism in medical
education.

Hybrid clinical simulation: Inclusion of immersive technology to develop skills on undergraduate medical students

Authors
Mildred Vanessa López Cabrera, Tecnologico de Monterrey School of Medicine and Health Sciences, Monterrey, Mexico
Eduardo Hernández-Rangel, University of California, Irvine, USA
Gibrán Prudencio Mejía Mejía, Universidad Vasco de Quiroga, Morelia, Mexico
José Luis Cerano Fuentes, Universidad Vasco de Quiroga, Morelia, Mexico

Presenter: Mildred Vanessa López Cabrera, Tecnologico de Monterrey, School of Medicine and Health Sciences, Monterrey, Mexico

Background: Clinical simulation provides the opportunity for the student to promote solutions in a safe environment through the reasoning of clinical cases to obtain the best option for care, integrating it with the concept of mastery learning where the student must repeat the task until he demonstrates his mastery. This tool has gained attention for practice and evaluation of technical procedures, as well as team training to improve performance in complex environments (Rosen, 2008). However, simulation as it is conceived is limited to a physical space and the acquisition of equipment that requires high investment and maintenance costs. New technologies that provide immersive learning models have grown exponentially, such as: the use of apps, augmented reality and virtual reality. The integration of augmented reality and virtual reality in medicine is a growing trend that is being used to complement practical training or skill development laboratories, including facilitating self-directed learning and remote diagnosis (Maani, 2011). This technology includes the use of three-dimensional graphics, immersive scenarios, patient avatars, and spaces for performance evaluation. Some models are focused on exposure therapy of patients with claustrophobia, post-traumatic stress disorder, pain management, surgical planning, cognitive training for patients with autism, etc. (Newbutt et al., 2016). However, its focus has been mainly on the development of therapeutic skills and training for medical specialties, there is a gap for training on basic skills part of the undergraduate curriculum, such as emergency management and clinical competencies. The benefits of these innovative systems lay on decentralization and access to state-of-the-art technology, graphics and videos that are very close to reality, that are produced and available without considering geographical or economic conditions, providing the opportunity to learn the best medicine, from the best clinical environments, and from the best doctors (Wiechmann, Kwan, Bokarius, and Toohey, 2015).

Achieving mastery in simulation before transitioning to real-life practice: are there drawbacks?

Authors
Bettina Willi, Hospital for Sick Children, Canada
Briseida Mema, University of Toronto, Canada
Anne Kawamura, University of Toronto, Canada

Presenter: Bettina Willi, Hospital for Sick Children, Toronto, Canada

Background: In the era of Competency Based Medical Education (CBME), certain training programs require their trainees to achieve a minimum passing score in a simulation context before being allowed transition to real life. This mastery model for simulation training is advocated to be effective.
However, what is the feasibility of this approach for a training program? We examined our Pediatric Intensive Care needs and calculated that each trainee would need at least 30 hours of simulation for procedural skills training alone before being allowed to participate in real –life supervised practice. Furthermore, Boot camps, a solution used by many training programs to manage these training requirements, do not allow for learning using deliberate practice. Months would go by until a learner achieves the predetermined proficiency in simulation.
Enforcing strict rules would impede learners from participation in real-life clinical context. Yet this may result in missed opportunities where trainees can participate and learn under supervision which is effective for the development of expertise for the following reasons. Learning is situated (Lave and Wenger) and trainees should participate in different learning contexts. Correlation of performance in simulation and real life is non-linear as performance is context related. Greeno's study of transfer argues that transfer of skills depends on whether learners see similarities across different situations. Involving learners in real-life helps them see the similarities and differences between simulation and practice and primes them for better use of simulation practice subsequently. Adaptive expertise requires learners to problem solve different type of non-routine situations such as those faced in real-life rather than the routine simulation practice.
Should programs, while striving to provide as much simulation training as possible, expose the training of learners to supervisors and encourage learners to take advantage of all opportunities with appropriate supervision and feedback.

A problem with problem-based learning

Authors
Martin Veysey, Hull York Medical School, Hull, UK
Marie Cohen, Hull York Medical School, Hull, UK

Presenter: Martin Veysey, Hull York Medical School, Hull, UK

Background: If "assessment drives learning" then a problem with problem-based learning (PBL) is assessment. PBL has been an adopted pedagogy in health professional education, based on the principle that it promotes not only cognitive outcomes, but also metacognitive. All of which are critical for healthcare professionals. Whilst assessment is not the only factor influencing learning in a PBL course, it can undermine the benefits of it, with students focusing on examinations, rather than the problems. This is especially true with written assessments of knowledge that focus on what you know, rather than what you know or don't know and how you go about gaining new information.

But if this is true, what is the solution? There are three potential approaches. Firstly, we could change our examinations. Open book, or certainty-based, assessments enable formal examinations to be authentic, not only to the style of teaching, but also future workplaces. Who expects their doctor to guess which of drug they should prescribe? Secondly, we could adopt programmatic assessment, using portfolios of aggregated assessment data, with an emphasis on the overall performance of students. And finally, we could focus our assessments away from the acquisition of knowledge, much of which may be redundant soon, and focus them on self-regulatory or self-authorship capacity. Self-regulation can be measured in kindergarten students, but these techniques have not yet been embraced in undergraduate education. Which approach to follow needs to be a subject of debate, but ultimately we need to move away from knowledge-based tests that artificially reassure us that students will make good clinicians. Whatever happens, if we are to avoid a slow and painful drift away from the ideals of PBL, and its demise, we need to adapt and refocus our assessments to ensure the benefits of PBL are retained for health professional education.

What condition do you think medicine's curiosity muscle is in?

Authors
Jennifer Yates, Department of Paediatrics, School of Medicine, University College Dublin, Dublin, Ireland
Sinead Murphy, Department of Paediatrics, School of Medicine, University College Dublin, Dublin, Ireland

Presenter: Jennifer Yates, Department of Paediatrics, School of Medicine, University College Dublin, Ireland

Background: Curiosity is an enrapturing and maddening concept, it is the eternal itch that needs to be scratched. There is and has been general concern amongst medical educators that the curiosity of medical students and modern medical professionals is diminishing. In fact, modern medical professionals have been likened to providers rather than doctors due to the increasing use of check lists and algorithmic medicine (1). It has been hypothesised that the diminishing curiosity levels may be due to the increasing pace of the medical world and the need for efficiency (2) and that current medical education and its' assessments are contributing to diminishing curiosity due to it's primary focus on learning facts and acquiring practical skills which causes students to focus on finding the right answers, but does not adequately equip them to formulate their own questions once working as a physician. Factors suggested as being detrimental for curiosity include negative feedback and a hostile environment (3.). However, we know that medical students are naturally curious people (4,5) and indeed many medical schools actively recruit inquisitive and curious students who can demonstrate they have a strong desire to learn (6). Sternzus et al measured curiosity levels across 4 years of an undergraduate medical degree. They demonstrated students had high levels of trait curiosity and demonstrated they were higher than the trait curiosity scores of other university/ high school students when compared to previous studies . However, state curiosity was consistently lower and fluctuated from year to year (7). This caused them to question is undergraduate medical education optimally supporting curiosity? It is posseted that curiosity is like a muscle, if you do not use it, you may lose the impetus to ever use it again (8) which then creates the question, what condition to you think medicines curiosity muscle is in?

Can computerized adaptive testing maximize the utility of progress tests?

Authors

Carlos Fernando Collares, Maastricht University and European Board of Medical Assessors, Maastricht, Netherlands

Presenter: Carlos Collares, Maastricht University and European Board of Medical Assessors, Maastricht, Netherlands

Background: Traditional paper-based progress tests have been used successfully for several decades worldwide. However, this assessment tool has a critical short-coming: low reliability for beginners. Formula scoring, in which penalties are given for wrong answers, can slightly increase reliability. However, this increase apparently occurs at the expense of validity. Computerized adaptive testing is a technology in which an algorithm dynamically adjusts the difficulties of the items according to the previous answers. Computerized adaptive testing is known to allow sharp reductions of test length while uniformly maintaining or increasing reliability for all participants. When I developed and implemented the first computerized adaptive progress test (CAPT) in Brazil eight years ago, my motivation was to reconcile validity and reliability for this assessment tool. After moving to Maastricht, I had the honor and the privilege to implement CAPTs in many different countries. Despite the reduction of test length by 50%, reliability estimates have always been excellent, regardless of the academic year of the test takers. Preliminary validity evidence is also very promising. However, if we use the "utility function" to evaluate the quality of CAPTs (Van der Vleuten, 1996), three other characteristics must be taken into account besides validity and reliability: acceptability, costs, and educational impact. Regarding acceptability, students' evaluations have been surprisingly positive. Students say the test resembles a "video game" and that they feel more motivated to study. In terms of costs, increased collaboration between schools has allowed price reductions of roughly 60% in four years. So far, one can infer that CAPTs have high utility value. However, the educational impact of CAPTs in comparison to traditional progress tests is not yet known. How aligned are CAPTs with modern learning theories? Based on current findings and different theoretical frameworks, I propose a collaborative research agenda to investigate the educational impact of CAPTs.

Medical Schools Should Organise Regular Short Sabbaticals on the Clinical 'Front Line' for Non-Clinical Educators

Authors
Hamed Khan, St Georges University of London, London, UK

Presenter: Hamed Khan, St Georges, University of London, UK

Background: An essential requirement for prospective medical school applicants is work experience- and rightly so. Medicine is a unique melange of art and science, with unparalleled rewards, and exceptional emotional and physical stress. In addition to scientific acumen, doctors need outstanding communication skills and emotional intelligence to disentangle psychological and social issues from physical pathology.
Reading about this is helpful, but only to a limited extent. Medical schools almost universally require prospective medical students to spend time shadowing doctors on the 'shopfloor', to get a 'real life' feel of what life as a doctor entails.
The value of this is indisputable, and universally recognized by medical schools. So surely we should also enable those who teach our students to benefit from such insight?
The brilliant non-clinical academics who teach our future doctors work relentlessly to enhance their insight and understanding of the clinical 'front line', and their dedication is unparalleled. It is time that medical schools actively facilitated their commitment and efforts by enabling them to gain first-hand experience.
This is why I believe that medical schools should organise regular short 'sabbatical' breaks for their non-clinical educators, to enable them to shadow doctors working on the clinical frontline.
Gaining regular first-hand experience and personified insight into the unique daily complexities and challenges of medicine, would be immeasurably helpful in contextualizing teaching. Such insight, and the ability to draw upon first-hand experiences and anecdotes, would enhance both the quality of teaching and the authority of educators. Doing this regularly would help non-clinical educators keep up-to-date with developments in clinical medicine, and the impact these have on clinicians and their practice.
It will also help develop links between front line clinicians and non-clinical educators, providing both with an insight into the challenges that both face, and help enhance mutual understanding and mutual respect.

7H8 (3620)
Debating the Potential of Competency-Based Medical Education: The Need for Constructive Criticism

Authors
Stanley J. Hamstra

Presenter: Stanley Hamstra, ACGME, Chicago, USA

Background: In a number of recent published reports, there has been sharp criticism of the value proposition for competency-based medical education (CBME). These tend to focus on theoretical concerns as well as the lack of an evidentiary base for making such a large change in medical education. When examined closely, these criticisms highlight differences in local jurisdictional culture and systems for health care delivery and education that create challenges to implementation. Certainly no single approach can be expected to address all the needs of every stakeholder group in every context.
I will argue that such criticism would be more constructive with further framing and deliberation regarding historical and contextual factors that impact not only the need for change, but also specific cultural and structural challenges to implementation.
The historical context for initiating such a large-scale change in medical education is summarized in a series of publications that expressed concerns regarding quality of care and public accountability. These concerns led to a variety of changes in the health care delivery system that consequently affected systems for teaching and assessing learners. In addition to concerns regarding quality of care, the continued attempt to utilize the traditional apprenticeship model within the modified health care system led to variation between learners - not only in exposure to certain disease categories, but also to biases in evaluation of performance based on professional judgment alone.
I will argue that CBME involves an attempt to make explicit that which may be implied. I will make the case that a CBME framework addresses these problems directly, albeit imperfectly, and as such, requires further study, debate and constructive criticism to adapt to the needs of trainees, their teachers, the health care systems in which they learn, and ultimately patients.

Student involvement in the admission process at the University of Copenhagen, Denmark

Authors
Annarita Ghosh Andersen, University of Copenhagen, Copenhagen, Denmark
Sara Klingenborg, University of Copenhagen, Copenhagen, Denmark
Mathilde Horn Andersen, University of Copenhagen, Copenhagen, Denmark

Presenter: Annarita Ghosh Andersen, University of Copenhagen, Denmark

Background: Medical schools all over the world have very different approaches to the admission process. At the University of Copenhagen 90 % of the students get accepted based on their grade point average and 10 % are accepted because of their motivational application and CV. The University of Copenhagen encourages student involvement in decisions concerning students made at faculty level. Therefore, it is seen as not only relevant but necessary for students to be involved in the application process.
Students exchange opinions and ideas with academic staff in meetings and workshops concerning the future applications and yearly one student is elected as part of the board, by other students at the association of medical students general election.
The election ensures that all the students backs the one student on the board.
The board consists of one student, one member of the academic staff and one clinician. This means that the qualified applications received are reviewed by both professors and students before a decision is made, ensuring that each applicant receives the optimal attention and judgement.
The applications are judged on 7 merits, which the board of medical studies chooses. The study board is likewise a collaboration between academic staff and elected students.The cooperation between students and staff benefits all; the knowledge from staff in what makes a good academic profile and the recognition from students on motivation and relevance.
Student involvement ensures a fair and relevant discussion of the best applicants. In a world with many different approaches to applications and admissions, the involvement of engaged and motivated students is both beneficial for the individual application process and for sharing knowledge peer-to-peer and between students and academic staff, reinforcing the link between faculty and student body.
Having students as part of the admission ensures a fair and relevant admission process.

7H10 (3077)
We're doing it all wrong! Selection methods must be institution specific!

Authors
Aimee K. Gardner
Brian J. Dunkin

Presenter: Aimee Gardner, Baylor College of Medicine, SurgWise Consulting, Houston, USA

Background: If you were applying for a barista position at Starbucks, you'd complete a different screening assessment than if you were applying for a barista position at Dunkin Donuts. This is because selection scientists know that the competencies required to successfully perform a job – even within the same occupation –is dependent upon the institution's unique culture, demands, and values.
The same is true for postgraduate medical education. Training programs may be held to the same accreditation standards, but the institutional climate can greatly impact the competencies required for success in any given program. For example, programs vary in the extent to which residents and junior consultants are expected to participate in research, teach medical students, and care for patients in rural settings. On a more subtle level, programs also differ in their promotion of diversity and inclusion, focus on innovation, provision of autonomy, and emphasis on other norms and values.
These intangible features make programs unique. As such, these aspects must be taken into consideration when selection systems are developed. Institutional culture is a critical consideration for determining which applicant assessment tools are most relevant and which can optimize information about applicant – program fit. Widespread implementation of "off the shelf" or externally-created screening tools, whether they be personality tests, situational judgment tests, or interest inventories, cannot fulfill this need. They must be considered and investigated through local validation studies to ensure their relevance, effectiveness, and ability to predict performance and retention.
Selection systems must be customized to capture each program's idiosyncratic demands, values, and culture if we care about maximizing the fit between applicant and institution. In today's training environment, one size does not fit all, and neither should our selection approach.

Lessons learned from implementing the integrated curriculum for nine years at a medical college in Korea: focused on the perspectives of graduates and faculty members

Authors

Dong Mi Yoo, Department of Medical Education, College of Medicine, The Catholic University of Korea, Seoul, Korea
Na Jin Kim, MASTER Center, College of Medicine, The Catholic University of Korea, Seoul, Korea
Soo Jung Kim, Department of Medical Humanities and Social Science, College of Medicine, The Catholic University of Korea, Seoul, Korea
Dae Chul Chung, Department of Pediatrics, College of Medicine, The Catholic University of Korea, Seoul, Korea
Jung Hyun Choi, Department of Internal Medicine, College of Medicine, The Catholic University of Korea, Seoul, Korea
Wha Sun Kang, Department of Medical Education, College of Medicine, The Catholic University of Korea, Seoul, Korea

Presenter: Wha Sun Kang, Department of Medical Education, College of Medicine, The Catholic University of Korea, Seoul, South Korea

Background: Catholic Medical College developed vertically integrated curriculum based on the SLICE model (Student-Centered, Longitudinal, Integrated, Competent, and Elective), and have implemented the curriculum since 2009. But little is known about how different students and faculty perceive the effect or outcome of the curriculum. We design this research to identify those perspectives as the first step of curriculum evaluation to promote the good effect and to settle the curriculum successfully through quality improvement.
Method: This research presents the results of a quantitative and qualitative study aimed at elucidating how well the goals of the OMNIBUS OMNIA curriculum, integrated medical curriculum of Catholic Medical College of Korea, were achieved from perspectives of the graduates' and faculty members.
Results: Graduates' and faculty members' satisfaction for overall curriculum was 3.2 and 3.76 out of 5 respectively. Especially graduates' satisfaction for 'the integration and connection of the curriculum' (3.63) was higher than faculty members' satisfaction (3. 06, 19.451. p=.001). From qualitative study of the focus group interviews graduates addressed that they needed more repetitive learning opportunities in the curriculum and complained that frequent assessments hinder consolidating process knowledge. Faculties pointed out the lack of integration and connection of the curriculum and urged for the strong sense of responsibility of professors who is involved with the particular segment of the curriculum.
Conclusion: Graduates presented more positive responses to the integrated curriculum than faculty members.

Graduates' satisfaction of every item was higher compared to that of faculty members. In particular, faculty members appealed for the need of full time instructor to reach the goals of the curriculum. This study demonstrated that the OMNIBUS OMNIA curriculum achieved its goals partially from the perspective of graduates' and faculty members'. In the analysis of survey and interviews graduates and faculty members also identified other strengths and weaknesses for improvement of the curriculum.
Take-home message: : This study provides lessons and impacts of implementation of the integrated medical curriculum. It identifies obstacles of integrated curriculum and encourages medical educators to reform their educational system.

7I2 (3592)

Shifting program evaluation from capturing to understanding: Trying to address the lack of evidence on Curricular reform

Authors

David Rojas, University of Toronto, Toronto, Canada
Lawrence Grierson, McMaster University, Hamilton, Canada
Maria Mylopoulos, University of Toronto, Toronto, Canada
Patricia Trvobich, University of Toronto, Toronto, Canada
Darius Bagli, University of Toronto, Toronto, Canada
Ryan Brydges, University of Toronto, Toronto, Canada

Presenter: David Rojas, University of Toronto, Canada

Background: The health professions education (HPE) literature reports a lack of evidence regarding the impact of curricular reforms. We suggest this is the consequence of a dearth of program evaluation tools that address the complexity of the educational programs underpinned by the curriculum. State of the art program evaluation practice proposes accounting for complexity by capturing the planned and emergent elements that arise when the program unfolds. However, no framework has been provided to accomplish this.
Method: We developed a program evaluation framework informed by systems engineering principles. We used our framework to evaluate the Pre-Residency Program (PRP) for international medical graduates in Ontario, Canada. Our framework involved multiple data collection methodologies (i.e., document analysis, observations [120 hours], and interviews [n=30]), abductive data analysis, reverse engineering of the data, and data triangulation. We explored the added value of our framework by also using a logic model framework and our collected data to evaluate the PRP program.
Results: Our results showed that our framework was the only one able to capture the elements that emerged when the program unfolded and, through our data analysis, provided some possible mechanisms for the emergent elements. We also found that further study is required to confirm or deny the possible mechanisms suggested by our framework. The logic model framework was limited to determine whether the program had achieved what was planned or not.
Conclusion: We have used state of the art program evaluation approaches and system engineering principles to develop a program evaluation framework that could

help mitigate the curricular reforms' lack of evidence. Our framework studies the planned and emergent elements in a program to understand the effect that the multiple curricula could have on the programs' dynamics. In doing so, we propose a shift in the program evaluation focus from capturing emergent elements, to trying to identify it's possible mechanisms.

Take-home message: The lack of curricular reform evidence can be circumvented by developing program evaluation tools that capture and study the effects that formal and informal curricula have on a program's dynamics, and its educational outcomes.

7I3 (1840)

Evaluating the effectiveness of educational interventions for patient benefit: The development of reporting guidelines

Authors

Hannah Hesselgreaves, Newcastle University, Newcastle upon Tyne, UK

Sally Corbett, Newcastle University, Newcastle upon Tyne, UK

Madeline Carter, Newcastle University, Newcastle upon Tyne, UK

Amelia Kehoe, Newcastle University, Newcastle upon Tyne, UK

Charlotte Rothwell, Newcastle University, Newcastle upon Tyne, UK

Jan Illing, Newcastle University, Newcastle upon Tyne, UK

Presenter: Hannah Hesselgreaves, Newcastle University, Newcastle upon Tyne, UK

Background: The UK Commission for Employment and Skills (UKCES) report that the NHS spends over £40billion on training every year. The effectiveness of this varied training is evaluated with different methodologies, using outcome measures that are not always robust, creating diversity in how outcomes are evidenced. Of the wealth of evidence reporting educational, attitudinal, behavioural, and service changes following education, only a fraction can evidence an effect on patients. Following a realist synthesis, we developed reporting guidelines to act as a resource to those aiming to demonstrate patient outcomes from their reporting of educational interventions.

Method: First, we familiarised ourselves with the current evidence (465 published papers were included in a realist review) of educational and training interventions which report patient outcomes (clinical effectiveness, patient experience, patient safety). Second, we consulted the current literature on good practice for reporting evaluations. These two processes produced a preliminary set of items. Third, we used a Delphi method with an interdisciplinary panel of journal editors, academics, and healthcare professionals who report educational interventions.

Results: Among the areas identified for specific guidance are: report how the need was identified that triggered the intervention; describe the educational or training intervention in full (delivery, duration and skills targeted); explain clearly how patient outcomes are defined and

measured; state the direction of effect (patient improvement or deterioration); state controls in appropriate methodologies; discuss reflections of the implementation or research team about how the intervention produced the patient outcome.

Conclusion: The development of this reporting guideline has drawn on multiple sources and in-depth knowledge of the evidence base. Each item of the guideline has been scrutinised by experts to create a resource that has high validity and ease of utility, to improve the evidence base of the educational impacts on patients, as well improving the ability to appraise that evidence base.

Take-home message: : There is great diversity in the quality of reporting patient outcomes, and weaknesses in reporting the effectiveness of interventions. It is intended that clarity and improved quality may be achieved with guidance.

7I4 (3231)

Evaluation of the Effectiveness of Interventions to Improve Quality of Midwifery Education in Ethiopia: a Quasi-Experimental Study Design without a Control Group

Authors

Tegbar Yigzaw

Muluneh Yigzaw

Firew Ayalew

Yohannes Molla

Mintwab Gelagay

Sharon Kibwana

Presenter: Tegbar Sendekie, Jhpiego, Addis Ababa, Ethiopia

Background: Although Ethiopia rightly increased the number of midwives in the last decade, the rapid scale-up of preservice education posed considerable challenges to assuring quality of education. In response, the Government, with support from development partners, implemented various interventions to improve quality of education.

Method: A pre-post evaluation design without control was employed to assess the impact of various interventions on the quality of midwifery education. Interventions targeted essential elements of preservice education; namely, students, instructors and preceptors, curriculum, educational infrastructure and resources, quality management, and regulation. Pre-test data was collected from 484 graduating students in 25 midwifery schools in 2013, and post-test data were gathered from 486 graduating students in 13 schools in 2016. Improvement in competence was assessed using a 10-station objective structured clinical examination (OSCE), while improvements in the learning environment and experience were evaluated through structured interview with students.

Results: Overall, the perception of students about educational inputs, processes and outputs significantly increased from 2013. Availability of teachers improved markedly, from 43% to 70.6% for classroom instructors and from 28.9% to 55.3% for skills lab assistants. The proportion of students who said skills lab assistants facilitated

learning effectively jumped from 44.6% to 76.1%. Quality of classroom instruction also rose from 56.2% to 67.7%. Similarly, competence score in the objective structured clinical examination increased by 4.8% over three years (pre-test= 51.8 %, pot-test = 56.6%, p < 0.001). However, the number of deliveries attended by students did not improve. The gender gap in performance observed at pre-test (55.6% vs. 49.8%, p < 0.001) also persisted at post-test (60.4% vs. 54.9%, p < 0.001).

Conclusion: The results suggest that the capacity building interventions have resulted in improving quality of education but also highlight additional efforts are needed to achieve the desired impact.

Take-home message: Our paper presents evaluation evidence on effectiveness and challenges of interventions to improving quality of education amidst push for increasing numbers.

7I5 (3461)
Are we doing it right? Evaluating the Behavioural Science programme at a new medical college in Qatar - two years in

Authors
Tanya Kane, College of Medicine, Qatar University, Doha, Qatar
Ayad Al-Moslih, College of Medicine, Qatar University, Doha, Qatar
Alison Carr, College of Medicine, Qatar University, Doha, Qatar

Presenter: Tanya Kane, College of Medicine, Doha, Qatar

Background: In addition to the indigenous population, medical students in Qatar will treat a diverse patient population of expatriates. Balancing societal norms and expectations alongside the knowledge and training that inhabit the highly circumscribed arena of medical practice is challenging for faculty and students alike. We have recognized the need to broaden social and behavioural science (SBS) content and materials to ensure it adequately addresses the cultural and religious specificities of the Arabian Gulf setting.

Method: As part of an integrated curriculum, SBS concepts are embedded in our weekly PBL cases and subsequently revisited in experiential review sessions of primary care clinical placements. Our SBS curriculum focuses first on exploring students' understandings of health and illness within the context of their own culture. This harnesses students' knowledge and experiences that can then be used as a useful platform to explore the psychosocial dimensions of medicine across different cultures. In order to assess our approach, we have conducted a qualitative survey of our first two cohorts to assess student perceptions of SBS content and curricular value.

Results: Most students surveyed regard SBS as an important part of the medical curriculum and acknowledge its capacity to improve health care delivery and cultivate professional ethics. SBS encourages students to question local conceptions of health and illness and in most cases, gradually develop a more culturally-relativist and holistic approach to the practice of medicine. Although feedback indicates that a small number of students initially perceive some SBS content to be at odds with their cultural mores and values, students credit exposure to SBS with broadening their perspectives.

Conclusion: Our students undertake a comprehensive professional undergraduate medical programme in a predominantly conservative Arab-Islamic environment. Although a minority express discomfort with certain topics, over time, concepts covered in SBS are regarded by students as essential preparation for the culturally diverse medical landscape in which they will work.

Take-home message: Start local and go global. Foregrounding Islamic and cultural underpinnings of medicine when teaching in Arab countries is an effective means of introducing SBS in a culturally-sensitive way and a useful launchpad for discussion.

7J: Short Communications: Assessment: Feedback

How closely does educator behaviour during feedback in contemporary clinical practice align with published recommendations: an observational study of 36 authentic formal feedback episodes across the health professions

Authors
Christina E Johnson, University of Melbourne and Monash Health, Melbourne, Australia
Jennifer L Keating, Monash University, Melbourne, Australia
Elizabeth K Molloy, University of Melbourne, Melbourne, Australia

Presenter: Christina Johnson, University of Melbourne and Monash Health, Melbourne, Australia

Background: Formal face-to-face feedback between educators and learners forms an integral part of workplace learning in the health professions. The literature describes features of high quality feedback thought to enhance learner outcomes. Little is known about how closely feedback in contemporary clinical practice aligns with these recommendations.
Method: Health professional educators (senior clinicians) and learners (students, junior clinicians or peers) videorecorded themselves undertaking a formal feedback conversation regarding the learner's performance in routine clinical practice.
The researchers independently reviewed these videos and rated educator behaviour against a modified version of the published Feedback Quality Instrument (FQI) (1 of the 25 educator behaviours was removed as it was not observable). Each item was rated 0=not seen, 1=done somewhat or done only sometimes, 2=done. Total scores could range from 0 – 42. Medians (IQR) were calculated for individual items and total score.
Results: Thirty-six videos involving 67 health professionals were analysed: 34 educators (47% men; 26 doctors, 4 nurses, 4 allied health) and 35 learners (34% men, same disciplines). Two participants were in both categories.
Five researchers independently rated educator behaviour observed in the recorded feedback episodes. A set of 3 FQI items targeting corrective comments were excluded from analysis as they were not universally applicable. FQI total score median (interquartile range IQR) were 21.4/42 (15.9-21.4).
Highest item scores (median >1.5) were for items describing educators asking learners what they wanted to focus on, linking their own comments to specific observed learner actions, explaining their reasoning and clarifying target performance.
Lowest items scores (median <0.5) were for items describing educators creating a safe learning environment (explicitly explaining purpose, process and non-judgemental approach at the start), promoting the value of learner self-assessment, checking learner understanding

of the action plan and discussing opportunities to review performance.
Analysis of 36 authentic feedback episodes revealed variable educator skill in quality feedback.
Conclusion: This observational study highlights the opportunities to assist educators to enhance their feedback skills, focusing on creating conditions for psychological safety, fostering learner involvement and understanding, and seeking opportunities for continuing learners' skill development.

7J2 (898)
Broadening the Scope of Feedback to Promote Its Relevance to Workplace Learning

Authors
Renée van der Leeuw, Gerion, Amsterdam, Netherlands
Pim Teunissen, Maastricht University, Maastricht, Netherlands and VU University Medical Center, Amsterdam, Netherlands
Cees van der Vleuten, Maastricht University, Maastricht, Netherlands

Presenter: Renée van der Leeuw, Gerion, Amsterdam, Netherlands

Background: A large and essential part of medical training is situated in the clinical workplace. In this workplace setting, feedback is frequently used as a way to support learning. However, the current use of feedback in medical education has limitations. First, the instrumental way feedback is defined in medical education excludes potential valuable sources of information for learning. Second, how feedback is practiced in clinical training situations, often as a unidirectional conversation or as a 'tick-box' exercise. Finally, a dominant research focus on "what works", rather than "how does it work", narrows its potential. By broadening the scope on feedback, we aim to promote its relevance to workplace learning.
Method: We explored the theoretical background of learning in interaction and current innovative trends regarding feedback in medical education. We started from the perspective of those involved in workplace learning in iteratively constructing a broader scope on feedback.
We present a new, wider perspective in which feedback could be redefined as "performance relevant information" (PRI). PRI can incorporate all information that is deemed relevant to the learner, drawn from interaction in workplace learning and one's interpretation of performance in the clinical workplace. This information can, for example, come from the evaluation of patient outcomes after treatment, observations of role models' performance, evaluations and assessments, exploring feelings of failure or success, and responses of colleagues and peers.
Conclusion: PRI draws attention to learning opportunities that better fit the highly social learning of clinical workplaces and current trends in medical education. It supports a practice of interpretation of individual or team performance in terms of relevance to their learning. This allows for a comprehensive way of viewing and stimulating workplace learning. Moreover, it acknowledges the complexity of the workplace context,

taking into account aspects that are not easily measurable or talked about (e.g., feelings, trust, lying awake at night).

Take-home message: PRI provides an opportunity to create lifelong learning strategies, by focusing on seeking out which information is relevant to you and why.

7J3 (1258)
Developing feedback literacy of learners in the workplace: a tried and tested model

Authors
Christy Noble, Gold Coast Health, Southport, Australia
Stephen Billett, Griffith University, Mt Gravatt, Australia
Christine Sly, Gold Coast Health, Southport, Australia
Leigh Collier, Gold Coast Health, Southport, Australia
Lyn Armit, Gold Coast Health, Southport, Australia
Elizabeth Molloy, University of Melbourne, Melbourne, Australia

Presenter: Christy Noble, Gold Coast Health, Southport, Australia

Background: Healthcare students have reported dissatisfaction with feedback in the workplace setting. Most educators and students see feedback as educator comments on students' performance. With the prevailing view of feedback, it is not surprising that students' active role in feedback tends to be overlooked in developing work-ready learners. Heightening learners' skills in feedback, as seekers, processers and users of performance information may support clinical placement experiences, and transitions to practice.

Method: This study researched a feedback literacy program, developed to augment students' engagement in feedback within their clinical placements at a major hospital. The dialogic feedback model, Feedback Mark 2 (Boud & Molloy, 2013), formed the basis of a multifaceted intervention to support students' engagement in feedback processes. An interprofessional student group (n=105) were involved in the program which included an e-learning module, a face-to-face workshop and reflective journal opportunities. Our research approach included surveys and interviews after students' clinical placements. Thematic analysis of survey and interview data revealed that the literacy program improved students' engagement in feedback processes in the workplace. Students were more likely to approach educators for feedback after tasks, and more likely to ask for feedback on specific aspects of their performance. They reported that prior to the feedback literacy program, they did not see these seeking behaviours as part of their role.

Results: The study findings suggest that a structured and targeted program to support student engagement in feedback processes may be an important part in the transition from classroom to workplace learning. This interprofessional feedback literacy program could be applied in other settings to improve learner engagement in feedback and could also be made available for clinical staff as co-participants.

Conclusion: Developing learners' feedback literacy, an emerging research priority in higher education, has limited attention in health professions education research. Our findings suggest that a targeted program, with follow up

on learner engagement, improve students' active participation in feedback processes. Further research, especially observational studies, is needed to capture how these changes manifest in practice.

7J4 (956)
Mastering feedback for learning

Authors
Jill Benson, ModMed, Adelaide, Australia

Presenter: Jill Benson, ModMed, Adelaide, Australia

Background: Formative assessment and feedback have been found to have a powerful influence on trainee performance. Feedback promotes learning by informing trainees of their progress or lack thereof; advising them about observed learning needs and resources available to facilitate their learning and motivating them to engage in appropriate learning activities. As much as possible feedback should be planned, enlightening, honest, and respectful, focussing on description rather than evaluation and behaviour rather than personality. Feedback is an essential component of any programmatic assessment training programme.

Method/Results: The literature was searched for tools utilised in feedback, desired outcomes and the roles which supervisors play. Despite evidence showing the importance of giving good feedback, many supervisors find it very difficult. To give feedback effectively, a supervisor needs to be aware of their own emotions, the appropriate role to play, tools to use, attitudes they would like to portray, and the desired outcome.

Although there are many different ways to give feedback, there isn't one 'right' way which will fit all scenarios. In the same way a doctor will change their approach during a consult depending on what a patient says, supervisors need to have a repertoire of skills for different situations and to tailor these as needed.

A series of videos was recorded, demonstrating expert supervisors giving feedback to acting trainees. Based on the literature and incorporating these videos, an interactive mastering feedback course was developed for supervisors and medical educators. A sample of this course will be presented.

Conclusion: Becoming an 'expert' in giving feedback will allow supervisors to deliberately use a suite of feedback skills in the variety of contexts in which they will be supervising. As with any new skill, the theory needs to be practised so the supervisor can give feedback efficiently and effectively and the trainee become a safe practitioner and life-long learner.

Take-home message: Supervisors can learn to give effective feedback and use their teaching time efficiently in order to facilitate optimum trainee education.

Effectiveness of chart audits with formative feedback to improve the quality of clinical records by ophthalmology residents

Authors
Ana Palis, Hospital Italiano de Buenos Aires, Buenos Aires, Argentina
Carlos Giusio, Hospital Italiano de Buenos Aires, Buenos Aires, Argentina
Tomas Ortiz-Basso, Hospital Italiano de Buenos Aires, Buenos Aires, Argentina
Eduardo Mayorga, Hospital Italiano de Buenos Aires, Buenos Aires, Argentina

Presenter: Ana Palis, Hospital Italiano de Buenos Aires, Argentina

Background: Auditing of medical records has been proposed for teaching and assessing several aspects of professional competence. Obtaining and registering a complete and adequate medical history is a skill that should be taught and can be learned and, therefore, must be evaluated. Providing feedback to residents about how they register medical records should further improve the quality of these records. We implemented and educational strategy consisting of didactic lectures and individualised feedback to residents of an Ophthalmology program; the purpose of this study was to evaluate the effectiveness of clinical record audit with individualised feedback to facilitate learning and improve the quality of medical records.

Method: Quasi-experimental study with historical control group. Participants: 9 ophthalmology residents compared to a historical control group of 9 residents. Thirteen clinical record quality standards were assessed in two groups of nine residents. One group attended a didactic lecture, received chart audit and individualised formative feedback (intervention group); the other group was not exposed to the educational strategy (control group). A total of 180 charts were assessed. Main Outcome Measure: Change in clinical record quality in charts created by residents after educational intervention.

Results: The control group obtained a total average score of 0.79 (95% Confidence Interval (CI) 0.73-0.85) per resident compared to the intervention group, (average = 0.93 (95%CI 0.89-0.97) (p<0.01). A statistically significant difference favoring the group receiving the intervention was found for the following recorded standards: chief complaint, ophthalmological history, uncorrected visual acuity, best corrected visual acuity, and informed consent.

Conclusion: Chart audits have been proposed for teaching and assessing Patient Care and Practice-based Learning and Improvement, and for quality improvement. We believe that the most crucial aspect of the educational intervention was the individualised feedback provided to residents. This is to our knowledge the first study measuring the effect of chart audits with formative feedback in Ophthalmology residents.

Take-home message: Chart audits have been proposed for teaching and assessing Patient Care and Practice-based Learning and Improvement. This study demonstrates that chart audit with formative feedback improved clinical recording by residents.

Listening for Success? Using audio to supplement written feedback in a taught masters programme

Authors
Leah Marks
Maria Jackson
Gerhard May
Saeeda Bhatti

Presenter: Leah Marks, University of Glasgow, UK

Background: Traditionally, feedback in taught MSc programmes has often been in written form, with this being relatively straightforward to both compile and transmit. However, our own experience demonstrated that there were a number of students for whom written feedback was not efficacious and opportunities for improvement in performance were being lost. Several previous studies have suggested that there may be merit in providing the opportunity for students to receive feedback in a variety of mediums, and that some may respond more positively to audio feedback. Most previous work has focused on the undergraduate setting, therefore we investigated the efficacy of audio feedback in a post graduate context.

Method: We provided audio feedback using Camtasia, on a range of written feedback for the MSc Genetic and Genomics/Genetic and Genomic Counselling at the University of Glasgow. Students received between 4-8 minutes of personalised feedback on their work, with a tutor talking through an on-screen word file of their written work, which contained highlighted text pertinent to the points raised. Files were transmitted to students using a combination of Dropbox and our university VLE. We used questionnaires and focus groups to investigate student experience of this feedback, and their receptivity to the feedback comments made.

Results: Students reported receiving audio feedback as an extremely positive experience. Aspects such as tone of voice, the ability to explain points more fully and reduction of the 'overwhelming' impact of receiving 'negative' feedback were cited as important by students . Audio feedback was perceived as more personal than written and helped establish a student/marker relationship conducive to further discussion. Tutors also found the process of providing audio feedback straightforward and in some cases felt that it provided greater clarity in explaining difficult concepts. Thus our experience, in conjunction with previous studies, suggests in It may be worth considering audio feedback in a post graduate context.

Conclusion: Audio feedback was logistically straightforward to deliver and may be useful in a variety of postgraduate settings. In particular, it may help establish a more positive student/tutor relationship, promoting further productive discussion.

Roy Ngerng Yi Ling, Chang-Gung Medical Education Research Center (CGMERC), Taoyuan, Taiwan

Presenter: Chung-Hsien Chaou, Chang-Gung Medical Education Research Center (CGMERC), Taoyuan, Taiwan

Background: Feedback is an essential part of clinical teaching and learning, but often perceived as unsatisfactory in busy clinical settings. This study aims to investigate the influence of the clinical environment and the mutual relationship between feedback giving and seeking within emergency departments (EDs)

Method: A multicenter online questionnaire study. Respondents comprised ED residents and clinical teachers from four Taiwanese teaching hospitals, different in geographical location and accreditation levels. The questionnaire was developed via an expert panel, and a pilot study ensured validity. Ninety clinical teachers (75.6% response rate) and 54 residents (87.1% response rate) participated.

Results: The majority of feedback is initiated by attending physicians, about 1-5 times per shift, and usually lasting 1-5 minutes. Feedback satisfaction was significantly lower for attending physicians than for residents (clinical teachers M=13.8 [SD=1.83], residents M=15.3 [SD=2.14], p<0.0001). The most common situation for feedback giving is "When the residents' decision can cause harm to patients" (91.1%). Positive feedback is less frequently provided in clinical settings (31.1%). Both groups of participants admitted hesitating between providing / seeking feedback and completing clinical work. Being busy and the relationship between both sides were reported as the most influential factors of clinical feedback.

Discussion: Feedback provision in a busy clinical setting is often circumstantial and unpredictable, short, and to the point. The clinical teachers, who hold the legal responsibility for the patients, are more stressed under the pressure of their clinical workload. For the learners, seeking feedback is an important part of clinical learning in the context of uncertainty. Cultivating an educational alliance between faculty and learners and the building of close relationships based on good intentions are equally important as the facets of faculty development and efforts to improve coaching and mentoring techniques.

Conclusion: ED clinical feedback provision is often short, circumstantial and initiated by attending physicians. Seeking feedback is an important part of clinical learning in the context of uncertainty. Being busy and the relationship between both sides were important influential factors of clinical feedback.

Take-home message: ED clinical teachers strike balance between saving lives and providing feedback.

Changes in perceived supervision quality after introduction of competency-based orthopedic residency training: a national 6-year follow-up study

Authors
Stefan N. van Vendeloo
Paul L.P. Brand
Boudewijn J. Kollen
Kees C.P.M. Verheyen

Presenter: Paul Brand, Isala Hospital, Zwolle, Netherlands

Background: Over the past decade orthopedic training programs in many countries have become competency-based. The potential benefits of these programs need to be balanced against the costs involved and the considerable efforts and time required from faculty and residents. We aimed to evaluate the perceived quality of the learning environment, before and after introduction of competency-based postgraduate orthopedic education (CBPGOE).
Method: From 2009 to 2014, we conducted annual surveys among all Dutch orthopedic residents during annual compulsory courses. The validated Dutch Residency Educational Climate Test (D-RECT, 50 items on 11 subscales) was used to assess the quality of the components of CBPGOE. Scores range from 1 (poor) to 5 (excellent).
Results: Over the 6-year period, 641 responses were obtained (response rate 92%). Scores for 'supervision' (95% CI for difference 0.06 to 0.28, p = 0.002) and 'coaching and assessment' (95% CI 0.11 to 0.35, p < 0.001) improved significantly after introduction of competency-based training. There was no significant change in score on the other subscales of the D-RECT.
Conclusion: Our study provides useful insight in the way orthopedic residents perceive and appreciate the introduction of some of the core components of CBPGOE, including improved perceived "supervision" and "coaching and assessment". Given the importance of supportive supervision and assessment for acquiring clinical competency, this is a reassuring finding.
Take-home message: After the introduction of some of the core components of CBPGOE the perceived quality of 'supervision' and 'coaching and assessment' improved significantly.

Conceptualization of Competency-Based Medical Education, Competency, and Competence within the CPD/CME and Residency Family Medicine Educational Literature: Preliminary Findings

Authors
Heather Lochnan
Simon Kitto
Gary Viner
Allyn Walsh
Ivy Oandasan
Paul Hendry

Presenter: Heather Lochnan, University of Ottawa, Canada

Background: The implementation of a competency-based medical education (CBME) across the continuum (undergraduate, postgraduate to continuing education), has been proposed as the ideal approach to improve quality and patient safety by contributing to the enhancement of physicians' knowledge, skills, attitudes, and behaviors. To promote this new educational framework and accelerate its uptake across CPD, it is important to focus on standardizing its language/vocabulary. Competence, competency and CBME are frequently used in the medical educational literature and lack consistent definitions within both CPD and family medicine (FM). This scoping review is the response to the increasing importance of FM to the effective care of populations and the concomitant movement of its training towards the competency-based framework in Canada and the USA.
Method: The primary objective of this scoping review was to examine the range and extent of how CBME is conceptualized within the CPD FM North American educational literature. Using Arksey and O'Malley six-step framework and following five inclusion criteria 80 articles were included in the dataset for analysis.
Results: Over 66% of all included studies were originated from Canada with the largest percent of studies (46%) categorized as original research articles, 33% as commentary/reflective papers, 14% as regulatory, and the remaining studies (6%) as review articles or editorial opinion. As expected, only 5 articles (6%) provided a referenced definition of CBME in FM residency and CPD/CME educational literature. No variations were found in the definitions of CBME.
Discussion and Conclusions: The finding that more than 75% of the studies were published after 2010 suggests that competency-based education research in FM has been getting more attention in the recent years. The low number of scholarly definitions contained within the literature suggests more attention needs to be paid to conceptual rigor to advance the field. This review is the first to examine how CBME was conceptualized within the American and Canadian FM medical literature.
Take-home message: The construction and dissemination of a shared definition of CBME is essential to its successful implementation. This review has identified a pressing need to clearly conceptualize CBME in the FM CPD context.

Using Reflection to be an Effective Communicator

Authors
Umberin Najeeb, University of Toronto, Canada
Ayelet Kuper, University of Toronto, Canada
Malika Sharma, University of Toronto, Canada

Presenter: Umberin Najeeb, University of Toronto, Canada

Background: The CanMEDS Physician Competency Framework is an educational framework identifying and describing seven roles for physicians: Medical Expert, Communicator, Collaborator, Leader, Health Advocate, Scholar, and Professional. The overarching goal of CanMEDS is to improve patient care; a competent physician seamlessly integrates the competencies of all seven CanMEDS Roles. Although CanMEDS has been around for more than a decade, there continues to be a need to augment the teaching and assessment of the Non-Medical Expert Roles during residency.

Method: As part of a larger program of research addressing the academic content underpinning the Non-Medical Expert Roles, we implemented an interactive session for eighteen fourth-year Internal Medicine residents to teach basic social science knowledge that supports the Communicator Role, particularly with respect to communicating across cultural and socio-economic divides. We then explored residents' perceptions about the Communicator Role in light of this new knowledge. Six weeks after the teaching session we asked residents to write an essay about clinical interactions they had recently observed, including discussing how a Non-Medical Expert CanMEDS Role might influence the care of Internal Medicine patients. These essays were analyzed using qualitative description for their understanding of the Communicator Role.

Results: All eighteen residents submitted thoughtful essays based on real-life experiences in professional settings. There was consensus that the main goal of effective communication was to provide compassionate and patient-centered care. Concepts such as cultural competency, humility, respect, social justice and active listening, which had been introduced in the teaching session, were described as essential for effective communication with patients and their families. This was particularly emphasized in terms of communicating with patients from minoritized ethnic and cultural communities. Professionalism and respectfulness were also seen as helpful, particularly for interprofessional communication. Moreover, effective communication was seen necessary for excellent collaboration, advocacy, leadership, and professionalism.

Conclusion: This curricular and assessment intervention enabled residents to understand and frame complex notions of clinical communication. Although this describes one small program, this approach may serve as a model for other specialties struggling with the more effective teaching of Non-Medical Expert Roles.

What Do Competence, Communication, Collaboration and Scholarship Mean for French Undergraduate Medical Students and Their Teachers?

Authors

Juliette Macabrey, CUMG, Faculty of Medicine Lyon Est, Lyon, France

Yves Zerbib, CUMG, Faculty of Medicine Lyon Est, Lyon, France

Jérôme Goffette, Joint Service of Humanities and Social Science, University Lyon 1, Lyon, France

Jérôme Etienne, Faculty of medicine Lyon Est, Lyon, France

Presenter: Juliette Macabrey, CUMG, Faculty of Medicine Lyon Est, Lyon, France

Background: Following a 2013 decree on French medical studies, Competency-Based Medical Education (CBME) should be integrated into undergraduate studies. Although many countries have already incorporated this paradigm, France is currently reflecting upon moving towards such a change. We were therefore interested in exploring undergraduate students' and teachers' perceptions of the concepts of competence, collaboration, communication and scholarship as described in CanMEDS 2015.

Method: A qualitative study was performed based on literature research and focus groups. At Lyon Est Faculty of Medicine, volunteer students in years 2 to 6 and their professors participated in focus group interviews. One group was set up for each year of study and each competence. All interviews were written down and analyzed by theme.

Results: Thirteen interviews took place with 40 students and 15 teachers between March 24th and July 26th, 2016 in Lyon Est Faculty of Medicine. Attendees felt that "competence" seemed necessary for the proper practice of the profession and that it linked theory to practice, leading to patient and society expectations being met. "Collaboration" appeared as a complex competence as it involved team work. It was linked to "communication" through a dialogue which required time, empathy and goodwill. Finally, "scholarship" was an evolving evidence- and practice-based knowledge. The execution of all these competencies increased health care effectiveness. Definitions and expectations articulated by students and professors were similar to those of CanMEDS. Students and professors seemed to accept and agree with the concept of competence as described by experts. This allows us to consider implementing CBME in French medical studies. Additionally, in order to extend this evolving medical training to postgraduate studies, it seems essential to develop research on competence focusing on the teaching and evaluation of the competencies.

Conclusion: France is currently looking into integrating CBME in undergraduate studies. The concepts of competence, collaboration, communication and scholarship seemed consistent with expectations among students and teachers who collectively provided interesting suggestions of their own. This encourages us to pursue an analysis of the implementation of CBME in France and develop research in this area.

Social Medicine: But, should it be a course in medical curriculum?

Authors
Teresa Van Deven, Schulich School of Medicine & Dentistry, London Ontario, Canada
Anna Gunz, Schulich School of Medicine & Dentistry, London Ontario, Canada
Gary Tithecott, Schulich School of Medicine & Dentistry, London Ontario, Canada

Presenter: Teresa Van Deven, Schulich School of Medicine & Dentistry, London, Ontario, Canada

Background: "Social Medicine is asinine. We are here to become medical experts not social workers" (Anonymous, Year 1 medical student).
"This course takes up space in an already cramped curriculum, further sending the mental sanity of medical students down a dark and sad trajectory" (Anonymous, Year 1 medical student).
"Instead of looking at the elderly as old people 'losing their marbles' I was enriched with the elders' stories of travel, of conflicts, of careers and perseverance through wars, of sickness and loss… I will remember these stories when I begin my practice" (Anonymous, Year 1 Medical Student).
Method: In response to a curricular vision of improved social accountability, our Doctor of Medicine program launched a year-long integrated Social Medicine course for Year 1 medical school students in September 2016.
We designed an interactive course to bring those sometimes invisible structural determinants of health to the forefront for our medical students. Our goal was to provide an exploration of structural competency so that students could begin to develop a language around interventions which could ultimately reduce health inequality at the level of neighborhoods, institutions and policies.
Results: Student feedback on this course is polarized; some embrace the opportunities and continue to explore their chosen demographic through service learning or research projects. Others view the course as taking up valuable time within the curriculum where they could be gaining more exposure to medical expert topics.
Based upon student evaluation and feedback, we will disband Social Medicine as a course; social determinants of health will be integrated into other areas of the curriculum; we will retain the Service Learning portion of the course.
Conclusion: By eliminating this as a course, we grapple with the worry that we could be losing the opportunities to provide a forum for our students to develop an understanding of the importance of engaging in their patients' social world. Will we also lose the opportunity to help shape early values of advocacy, empathy, communication and social accountability in our future care givers?

7L2 (2210)
Filling the Gap – Implementation of Global Health Studies within the Education of Future Health Professionals

Authors
Judith Mletzko, University of Witten/Herdecke, Witten, Germany
Nicolas Aschoff, University of Witten/Herdecke, Witten, Germany
Diethard Tauschel, University of Witten/Herdecke, Witten, Germany
Niklas Peitz, University of Witten/Herdecke, Witten, Germany
Till Eckert, University of Witten/Herdecke, Witten, Germany
Friedrich Edelhäuser, University of Witten/Herdecke, Witten, Germany

Presenter: Judith Mletzko, University of Witten/Herdecke, Witten, Germany

Background: A recent analysis displayed a lack of teaching possibilities within health studies concerning Global Health (GH) (Kaffes, 2016) in German universities. In view of the complex consequences of globalization, education in GH needs to be prioritized.
Being confronted with challenges like growing health inequities, the outbreaks of epidemics and refugee health, students of medicine and psychology started the initiative "Weltgesundheit" (World Health) with the assistance of lecturers to incorporate GH-topics within their education. Mission statement and multimodal teaching concepts were developed and fundraising activities were conducted.
Method/Results: From 2016-2017, three lecture and workshop series were set up with free access for students, staff of all faculties and the public. Additionally, courses were implemented into existing curricula. Experts from universities from all over the world and professionals working for international organisations gave holistic insight into GH-challenges. N=97 students signed up, of which N=80 (82,5%) met the accreditation criteria. N=71 (11,7%) out of N=608 medical students attended the lecture series. On average, 33% of all participants were members of other faculties, allowing an inter-disciplinary approach to the various topics.
Discussion: The student initiative has established a possibility to face GH-relevant topics. The education activities need further implementation into the curricula to reach a higher number of students, as their importance for all health professionals working in both national or international settings needs to be emphasized. Research opportunities must be established to point out its relevance on a scientific level. Preparatory courses especially for students aspiring to work in low-resource settings need to be offered.
Conclusion: The multi-professional student initiative "Weltgesundheit" developed and implemented teaching and learning activities. These met the growing interest of students towards GH-related themes. Thus, a start and

contribution to build core competencies concerning the growing challenges of GH was made. Universities should consider GH as a high priority issue in education and therefore build the necessary institutional structures and actively involve students.

Take-home message: Global Health-related subjects should systematically be integrated into the education of health-care professionals to meet the increasing needs of a globalized world. Student engagement can help fulfil this task.

Implementing a Quality Improvement Module as core curriculum for Year 4 medical students: reviewing the first year of implementation

Authors
Cindy Sethi, Guy's King's and St Thomas' School of Medical Education, London, UK
Joe Esland, Guy's King's and St Thomas' School of Medical Education, London, UK
Martha Martin, Guy's King's and St Thomas' School of Medical Education, London, UK
Louise Dubras, Guy's King's and St Thomas' School of Medical Education, London, UK
Ann Wylie, Guy's King's and St Thomas' School of Medical Education, London, UK
Anne McKee, Guy's King's and St Thomas' School of Medical Education, London, UK

Presenter: Ann Wylie, Guy's King's and St Thomas' School of Medical Education, London, UK

Background: In September 2016, King's College London (KCL) introduced a new undergraduate medical curriculum. This included a 'Quality Improvement and Evidence Based Practice Module (30 credits: L6) within the 'Population Science and Quality Improvement (PSQI) theme.

Method: A key aim of the module is to support students to understand QI methodology and develop relevant skills. During year 4, students identify and undertake a Quality Improvement project in small groups within a healthcare setting. The approach taken is based upon the Institute for Health Improvement Quality Improvement Practicum. This has been adapted by KCL faculty for use within the NHS (UK) at undergraduate level. Teaching included online and face-to face provision.

Results: From September 2016 to March 2017, 420 medical students undertook a QI project, working in groups of 2-5. All groups were able to identify a clinical problem, collect baseline data and design at least one PDSA (Plan, Do, Study, Act) cycle. A random sample of 20 projects were analysed
14/20 projects demonstrated intended improvements
2/20 projects completed 2 PDSA cycles and achieved intended targets
1 student group was shortlisted for national Patient Safety awards, one publication and 3 other projects received university funding for national conference presentation. Electronic module evaluation was undertaken (response rate 50%); using a 5-point Likert Scale (1 ranking as "poor").

Routine module evaluation and an educational research study identified a 'patchy' implementation which included early successes and key challenges. Module feedback was positive (allocation and organization 3.5/50. Domains that scored highly were: the opportunity to work with peers (3.9), supervisors (4.1) and clinical teams (3.5). Supervisors and students both reported that more tutorial/supervisory time was needed. The appropriateness of some placements was questioned. Students questioned whether supervisors were sufficiently aware of module requirements.

Conclusion: Despite challenges many QI projects resulted in some improved outcomes for patients. Implementing curricular change on this scale and at this pace would have benefited from more piloting. Lessons learned will inform how to better support the embedding of QI methodology, particularly with faculty.

The Importance of the Approach of Palliative Care in Medical School and its Impact on Academic Practice

Authors
Carolina Rodrigues Laranjeira Vilar, Little Prince University, Curitiba, Brazil
Anna Carolina Neiverth, Little Prince University, Curitiba, Brazil
Priscilla Dal Pra, Little Prince University, Curitiba, Brazil
Izabel Cristina Meister Martins Coelho, Little Prince University, Curitiba, Brazil

Presenter: Carolina Rodrigues Laranjeira Vilar, Little Prince University, Curitiba, Brazil

Background: Palliative care is the assistance promoted by a multidisciplinary team to relieve patients from suffering and improve quality of life for them and their relatives, in face of a worsening health condition which could interrupt life. This practice began in Brazil during the 1990s in a few organized services, but it became accessible to the general population only in the last decade through the SUS, Brazilian's governmental health system. This theme is recommended by the 2014 National Curriculum Guidelines for all medical courses of Brazil.

Method: During the course "Medical Communications Skills" second year undergraduate students are introduced on palliative care through pre-study, pre-test, case studies, and a realistic simulation using the Spikes protocol (communication of difficult news). This prepared students with experience to better deal with critical events and reduce anxiety, thus improving overall health care assistance for society.
Self-reflection allowed students to understand the importance of the applicability of palliative care, demystifying its association with terminal illnesses in order to guarantee a humanized, ethical care, centered on patients needs and their families.

Results: Palliative care introduction through principles, dimensions (physical, psychological, social and spiritual) and conducts, allowed undergraduates to overcome difficulties found in practice and work with the patients' emotions. Thus, it was possible to demystify palliative care's association with terminal illnesses since it is possible

to apply it to chronic illnesses. In this context, the students understood the importance of its application due to the transition of the epidemiological profile and diseases of the Brazilian population.

Conclusion: The importance of palliative care is recommended to be taught early and by different teaching-learning methodologies in order to provide theoretical and practical support during the undergraduate's academic period. It enables a humanized clinical practice in the future and guarantees the individuality on patient care during the process of becoming ill.

7L5 (2436)
Canadian and US veterinary students' perceptions of companion-animal nutrition information and veterinary nutrition education: a mixed-methods study

Authors
May Kamleh, University of Guelph, Guelph, Canada
Deep Khosa, University of Guelph, Guelph, Canada
Adronie Verbrugghe, University of Guelph, Guelph, Canada
Cate Dewey, University of Guelph, Guelph, Canada
Elizabeth Stone, University of Guelph, Guelph, Canada

Presenter: May Kamleh, University of Guelph, Canada

Background: Knowledge of nutrition is vital for veterinarians to inform owners about care of pets and management of disease. The aim of this study was to elicit student veterinarians' nutrition-related perceptions and information-seeking behaviours at the time of entering veterinary school and identify more effective ways to deliver nutrition education.

Method: Participants were newly enrolled veterinary students at all Canadian and five randomly selected US veterinary schools (n=352). An online questionnaire tool was designed based on insight gained from focus group discussions (n=19), collecting detailed information on students' attitudes about their own and their pet's nutrition, and importance of veterinary nutrition education.

Results: Perceived veterinary nutrition knowledge was correlated with how "healthy" students viewed themselves (p=0.02). The method of nutrition instruction and perceived barriers to incorporating nutrition education correlated with student confidence (p < 0.0001), but varied among schools. Overall, students thought their curriculum would provide more training in medicine and surgery than nutrition (p= 0.0002). Learning obstacles included seeking credible sources of information and lack of consistency in nutrition training. Students anticipated greater confidence in their ability to counsel patients regarding basic nutrition concepts than in discussing the role of nutrition in disease treatment.

Discussion: This study has elucidated that students' perceptions of companion-animal nutrition were associated with those of their own nutrition and influenced their attitudes regarding nutrition education. The size, location and availability of a veterinary nutritionist amongst faculty were all factors that persuaded students' confidence in the nutrition curricula. Given the readily accessible online nutrition information,

our data supports that students entering veterinary school have their own perceptions on pet nutrition that may impact nutrition education, and suggests this as an important consideration in the design and delivery of a veterinary nutrition curriculum to improve communication challenges with owners.

Conclusion: Education aimed at improving nutrition competencies is vital for veterinary practitioners. Examining nutrition-related perceptions of students entering veterinary school are important aspects to consider in the design and delivery of a veterinary nutrition curriculum, and maybe equally important for students entering other professional health programs such as human medicine.

7L6 (3683)
Developing a toolkit on inclusion of public health in the medical curriculum for medical students

Authors
Nishwa Azeem, IFMSA (International Federation of Medical Students Association), Lahore, Pakistan
Pablo Daniel Estrella Porter, IFMSA (International Federation of Medical Students Association), Quito, Ecuador
Wan ting Chen, IFMSA, Taipei, Taiwan
Ilia Nadareishvili, IFMSA, Tiflis, Georgia
Rosie James, IFMSA, Galway, Ireland
Sanne de Wit, IFMSA, Amsterdam, The Netherlands

Presenter: Izza Bazigh, IFMSA

Background: Public Health is a crucial component of healthcare professionals' knowledge. On the contrary in many programs and medical curricula public health, health systems and associated subjects are not given enough importance and due attention to cover all the needs of medical students or the future challenges as health professionals. In other cases the methodologies of teaching Public Health are strongly lacking in helping to develop students' interest and application skills. At the International Federation of Medical Students' Associations (IFMSA), students have observed the lack in the depth of knowledge of public health and want to voice their informed opinions to advocate for its apt inclusion in the medical curriculum.

Summary of work: IFMSA is developing a toolkit for medical students and teaching institutes to understand the magnanimity of the issue, assess and grade their curriculum's inclusion of public health, provide and voice their informed needs and input (from more than 500 medical students worldwide). It would educate medical students about the content as well as preferred methodologies for teaching public health and equip them with advocacy skills to enable them to advocate for its inclusion in their respective medical curriculum.

Summary of results: The topic has been added to the three year strategic plan of Standing Committee on Public Health 2018-2022. To ensure the timely development, effective spread and sufficient implementation of the toolkit. It will be released by August 2018.

Discussion & Conclusions The toolkit on public health in medical curriculum is being developed on different

medical student sessions at Regional Meetings and General Assemblies of the Federation. The impact of the toolkit will be evaluated by IFMSA, through a small working group on implementation of the toolkit.

Take-home Messages: Public health including global health is essential for all medical students as future healthcare providers. To take the initiative for its inclusion we need to educate medical students about its importance and represent informed views. Thus IFMSA is, through this toolkit, providing medical students with all the step by step skills to understand, advocate and implement the inclusion of public health in medical curriculum globally.

An argument-based approach to validity concerning the assessment of physicians' professional performance: A systematic review of questionnaire-based assessment tools

Authors

Mirja van der Meulen, Maastricht University, Maastricht, Netherlands
Alina Smirnova, Maastricht University, Maastricht, Netherlands
Mirjam oude Egbrink, Maastricht University, Maastricht, Netherlands
Sylvia Heenemand, Maastricht University, Maastricht, Netherlands
Cees van der Vleuten, Maastricht University, Maastricht, Netherlands
Kiki Lombarts, AMC, Amsterdam, Netherlands

Presenter: Mirja van der Meulen, Maastricht University, Maastricht, Netherlands

Background: Evaluating physicians' professional performance in clinical and teaching practice is highly valued to ensure quality patient care and competent professionals. However, without trustworthy assessment data resulting feedback and/or decisions about physicians' performance will be flawed. Although studies exist that reviewed validity evidence of peer questionnaire-based assessment tools, these studies did not delve into the prioritization of evidence for the different uses of assessment. This is crucial as summative assessments require different support than formative assessments. Examining assessment tools using this argument-based validity approach is vital to support physicians' ongoing pursuit of professional development.
Method: We conducted a systematic search for references to peer questionnaire-based assessment tools published from inception to October 2016 from PubMed, ERIC, PsycINFO and Web of Sciences. Included studies report on validity evidence of tools used for physicians' clinical and teaching performance. Using Kane's framework data extraction was done based on four types of inferences in the validity argument; scoring, generalization, extrapolation and implications2.
Results: 46 articles about clinical performance and 87 articles about teaching performance tools provided different types of validity evidence. Studies mostly gathered generalization and extrapolation evidence, thus evidence on how well an observed score generalizes to the true score and whether the observations made are linked to the real-world activity of interest. Scoring (which requires information about how the data were collected, recorded and scored) and implications evidence (what

consequences or impact the assessment has on the physician, other stakeholders and society) were generally lacking.
Conclusion: According to the argument-based approach not all tools seem to be supportive for their intended use. Tools used for formative purposes provided sufficient evidence, yet for summative purposes gaps remain. Furthermore, evidence concerning implications of the assessment tools is lacking both for formative and summative purposes.
Take-home message: More research is required to provide support for decisions based on these tools, in particular for higher-stakes decisions.

7M2 (3134)
Office emergencies: a novel simulation-based CPD activity

Authors

Richard Waldolf, Montfort Hospital, Ottawa, Canada
Estelle Éthier, Montfort Hospital, Ottawa, Canada
Nicole Parent, Association des Médecins Francophones du Canada, Montréal, Canada
Céline Monette, Association des Médecins Francophones du Canada, Montréal, Canada
Alain Michon, Montfort Hospital, Ottawa, Canada

Presenter: Richard Waldolf, Montfort Hospital, Ottawa, Canada

Background: Transfer of new knowledge into practice is rarely measured or even observed. Furthermore, most learning objectives of accredited CPD activities offered by medical associations are not designed to promote clinical practice behaviour change. Rather, CPD activities typically assess participants' satisfaction and occasionally a change in knowledge, skills or attitudes. Small group CPD have shown greater potential for behaviour change.
Method: The Knowledge Institute at the Montfort Hospital, in collaboration with l'Association des Médecins Francophones du Canada, has developed a four-hour CPD simulation workshop on the management of office emergencies for practicing physicians. This paper presents the educational framework behind this workshop, the evaluation tool and some preliminary results.
This workshop is based on the competency-based learning approach and on simulation best practice guidelines, with pre-post evaluations and a six-month post questionnaire. Before the workshop, participants reflect on their practice and review pertinent pre-course materials. During the workshop, they are placed in small groups and are given the opportunity be the leader of a simulated crisis. A debriefing session then takes place; allowing participants to reflect on their performance as well as identify areas for improvement. Finally, participants complete a self-assessment based on the feedback provided by the instructor and the other participants. They are also given the opportunity to complete an individualized professional development plan.
Results: This workshop allowed participants to become aware of their lack of comfort or competence dealing with critical events in the office setting. Preliminary analysis has showed that the workshop increased participants' awareness of available equipment in their own institutions

and increased their interest in instituting tangible changes in practice.

Discussion & Conclusions: This type of learning activity seems to have decreased participants' anxiety with simulation as a teaching modality. Participants felt that the workshop triggered an interest in instituting tangible changes in their own clinical settings. These are the changes we hope to assess in the coming months.

Take-home message: : This type of experiential learning activity should be more accessible to practicing physicians as it was noted to be both engaging and enriching for participants as compared to traditional CPD activities.

Coping through learning from medical errors: Experiences of adverse events in CPD

Authors
Asta Toivonen, University of Helsinki, Department of Public Health, Helsinki, Finland
Maarit Nevalainen, University of Helsinki, Department of General Practice and Primary Health Care, Helsinki, Finland
Eeva Pyörälä, University of Helsinki, Centre for University Teaching and Learning, Helsinki, Finland

Presenter: Asta Toivonen, University of Helsinki, Department of Public Health, Helsinki, Finland

Background: Medical errors occur in healthcare, despite the active prevention through patient safety efforts. The nature of adverse events varies, but they are intense experiences to all involved and critical for learning. Processing these events should be done constructively with colleagues and the healthcare teams involved. The aim of this study was to explore the participants' experiences of and ways of coping with adverse events in a medical error workshop at a continuing professional development (CPD) event.

Method: During the years of 2015-2018, we conducted four workshops on learning from error at the main CPD event in Finland, the Finnish Medical Convention, with over 6 000 participants. In 2018, 49 out of 61 (80%) participants answered a questionnaire concerning their experiences of the errors and ideas of learning from them. The data were analyzed using content analysis.

Results: Two thirds (65%) of participants were female and 33% had specialist training. 43% of our respondents were undergraduate medical students, 31% had less than ten years and 27% more than ten years of working experience. Nearly all reported personal experiences of adverse events, mostly concerning medication issues, cognitive errors and communication relapses. The best way to cope with and learn from events was through reviewing, reflecting the event with colleagues and the work community in a constructive manner.

There was clearly a need for training on learning from adverse events issues according to the active participation in the workshops in CPD. Individuals and working-life communities learned from medical errors through the discussion and open disclosure of the events. Open, psychologically safe environment and collegial support were prerequisites for the learning and recovering.

Processing these events should be done constructively with colleagues and the healthcare teams involved.

Conclusion: Medical errors happen and while trying the best to foster patient safety in health care, it is crucial to develop protocols for dealing with adverse events. Learning from errors should form part of doctors' training throughout their careers, from basic degree to specialist training and continuing professional development (CPD).

Regularly Scheduled Series as Authentic Learning Spaces for Effective Interprofessional CPD

Authors
Mila Kostic

Presenter: Mila Kostic, University of Pennsylvania, Philadelphia, USA

Background: IPE for practicing clinicians has been recognized broadly by national and international healthcare and accrediting organizations as an important way of educating HCPs to support team-based practice in the US and globally. While organizations such as WHO, IPEC and Joint Accreditation provide guidance about relevant competency domains, employing effective learning and teaching IPE strategies in AMCs and hospitals where traditional systems and hierarchical structures still dominate, continues to represents a challenge for meaningful delivery of IP Continuing Education (IPCE). IPE at Penn Medicine has been strengthened by achieving Joint Accreditation for IPCE and the application of processes and structures put in place as part of this effort.

Method: One of the areas for development identified was a large block of regularly scheduled series (RSS) such as departmental Grand Rounds, Tumor Boards, MM and Clinical Case Conferences representing close to 5,000 annual sessions organized in 119 series. Over 2 years, we provided intensive training and resource support for developing education planned for the team and by the team.

Results: Over two and a half years our RSS program was transformed from 100% physician-planned and delivered to 64% (76 series) IPCE. The IPCE approach favored case-based formats over lecture-based ones 58% vs 42% and more frequent session schedule such as weekly vs monthly (56% vs 44%). Evaluation outcomes were assessed globally with a single instrument assessing knowledge, skill and attitude changes and satisfaction. In addition, it provided opportunity for reflection about relevance to practice changes, improvements of the team care and patient outcomes. We collected and analyzed 1,500 returned responses representing 26% of the learners.

The changes in practice as referenced through reflective statements were thematically analyzed and provided meaningful results and baseline for future development.

Conclusion: While institutional structures of RSS are ideally positioned as institutional pillars for continuous IPE opportunities, much more intentional support is needed to facilitate true IPCE pedagogical strategies such as practice situated, team-based learning (TBL) that is continuously linked to the departmental and institutional measures of

quality and safety and patient and provider experience of care.

"STEP" and "CUS" Keyword-mnemonics-based simulation training enhance "patient-centered communication" skill of nurses in respiratory intensive care units

Authors

Ying-Ying Yang
Ling-Yu Yang
Hui-Wen Yang
Ya-Lin Chen
Liao Shu Che
Shinn-Jang Hwang

Presenter: Ying-Ying Yang, Taipei Veterans General Hospital, Taipei, Taiwan

Background: For respiratory intensive care unit (RCU) patients, nurses had more opportunity than doctor to confront the anxiety of family-member by gathering information from their peers/doctors within and changing duty. This study aims to evaluate the effects of "STEP and CUS" Keyword-mnemonics-based simulation on the "patient-centered communication" skill of RCU nurses.
Method: Between 2017, October to 2017 Jan, thirty RCU nurses received "STEP and CUS" Keyword-mnemonics-based crisis resource management (CRM) simulation for the management of acute respiratory distress syndrome patients. STEP is the abbreviation of Status of the patient, Team members, Environment, Progress to the goal" whereas CUS is the abbreviation of a kind of communication skill using I am Concerned; I am Uncomfortable, this is a Safety issue". The CRM simulation (20-minutes) was undergone with one doctor, three nurses, and one respiratory therapist on Siman@3G and standardized patients. Three nurses draw lots to play the leader, monitor and communication. Before and after training, two experienced raters, one senior and one doctor, interview family-member of RCU patients to rate the "patient-centered communication" skill of each enrolled nurses (n=30). The checklist-based assessment of 10 items from critical care family needs inventory (CCFNI) was used for this workplace assessment.
Results: Before training, high CCFNI score was noted in nurses having more than 1-year of clinical-practice (n=16) than those having less than 1-year of clinical-practice (n=14). Nurses with previous CRM training (n=17) had better performance than those without previous training (n=13). RCU nurses that receiving CRM training 6-month before (n=10) had poor performance than those receiving CRM training within 6–month (n=7).
Significantly, nurses who are playing either leader monitor or communication in CRM simulation had similar degree of improvement in their "patient-centered communication" skill at the post-simulation stage assessment by family-member. Post-training questionnaire revealed that most (72%) enrolled nurses are familiar with STEP and CUS Keyword-mnemonics in 3-month follow-up stage. Most (80%) of them reported that they used these STEP and CUS skills during communicate with family-member in post-simulation stage.

Conclusion: STEP and CUS Keyword-mnemonics-based simulation can effectively improved RCU nurse "patient-centered communication" skill.

Early Outcomes of Virtual Environment-Based Provider- and Patient-Facing Education for Disease Management

Authors

Rosalyn Scott, Brandon Associates, Marina del Rey, CA, USA
Brian Burke, Veterans Health Administration, Dayton, Ohio, USA
Paul Ingmundson, Veterans Health Administration, San Antonio, TX, USA
Michael Heh, Veterans Health Administration, Long Beach, CA, USA
Brian James, Veterans Health Administration, Minneapolis, MN, USA

Presenter: Rosalyn Scott, Brandon Associates, Marina del Rey, CA, USA

Background: The US Veterans Health Administration Virtual Medical Center (VMC) is a collaborative care and learning avatar-based virtual environment available anytime and anywhere. The VMC has the potential to improve Veteran healthcare by eliminating barriers to access, cultivating Veteran engagement and providing continuing professional development (CPD) for providers aligned with VA care models. This virtual technology promotes participation from the convenience of home and office, increases the likelihood of Veteran-provider interactions, makes interactive provider education more accessible and could positively impact health outcomes.
Method: Initial projects centered on clinical challenges not fully met by conventional approaches and on strategies synergistic with current clinical care models. The first pilots focused on Veteran-facing and provider-facing education to support the management of diabetes, obesity and sleep disturbances. Strategies included flipped classroom curricula and self-guided activities. Interactive workbooks provided a guide to didactic material, videos and other multi-media resources accessible in the VMC. Group activities included facilitator-led and peer group sessions. Independently-led focus groups assessed impact. Participants expressed strong feelings of empowerment. They felt free to move about and explore the wealth of information and not have to wait to get materials. All had taken time to look at materials outside of their curriculum. This freedom fostered self-learning. Veterans liked that they were with fellow Veterans - this fostered storytelling and experience sharing. They also openly spoke about how hearing ideas and sharing were powerful learning experiences that had more impact than looking just looking at written materials.
Discussion & Conclusion: The VMC provides the opportunity to address important challenges facing the VA healthcare system including CPD for a widely distributed workforce; access to care; empowerment of Veterans to improve their well-being; unequal distribution of expertise; and, conflicting schedules/lifestyles/disabilities affecting travel to traditional care sites. Our focus groups

supported the effectiveness of VMC-based strategies to address these issues.

Take-home message: The VMC challenges us to answer the questions: How can we care for our Veterans without being in the same room? How can we best insure the ongoing professional development of our staff? What works and what is lost?

John Dean, University of Otago, Christchurch, New Zealand
Lutz Beckert, University of Otago, Christchurch, New Zealand
Cameron Lacey, University of Otago, Christchurch, New Zealand
Tania Huria, University of Otago, Christchurch, New Zealand

Presenter: Suzanne Pitama, University of Otago, Christchurch, New Zealand

Background: Over the last 10 years a change in indigenous health content has been documented, which maps a movement towards a focus on the broader socio-political influences that maintain indigenous health inequities. This content moves the learner from a position of critiquing the indigenous patient/community to the development of a critical lens on policy and procedures that influence systemic and clinician bias. This new learning content has dictated the use of learning methods that encourage critical reflective thinking and skill based (communication and clinical competency). The purpose of this paper is to document the design, implementation and evaluation of an indigenous health curriculum initiative couched within a socio-political context that was a joint collaboration between the disciplines of Indigenous health and clinical skills.
Method: The evaluation included formal anonymous student feedback on the learning session which collected quantitative (likert scale) data, and 2 open ended questions. Marking schedules on student performances were collected from the student, their peers (4), simulated patient and clinical assessor to determine correlations, and focus groups were held with students and clinical assessors/simulated patients.
Results: Overall students rated the session highly with 98% of the students reporting that the use of simulated patients as a teaching method assisted them to apply Indigenous health and Clinical Skills within a clinical context. 95% of students agreed that the scenarios used in the session provided an appropriate clinical context for indigenous health. Students appreciated feedback from the simulated patient, their peers and a clinical assessor. There was high correlation between clinical assessors and peer marking of students, and low correlation between students self reported performance and those of the clinical assessors and their peers. Students identified gaps in their learning that they wanted to continue to work on.

Conclusion: Overall this session provided scenarios that promoted socio-political influences that maintain indigenous health inequities, and allowed students to demonstrate competencies in both cultural and clinical competencies.Students reported an intent for transformative practice to support indigenous health gains.
Take-home message: Health education has the potential to contribute to health equity.

Does a Broadly Sampled Assessment Lead to Smaller Ethnicity-Related Differences in Clinical Grades?

Authors
Chantal E.E. van Andel
Marise Ph. Born
Axel P.N. Themmen
Karen M.

Presenter: Chantal van Andel, Erasmus MC, Rotterdam, Netherlands

Background: Previous research has shown that clinical grades can be predicted by students' ethnicity. A broadly sampled assessment involves mixed assessment methods used by multiple assessors across multiple moments. This type of assessment is expected to reduce unwarranted variances, and to therefore mitigate ethnic disparities in clinical ratings.
Method: Students' ethnicity was classified as Turkish/Moroccan/ African, Surinamese/Antillean, Asian, Western, and native Dutch. Our first research question involved the comparison between clinical grades of students with different ethnicities in a global evaluation system, and in a broadly sampled evaluation system. In total, data from 1667 students (74.3% native Dutch) who entered medical training between 2002 and 2004 (global evaluation: 818 students) and between 2008 and 2010 (broadly sampled evaluation: 849 students) were included. The main outcome measure was whether or not a student received ≥3 times a grade of 8 or higher (on a scale from 1-10). Our second research question involved the comparison between clinical grades of students with different ethnicities before and after clinical supervisors were allowed to deviate from the broadly sampled assessment scores. In total, 849 students (72.4% native Dutch) were included. The main outcome measure was the total deviating grade points a student received from supervisors. Both analyses were adjusted for gender, age, immigration status and average bachelor grade.
Results: Clinical grades of students of different ethnicities were more similar in a broadly sampled than in a global evaluation system, even after adjustments. More specifically, when assessed with broad samples, native Dutch students had lower chances, whereas other ethnic student groups had higher chances of receiving ≥3 times a grade of 8 or higher (on a scale from 1-10), as compared to when they were globally assessed. When supervisors were allowed to deviate from broadly sampled scores, ethnicity-related differences in clinical grades were re-introduced.
Conclusion: Besides broad sampling techniques, better structured evaluations could also lead to smaller group

differences. It remains unclear which factor has (primarily) mitigated ethnic disparities in grades.

Take-home message: A broadly sampled assessment of clinical competencies potentially restricts in-group favoritism towards native students.

Emphasising Diversity Amongst Second Year Medical Students as part of their Personal and Professional Development

Authors
Maria Regan
Kennedy Edwards
Isobel Braidman

Presenter: Maria Regan, University of Manchester Medical School, Manchester, UK

Background: Educating medical students to understand the importance of cultural competency is continuously emphasised by the General Medical Council (GMC, 2009; 2013). However, many medical schools experience challenges when delivering diversity training across the medical curriculum.

Method: At Manchester, in line with the intended learning outcomes of 'Dr as Professional', an innovative group session was introduced to Year 2 medical students to highlight diversity amongst peers (n=376). In the sessions students anonymously answered critical questions aimed at drawing out their understanding using Turning Point technologies. After the session students reflected on important issues raised in discussion and on their own experiences for feedback from Tutors for Personal and Professional Development (TPPDs) and as entries in their ePPDportfolios.

Results: Twenty-one group sessions of 24 students were delivered across the Year 2 cohort. Feedback from Group Tutors indicated the sessions were successful in actively engaging students and helping their understanding of diversity. With consent, we randomly selected reflective PPDportfolio entries to investigate student understanding (n=20). Thematic analysis identified 5 key themes which were used on 52 occasions: Bias (28%), Assumptions (19%), Impact of Group session (23%), Taking Responsibility for Own Learning (17%) and Interpreting Interactions (13%). TPPD Tutors also highlighted improved awareness of diversity from previous years in the ePPDportfolios entries. Introducing group sessions enabled students to discuss sensitive issues in a safe environment facilitated by a Tutor. Although there is an increased emphasis on cultural competency teaching with patients, little exists in medical curricula to help students understand diversity amongst colleagues. This study is a first step towards exploring the challenges of supporting students to respect learners from diverse backgrounds and communities. We aim to use this data for further investigation of how this could be enhanced across the medical curriculum and wider Faculty programmes.

Conclusion: Enhancing medical students' understanding of respecting individuals and working effectively within a multi-professional team is important. Medical Schools should be encouraged to provide opportunities for

students to reflect on the importance of diversity amongst colleagues.

The role of study strategy in motivation and academic performance of ethnic minority and majority students: a structural equation model

Authors
Ulviye Isik, VUmc School of Medical Sciences, Amsterdam, Netherlands
Janneke Wilschut, VU University Medical Center, Amsterdam, Netherlands
Gerda Croiset, VUmc School of Medical Sciences, Amsterdam, Netherlands
Rashmi A. Kusurkar, VUmc School of Medical Sciences, Amsterdam, Netherlands

Presenter: Ulviye Isik, VUmc School of Medical Sciences, Amsterdam, Netherlands

Background: Underperformance among ethnic minority students has been reported in several studies. Autonomous motivation (AM; acting out of true interest or personal endorsement) is associated with better learning and academic performance. Controlled motivation (CM) is acting out of pressure or for rewards. This study investigated whether the type of study strategy, namely surface, achieving, or deep (the "desirable" type), was a mediator between AM and academic performance (GPA and clerkship performance), and whether these relations were different for students from different ethnic groups.

Method: Data on ethnic background, motivation, and study strategy was collected cross-sectionally from all medical students of VUmc School of Medical Sciences through an electronic survey in September 2015. Ethnic minority, as per the Dutch Statistics Bureau, means "a person with at least one parent born outside Netherlands" and is classified into: 'Turkish/Moroccan/African', 'Surinamese/Antillean', 'Asian', 'Western', and 'Other'. The response rate was 38.6% (947/ 2451). Structural Equation Modelling (SEM) was performed to test the hypothesized model: a higher AM has a positive association with academic performance through deep and achieving strategy, and has a negative association with performance through surface strategy.

Results: The models with the outcome variables GPA (n= 807; df=1, RMSEA= 0.000, p= 0.56) and clerkship performance (n= 804; df=1, RMSEA= 0.007 ,p= 0.31) had a good fit.

These models showed differences in the relations for the ethnic majority and minority groups.

The ethnic groups were considered separately to gain a better understanding about the needed intervention/support in the curriculum. In this study, AM had a positive association with GPA through achieving strategy for the ethnic majority students only. It might be that the size of the minority groups was too small to detect differences or that other factors mediate these relations in ethnic minority students. Overall students tend

to use achieving strategy more often than the desired deep strategy.

Conclusion: Qualitative research is needed to identify other factors influencing the academic performance of ethnic minority students and what they experience during their education, in order to support their learning in the right manner.
